Problema respectării dreptului la viața privată și garantarea acesteia în faza urmăririi penale rămâne un subiect sensibil pentru state precum România și Republica Moldova. Cercetarea și soluționarea deficiențelor constatate contribuie la îmbunătățirea calității actului de justiție, și nu numai, și la consolidarea încrederii cetățenilor în instituțiile statului. Din acest punct de vedere, proiectul de cercetare se datorează în primul rând revizuirii și analizării stabilirii garanțiilor de care beneficiază subiecții față de care este aplicat arestul preventiv, și nu numai, și în privința evaluării aplicabilității normelor procesual penale de către organele competente ale statelor, din acest punct de vedere, al respectării dreptului la viața privată învinuiților sau inculpaților față de care este aplicat arestul preventiv, potrivit legislației din Republica Moldova sau inculpaților, potrivit legislației

din România. În acest sens, importanța este determinată tocmai de necesitatea identificării lacunelor legislative care afectează acest drept la viața privată învinuiților/inculpaților față de care este aplicat arestul preventiv.

Studiul urmărește de a se stabili direcțiile și tendințele procesual-penale pe linia asigurării și realizării dreptului la viața privată învinuiților/inculpaților față de care este aplicat arestul preventiv. Sunt abordate în acest sens și aspecte practice ale respectării dreptului la viața privată învinuiților/inculpaților față de care este aplicat arestul preventiv, în scopul reliefării dificultăților tehnice și procesuale cu care se confruntă organele de drept, pentru a se asigura respectarea dreptului la viața privată în practica de aplicare a normelor procesual penale.

Cuvinte-cheie: măsuri de protecție, dreptul la viața privată, faza urmăririi penale, învinuiți, inculpați, arest preventiv.

Introduction. The study on the purpose of applying the measure of preventive arrest in Romania and the Republic of Moldova, analyzed from the perspective of respecting the right to privacy, highlights a series of essential aspects for understanding how the two legal systems balance the need for deprivation of liberty, from the point of view of fundamental rights.

The term accused/defendant in the legislation of the Republic of Moldova and defendant in the legislation of Romania, refers to a procedural capacity (from the Latin legitimatio ad causam), namely the person accused of committing a crime in a criminal trial, but who has not yet been sent to trial. Preventive arrest represents a restrictive procedural measure in criminal law, by which a person is deprived of liberty for a certain period, before a final judgment is pronounced. This latter measure, even if it must be taken by the authorities to prevent the commission of new crimes, or the influence of witnesses and the destruction of evidence, is not often its application is ordered subjectively by the criminal prosecution bodies themselves. The purpose of the study is to identify and clarify the current situation regarding the measure of preventive arrest, by presenting practical situations, and the application of norms, which lead to the respect and not to the violation and failure to protect the right to private life. Although both states share similar legal traditions and are influenced by European standards, the way in which preventive arrest is applied presents significant differences, both at the legislative and jurisprudential levels.

Methods and materials applied. The study on the purpose of applying the measure of preventive arrest in Romania and the Republic of Moldova, in accordance with the respect for the right to private life, is based on a complex and interdisciplinary methodology, which combined:

- *Legal analysis*: by examining the provisions of the CPC ROM and the CPC RM regarding preventive arrest; analysis of constitutional guarantees regarding individual freedom and privacy; assessment of the conformity of national legislation with ECHR standards (Art. 5 and Art. 8), allowing the identification of differences and similarities between the two legal systems, as well as possible legislative gaps;
- *Comparative research*: analyzing the ways in which Romania and the Republic of Moldova regulate and apply the measure of preventive arrest;
- *Examination of jurisprudence and doctrinal evaluation.*

Discussions and results obtained. The measure of preventive arrest represents one of the most intrusive interventions of the state in the sphere of individual freedom and private life. By its nature, it involves the deprivation of liberty of a person who has not been definitively convicted, which requires a rigorous analysis of its justification, proportionality and necessity. In Romania and the Republic of Moldova, the regulations on preventive arrest are influenced by both domestic legal traditions and European standards, in particular those established by the European Convention on Human Rights

(ECHR). In this context, respect for the right to private life becomes an essential criterion in assessing the legality and legitimacy of the measure.

Preventive arrest is regulated in Romania by the CPC, which defines it as a preventive measure depriving of liberty, applicable only under conditions strictly determined by law [1]. In the Republic of Moldova, the regulation is similar, the CPC providing that preventive detention may be ordered only when there are reasonable suspicions and concrete procedural risks [2]. In both systems, the measure is exceptional in nature, being subject to the principle of subsidiarity: it can only be ordered if other preventive measures are insufficient.

This approach reflects the standards of the ECHR, which has consistently established that preventive detention must be justified by "relevant and sufficient" reasons, and the mere gravity of the accusation cannot constitute an autonomous basis for deprivation of liberty [3].

The right to private life, enshrined in Art. 26 of the Romanian Constitution, Art. 28 of the Constitution of the Republic of Moldova and Art. 8 of the ECHR, is inherently affected by the application of preventive detention. Deprivation of liberty in this sense implies limiting contact with the family, monitoring correspondence and conversations, restricting freedom of movement, and exposure to conditions of detention that may affect human dignity. In this regard, the ECHR has emphasized that interferences with private life must be proportionate and necessary in a democratic society, and the state has the obligation to ensure conditions of detention compatible with respect for the dignity of the person [4].

In Romania, the preventive arrest measure is applied to the defendant, against whom the criminal action has been initiated. The conditions and cases for applying the preventive arrest measure are mentioned in Art. 223 of the CPC ROM, and the situations that require this measure are provided for in par. (1) letters a)-d). Why are they mentioned in the study, since the legislation justifies the application of the preventive arrest measure and the intrusion into the defendant's right to private life, a measure that is fully justified in the situation described in Art. 223[1] par. (1) letters a)-d) CPC ROM. The ECtHR examples

[1] (1) The measure of preventive arrest may be taken by the judge of rights and liberties, during the criminal investigation, by the judge of the preliminary chamber, in the preliminary chamber procedure, or by the court before which the case is pending, during the trial, only if the evidence shows reasonable suspicion that the defendant has committed a crime and one of the following situations exists: a) the defendant has fled or hidden, in order to evade the criminal investigation or the trial, or has made preparations of any kind for such acts; b) the defendant attempts to influence another participant in the commission of the crime, a witness or an expert or to destroy, alter, hide or steal material means of evidence or to determine another person to engage in such behavior; c) the defendant exerts pressure on the injured person or tries to reach a fraudulent agreement with him/her; d) there is a reasonable suspicion that, after the initiation of criminal proceedings against him, the defendant has intentionally committed a new crime or is preparing to commit a new crime. (2) The measure of preventive arrest of the defendant may also be taken if, from the evidence, there is reasonable suspicion that he has committed an intentional crime against life, a crime that caused bodily harm or death to a person, a crime against national security provided for by the Criminal Code and other special laws, a drug trafficking crime, a crime under the regime regarding doping substances, carrying out illegal operations with precursors or other products likely to have psychoactive effects, a crime regarding non-compliance with the regime of weapons, ammunition, nuclear materials, explosive materials and precursors of restricted explosives, trafficking and exploitation of vulnerable persons, acts of terrorism, money laundering, counterfeiting of coins, stamps or other values, blackmail, rape, illegal deprivation of liberty, tax evasion, insult, judicial insult, a corruption crime, a crime committed through computer systems or means of communication. electronic or another crime for which the law provides for a prison sentence of 5 years or more and, based on the assessment of the seriousness of the act, the manner and circumstances of its commission, the environment and environment from which it comes, the criminal record and other circumstances concerning the person, it is found that his deprivation of liberty is necessary to eliminate a state of danger to public order. (3) With respect to the defendant who, in the same case, during the criminal investigation, the preliminary chamber procedure or the trial, has been previously arrested on remand or for whom house arrest was previously ordered, the measure of preventive arrest may be ordered only if new grounds have arisen that make his deprivation of liberty necessary.

mentioned by author Daniel Cristea fully justify the application of the preventive arrest measure:

➢ "when there is a risk that the accused will not appear for trial: *Stögmüller v. Austria*, of 10 November 1969, Series A No.9, para. 15;

➢ when there is a risk that the accused, if released, will take measures that would prejudice the administration of justice: *Wemhoff v. Germany*, of 27 June 1968, Series A No.7, para. 14;

➢ or will commit other crimes: *Matznetter v. Austria*, of 10 November 1969, Series A No.10, para. 9;

➢ or will cause public disorder: *Letellier v. France*, of 26 June 1991, Series A No.207, para. 51;

➢ influences the proper conduct of the proceedings: *Trzaska v. Poland*, of 11 July 2000, No.25792/94, para. 65" [5, p.418-419].

Even though Art. 8 of the ECHR states that "a person has the right to live free from restrictions imposed by the state, that private life is superior to public life" [6, p.3], the legislative provisions provided for in Art. 223 of the CPC ROM are clearly defined and justify this measure of preventive arrest in view of the common collective objective.

However, the right to privacy, when applying the measure of preventive arrest, can be violated through a multitude of actions. For example:

- Access to personal data during the criminal investigation phase, which is non-public. In this sense, the disclosure of personal information about the defendant, such as correspondence or medical data, without his consent, constitutes a violation of privacy;
- Publicity of the case, by transmitting and disseminating information about the defendant in the media, including images or personal details, which lead to the violation of the right to privacy. E.g.: the ECtHR case *Batiashvili v. Georgia* [7], in which the recordings made "were sent to a television channel and broadcast before the applicant was charged and arrested", as a result of influencing the decision;
- During technical surveillance, the use of means of interception of conversations or video surveillance without respecting the legal conditions and their transmission to the press; E.g.: the ECtHR case *Căşuneanu v. Romania* [8], illustrates the need to apply the provisions of Art. 4, para.(1), letter (f) of EU Directive 2016/680[2] [9], in relation to "leaks to the press since the commencement of the criminal proceedings against the applicant, since fragments of the conversations between the defendants, obtained as a result of telephone interceptions during the surveillance operation within the framework of the criminal investigation, carried out prior to the criminal proceedings, were broadcast, which appeared in the newspapers before the applicant and the co-defendant were brought to trial";
- Conditions in detention centres, which are due to lack of space or constant surveillance in pre-trial detention centres. E.g.: the ECtHR case *Polgar v. Romania* [10], which addressed inadequate conditions of detention in prisons in Romania, indirectly affecting the right to private life.

In the Republic of Moldova, the measure of preventive arrest constitutes an exceptional measure, which may be applied, as the case may be, to the suspect, accused or defendant, when other preventive measures are not sufficient to ensure the proper conduct of the criminal trial. It may be ordered if there are reasonable grounds to believe that he has committed a crime and if certain conditions are met, such as:

[2] Member States shall ensure that personal data: are processed in a manner that ensures adequate security of personal data, including protection against unauthorised or unlawful processing and against accidental loss, destruction or damage, by taking appropriate technical or organisational measures

– Preventing evasion from criminal prosecution or trial;
– Preventing the influence of witnesses or the destruction of evidence;
– Preventing the commission of new crimes.

The concordance with the right to private life has been emphasized in many studies and cases, with reference to the application of the measure of preventive arrest, on the occasion of which the respect for this right to private life is essential in a state governed by law. In this regard, the following issues identified concern the violation of the right to private life:

– Excessive duration of preventive arrest. For example, the case of *Buzadji v. Moldova* [11], concerning reasonable suspicion, which is a sine qua non for a lawful detention, is not sufficient to justify the extension of detention;

– Lack of adequate reasoning. For example, in the case of *Boicenco v. Moldova* [12], the courts, when ordering the extension of detention, did not indicate the reasons considered to have impeded the trial or that other crimes might be hidden or committed. In this regard, with regard to decisions on preventive detention, the judges do not sufficiently analyse the alternative measures that could be applied;

– Regarding the disclosure of confidential information: the case of *Batiashvili v. Georgia* [13] – the recordings made "were sent to a television channel and broadcast before the applicant was charged and arrested".

– Regarding the extension of pre-trial detention as an excessive duration of pre-trial detention, in the case of *Pînzari v. Republic of Moldova* [14], the measure was contrary to legal provisions and considered a violation of the right to liberty and security, which indirectly affected the applicant's private life.

The application of the measure of preventive arrest is always based on legal principles, as a balance between individual rights and the public interest in order to protect the right to private life itself. In this sense, compliance with proportionality with the intended purpose is the measure that must be applied only if it is absolutely necessary to protect the public interest. Therefore, the causes for the proper conduct of the criminal trial, such as the prevention of crimes or the protection of evidence, are necessary elements to order the measure of preventive arrest. Of course, the measures are provided for by law, they must be applied transparently, so that the method of application is clear by justifying the measure, respecting all the conditions of the right to private life. We mention the right to fairness in the application of preventive arrest; this right ensures protection against abuses and the right to private life.

The application of the measure of preventive arrest and the right to private life, however, required clear rules, which are not often violated. Examples in which the measure of preventive detention can lead to a violation of the right to private life are diverse, from the public disclosure of personal information during the criminal investigation phase, which is non-public, to excessive surveillance during the period of preventive detention, are measures that represent unjustified intrusions into private life. At the same time, invasive body examinations during preventive detention procedures, which are not justified by real needs, are a violation of dignity and private life; inadequate conditions in detention, due to narrow spaces during preventive detention, constitute violations of private life. Last but not least, the effect produced by the measure of preventive detention, such as the restriction and limitation of the right to communicate with the family, constitutes a violation of the right to private life.

Such situations have been challenged before the European Court of Human Rights, the Court which has repeatedly established that detention measures must respect both

human dignity and the right to private life.

We can say that Romanian courts have evolved significantly in justifying the measure of preventive detention, especially after repeated convictions at the ECHR. Decisions such as *Calmanovici v. Romania* [15], however, have determined a paradigm shift, with courts being obliged to provide individualized motivations and to analyze alternative measures. However, practice shows that sometimes stereotyped formulas are still used, and the duration of preventive detention can become excessive.

The Republic of Moldova was, however, the subject of one of the most important ECHR rulings on pre-trial detention: *Buzadji v. Republic of Moldova* [16], in which the Court established that, after a certain period, the authorities must demonstrate additional reasons for maintaining detention. Although the legislation has been amended, judicial practice continues to face problems regarding the excessive duration and insufficient justification of the measure.

Thus, the application of pre-trial detention in the two states highlights a constant tension between the need to ensure the proper conduct of the criminal trial and the protection of fundamental rights. Although the legislation is generally in line with European standards, judicial practice shows, as mentioned above, that the measure is sometimes applied too lightly, the justifications are insufficient, and alternative measures are underused.

However, alternative measures to pre-trial detention represent an essential tool in the architecture of the modern criminal process, with the role of ensuring the balance between the need for the efficient conduct of the criminal prosecution and respect for the fundamental rights of the individual. In the context of European developments and the jurisprudence of the European Court of Human Rights (ECHR), both Romania and the Republic of Moldova have had to adapt their legislation and judicial practice to reduce excessive reliance on preventive detention and to promote less intrusive measures compatible with the right to privacy. Although the CPC ROM provides for a series of alternative measures, such as judicial control, judicial control on bail, house arrest [17], these measures must be designed to limit the interference with the person's liberty, allowing the authorities, in accordance with the principle of proportionality, to prevent procedural risks, according to which deprivation of liberty should be used only as a last resort, in the RM courts increasingly resort to preventive detention, even if the CPC RM regulates measures similar to the CPC ROM, such as provisional release under judicial control, provisional release on personal guarantee or bail, or house arrest [18].

Conclusions. The application of the measure of preventive arrest in Romania and the Republic of Moldova, in accordance with the respect for the right to privacy, highlighted the complexity of the balance between the need for the efficient conduct of the criminal trial and the protection of the fundamental rights of the person. The comparative analysis of the two legal systems, corroborated with European and international standards, allowed the formulation of general conclusions that reflect both the progress made and the persistent challenges.

Pre-trial arrest being one of the most intrusive procedural measures, its application must be strictly necessary, proportionate and justified. Romania and the Republic of Moldova have made important progress, but in order to ensure full respect for the right to privacy, a paradigm shift was necessary, from a culture of preventive detention to a culture of procedural guarantees and the protection of fundamental rights.

From the perspective of the right to privacy, preventive arrest, as it turns out, can affect the confidentiality of the person's life, through excessive surveillance before the

application of the measure and can lead to separation from the family and the interruption of social relations.

This right to privacy may, however, be restricted, in accordance with the legislation, only if the restriction is proportionate, necessary and provided for by law. In this regard, judges must carefully assess whether the measure of preventive detention is justified in order to restrict the right to privacy.

The study demonstrates that the application of the measure of preventive detention in Romania and the Republic of Moldova is thus at the intersection between the need to protect public order and the state's obligation to respect the fundamental rights of the individual. Although progress is evident, especially under the influence of the ECHR jurisprudence, important challenges persist related to the justification of the measure, the length of detention, the conditions of detention and the insufficient use of alternative measures.

However, respect for the right to privacy is not an obstacle to justice, but an essential condition for the legitimacy and fairness of the criminal process. Both Romania and the Republic of Moldova must continue reforms to ensure a real balance between the efficiency of the criminal process and this protection.

Pre-trial detention in both states must be regulated as a measure of last resort, applicable only when other preventive measures are not sufficient to ensure the proper conduct of the criminal trial.

THE NOTION OF MONETARY SIGNS IN THE CONTEXT OF THE OFFENCES PROVIDED IN ARTICOLE 236 OF THE CRIMINAL CODE

Carmen DICHII,
PhD Candidate, Moldova State University,
Prosecutor, Edineț Prosecutor's Office, Ocnița Territorial Unit
Republic of Moldova
ORCID: 0009-0000-7522-7347

Abstract

The article seeks to explain what is meant by monetary signs within the meaning of Art. 236 of the Criminal Code of the Republic of Moldova and why this notion is essential for understanding the legal substance of the offences involving the manufacturing or putting into circulation of counterfeit banknotes or titles of false values.

The analysis focuses on banknotes and metallic coins – including jubilee and commemorative ones – issued by the National Bank of Moldova or by the monetary authorities of other states or state unions. The investigation highlights that these entities cannot be reduced to mere material objects, since their economic and legal function is to guarantee the stability and credibility of payments.

The main aim of the article is to determine the semantic content of the notion of monetary signs through an examination of the relevant normative acts from the Republic of Moldova, from other states, and from the European Union, in order to outline a coherent and operational meaning for the interpretation of Art. 236 of the Criminal Code of the Republic of Moldova.

Keywords: monetary signs, leu, ban, banknotes, metallic coins, authorized authority.

NOȚIUNEA DE SEMNE BĂNEȘTI ÎN CONTEXTUL INFRACȚIUNILOR PREVĂZUTE LA ARTICOLUL 236 DIN CODUL PENAL

Abstract

Articolul urmărește să explice ce înseamnă semne bănești în sensul Art. 236 din Codul penal al Republicii Moldova și de ce această noțiune este atât de importantă pentru a percepe esența juridică a infracțiunilor de fabricare sau punere în circulație a semnelor bănești false sau a titlurilor de valoare false

În centrul atenției se află bancnotele și monedele metalice – inclusiv cele jubiliare sau comemorative – emise de Banca Națională a Moldovei ori de autoritățile monetare ale altor state ori ale unor uniuni statale. Investigația evidențiază că aceste entități nu pot fi reduse la simple entități materiale, întrucât funcția lor economică și juridică este aceea de a garanta stabilitatea și credibilitatea plăților.

Scopul principal al articolului este de a determina semantismul noțiunii de semne bănești prin analiza actelor normative relevante din Republica Moldova, din alte state și din cadrul Uniunii Europene, pentru a contura un înțeles coerent și aplicabil în interpretarea Art. 236 din Codul penal al Republicii Moldova.

Cuvinte-cheie: semne bănești, leu, ban, banknote, monede metalice, organ autorizat.

Introduction. As I noted in a recent publication, "in the case of the offenses provided under Article 236 of the Criminal Code of the Republic of Moldova (hereinafter – CC RM), the impairment of the legal interest of the offense is initially brought about through, among other things, authentic monetary signs [...] which relate to the material object of the social relations protected in Article 236 CC RM. By initiating the criminal activity, the perpetrator causes these entities to be transformed into false monetary signs which

relate to the material object of the offenses provided in Article 236 CC RM" [1]. Starting from this hypothesis, below we attempt to show why defining the content of the notion of monetary signs is not a mere terminological exercise but a condition for understanding what exactly criminal law protects and why the manufacture and putting into circulation of counterfeit monetary signs undermines public confidence in payment mechanisms. Such a clarification makes it possible to distinguish between the physical medium of monetary signs and their legal function, providing a practical reference for interpreting Article 236 CC RM and for avoiding inconsistent solutions in its application.

Methods and materials applied. The present investigation applies a normative analysis to interpret coherently and systematically the provisions of Article 236 CC RM together with the extra-penal norms that complement and give them content. At the same time, the comparative method is used by relating the norms of the Republic of Moldova's legislation to European regulations and to those of other states, in order to highlight relevant convergences and differences. In parallel, the historical method is employed to trace the evolution of specific categories of monetary signs in the territory of the Republic of Moldova and the way this evolution has influenced the legislator's terminological choices.

Discussions and results obtained. In the original version of Article 236 CC RM the term "money" (in the title) and the expression "banknotes of the National Bank of Moldova, coins, foreign currency" (in the operative part) were used. After the entry into force of Law No.33 of 06.03.2012 for the amendment and completion of certain legislative acts (hereinafter Law No.33/2012), in the title of Article 236 CC RM the term "money" was substituted with the expression "monetary signs"; in the operative part of that article the expression "banknotes of the National Bank of Moldova, coins, foreign currency" was replaced by the phrase "monetary signs (banknotes and metallic coins, including jubilee and commemorative ones, issued by the National Bank of Moldova or by the authorized body of a foreign state or of a monetary union of foreign states)".

The phrase "monetary signs" or similar expressions are frequently used in Romanian legislation: Law No.102 of 21.09.1992 on the national coat of arms and the state seal; Law No.312 of 28.06.2004 on the Statute of the National Bank of Romania; Regulation No.8 of the National Bank of Romania of 19.12.2002 on the procedure for detecting counterfeit or forged euro banknotes and coins, etc.

Besides this, the phrase "monetary signs" or related expressions are used in Romanian translations of foreign criminal laws that contain provisions corresponding to Article 236 of the CC RM: "monetary symbols (însemne băneşti)" [2] (Art. 243 of the Criminal Code of the Republic of Bulgaria); "monetary signs (semne băneşti)" [3] (Art. 310 of the Criminal Code of the Republic of Poland); "currency signs (semne monetare)" [4; 5] (Art. 442-1 of the Criminal Code of the French Republic; Art. 213 of the Criminal Code of the Grand Duchy of Luxembourg).

In accordance with paragraph (2) of the Article 130 of the Constitution, "the national currency of the Republic of Moldova is the Moldovan leu" [6]. In turn, paragraph (1) of Article 479 of the Civil Code provides that "the national currency, the leu, constitutes a legal means of payment, mandatory for acceptance at its nominal value throughout the territory of the Republic of Moldova" [7]. Last but not least, Article 3 of Law No.1232 of 15.12.1992 on money (hereinafter Law No.1232/1992) states that "the national currency – the leu – is the legal means of payment on the territory of the Republic of Moldova" [8].

The difference in wording between paragraph (2) of Article 130 of the Constitution, paragraph (1) of Article 479 of the Civil Code and Article 3 of Law No.1232/1992, on the one hand, and Article 236 CC RM, on the other, does not reveal an error but only the fact that Article 236 CC RM requires more specific terminology adapted to the particularities

of the incrimination; for this reason the legislator resorted to the phrase "monetary signs" capable of covering both banknotes and coins simultaneously without being conflated with either.

Below, we will analyse precisely these concrete categories. In the operative part of Article 236 CC RM they are mentioned in the formulation "banknotes and metallic coins, including jubilee and commemorative ones, issued by the National Bank of Moldova or by the authorized body of a foreign state or of a monetary union of foreign states".

The first segment that must be examined in this context concerns *the banknotes and metallic coins, including jubilee and commemorative ones, issued by the National Bank of Moldova (hereinafter* – NBM).

In this regard, Article 1 of Law No.1232/1992 provides: "The monetary unit of the Republic of Moldova is the leu (Moldovan), equal to 100 bani. Cash is in circulation in the form of paper monetary signs (banknotes) and metallic monetary signs (coins)" [8]. Similarly, although without directly using the expression "monetary signs", paragraph (1) of Article 56 of Law No.548 of 21.07.1995 on the National Bank of Moldova (hereinafter – Law No.548/1995) states: "The monetary unit of the Republic of Moldova is the Moldovan leu. One leu is divided into 100 bani" [9]. Viewed together, these provisions show that the wording in Article 236 CC RM – "monetary signs" – does not depart from the general legislative framework but particularizes it, providing a semantic fit appropriate to the needs of criminal law.

It should be noted that the current monetary signs were put into circulation by Decree No.200 of the President of the Republic of Moldova of 24.11.1993 on the introduction of the national currency in the Republic of Moldova. That normative act establishes, among other things: "As of 18:00 on 2 December 1993, the leu (Moldovan) shall be considered the sole legal means of payment on the territory of the Republic of Moldova" [10]. Therefore, the establishment of the Moldovan leu as the legal means of payment marks the definitive transition to the current monetary signs and consolidates the framework within which Article 236 CC RM protects these values expressed in their concrete categories: banknotes and metallic coins.

Metallic coins, one of these categories, include not only "metallic monetary signs (money regarded as subsidiary coin), put into circulation by the NBM" [11; 12]. As evidence of this, we present two examples of normative acts by which metallic coins were put into circulation: NBM Decision No.1 of 12.01.1998 on the putting into circulation of the metallic coin with the nominal value of 50 bani, model of 1997; NBM Decision No.5 of 22.02.2018 on the putting into circulation as a means of payment of new metallic coins. In accordance with the latter of these normative acts, "as of 28 February 2018, four new metallic coins with the nominal values of 1 leu, 2 lei, 5 lei and 10 lei were put into circulation as a means of payment on the territory of the Republic of Moldova" [13].

Banknotes constitute the other category of monetary signs specified in Article 236 CC RM. The reference is to "paper monetary signs (Moldovan lei) put into circulation by the NBM" [11; 12].

The NBM issues banknotes in denominations from 1 leu to 1000 lei. For most denominations there are multiple issues (1993-2015), reflecting both design evolution and the continuous modernization of anti-counterfeiting security features.

Among the examples of normative acts by which banknotes were put into circulation we highlight: NBM Decision No.319 of 25.11.1999 on the putting into circulation of the banknote with the nominal value of 500 lei; NBM Decision No.249 of 13.10.2003 on the putting into circulation of the banknote with the nominal value of 1000 lei; NBM Decision No.2 of 24.09.2015 on the putting into circulation as a means of payment of certain mod-

ernized banknotes; etc.

A distinct category of monetary signs, specified in Article 236 CC RM, consists of *jubilee or commemorative monetary signs (metallic coins or banknotes)*.

The NBM has issued commemorative coins since 1996, most of them made of precious metals (gold and silver), in limited mintages, dedicated to personalities, historical events, cultural heritage, science, nature and other national themes. These coins are grouped into numerous thematic series (Personalities; Historical Events; Monasteries; Red Book; Monuments; Science and Innovation; etc.).

The first jubilee coin is referenced in Parliamentary Decision No.1012 of 23.10.1996 on the putting into circulation of the jubilee coin dedicated to the 5th anniversary of the proclamation of the independence of the Republic of Moldova. The first commemorative coins are referenced in NBM Decision No.342 of 14.11.2000 on the putting into circulation as a means of payment and for numismatic purposes of certain commemorative coins.

The NBM has issued a single commemorative banknote. This banknote is referred to in NBM Decision No.223 of 21.11.2013 on the putting into circulation as a means of payment and for numismatic purposes of certain commemorative coins and a commemorative banknote. In point V of that normative act we find the following wording: "Commemorative coins and commemorative banknotes are accepted as a means of payment at their nominal value" [14]. In fact, provisions of this kind can be identified in all normative acts by which jubilee or commemorative monetary signs were put into circulation. Such provisions constitute the legal basis for considering these monetary signs as the material object or product of the offenses provided for in Article 236 CC RM.

In another respect, for banknotes and metallic coins (including jubilee and commemorative ones) to be able to represent the material object or product of the offenses provided for in Article 236 CC RM, it is necessary that they *be issued by the NBM*. This condition is expressly established in Article 236 CC RM.

Per a contrario, objects issued on the territory of the Republic of Moldova by anyone else cannot constitute the material object or product of the offenses provided for in Article 236 CC RM. This refers in particular to the so-called "rubles of the moldovan nistrian republic" and the so-called "kopecks of the moldovan nistrian republic". These are issued by the so-called "transnistrian republican bank". This is an unconstitutional entity which, for the purposes of Article 134^{23} CC RM, constitutes "an alleged authority created on the territory of a state, outside that state's constitutional regulations and not recognized in accordance with the provisions of international treaties" [15]. Under these circumstances, it is clear that such objects cannot benefit from the criminal-law protection reserved for the monetary signs of the Republic of Moldova, and their inclusion within the scope of Article 236 CC RM is excluded by their very unconstitutional nature. The alleged monetary signs issued on the territory of the Republic of Moldova by an unconstitutional entity, if counterfeited, should be treated as instruments for committing fraud or for causing material damage by deception or abuse of trust.

We examined the first segment of the description in Article 236 CC RM of the material object or product of the offense – the banknotes and metallic coins, including jubilee and commemorative ones, issued by the NBM. The second such segment concerns *the banknotes and metallic coins, including jubilee and commemorative ones, issued by the authorized body of a foreign state or of a monetary union of foreign states.*

There are no modern states that have two distinct national monetary signs of their own, issued in parallel by their authorized body. There are, however, states with two monetary signs, one of which is foreign (for example: Panama, Zimbabwe), or states that use foreign monetary signs (for example: Montenegro). Such monetary signs can, of course,

constitute the material object or product of the offenses provided for in Article 236 CC RM.

It should be noted that this article applies regardless of whether the issuing state of the monetary signs manufactured or put into circulation has signed, ratified, or acceded to the Geneva Convention.

When we speak of monetary unions of foreign states, we primarily mean monetary unions with a common monetary policy (that is, with common monetary signs and a common central bank). Thus, in the Euro area, the European Central Bank issues the euro. Council Regulation (EC) No.974/98 of 3 May 1998 on the introduction of the euro provides in Article 2: "As from 1 January 1999 the currency of the participating Member States shall be the euro. The currency unit shall be one euro. One euro shall be divided into one hundred cent" [16]. In the East Caribbean Currency Union, the East Caribbean dollar is issued by the Eastern Caribbean Central Bank. In the West African Monetary Union, the Central Bank of West African States issues the West African franc. In the Central African Monetary Union, the Central Bank of the Economic and Monetary Community of Central Africa issues the Central African franc. In the Pacific Monetary Union, the Issuing Institution for Overseas Territories issues the CFP franc of the French Pacific Communities.

Foreign monetary signs are issued either by the authorized body of the monetary union of foreign states or by the authorized body of a foreign state. The important point is that, in both cases, the issuing body is an authorized one. The following do not meet this condition: the so-called "north cypriot lira" issued by the so-called "central bank of the turkish republic of northern cyprus"; the so-called "somaliland shilling" issued by the so-called "bank of somaliland"; the so-called "abkhazia apsar" issued by the so-called "national bank of abkhazia"; the so-called "south ossetian rouble" issued by the so-called "national bank of south ossetia" etc. These alleged issuing authorities are nothing other than unconstitutional entities within the meaning of Article 134^{23} CC RM. The alleged monetary signs issued in the territory of other states by such entities, if counterfeited, can be used as instruments for committing fraud or for causing material damage by deception or abuse of trust.

It is possible that jubilee or commemorative coins or banknotes may be issued by the authorized body of a foreign state. As an example in this regard we present Circular No.42 of the National Bank of Romania of 15.09.2023 concerning the release into the numismatic circuit of the mint set on the theme "175 years since the adoption of the tricolor". The following passage from Article 1 of that normative act deserves attention: "The mint set will contain the Romanian coins in circulation, with the nominal values of: 1 ban, 5 bani, 10 bani, 50 bani [...]" [17]. In other words, the metallic coins specified in this circular have a vocation not only as numismatic objects but also as monetary signs, as means of payment.

It is also possible that some monetary unions of foreign states may issue jubilee or commemorative coins, either through a common authorized body or through coordinated issues at the union level.

Having examined all the hypotheses that fall within the scope of the phrase "monetary signs (banknotes and metallic coins, including jubilee and commemorative ones, issued by the National Bank of Moldova or by the authorized body of a foreign state or of a monetary union of foreign states)" as used in Article 236 CC RM, it is necessary to analyse the counter-hypotheses that do not fall within the scope of that phrase.

The first of these counter-hypotheses is *virtual currency*.

In accordance with paragraph (5) of Article 132^{3} of the CC RM, "virtual currency means a digital representation of value that is not issued or guaranteed by a central bank or a public authority, is not necessarily linked to a legally established currency and does

not have the legal status of money or currency, but is accepted by natural or legal persons as a means of exchange and can be transferred, stored and traded electronically" [15]. The phrase "digital representation" in this definition clearly demonstrates the incorporeal, immaterial nature of virtual currencies. It should be noted, however, that the offenses provided in Article 236 CC RM have a material object, not an immaterial one. This is the first indication confirming that virtual currencies cannot constitute the material object or product of the offenses provided for in Article 236 CC RM. Other indications can also be identified in paragraph (5) of Article 132^3 CC RM: "is not issued or guaranteed by a central bank or a public authority" [15]; "does not have the legal status of currency or money" [15].

All of the above are sufficient to state that virtual currencies do not constitute the material object or product of the offenses provided in Article 236 CC RM.

Virtual currencies, if created fraudulently, may be used as means for committing fraud or for causing material damage by deception or abuse of trust.

Another counter-hypothesis is *electronic money*.

In accordance with paragraph (4) of Article 132^3 of the CC RM, "electronic money means a monetary value stored electronically, including magnetically, representing a claim on the issuer, which is issued upon receipt of funds (other than electronic money) for the purpose of carrying out payment transactions, and which is accepted by a person other than the issuer of the electronic money" [15]. It follows that electronic money is a specialized form of cashless monetary means.

In the logic of the foregoing, it is necessary to reiterate: "Article 236 CC RM concerns exclusively the circulation of monetary signs in cash [...]. The circulation of cashless monetary signs constitutes the process of movement of monetary signs that have no material expression, in the form of an entry in a bank account, a process in which, during a settlement transaction, a certain sum of money is debited from one subject's bank account and credited to another subject's bank account" [18].

Along the same lines, it should be noted that Article 169a of the Penal Code of the Kingdom of Denmark establishes liability for "a person who, without right, produces, acquires or distributes false electronic money with the intent that it be used as genuine" [19]. The criminal law of the Republic of Moldova does not expressly incriminate such an act. False electronic money produced to be used as genuine may serve as an instrument for committing fraud or for causing material damage by deception or abuse of trust.

Another counter-hypothesis is *the cashless payment instrument*.

According to paragraph (2) of Article 132^3 of the CC RM, "by cashless payment instrument is meant a device, an object or a record, which is protected, immaterial or material or a combination of these, other than legal tender, and which, alone or together with a procedure or set of procedures, enables the holder or user to transfer money or monetary value, including by means of electronic money or virtual currency" [15]. The phrase "other than legal tender" in this definition clearly demonstrates that cashless payment instruments do not constitute the material object or product of the offenses provided for in Article 236 CC RM. A cashless payment instrument that is falsified may constitute the means of committing the offense provided, for example, in paragraph (1) of Article 260^8 CC RM.

The last counter-hypothesis is that of *medals*, *tokens*, *fiches*, *etc*.

Thus, let. (c) of Article 1 of Council Regulation (EC) No.2182/2004 of 6 December 2004 concerning medals and tokens similar to euro coins contains the following definition: "medals and tokens' means those metallic objects, other than blanks intended for striking coins, which have the appearance and/or technical properties of a coin but are not issued under national or participating third country legislative provisions or other foreign legislative provisions, and which therefore are neither a legal means of payment

nor legal tender" [20]. The final part of this definition clearly denotes that medals and tokens, as understood by the cited normative act, do not constitute the material object or product of the offences provided for in Article 236 CC RM.

§ 334[2] of the Criminal Code of the Republic of Estonia provides liability for "the manufacture of medals or tokens having visual characteristics, dimensions and metallic properties similar to those of the euro coin, as described in Council Regulation (EC) No.2182/2004 on medals and tokens similar to euro coins [...] for commercial purposes or the sale, import or distribution of such medals or tokens" [21]. Article 215A of the Criminal Code of Greece establishes liability for a similar offence. The criminal law of the Republic of Moldova does not expressly incriminate such acts. False medals or tokens similar to euro coins may serve as instruments for committing fraud or for causing material damage by deception or abuse of trust. With regard to "the colour reproduction of banknotes and metallic coins issued by the National Bank of Moldova, with dimensions from 2/3 to 4/3, partial or complete, for advertising, informational or other commercial purposes" [22], it should be noted that such an act is qualified under Article 289[1] of the Code of Administrative Offences of the Republic of Moldova.

In the context of the same counter-hypothesis, Article 2 of Law No.291 of 16.12.2016 on the organization and conduct of gambling contains the following definition: "specific gaming means – equivalents of monetary means, bearing the right to participate in the game of chance and to receive winnings in the event of a favourable game outcome (tickets, including lottery tickets, official paper prints of information, coupons, tokens, impulses, blanks, fiches etc.), which may be expressed in material or electronic form" [23]. Such specific gaming means, if counterfeited, may serve as instruments for committing fraud or for causing material damage by deception or abuse of trust.

A similar statement can be made regarding telephone fiches, parking tokens, car-wash tokens, tokens for jukeboxes, promotional/display tokens, etc. These are not monetary signs within the meaning of Article 236 CC RM. Consequently, the manufacture or circulation of such falsified objects cannot be qualified under that article.

Conclusions. The terminology used in Article 236 CC RM referring to monetary signs as the material object or product of the offense, is the result of a legislative and historical evolution that required a distinction between banknotes and metallic coins. An analysis of the regulatory changes, monetary practices from the early years of independence and current regulations shows that the phrase "monetary signs" provides adequate coverage for all forms of cash in circulation. Comparing the Moldovan solutions with those of other states and with European practice confirms that this terminological choice fits within a broader trend toward conceptual clarification. The notion of monetary signs thus emerges as a terminological tool capable of ensuring the uniform and predictable application of Article 236 CC RM.

Abstract

This study examines the offence of treason against the state, regulated by Article 337 of the Criminal Code of the Republic of Moldova, from the perspective of the requirements regarding the quality of criminal law enshrined in Article 7 of the European Convention on Human Rights. The analysis is grounded in the principle of legality of offences and penalties (nullum crimen, nulla poena sine lege), highlighting the defining requirements of a criminal-law provision: accessibility, clarity, and foreseeability.

The scientific inquiry aims to assess the normative content of the incriminating provision, with particular emphasis on the manner in which the constituent elements of the offence of treason against the state are formulated, in order to determine the extent to which the norm enables its addressees to adjust their conduct accordingly and to exclude the risk of arbitrary application of criminal law.

By reference to the case-law of the European Court of Human Rights, the research assesses the conformity of the provisions of Article 337 of the Criminal Code with European standards concerning the foreseeability and certainty of criminal-law norms, while also highlighting the risks of an extensive interpretation that could undermine the principle of legal certainty and the guarantees of fundamental rights.

The study argues for the need for precise, clear, and foreseeable regulation of the offence of treason against the state, in full compliance with the requirements of Article 7 of the ECHR, with a view to ensuring a fair balance between the imperatives of protecting state security and respecting the fundamental rights and freedoms of the individual.

Keywords: criminal offence, treason against the state, accessibility, clarity, foreseeability.

INFRACȚIUNEA DE TRĂDARE DE PATRIE (ARTICOLUL 337 CODUL PENAL AL REPUBLICII MOLDOVA) ÎN LUMINA STANDARDELOR DE CALITATE ALE LEGII PENALE CONSACRATE DE ARTICOLUL 7 CTEDO

Abstract

Studiul examinează infracțiunea de trădare de patrie, reglementată de Art. 337 din Codul penal al Republicii Moldova, prin prisma exigențelor de calitate ale legii penale consacrate de Art. 7 din Convenția Europeană a Drepturilor Omului. Analiza este fundamentată pe principiul legalității incriminării și pedepsei („nullum crimen, nulla poena sine lege"), fiind evidențiate cerințele definitorii ale normei penale: accesibilitatea, claritatea și previzibilitatea.

Demersul științific vizează evaluarea conținutului normativ al dispoziției de incriminare, cu accent asupra modului de formulare a elementelor constitutive ale infracțiunii de trădare de patrie, în vederea determinării gradului în care norma oferă destinatarilor săi posibilitatea de a-și conforma conduita și de a exclude riscul aplicării arbitrare a legii penale.

Prin raportare la jurisprudența Curții Europene a Drepturilor Omului, cercetarea apreciază conformitatea prevederilor Art. 337 C.pen. cu standardele europene privind previzibilitatea și certitudinea normei penale, fiind totodată evidențiate riscurile unei interpretări extensive ce ar putea aduce atingere principiului securității juridice și garanțiilor drepturilor fundamentale.

Se argumentează necesitatea unei reglementări precise, clare și previzibile a incriminării trădării de patrie, în deplină concordanță cu exigențele Art. 7 CtEDO, în vederea asigurării unui just echilibru între imperativele protecției securității statului și respectarea drepturilor și libertăților fundamentale ale persoanei.

Cuvinte-cheie: infracțiune, trădare de patrie, accesibilitate, claritate, previzibilitate.

Introduction. The legal regime governing treason against the state lies at the intersection of two inseparable requirements. On the one hand, the State has the right and the obligation to defend its sovereignty, independence, unity, indivisibility, security, and defence capacity. On the other hand, precisely in the field of offences against state security, the requirement of clarity of criminal law calls for a well-delimited formulation of the incrimination, since the margin of discretion left to law-enforcement authorities is, naturally, broader than in the case of many ordinary offences. These values are enshrined at the constitutional level and are incorporated into the criminal-law provision on treason against the state [1; 2, Art. 1; 4, Art. 337]; however, their protection does not relieve the legislature of the obligation to describe the prohibited conduct in strict accordance with the requirements of the principle of legality of incrimination.

The text of Article 337 of the Criminal Code of the Republic of Moldova was amended by Law No.136 of 6 June 2024, under which treason against the state is defined as "an act committed intentionally by a citizen of the Republic of Moldova against the sovereignty, independence, unity, indivisibility, security, or defence capacity of the Republic of Moldova, in the interest of a foreign state, a foreign organisation, an unconstitutional entity, or their representatives, expressed through: a) going over to the enemy in time of war or armed conflict; b) espionage; c) disclosure of state secrets; d) providing assistance for the purpose of carrying out hostile activities against state security" [1].

From the perspective of the present study, the central issue concerns the extent to which the legislative text satisfies the standards of accessibility and foreseeability developed in the case-law of the European Court of Human Rights.

Discussions and results obtaone. I. The Evolution of the Law and the 2024 Legislative Intervention. In the previous wording, Article 337 of the Criminal Code described treason against the state as an act committed intentionally by a citizen of the Republic of Moldova to the detriment of the sovereignty, territorial inviolability, or state security and defence capacity of the Republic of Moldova, by going over to the enemy, espionage, disclosure of state secrets, or aiding a foreign state in carrying out hostile activity against the Republic of Moldova [4, Art. 337].

Law No.136/2024 introduced several major legislative amendments concerning the scope of incrimination of the offence of treason against the state [1]. One of the legislature's primary concerns was to create a legislative model of incrimination capable of allowing a clearer and more effective individualisation of criminal liability for the act of treason against the state. Such individualisation is strictly calibrated according to the seriousness of the various forms of treason established by the legislature within the criminal-law framework.

Accordingly, the incriminating provision in Article 337 of the Criminal Code was structured into four paragraphs: paragraph (1) provides for the basic composition or standard form of the offence; paragraph (2) concerns the commission of treason against the state for material gain or by a public person, a person holding a position of responsibility, or a person holding a position of public dignity; paragraph (3) refers to the act that caused the death of a person; and paragraph (4) regulates the special form of exemption from criminal liability [1].

Another legislative amendment concerns the reformulation of the phrase "sovereignty, territorial inviolability or state security and defence capacity" as "sovereignty, independence, unity, indivisibility, security or defence capacity", thereby bringing the criminal-law text more closely into line with the social values provided for in Article 1 of the Constitution [1; 2, Art. 1]. Through this legislative amendment, the sphere of social relations subject to criminal-law protection through the incrimination of treason against the state was substantially expanded. Thus, whereas the previous incriminating text listed four social values subject to criminal-law protection, the current list has been extended to six social values, through the inclusion of the "unity" and "indivisibility" of the State [1]. Such clarification is justified in the context of the geopolitical vulnerability of the Republic of Moldova, especially with reference to the experience of the separation of the Transnistrian region.

The third legislative amendment concerns the clarification of "going over to the enemy" as a normative manner of committing the offence. Thus, the wording "going over to the enemy" became "going over to the enemy in time of war or armed conflict" [1]. Through this intervention, the legislature specified the temporal element of the act, with the aim of distinguishing this manner of commission from other hostile acts that may be carried out to the detriment of the security of the Republic of Moldova. Therefore, the act of going over to the enemy may be committed either in time of war or during an armed conflict [1; 4, Art. 337].

In fact, even before the entry into force of Law No.136/2024, the act of going over to the enemy was treated as a criminal activity that could be carried out only in time of war: "Going over to the enemy means both the movement of a citizen of the Republic of Moldova to the enemy camp, on its territory, within the disposition of enemy troops, and the commission of other acts capable of favouring the enemy's activity or weakening the combat strength of our army or of allied armies, acts committed on the territory of our country in time of war" [3, p. 525]. We consider, however, that such clarification by the legislature is welcome, since not every military conflict reaches the scale of a war within the meaning of Article 127 of the Criminal Code, which defines wartime as "the interval from the date of declaration of mobilisation or the commencement of war operations until the date on which the army is placed on a peacetime footing" [4, Art. 127].

Another legislative amendment consists in the reformulation of the act of "aiding a foreign state in carrying out hostile activity against the Republic of Moldova" as "aiding for the purpose of carrying out hostile activities against state security" [1]. The rationale for this clarification is explained, on the one hand, by the legislature's concern to distinguish this normative manner from going over to the enemy, by removing the word "hostile" in its former form associated with the enemy, and, on the other hand, by the intention to expand the scope of incrimination of the offence of treason against the state to the new emerging threats affecting state security. In the current geopolitical context, shaped by hybrid warfare, separatism, the dangers of their expansion, the massive manipulation of electoral processes through the external corruption of voters, and the energy vulnerabil-

ity of the Republic of Moldova, such clarification of the normative text may be explained by the need to adapt criminal law to constantly evolving security threats [5].

II. The Standard of Quality of Criminal Law in the Case-Law of the Strasbourg Court. Following its accession to the ECHR, the Republic of Moldova assumed the obligation to guarantee the respect and protection of fundamental rights and freedoms to all persons within its jurisdiction [7, Art. 1]. According to the principle of subsidiarity, the primary responsibility for ensuring fundamental rights and freedoms lies with the State. This principle means that, before applying to the Convention bodies, any applicant must have submitted his or her complaint to the competent national authorities capable of providing an effective and adequate remedy in the circumstances of the case [7, Art. 35]. At the same time, this principle reflects not only the existence of effective remedies, but also the primary obligation of all authorities, especially the courts, to prevent violations by directly applying the European Convention in their own judgments.

Article 7 § 1 of the Convention enshrines not only the prohibition of the retroactive application of a more severe criminal law, but also the prohibition of the extensive application of criminal law to the detriment of the accused [7, Art. 7; 8, para. 2]. In *Kokkinakis v. Greece*, the Court held that the law must clearly define offences and penalties [9, § 52]. In The Sunday Times v. the United Kingdom, the Court formulated the requirements of accessibility and foreseeability, stating that a norm is "law" only if it is formulated with sufficient precision to enable a person to regulate his or her conduct [10, § 49].

In *Cantoni v. France*, the Court clarified that the requirement of foreseeability is not excluded merely because the addressee of the norm must seek appropriate legal advice in order to assess the consequences of his or her conduct, especially where persons engaged in professional activities are concerned. However, this possibility does not exempt the legislature from the obligation to formulate the criminal-law norm in a sufficiently accessible and foreseeable manner [11, § 35].

Furthermore, in *Kafkaris v. Cyprus*, the Court emphasised that Article 7 concerns punishment as well, not only the definition of the offence [12, §§ 137-142]. In *Del Río Prada v. Spain and Kononov v. Latvia*, emphasis was placed on the foreseeability of judicial interpretation and on the limits of the jurisprudential development of criminal law [13, §§ 91-93, 111-117; 14, § 185]. In *G.I.E.M. S.R.L. and Others v. Italy*, the Court held that there must be a sufficient intellectual link between the perpetrator's conduct and the criminal liability incurred [15, §§ 241-242, 246].

In *Sud Fondi S.R.L. and Others v. Italy*, and subsequently in *Pessino v. France*, the Court stated that the interpretative function of the courts cannot compensate for the lack of determinacy of the legal text [16, §§ 105-117; 17, §§ 35-36]. In a related context, the judgment in *Rotaru v. Romania* affirmed that legal norms must indicate with sufficient clarity the scope of the authorities' discretion and the manner of its exercise, in order to prevent arbitrariness [18, §§ 55, 61].

III. Hostile Activities against State Security and the Problem of Criminal Legality. The core of the criticism lies in the phrase "hostile activities against state security". The Criminal Code does not contain a definition of this notion [4]. Nor does Law No.249/2025 on the National Security of the Republic of Moldova define the term "hostile" separately, although it regulates notions such as "threat", "risk", "danger", "vulnerability", and "national security" [6, Art. 3]. This gives rise to the first difficulty: the legislature has transferred to judicial practice the task of giving content to a formula with a very broad semantic scope.

In recent literature, the conduct of "providing assistance for the purpose of carrying out hostile activities against state security" is explained by reference to acts such as

recruiting citizens in the interest of a foreign intelligence service, supporting the activity of foreign spies, or carrying out other actions directed against the sovereignty, independence, unity, indivisibility, security, or defence capacity of the Republic of Moldova [5].

From an explanatory point of view, the doctrinal approach is useful. From the perspective of Article 7 of the Convention, however, doctrinal clarification cannot take the place of a legal definition. There is also the view that the former Article 337 no longer responded to new manifestations affecting national security, but this solution also signals the risk that the new regulation may shift the problem from the insufficiency of the old wording to the elasticity of the new one [5].

It is not irrelevant that, in August 2025, the Constitutional Court declared inadmissible an objection of unconstitutionality concerning the former phrase "providing assistance to a foreign state in carrying out hostile activity against the Republic of Moldova" [19]. Among the arguments relied on by the Court was the following reasoning: "The Court notes that, although the legislature used broader wording in the phrase 'aiding a foreign state in carrying out hostile activity against the Republic of Moldova' in the context of the offence of treason against the state, other wording in the challenged provision clarifies its scope of application. For example, by using the phrase 'aiding a foreign state,' the legislature specifies the condition of collaboration between the citizen of the Republic of Moldova and a foreign state. Likewise, by using the phrases 'to the detriment of the sovereignty, territorial inviolability or state security and defence capacity of the Republic of Moldova', as well as 'against the Republic of Moldova', the legislature specifies the purpose of the assistance in question and the values against which the criminal actions are directed, namely the special legal object. At the same time, the legislature sanctions only the act committed intentionally" [19, § 27].

The Court also held: "Having regard to the variety of situations that may arise in practice, the Court considers that it is neither possible nor reasonable for the legislature to provide in the Criminal Code an exhaustive list of the ways in which assistance may be provided to a foreign state and, respectively, of the hostile activities carried out against the Republic of Moldova, which may occur in the context and essence of the offence of treason against the state. Moreover, such a list could omit the regulation of situations that would reasonably justify criminal liability under Article 337 of the Criminal Code" [19, § 29].

The finding of inadmissibility does not, however, amount to a substantive validation of the quality of the text. On the contrary, the mere fact that the former wording generated constitutional litigation confirms the persistence of an area of normative uncertainty. Since the new text neither provides a list of the acts concerned nor lays down a legal criterion for delimitation, the reservations have not disappeared.

Conclusions. Any assessment of the clarity of the text must also take into account the place of Article 337 of the Criminal Code within the overall framework of offences against state security. Indeed, the more Article 337 of the Criminal Code uses terms with a high degree of generality, the more difficult it becomes to distinguish treason against the state from other offences against state security.

With regard to the modality consisting in "providing assistance for the purpose of carrying out hostile activities against state security", the law does not expressly specify which hostile activities are envisaged, only doctrinal examples being indicated, such as recruitment for a foreign intelligence service, facilitating the activity of foreign spies, or committing acts likely to seriously affect the security of the Republic of Moldova [5].

From the perspective of Article 7 of the Convention, such a margin of interpreta-

tion must be treated with caution, since a criminal-law norm must enable its addressee to foresee, to a reasonable degree, whether a certain conduct falls within the scope of criminal incrimination [7, Art. 7; 8, para. 2]. Amnesty International's reaction following the adoption of Law No.136/2024 moved precisely in this direction, pointing to the risk that the expanded definition of treason against the state could be used abusively against critical voices [20]. Even though such a position belongs to a non-governmental actor, not to a judicial body, the warning remains valid.

The criticism concerning the lack of clarity of Article 337 of the Criminal Code also has a broader Convention dimension, since an incrimination formulated in open-ended terms may produce collateral effects on freedom of expression. The Court held in Rotaru v. Romania that the law must provide adequate protection against arbitrariness [18, §§ 55, 61]. In criminal matters, this requirement becomes all the more important where the norm may affect conduct situated in the proximity of the exercise of fundamental freedoms.

At the European level, a criminal-law norm formulated in vague terms may raise issues both from the perspective of Article 7 of the Convention, with regard to the foreseeability of incrimination, and, in a related manner, from the perspective of Article 10, where it risks producing a chilling effect on the exercise of freedom of expression [7, Arts. 7 and 10].

Within this framework, phrases such as "hostile activities", if not delimited by clear criteria from lawful conduct, may create an area of uncertainty incompatible with the requirement of quality of criminal law.

Abstract

The regulation of special investigative techniques differs significantly between continental legal systems and those of the common law type. In continental states, these measures are regulated through detailed codifications and are based on the principle of written legality. By contrast, in the United States and the United Kingdom, the rules governing special investigations have developed primarily through case law, institutional practices of law enforcement agencies, and legislative acts adopted on an ad hoc basis in response to security challenges or judicial oversight.

An important philosophical difference can be observed in the use of undercover operations. In the American system, these methods are often considered the primary investigative option, with prosecutors encouraged to use them before conventional methods of evidence gathering. In European states, such as Germany, the approach is the opposite, with undercover investigations designed as measures of last resort.

With regard to interceptions and technical surveillance, the American system emphasizes compliance with constitutional standards and the requirement of "necessity," which entails demonstrating that traditional methods are ineffective, dangerous, or unlikely to yield results. The American regulatory framework thus remains a fragmented one, composed of legislative acts, judicial decisions, and administrative regulations.

Keywords: information, special investigative activity, special investigative techniques, common law system, undercover investigations, special investigative measures, etc.

INVESTIGAȚIILE SPECIALE ÎN SISTEMUL DE COMMON LAW

Abstract

Reglementarea tehnicilor speciale de investigație diferă semnificativ între sistemele de drept continental și cele de tip common law. În statele continentale, aceste măsuri sunt reglementate prin codificări detaliate și se bazează pe principiul legalității scrise. În schimb, în Statele Unite și Regatul Unit, normele privind investigațiile speciale s-au dezvoltat în principal prin jurisprudență, practici instituționale ale agențiilor de aplicare a legii și acte legislative adoptate punctual ca răspuns la provocări de securitate sau la intervenția controlului judecătoresc.

[1] The paper was developed within the research project "Modern Special Measures and Means for the Prevention and Combating of Crime: Realities and Development Perspectives in the Context of European Integration" (code 25.80012.0807.49SE), funded by the state budget.

O diferență importantă de filozofie se observă în utilizarea operațiunilor sub acoperire. În sistemul american, aceste metode sunt adesea considerate prima opțiune investigativă, procurorii fiind încurajați să le utilizeze înaintea metodelor convenționale de administrare a probelor. În statele europene, precum Germania, abordarea este opusă, investigațiile sub acoperire fiind concepute ca măsuri de ultimă instanță.

În privința interceptărilor și a supravegherii tehnice, sistemul american pune accent pe respectarea standardelor constituționale și pe condiția de „necesitate", care impune demonstrarea faptului că metodele tradiționale sunt ineficiente, periculoase sau puțin probabile să producă rezultate. Cadrul normativ american rămâne astfel unul fragmentar, format din acte legislative, hotărâri judecătorești și reglementări administrative.

Cuvinte-cheie: informație, activitate specială de investigație, tehnici speciale de investigații, sistem de common law, investigații sub acoperire, măsuri speciale de investigații, etc.

Introduction. Special investigative measures represent an essential tool in combating organized crime, terrorism, and other forms of serious criminality, enabling authorities to obtain information or evidence in situations where traditional investigative methods become ineffective or even impossible. These techniques – which include the interception of communications, covert surveillance, infiltration, the use of undercover agents, or access to electronic data – inherently involve a temporary restriction of certain fundamental rights (privacy, inviolability of the home, and secrecy of correspondence), which is why their legal regulation must ensure a delicate balance between the need for public security and the protection of the rule of law.

The legal systems of the United States of America and the United Kingdom of Great Britain provide two relevant comparative models for the analysis of special investigative measures. In the United States, detectives act simultaneously as undercover investigators and law enforcement officers, without a rigid procedural distinction between the pre-trial phase and the use of special investigative techniques. The police may initiate, either ex officio or upon a victim's complaint, actions such as seizure, interception, surveillance, or infiltration, independently deciding on their necessity, and subsequently transmit the case to the prosecutor or directly to the court. In the United Kingdom, the regulation of special investigative measures is based on a complex and layered legal architecture characteristic of the common law tradition, which combines case law, primary legislation (PACE 1984, RIPA 2000, IPA 2016, CHIS 2021), secondary legislation, and detailed codes of practice issued by the Home Office.

This paper aims to provide a comparative analysis of the regulation and application of special investigative measures in the law of the United States and the United Kingdom, with an emphasis on procedural aspects, authorization requirements, limits imposed by the protection of human rights, and mechanisms of judicial and parliamentary oversight. By comparing the two systems—one characterized by operational flexibility and an overlap between investigation and prosecution (the United States), the other by a multi-layered legal structure and enhanced procedural transparency (the United Kingdom)—the study seeks to identify optimal solutions that could inspire potential reforms in the legislation of the Republic of Moldova, taking into account the specific features of the civil law system and European commitments in the field of fundamental rights protection.

The study addresses, on the one hand, the institutional and procedural particularities of each system, and on the other hand, the way in which they manage the ongoing tension between the effectiveness of the fight against crime and compliance with the principles of the rule of law. Special attention is given to recent legislative developments, influenced by technological challenges (mass data collection, electronic surveillance) and by post-September 11, 2001 national security imperatives.

Through this comparative approach, the paper contributes to the scholarly debate

on the modernization of investigative tools in the context of the globalization of crime and the digitalization of society, emphasizing the need for a legal framework that is proportionate, predictable, and subject to democratic oversight.

Methods and materials applied. In the process of elaborating the study, doctrinal material, normative acts, activity reports, and scientific works regarding the conditions for carrying out special investigative measures were used. The investigation of this phenomenon was also made possible through the application of several scientific research methods of legal theory: the logical method, the method of comparative analysis, systemic analysis, statistical analysis, etc. At the same time, the works of local scholars, empirical information, as well as the opinions of employees within police structures were used.

Discussions and results obtained. While in continental states the regulations regarding special investigative techniques have developed around the principle of written legality and detailed codification, the experience of common law systems, such as the United States and the United Kingdom, follows a different trajectory. In these jurisdictions, the rules governing special investigations have not crystallized through unified codes, but through case law, practices developed by law enforcement agencies, and acts adopted on a case-by-case basis in response to security challenges or to the pressure of judicial oversight.

A fundamental difference in philosophy is highlighted by the American researcher Jacqueline Ross in a comparative study devoted to the United States and Germany. Thus, American prosecutors are trained to consider undercover methods, rather than conventional ones, as the first option in investigating certain offenses: “Before you subpoena documents; before you call witnesses before the grand jury; before you resort to conventional sources of evidence—make sure you have exhausted all undercover options. This must become your mantra” [35]. By contrast, in Germany, as in other European states, the fundamental rule is entirely the opposite: “Undercover investigation must always be considered a tactic of last resort” [35].

This difference in approach between the United States and Germany refers in particular to undercover operations. With regard to wiretapping and other forms of technical surveillance, the American philosophy is somewhat different, with emphasis placed on compliance with constitutional requirements and on fulfilling the condition of “necessity”. Federal law requires that an application for authorization of interception be accompanied by a full statement showing whether other investigative procedures have been tried and failed, or why they reasonably appear unlikely to succeed if tried, or would be too dangerous [29].

Thus, in the United States, constitutional standards regarding interceptions and surveillance derive primarily from the interpretation of the Fourth Amendment by the Supreme Court [33], while the requirement of “necessity” provided by Section 18 U.S.C. § 2518(1)(a) of the United States Code imposes that such measures be ordered only when traditional methods are ineffective, too dangerous, or unlikely to produce results. These constitutional guarantees have subsequently been detailed and strengthened through a series of major legislative acts.

Unlike the states of the ex-Soviet space, including the Republic of Moldova, the United States has never shown a tendency to adopt a single and exhaustive law regulating special investigative techniques. The American normative framework consists of a mosaic of legislative acts, executive orders, departmental instructions, and judicial decisions, reflecting both the complexity of the federal system and the specificity of the common law tradition [12].

The American legal system, based on the separation of powers and federalism, makes the regulation of special investigative techniques a multi-layered one. The main sources of law that authorize and limit the use of these techniques can be divided into four categories:

• *Legislative acts of Congress*, which constitute the legal foundation of any technique. Relevant examples include the Omnibus Crime Control and Safe Streets Act (1968), the Foreign Intelligence Surveillance Act (FISA, 1978), or the USA PATRIOT Act (2001), which establish the general framework, authorize certain techniques, and impose procedural and time limits.

• *Executive Orders of the President*, which establish tasks and competences for intelligence agencies (such as the NSA or CIA) and detail the manner of implementing federal laws.

• *Departmental guidelines issued by the Attorney General*, which provide precise rules for subordinate agencies (e.g., the FBI) regarding undercover operations or the use of informants.

• *Judicial decisions*, which play a vital role in defining constitutional limits. For example, in Katz v. United States (1967) [24], the Supreme Court established that electronic surveillance requires a judicial warrant, enshrining the principle of "reasonable expectation of privacy". In *Hoffa v. United States* (1966) [18], the Court decided that the use of informants and undercover agents does not constitute a "search" within the meaning of the Fourth Amendment, and in *Illinois v. Perkins* (1990) [19], it was held that an undercover agent interrogating a suspect in prison is not required to read Miranda rights, since there is not the same coercive pressure as in an official interrogation [33].

Although judicial precedent carries essential weight, the law adopted by Congress occupies a leading place in the system of sources of law. The system of legislative acts is complex and dynamic, the acts complementing and substituting each other. Among the most important regulations are:

• Omnibus Crime Control and Safe Streets Act (1968) [26];
• Foreign Intelligence Surveillance Act (FISA, 1978) [38];
• Communications Assistance for Law Enforcement Act (CALEA, 1994) [5];
• USA PATRIOT Act (2001) [43].

This framework is complemented by guidelines of the Attorney General, such as:

• FBI Undercover Operations Guidelines (1980) [36];
• Guidelines for the investigation of ordinary crimes, organized crime, terrorism, and domestic security (1983) [3];
• Guidelines regarding methods of obtaining documentary materials held by third parties [17].

It should be noted that the regime of telephone interceptions is regulated in Title III of the Omnibus Crime Control and Safe Streets Act of 1968, also known as the Federal Wiretap Act [37]. This title establishes the general framework for the interception of wire, oral, or electronic communications, including the authorization procedure. The law provides that, in emergency situations involving serious threats to national security, interception may begin without a judicial warrant, with the approval of the U.S. Attorney General or a lawyer delegated by him, provided that within 48 hours an application for authorization is submitted to the court. If authorization is not obtained within this period, the interception must be immediately terminated (§2518(7) U.S.C.) [40].

The fight against crime in the United States is not only a federal matter, but also one involving state and local authorities. The main directions of activity of the police in the United States include regulation, enforcement, search, and investigation of criminal acts.

In this context, it is important to emphasize that the activity of special investigations is not institutionally separated from the criminal process: American criminal legislation is structured in such a way as to integrate the covert dimension of the investigation directly within criminal prosecution [1].

In police activity, special investigative measures occupy a central place, police officers acting simultaneously both as undercover investigators and as criminal investigation bodies (detectives). The American system does not distinguish, from a procedural point of view, between special investigative measures and criminal investigation actions, and the pre-trial phase often overlaps with the application of these techniques. The detective, either upon the complaint of the victim or on his own initiative, may carry out preliminary or in-depth investigative actions, including seizure, interceptions, surveillance, or infiltration [4]. He decides on the necessary measures, and after accumulating sufficient evidence may transmit the case to the prosecutor or even directly to the court. During the trial, the police testify as witnesses, which shows the direct connection between undercover investigation and judicial activity [42].

It should also be noted that in the United States the procedure for applying restrictive measures on constitutional rights depends on the purpose. On the one hand, there are measures intended for national security [38], intelligence and counterintelligence, including the prevention of international terrorism [26]; on the other hand, measures applied in the context of ordinary crime. Depending on the authority ordering the measures, they are divided into two categories:

• Those requiring judicial authorization (interception of communications, control of correspondence, restriction of the inviolability of the home) [26];

• Those that may be carried out without a judicial warrant when there is consent from one of the involved persons (external physical surveillance, infiltration, undercover operations, certain telephone interceptions, and electronic surveillance) [11].

In the United Kingdom, the fight against crime is carried out at distinct levels, reflecting the constitutional structure of the state. Thus, there are three separate criminal jurisdictions: England and Wales, Scotland, and Northern Ireland. This system of devolution allows each nation to have its own legal systems and law enforcement institutions, including the police, prosecution, and courts. Even in this context, certain agencies, such as the MI5, the Metropolitan Police Service, or the National Crime Agency, operate across the entire United Kingdom, particularly in cases of terrorism and serious organized crime [27].

The subjects and officials of operational subdivisions and other law enforcement bodies from all districts of Great Britain are independent in their activity from the central office of the Home Office, although, formally, they are included within its structure. The level of interaction and cooperation between these units is high, due to the objective requirement of coherence in special investigative activities in combating crime.

The British system for regulating special investigations is built on several legal levels, reflecting the common law tradition and the particular way in which the rule of law functions in the United Kingdom. These levels are:

1. Case law (common law) is the foundation of British law. The courts, especially the House of Lords (until 2009) and subsequently the Supreme Court of the United Kingdom, have created essential rules regarding the protection of private life and the limits of investigations. A classic example is Malone v. Commissioner of Police of the Metropolis [25], where the lack of a legal basis for secret interceptions was criticized, which led to the adoption of the first modern law in this field – the Interception of Communications Act 1985 (repealed in 2000).

2. Primary legislation (statute law) is the central source of investigative powers, adopted directly by the British Parliament:

✓ The Police and Criminal Evidence Act 1984 (PACE) [28] is a form of criminal procedure code for England and Wales, although it is not a code in the full sense of civil law systems, such as that of the Republic of Moldova. This law, together with the codes of practice subordinate to it, standardized and modernized police procedures of investigation, arrest, search, and interrogation.

✓ The Regulation of Investigatory Powers Act 2000 (RIPA) [30] regulates interceptions, covert surveillance, and the use of undercover agents.

✓ The Investigatory Powers Act 2016 (IPA) [21]—also known as the "Snooper's Charter"—consolidated and expanded previous regulations, establishing detailed procedures of authorization and control, including for the bulk collection of data.

✓ The Covert Human Intelligence Sources (Criminal Conduct) Act 2021 (CHIS Act) [7] expressly introduced criminal immunity for covert human intelligence sources (including informants and agents), providing a controversial legal framework for authorizing "criminal conduct" necessary to maintain cover identities.

3. Secondary legislation (delegated/secondary legislation). Parliament often delegates competence to ministers or agencies to issue statutory instruments that detail the application of primary laws:

➢ The Investigatory Powers (Interception by Businesses etc. for Monitoring and Record-Keeping Purposes) Regulations 2018 [39], which regulate interceptions carried out by companies.

➢ The Regulation of Investigatory Powers (Directed Surveillance and Covert Human Intelligence Sources) Order 2010 [32], which defines the authorities that may approve certain types of surveillance.

4. Codes of practice are binding documents issued by the Home Office (similar to the Ministry of Internal Affairs of the Republic of Moldova) and approved by Parliament, intended to ensure the uniform and proportionate application of the law. They establish in detail the procedures that agencies must follow:

✓ Covert Human Intelligence Sources Code of Practice (2022) [8]—regarding the recruitment, use, and protection of undercover agents.

✓ Interception of Communications Code of Practice (2022) [20]—regarding the procedure for requesting and authorizing interceptions.

✓ Equipment Interference Code of Practice (2018) [13]—regarding access to electronic devices and online searches. This code is issued under the IPA and regulates activities involving the manipulation of or access to equipment, such as computers, phones, tablets, or networks.

✓ Covert Surveillance and Property Interference Code of Practice (2002) [7]—developed by the Home Office and issued under RIPA. This Code is an essential guide detailing how public authorities (including the police, intelligence services, and other agencies) must act when using covert surveillance powers and property interference.

It should be noted that all Codes of Practice do not contain restricted information and are publicly available on the website of the Home Office of the United Kingdom. In the Republic of Moldova, by contrast, the organization, tactics, and methods of special investigative activity are regulated by departmental and interdepartmental acts registered at the state level, which mainly contain information constituting state secrets.

Unlike continental legal systems, such as that of the Republic of Moldova, where special investigative measures are defined in an exhaustive legal list (see Article 27 para.

(2) of Law No.59/2012), the British common law system adopts a different approach. It is not based on a rigid list of actions, but on fundamental principles such as legality, necessity, and proportionality. This flexibility allows the rapid adaptation of the legal framework to technological developments and new forms of crime, a defining feature of the British regulatory system [10].

In the United Kingdom, law enforcement relies on a range of undercover operations that correspond to special investigative techniques used in other European countries [10]. These generally include interception of communications [21], the use of human intelligence sources (informants) [7], and various types of surveillance (directed, intrusive, or covert) [30], adapted to the conditions and characteristics of each case. Each of these techniques is regulated in detail through its own Code of Practice, which establishes the precise conditions and procedures for their implementation. A notable distinction is made between the interception of the content of a conversation and its mere visualization (access to communications data) [34]. This visualization is regulated by Part II of the RIPA Act and is essentially considered a form of surveillance, highlighting the nuanced approach of British legislation [41].

Before the adoption of the Investigatory Powers Act (IPA) of 2016, the authorization of special investigative measures in the United Kingdom was outside direct judicial control [15]. Decisions were made by senior officials within the Home Office and by the heads of special services, depending on the specifics of each measure.

With the entry into force of the IPA 2016, a fundamental reform of the surveillance system was introduced, aimed at strengthening guarantees for the protection of privacy and citizens' rights. The law created a single independent oversight body: the Investigatory Powers Commissioner's Office (IPCO) [23].

IPCO assumed and unified the oversight functions previously exercised by three separate commissioners. Its main responsibilities include the judicial approval of warrants for the most intrusive investigative measures, a mechanism known as the "double-lock" [22]. Under this system, a warrant initially issued by a minister or an agency head must also be mandatorily validated by an independent judicial commissioner within IPCO. In addition, IPCO supervises the activities of all law enforcement agencies, including secret police services, ensuring the legality and proportionality of their actions [15].

Both in the United Kingdom and in most European states, there is a tendency to recognize the dialectical unity between criminal prosecution and special investigations aimed at detecting offenses and supporting subsequent investigations [2]. This convergence implicitly leads to a progressive blurring of the legal boundaries between non-procedural and procedural activities.

In assessing the admissibility of evidence obtained through special investigative techniques within criminal proceedings, British courts do not distinguish between the legal nature of such evidence and that of procedural evidence [15]. The use of results obtained through special investigative techniques is recognized as lawful by international norms and by the case law of the European Court of Human Rights [6]. A relevant aspect mentioned is that the Regulation of Investigatory Powers (Codes of Practice) (Jersey) Order 2006, through section 1.5, explicitly provides that if any provision of the Code of Practice appears relevant to any court or tribunal, the results obtained through the application of those Codes must be taken into consideration [30]. By comparison, the current provisions of the Criminal Procedure Code of the Republic of Moldova allow the use of the results of special investigative measures as evidence provided that they are obtained within criminal proceedings (Article 93 para. (4)).

However, it is essential to note that the results obtained through special investigative techniques cannot constitute the sole or principal evidence on which an accusation is based and must be examined by the court under adversarial proceedings, in which both parties have the opportunity to challenge them [22]. Similar provisions are also found in Moldovan legislation: "A conviction judgment cannot be based, to a decisive extent, on [...] evidence obtained as a result of special investigative measures" (Article 101 para. (5) of the Criminal Procedure Code of the Republic of Moldova).

Conclusion. The comparative analysis of the regulation of special investigative measures in the United States of America and in the United Kingdom highlights two distinct, yet complementary models, adapted to legal traditions and to the practical needs of combating organized crime, terrorism, and serious criminality.

In the American system, the absence of a rigid procedural distinction between the pre-trial phase and criminal prosecution grants detectives significant operational flexibility. They may initiate and carry out special actions—including interceptions, surveillance, seizure, or undercover operations—both upon a victim's complaint and on their own initiative, deciding directly on their necessity and proportionality. This overlap between investigation and judicial activity allows for a rapid and efficient response, but raises challenges related to ex ante judicial control and the uniform guarantee of constitutional rights protection, especially depending on the purpose (national security versus ordinary crime).

By contrast, the British system is characterized by a stratified and multi-level legal architecture, specific to the common law tradition. The regulation of special investigations is based on a harmonious combination of case law, primary legislation (PACE 1984, RIPA 2000, IPA 2016—"Snooper's Charter"—and CHIS 2021), secondary legislation, and detailed codes of practice issued by the Home Office. These instruments ensure a transparent, predictable, and proportionate framework, with emphasis on authorization, independent oversight, and the protection of private life. The CHIS Act 2021 represents a significant step by expressly granting criminal immunity for the criminal conduct of undercover agents necessary to maintain cover identities, but also remains a subject of intense debate regarding the ethical and constitutional limits of such powers.

The two systems illustrate the universal tension between the effectiveness of combating crime and respect for the principles of the rule of law. The American model prioritizes operational capacity and police initiative, while the British model emphasizes normative stratification, the transparency of codes of practice (publicly available), and multi-level control. Both have evolved under the pressure of contemporary challenges—digitalization of communications, mass data collection, and transnational threats—demonstrating the adaptability of mature legal systems.

For the Republic of Moldova, which operates within a continental legal system and is engaged in the process of aligning with European standards of human rights protection, the American and British experience offers valuable lessons. A clear, proportionate regulation of special investigative measures subject to effective judicial control is necessary, one that avoids both excessive fragmentation and uncontrolled discretion. The adoption of a legal framework combining operational flexibility with transparent guarantees of proportionality, necessity, and independence of authorization would contribute to increasing the efficiency of criminal investigation bodies, without compromising public trust in the rule of law.

Ultimately, the success of any system of special investigations lies not only in the powers granted to authorities, but in the delicate balance it establishes between collec-

tive security and individual freedoms. A reform inspired by the best practices identified in the United States and the United Kingdom could represent an important step toward modernizing the national system for combating crime in the context of current global challenges.

CRIMINAL RESPONSIBILITY OCCURRING IN THE CASE OF COMMITTING CRIMES AGAINST PEOPLE WITH DISABILITIES – THE VICTIM IN CRIMINAL LAW

Viorica STRELCIUC,
PhD, University Lecturer,
State University of Moldova
ORCID: 0009-0005-3461-5294

Abstract

This study aims to analyze the legal and doctrinal framework of offenses committed against persons with disabilities, focusing on the regime of aggravating circumstances as provided by the Criminal Code of the Republic of Moldova. Through this article, we emphasize that the "state of helplessness" (starea de neputință), deriving from physical or mental impairments, increases the degree of social harm of the act, thereby justifying more severe sanctions—ranging from long-term imprisonment to life imprisonment.

Furthermore, the article examines the legal regime of crimes perpetrated against individuals with disabilities, highlighting the conceptual application of aggravating circumstances. The author concludes that the tightening of penalties represents a measure of legal equity rather than mere retribution. The protection of persons with disabilities within criminal law is regarded as an indicator of a state's level of civilization, transforming legislation into a necessary "shield" to restore the balance of power between the aggressor and the vulnerable victim. These aggravating circumstances are rooted in the victim's state of helplessness, caused by the degree of disability present at the time of the offense and verified by medical certification issued in accordance with current legislation.

Keywords: persons with disabilities, offense, criminal liability, aggravating circumstances, victim, ill-treatment, homicide.

RĂSPUNDEREA PENALĂ SURVENITĂ ÎN CAZUL COMITERII INFRACȚIUNILOR ASUPRA PERSOANEI CU DIZABILITĂȚI – VICTIMA ÎN DREPTUL PENAL

Abstract

Acest studiu își propune ca obiectiv, analiza cadrului juridic și doctrinar al infracțiunilor săvârșite asupra persoanelor cu dizabilități, punând accent pe regimul circumstanțelor agravante prevăzut de Codul penal al Republicii Moldova. Prin conținutul prezentului articol, dorim să subliniem că „starea de neputință", derivată din deficiențe fizice sau psihice, sporește gradul prejudiciabil al faptei, justificând pedepse mai aspre (de la închisoare de lungă durată la detențiune pe viață).

Totodată, articolul analizează regimul juridic al infracțiunilor săvârșite împotriva persoanelor cu dizabilități, punând accent pe conceptul de circumstanță agravantă. Autorul concluzionează că asprirea pedepselor reprezintă o măsură de echitate juridică, nu doar de retribuție. Protecția persoanelor cu dizabilități în dreptul penal este privită ca un indicator al gradului de civilizație al unui stat, transformând legislația într-un „scut" necesar pentru restabilirea balanței de putere între agresor și victima vulnerabilă. Circumstanțele agravante se reiterează în starea de neputință a victimei infracțiunii cauzate de gradul de dizabilitate prezent la momentul săvârșirii infracțiunii, confirmat prin certificatele medicale eliberate în corepsundere cu legislația în vigoare.

Cuvinte-cheie: persoane cu dizabilități, infracțiune, răspundere penală, circumstanțe agravante, victimă, rele tratamente, omor.

Introduction. In accordance with Article 77, paragraph (1), item e) of the Criminal Code No.985/2002 [1], the following are considered aggravating circumstances: "the knowing commission of an offense against a minor or a pregnant woman, or by taking advantage of the known or obvious state of helplessness of the victim, due to advanced age, illness, disability, or other factors". Specialized legal doctrine operates with various definitions of the concept of an aggravating circumstance; however, we align our research with the author Popescu Dorin, who states: "Aggravating circumstances represent specific facts, states, situations, settings, or qualities of an objective and subjective nature, established by law, occurring prior to, concurrently with, or subsequent to the commission of the offense, which reveal an increased degree of social harm of the crime and/or the offender's person, influencing the implementation of criminal liability, including the determination of the category and amount of the criminal penalty" [2, p.4].

Consequently, offenses committed against persons with disabilities are classified under the category of crimes committed under aggravating circumstances. Criminal legislation does not provide an autonomous definition of the category of "persons with disabilities", indicating instead in Art. 134^{22} of the Criminal Code that: "A person with disabilities is understood as the person defined as such in Law No.60/2012 on the Social Inclusion of Persons with Disabilities". Along the same lines, according to Article 2 of Law No.60/2012, persons with disabilities are those with physical, mental, intellectual, or sensory impairments which, in interaction with various barriers or obstacles, may hinder their full and effective participation in society on an equal basis with others [3].

The scope of Law No.60/2012 primarily extends to persons with disabilities who are citizens of the Republic of Moldova, citizens of European Union member states, citizens of Schengen Agreement signatory states, and foreign nationals with legal residence in the Republic of Moldova under the conditions of the law.

As a result, disability is the generic term applied to impairments, activity limitations, and participation restrictions, denoting the negative aspects of the interaction between an individual (with a health problem) and the contextual factors in which they find themselves (environmental and personal factors). Offenses committed under aggravating circumstances are criminal acts which, due to the method, purpose, or context (e.g., cruelty, premeditation, recidivism), present an increased social danger, thereby attracting more severe penalties.

In the Republic of Moldova, a series of instruments and regulations have been identified aimed at the integration of persons with disabilities both into social life in general and into specific spheres, such as: integration into the labor market, education, and the state's cultural activities.

Another primary task of the state is the creation of all legal instruments across various branches of law intended to defend the rights and interests of persons with disabilities. The concept that a degree of disability is not a "condemnation" represents a fundamental paradigm shift in modern society. This classification should not be viewed as a social or professional barrier, but as a mechanism through which the state and the community recognize the necessity for reasonable adjustments. Thus, disability becomes the starting point for guaranteeing equal opportunities, transforming vulnerability into opportunity through accessibility and personalized support.

Methods and materials applied. The research conducted is based on the study of specialized doctrine, national social protection and criminal legislation, as well as the judicial practice of courts in the Republic of Moldova and abroad. In order to achieve the aim and objectives set forth above, the logical (rational) method, the historical method,

the systemic analysis method, and the comparative method were applied. Thus, all three perspectives—exegetical, dogmatic, and critical—through which this study is presented involve the use of the following categories and laws of logic: definition; specification and generalization; division and classification; differentiation and integration; analysis and synthesis; demonstration; argumentation; reasoning, etc.

From a historical perspective, particular importance was placed on consulting the doctrine regarding the inclusion of persons with disabilities and the types of criminal penalties applied over time.

From a doctrinal standpoint, within this paper, liability for various offenses committed against persons with disabilities is examined through the lens of the social protection law branch in general, compared to that of criminal law in particular. Furthermore, through a comparative approach, we have succeeded in delimiting the situation of an offender who has committed a crime under a concurrence of aggravating circumstances as opposed to mitigating ones, as well as various forms of manifestation and regulation.

Discussion and results obtained. Criminal legislation grants increased significance to the aggravation of criminal liability in cases where offenses are committed against persons with disabilities. We fully support the legislator's stance, given that a person with a disability, in the event of an offense committed against them:

1. Cannot defend themselves physically or psychologically as a result of their state of vulnerability caused by the degree of disability (regardless of its nature).
2. Is limited in opportunities and resources compared to a healthy person.

In this regard, Romania has developed a study titled *Victims with Disabilities of Crimes in Romania* [4], which notes that adult victims with psychosocial and intellectual disabilities represent one of the most vulnerable categories of participants in the criminal process. Prejudices and excessive procedural formalism combine with a lack of knowledge and/or expertise among professionals, often resulting in decision-making that fails to address the specific needs of persons with disabilities. Based on the aforementioned report, it was established that although maximum efforts are being made to improve the situation regarding the prevention and punishment of crimes against persons with disabilities, the situation remains quite alarming, and the rights and interests of such categories of persons remain under serious question.

Returning to national legislation, we note that according to the Criminal Code (CC), several types of offenses entail increased liability due to the existence of aggravating circumstances, namely:

1. Article 145, paragraph (2), item e): Intentional Homicide:

"*Intentional homicide committed knowingly against a minor or a pregnant woman, or by taking advantage of the known or obvious state of helplessness of the victim, which is due to advanced age, illness, disability, or other factors, is punishable by imprisonment from 15 to 20 years or life imprisonment, compared to paragraph* (1), *which is punishable by imprisonment from 10 to 15 years*".

According to the criminal norm stated above, we distinguish two main aspects of criminal liability: the subjective side and the objective side. These bring to the fore homicide committed knowingly (with intent and knowledge) against a person with disabilities, manifested by the fact that the offender commits the criminal acts specifically by taking advantage of the victim's state of helplessness, which they are aware of at the time of the act. According to doctrine—among the Romans, for example: "*Homicide was considered a public crime and had the special name of 'parricidium', namely the offense consisting of the suppression of the life of a free person in the community*" [5, p.15]. This could be punished

by the death penalty or other types of punishments, such as the amputation of the convict's hand, flagellation, etc., taking various factual circumstances into account.

From ancient times, homicide was considered a very serious offense and was punished accordingly. While we lack direct records regarding homicide specifically committed against a person with a disability, there are opinions stating: "*whoever kills while defending their life from danger is innocent; whoever kills being a small child, or insane, or of unsound mind, is innocent; whoever kills by throwing something and through negligence, shall pay a ransom for the murder to the relatives of the deceased*" [5, p.17]. From this, we observe the differentiation of the type of homicide based on the perpetrator's state and whether the offense was committed intentionally and knowingly, or as a result of age or erroneous perception caused by mental health status.

Returning to the subject of the offense, we determine that the perpetrator's criminal penalty is increased for the murder of a person with a disability, for which imprisonment from 15 to 20 years or life imprisonment may be applied, compared to the first paragraph where only imprisonment is applicable. The question arises: why did the legislator decide that an act committed against a person with a disability is particularly serious, applying life imprisonment in some cases? We note in this regard that the logic for such a penalty lies in the victim's state of helplessness and inability to self-defend, caused by certain physical or mental disabilities. If the subject of the offense, knowing the victim's state of impossibility, committed the criminal act under such circumstances, we classify it as particularly serious and intentional.

On the other hand, we consider the legislator's approach of increasing the applied penalty to be correct, given that it constitutes aggravated (qualified) homicide. This is due to the social relations concerning the fundamental right to life, as well as the additional protection afforded to persons who cannot defend themselves. Aggravating circumstances are determined by the victim of the criminal act, who is a person with impairments that limit their capacity to react, defend themselves, or understand the danger. The essential condition is that the victim is in a position of inability to defend themselves. This state must exist at the time of the act and must be known to the aggressor.

We reiterate that the victim of the criminal offense provided for in Art. 145, para. (2), item e) CC is a person with a disability—specifically, a person who, at the time the offense was committed against them, is medically recognized as having a disability and possesses a certificate issued in the order and manner established by legislation, confirming the illness through the presence of a state of disability.

2. Article 151, paragraph (2), item b): Intentional Grievous Bodily Harm:

"*Intentional grievous injury to bodily integrity or health committed against a person with disabilities is punishable by* ***imprisonment from 10 to 12 years***".

The synthesis regarding intentional grievous injury to bodily integrity or health committed against a person with disabilities concerns an *aggravated form* of offenses against health, defined by the victim's increased vulnerability and the devastating impact on their quality of life. The harsher sanctioning of this act reflects a criminal policy of *zero tolerance* toward abuses directed at social segments at risk, recognizing that an injury to a person with disabilities represents a *double aggression*: against the physical body and against human dignity within the context of vulnerability.

Furthermore, this legal provision aims to apply a more severe penalty to offenders whose criminal acts against a person with disabilities result in serious injuries that are often irreversible or significantly more difficult to recover from compared to a person without pre-existing impairments.

As in the case mentioned above, a criminal act committed against a victim with disabilities presupposes that the perpetrator took advantage of the victim's *state of helplessness or dependency*, making it far more serious and dangerous for the life and health of the victim, as well as for civil society as a whole.

In the same vein, the offense is aggravated by the existence of *aggravating circumstances*, manifested both through the victim's state of helplessness caused by their degree of disability and the latter's inability to self-defend.

3. Article 159, paragraph (2), item a[1]): Illegal Induction of Abortion:

"*...regarding the* ***illegal induction of abortion****, committed against a person in a* ***state of helplessness*** *due to advanced age, illness, disability, or other factors, is punishable by* ***1 to 6 years of imprisonment****, with (or without) the deprivation of the right to hold certain positions or exercise a certain activity for a term of up to 5 years*".

The analysis of the offense of illegal induction of abortion against a person in a state of helplessness (which includes persons with severe physical or mental disabilities) represents a critical intersection between the right to life, bodily integrity, and *reproductive freedom*. The specific nature of such an offense is revealed by the fact that, in the case of a person in a state of helplessness, the freedom of decision and *self-determination* is added to the legal protection, which is gravely violated by the lack of valid consent or by its total disregard.

A state of helplessness may stem from a severe mental disability (lack of discernment), a physical disability that prevents offering resistance, or a state of unconsciousness. Criminal justice ensures that no person is subjected to forced reproductive procedures under the pretext of a "best interest" determined solely by their disability.

4. Article 164, paragraph (2), item c): Kidnapping:

"***Kidnapping*** *a person, committed knowingly against a minor or a pregnant woman, or by taking advantage of the known or obvious* ***state of helplessness*** *of the victim, which is due to advanced age, illness, disability, or other factors, is punishable by* ***imprisonment from 6 to 10 years***".

The kidnapping of a person represents one of the most serious interferences with individual liberty, a fundamental right established both by national constitutions and international conventions. When this act is directed against categories of persons with increased vulnerability—such as minors, pregnant women, or persons in a state of helplessness due to illness or disability—the legislator intervenes with increased rigor, reflected in the sentencing range of 6 to 10 years of imprisonment. This analysis focuses on the ethical and legal foundation for the aggravated classification of kidnapping under these specific circumstances.

The prison sentence of 6 to 10 years reflects a criminal policy aimed at protecting *human dignity*. In the case of persons with disabilities or the elderly, kidnapping is often associated with exploitation, submission to degrading treatment, or intentional neglect.

From a social perspective, this aggravating factor serves a preventive role, discouraging the victimization of those who cannot cry out for help or who depend entirely on a controlled and safe environment. Their kidnapping does not only destroy their freedom of movement; it abruptly nullifies their entire *life-support system*.

Kidnapping committed against a vulnerable person is not merely a crime against liberty, but an act of profound social cowardice that attacks the very foundations of humanity. By establishing high sentencing limits, criminal legislation seeks to balance the power dynamic between the aggressor and the victim who cannot defend themselves, offering a supplementary legal guarantee to those who need it most.

5. Article 177, paragraph (2), item h): Rape:

"*Rape committed against a person in a* ***state of helplessness*** *due to advanced age,*

illness, disability, or other factors, is punishable by imprisonment from 7 to 12 years".

The offense of rape, in its aggravated forms, represents one of the most severe infringements on sexual liberty and human dignity. When forced sexual intercourse is directed against a person in a state of helplessness—caused by disability, illness, or advanced age—the act acquires a dimension of extreme gravity. The prison sentence of 7 to 12 years reflects not only social disapproval but also the necessity for enhanced legal protection for categories of citizens who cannot defend themselves.

In the case of persons in a state of helplessness, a *secondary legal object* of major importance emerges: the physical and psychological integrity of the vulnerable person. Here, the legislator does not merely sanction the lack of consent, but specifically the *exploitation of an incapacity*. The victim is deprived of the possibility to offer physical resistance or to understand the nature of the act, transforming the aggression into a profound violation of human dignity.

Rape against a person with disabilities often has far more devastating consequences than in typical cases. Beyond the physical trauma, the psychological impact is amplified by a sense of total helplessness. For an individual who depends on the care of others, such an act fundamentally destroys trust in their environment and in the safety of their own home or care centers.

From the perspective of criminal policy, the sentencing limits (7-12 years) are calibrated to serve both a deterrent function (general prevention) and a punitive function regarding the offender's lack of scruples. Modern society deems it unacceptable for physical or mental weakness to become an opportunity for sexual aggression.

Evidence and probation in such cases are often complex. The victim may face difficulties in testifying due to disability or age (memory disorders, communication barriers). For this reason, forensic and psychiatric expertise becomes the central pillars of the criminal case. Justice must ensure a hearing adapted to the victim's needs to avoid re-traumatization, while simultaneously respecting human rights protection standards.

Rape committed by taking advantage of the victim's state of helplessness represents a form of violence that attacks the very essence of humanity. By classifying this act with sentencing limits higher than those for simple rape, criminal law assumes the role of a shield for the most fragile members of society. This approach emphasizes that disability or illness should never be a risk factor, but rather a reason for absolute legal and social protection.

6. Article 201¹: Domestic Violence:

"*...regarding domestic violence, paragraph (2) mentions that the intentional action or inaction committed by a family member against another family member, including through information technologies or electronic communications, manifested through ill-treatment, violent acts, etc., committed against persons with disabilities, is punishable by unpaid community service from 180 to 240 hours or imprisonment from 1 to 6 years*".

Domestic violence is one of the most insidious forms of criminality because it occurs in a space that, by definition, should provide protection and support: the home. When this aggression targets a person with disabilities, the act transcends the sphere of a simple domestic conflict, becoming a grave violation of human rights and a manifestation of a profoundly inequitable power dynamic. The legal provision sanctioning these acts reflects the legislator's will to establish a special protection regime for vulnerable categories.

A modern and essential feature of this legal norm is the recognition of violence exercised through *information technologies*. For a person with disabilities, the digital space is often a vital window to the world. The use of this channel by a family member to humiliate, abusively monitor, or isolate the victim represents a form of psychological control

that is extremely effective and destructive. The legislator thus adapts the letter of the law to technological realities, refusing to leave "gray areas" where an aggressor could hide behind a screen.

Unlike other offenses against the person, domestic violence against persons with disabilities places major emphasis on *inaction*. In many cases, the person with disabilities depends entirely on a family member for basic needs: food, hygiene, or the administration of medication. In this context, the deliberate refusal to provide assistance is not merely negligence, but an *active form of violence*. Intentional inaction transforms the victim's dependence into a weapon, causing suffering that can often be more atrocious and lasting than a specific physical assault.

The victim's disability is not just a general mitigating or aggravating circumstance; it becomes a central element of the *legal typology* (*tipicitate*) of this variant of the offense. This legislative choice is based on the principle of equity: the law must be harsher where the victim is more fragile. Persons with disabilities face additional barriers in reporting abuse (communication difficulties, reduced mobility, or fear of losing their only source of care), making state intervention imperative through deterrent penalties.

The analysis of this offense highlights a legal vision that is not limited to punishing an act, but to protecting dignity. By explicitly criminalizing violence against persons with disabilities within the family, including in virtual spaces, criminal legislation recognizes that vulnerability must not be an invitation to abuse, but a foundation for heightened responsibility. Ultimately, the level of civilization of a society is measured by how it succeeds in protecting those who, for reasons beyond their control, cannot protect themselves against those closest to them.

7. Article 280, paragraph (2), item c): Hostage-Taking:

"*The taking or detaining of a person as a* ***hostage*** *and the threat of death, injury to bodily integrity or health, or continued detention of the person in this capacity for the purpose of compelling the state, an international organization, a legal or natural person, or a group of persons to perform or abstain from performing any action as a condition for the release of the hostage, is punishable by* ***imprisonment from 6 to 12 years*** *with (or without) a fine in the amount of 850 to 1350 conventional units*".

The offense of *hostage-taking* represents one of the most complex and grave manifestations of criminality, situated at the intersection of terrorism, deprivation of liberty, and blackmail. By its very structure, this act does not merely threaten an individual's safety but aims to undermine state authority or the stability of international organizations. The prison sentence of 6 to 12 years, accompanied by substantial fines, reflects the extraordinary *social danger* represented by the transformation of a human being into an instrument of political or economic negotiation.

The *primary legal object* of this offense consists of the social relations concerning physical liberty and personal safety. However, the specificity of this act lies in the existence of a *complex secondary legal object*: public order and the authority of institutions. Unlike a simple deprivation of liberty, hostage-taking is not limited to the isolation of the victim; it seeks to coerce an external will (the state, a company, or a group of persons). Thus, the victim becomes a "bargaining chip", and their freedom is conditioned upon the fulfillment of requirements that, under normal circumstances, would not have been accepted by the extorted entity.

Hostage-taking is an offense that denies a person's status as a *subject of law*, transforming them into an object of transaction. Legal analysis reveals a complex structure in which individual violence is intertwined with aggression against the *rule of law*. Through

the severity of the prescribed penalties, the state reaffirms its role as the guarantor of individual liberty, sending a clear message: a person's life and freedom can never be the subject of negotiation, regardless of the political or material stakes invoked by the aggressor.

Conclusions. The evolution of modern criminal law marks a fundamental transition from the punishment of the act itself to a nuanced analysis of the context in which it occurs, with a particular emphasis on the status of the subjects involved. The analyzed text highlights that disability is not merely a medical state regulated by Law No.60/2012, but becomes an essential legal variable that transforms a simple offense into an aggravated (qualified) one. In light of Article 77 of the Criminal Code of the Republic of Moldova, the "state of helplessness" is recognized as a fundamental aggravating circumstance, reflecting an increased degree of social danger posed by the perpetrator who chooses to exploit human fragility.

Ultimately, the tightening of penalties—extending to life imprisonment in cases of aggravated homicide – is not a mere act of retribution, but a measure of legal equity. Criminal legislation acts as a "shield" for those who, due to physical or mental barriers, are unable to offer resistance.

The synthesis of this text leads us to a central idea: the level of civilization of a state and the efficiency of its judicial system are measured not by the number of laws, but by their capacity to restore the balance of power between the aggressor and the vulnerable victim. The protection of persons with disabilities in criminal law is not a privilege but an ethical necessity, confirming that human life and dignity are absolute values that cannot be negotiated or ignored under the pretext of weakness.

Consequently, the core argument underlying the increased gravity of these acts resides in the profound imbalance between the aggressor and the victim. In criminal law, the "state of helplessness"—whether physical, sensory, or intellectual—is the element that transforms a basic offense into a qualified one. When a perpetrator chooses to take advantage of the mobility, communication, or perception limitations of a person with disabilities, they do not merely attack their physical integrity; they consciously exploit a handicap to ensure the success of the crime and their own impunity. This use of vulnerability as a criminal "instrument" reveals an extraordinary social danger inherent in the offender.

JUVENILE CRIMINAL LIABILITY IN THE REPUBLIC OF MOLDOVA: MITIGATED REGIME AND EDUCATIONAL ORIENTATION

Gheorghe GLADCHI,
PhD Habilitated, University Professor,
Department of Criminal Law and Criminology,
"Ștefan cel Mare" Academy of the Ministry of Internal Affairs,
Republic of Moldova
ORCID: 0000-0001-9786-1111

Abstract

The article analyzes the legal regime of criminal liability for minors in the criminal law of the Republic of Moldova, highlighting its distinct character compared to that applicable to adults. This form of liability is based on the need to protect the developing person and on the recognition of their reduced level of psychological and social maturity. Consequently, the sanctioning system applicable to minors is characterized by limitation (in terms of age and incrimination), strong individualization, differentiation (educational measures and punishments), and humanization (reduced punishments, educational measures); it is primarily educational rather than repressive in orientation.

An essential element is the age of criminal responsibility, which determines the applicability of criminal norms and reflects the minor's reduced capacity for discernment. Likewise, the purpose of criminal liability is predominantly educational and oriented toward social reintegration, in contrast to the repressive and retributive character specific to adults. In this context, the limitation of categories of punishments applicable to minors and the substantial reduction of sentencing limits are noteworthy. The individualization of the sanction gains increased importance, being adapted to the age and personality characteristics of the minor, and the execution of punishments pursues the same educational goals.

A central element of the criminal regime for minors is the possibility of applying educational coercive measures, either as an alternative to punishment or as a substitute for criminal liability, depending on the gravity of the act and the minor's personality. Overall, juvenile criminal liability constitutes an autonomous institution, based on the principle of proportionality and primarily oriented toward prevention and social reintegration.

Keywords: minor, minority, criminal liability, criminal punishment, age of criminal responsibility, purpose of juvenile criminal liability, sanctioning system for minors, individualization of the punishment applied to the minor, educational coercive measures, execution of punishments applied to minors, release of the minor from criminal liability, release of the minor from punishment.

RĂSPUNDEREA PENALĂ A MINORILOR ÎN REPUBLICA MOLDOVA: REGIM ATENUAT ȘI ORIENTARE EDUCATIVĂ

Abstract

Articolul analizează regimul juridic al răspunderii penale a minorilor în dreptul penal al Republicii Moldova, evidențiind caracterul său distinct față de cel aplicabil persoanelor mature. Această formă de răspundere este fundamentată pe necesitatea protejării persoanei aflate în dezvoltare și pe recunoașterea nivelului redus de maturitate psihică și socială. În consecință, sistemul sancționator aplicabil minorilor se caracterizează prin limitare (sub aspectul vârstei și incriminării), individualizare accentuată, diferențiere (măsuri educative și pedepse), umanizare (pedepse reduse, măsuri educative); orientare preponderent educativă și nu represivă.

Un element esențial îl constituie vârsta răspunderii penale, care determină aplicabilitatea normelor penale și reflectă capacitatea redusă de discernământ a minorului. De asemenea, scopul răspunderii penale

este predominant educativ și orientat spre reintegrare socială, în opoziție cu caracterul represiv și retributiv specific adulților. În acest context, se remarcă limitarea categoriilor de pedepse aplicabile minorilor și reducerea substanțială a limitelor de pedeapsă. Individualizarea sancțiunii capătă o importanță sporită, fiind adaptată particularităților de vârstă și personalitate ale minorului, iar executarea pedepselor urmărește aceleași finalități educative.

Un element central al regimului penal al minorilor îl constituie posibilitatea aplicării măsurilor de constrângere cu caracter educativ, fie ca alternativă la pedeapsă, fie ca substitut al răspunderii penale, în funcție de gravitatea faptei și de persoana minorului. În ansamblu, răspunderea penală a minorilor constituie o instituție autonomă, bazată pe principiul proporționalității și orientată prioritar spre prevenție și reintegrare socială.

Cuvinte-cheie: minor, minoritate, răspundere penală, pedeapsă penală, vârsta răspunderii penale, scopul răspunderii penale a minorului, sistemul sancționator pentru minori, individualizarea pedepsei aplicate minorului, măsurile de constrângere cu caracter educativ, executarea pedepselor aplicate minorilor, liberarea minorului de răspundere penală, liberarea minorului de pedeapsă.

Introduction. Juvenile delinquency is a component part of crime as a whole, while simultaneously possessing its own specificity and distinct characteristic features. The problem of juvenile delinquency has always been one of the most serious and topical, being determined by the particularities of the psychological and moral development of minors, their social immaturity, and being directly linked to the continuous development of society [1, p.256-257].

The specificity of the criminal phenomenon among minors raises particular problems regarding prevention and control, as its causality involves an interaction with a multitude of factors, such as: the particularities of the social-psychological development of minors; an insufficient level of socialization; inadequate psychophysical, age, and social maturity; distorted perceptions of moral priorities; and specific character traits (irascibility, instability), making them easily susceptible to influence from "informal leaders" and adults, etc. [2, p.690]. Here, we note that the age of the minor determines a series of psychological particularities and instability caused by the process of personality formation, the physical and intellectual development of the individual, and puberty. At this age, minors are too categorical, irascible, violent, unbalanced, and incapable of evaluating situations while considering all circumstances; they lack social life experience and do not fully understand the social significance of their conduct—which is dangerous to social values—nor the significance of the sanctions that might be applied to them.

Relative to the age and living conditions of minors, the acts they commit naturally present, as a rule, a less serious degree of social danger than those committed by adults. However, relative to the biopsychical state of minors, the means of criminal legal coercion, primarily punishments, appear poorly suited for achieving the purpose of the law in relation to juvenile offenders. These means of coercion tend toward the re-education of the adult offender, whereas for juvenile offenders, what is required is not re-education (the reconstruction of previous education), but rather an initial education through appropriate means [3, p.217].

All of the aforementioned factors have led our legislator to fundamentally regulate the criminal liability of minors, particularly through the adoption and application of special provisions and a sanctioning system for minors, distinct from those concerning the fight against adult criminality. Furthermore, it should also be mentioned that criminal legislations throughout history have contained special provisions for minors, both regarding the age at which criminal liability began and the criminal punishments to which they were subjected (which were lighter than those for adults) [4, p.302].

Methods and materials applied. The present research is based on a complex theoretical-legal approach to the institution of juvenile criminal liability within the criminal

law of the Republic of Moldova. In conducting the study, general and special legal research methods were used, particularly the methods of analysis and synthesis, the systemic method, the comparative method, and the interpretive method (grammatical, logical, and teleological) of the relevant legal norms.

The method of analysis allowed for a detailed examination of the provisions of the current Criminal Code regarding the criminal liability of minors, while the method of synthesis facilitated the integration of the results into a unified vision of the applicable legal regime. The comparative method was used to highlight the particularities of the national regime in relation to European standards and the general principles of contemporary criminal law. Simultaneously, the systemic method contributed to highlighting the interdependence between the analyzed legal institutions.

The empirical and normative material of the research includes the provisions of the Criminal Code of the Republic of Moldova, related normative acts, as well as relevant legal doctrine. Furthermore, doctrinal sources and specialized studies addressing the issue of juvenile criminal liability from both theoretical and practical perspectives were utilized.

The research is based on a qualitative analysis of the normative and doctrinal framework, aiming to identify the particularities, principles, and purposes of the sanctioning system applicable to minors, in order to highlight its distinct character and its predominantly educational orientation.

Discussions and results obtained. Criminal liability of minors, according to the current Criminal Code, presents certain particularities based on the necessity of protecting the person in formation and the recognition of their reduced level of psychological and social maturity compared to mature persons. Compared to mature persons, the criminal liability of minors is characterized by limitation (in terms of age and incrimination), accentuated individualization, differentiation (educational measures and punishments), humanization (reduced punishments, educational measures), and a predominantly educational rather than repressive orientation. Overall, national legislative solutions confirm that minority does not exclude criminal liability but confers upon it a mitigated legal regime, adapted to age particularities and oriented toward preventing juvenile delinquency through predominantly educational means.

Through its predominantly educational and social reintegration orientation, the criminal liability of minors distinguishes itself fundamentally from the criminal liability of mature persons, which has a predominantly repressive and retributive character. This differentiation does not constitute an unjustified privilege but an expression of the principle of proportionality and the increased protection of the person in formation.

In doctrine, it has been constantly emphasized that the criminal treatment of minors does not represent an arbitrary derogation from the principle of equality before the criminal law, but a differentiated application of the principle of proportionality, adapted to the minor's real capacity for criminal liability [3, p.217-218].

A first essential particularity of the criminal liability of minors consists in the age of criminal responsibility [5, p.32]. While mature persons are criminally liable for any offense, minors have limited criminal liability: from 14 years old – only for offenses expressly provided by law (Art. 21 para. (2) Criminal Code), and from 16 years old – under general conditions (Art. 21 para. (1) Criminal Code). Below the age of 14, criminal liability is excluded. This differentiation reflects the position of the legislator according to which the capacity to awareness of the consequences of the act is incompletely developed in the minor.

The court of law is obliged to establish exactly the age of the minor (day, month, year of birth), because their age represents a circumstance that must be proven and con-

stitutes a mandatory condition for criminal liability [6, p.367].

The specificity of the criminal liability of minors is also manifested in the special approach through which the legislator assesses the offenses committed by minors and their personality when establishing the state of recidivism [7, p.450-451]. Thus, according to Art. 34 para. (5) lit.a) Criminal Code, criminal records for offenses committed during minority are not taken into account when establishing the state of recidivism.

Substantial differences are also found in terms of the purpose of criminal liability. If in the case of adults criminal liability predominantly pursues social retribution and general prevention, in the case of minors the purpose is mainly educational and for social reintegration. Our legislator starts from the premise that the minor can be corrected more effectively through education than through severe criminal coercion.

A third particularity concerns the limitation of the categories of punishments applicable to minors. The legislator has established a restricted sanctioning system for minors, excluding punishments incompatible with the status of a person in the process of formation. A limited number of punishments apply to minors, excluding punishments incompatible with their age, including life imprisonment (Art. 71 para. (3) of the Criminal Code) or unpaid community service for persons who have not reached the age of 16 (Art. 67 para. (4) CC). Life imprisonment cannot be applied to minors, as the minor's personality is not definitively crystallized in an antisocial sense, being always susceptible to rehabilitation.

The criminal law in force does not establish any particularities for applying the penalty of a fine to minors. However, when applying the penalty of a fine to a minor, the principle of the personal nature of liability must be considered, according to which only the person who committed an act provided for by criminal law intentionally or through imprudence is subject to criminal liability and punishment, and in no way any other person (Art. 6 CC). The fine will be applied to the minor if they have a real possibility to pay it from their own sources, so that the minor understands the essence of the punishment applied so that it achieves its purpose [8, p.33].

Punishments such as deprivation of the right to hold certain positions or to exercise a certain activity, deprivation of the right to drive means of transport or the cancellation of this right, the withdrawal of a military or special rank, of a special title, of a qualification (classification) degree and of state distinctions have little relevance in the case of juvenile offenders, because they are almost never applied to minors by virtue of the fact that minors aged between 14 and 18 cannot meet the qualities mentioned in the respective norms; consequently, they do not have those rights of which they can be deprived or which can be withdrawn through the court sentence [9, p.466]. In contrast, mature persons may be subject to the full spectrum of punishments provided by the Criminal Code.

The current system of punishments directs the courts to analyze the circumstances of the case in detail, to take into account the person of the minor, to elucidate the causes of their commission of the offense, and to establish a punishment sufficiently effective both for the correction of the offender, for the realization of the goals of general prevention, and for the restoration of social equity [10, p.482].

This normative option reflects an objectively justified differentiation, compatible with Art. 16 of the Constitution, and corresponds to the requirements of the European Court of Human Rights regarding the differentiated treatment of minors in relation to adults. In the case of *T. v. United Kingdom*, application No.24724/94, Judgment of December 16, 1999, the Court emphasized that minors cannot be subjected to a sanctioning regime identical to that of adults, as their capacity for understanding and participation in the process is structurally different [11]. The Court held that simply holding a minor

criminally liable is not, in itself, contrary to the Convention, but the procedure must be adapted to the age and capacity of the child; the public trial, the intimidating atmosphere, and the complexity of the procedure prevented the minor's effective participation in the judgment. The Court emphasized the principle that the minor must be able to "participate effectively" in the process to benefit from the guarantees of Art. 6 of the European Convention on Human Rights. The judgment is fundamental for the development of standards regarding juvenile justice; the enshrining of the states' obligation to adapt criminal procedure to the age and maturity of the minor; and the definition of the concept of effective participation in the trial.

Another important particularity consists in the substantial reduction of the sentencing limits provided by law for minors compared to adults. This reduction targets the duration of the prison sentence, being an expression of the recognition of the minor's diminished capacity for culpability.

According to Art. 70 para. (3) Criminal Code, when establishing the prison sentence for a person who, at the date of the offense, had not reached the age of 18, the prison term is established from the maximum punishment provided by criminal law for the offense committed, reduced by half. At the same time, the final punishment established for a concurrence of offenses regarding minors cannot exceed the term of 12 years and 6 months (Art. 84 para. (1) of the Criminal Code), and in the case of a cumulative sentence, the final punishment regarding minors cannot exceed the term of 15 years (art. 85 para. (1) of the Criminal Code).

From a doctrinal perspective, the reduction of the amount of the punishment does not constitute unjustified leniency, but expresses the reduction of imputability, determined by the incomplete development of discernment and self-control. The European Court of Human Rights reaffirmed this thesis in the case of *Blokhin v. Russia*, Grand Chamber, 2016 [12], stating that the state's reaction to juvenile delinquency must be proportional, individualized, and adapted to the particularities of the minor's age, emphasizing that the application of repressive measures of a quasi-criminal nature, without adequate procedural guarantees, is incompatible with Art. 6 and Art. 5 of the European Convention, as well as with the requirements for the special protection of the child in conflict with the law.

The Particularity of Individualizing the Minor's Punishment. Judicial individualization of the punishment acquires, in the case of minors, a qualitatively superior dimension, the court being obliged to analyze not only the act and the form of guilt, but also the psychosocial profile of the minor, the family environment, the level of education, the degree of influence exercised by other persons, and the concrete circumstances of the commission of the offense. Individualization of the minor's punishment is broader and more flexible than the individualization of the punishment in the case of mature persons.

In solving this issue, the court of law, in addition to the general criteria set out in Art. 75 of the Criminal Code, will also take into account the circumstances provided by Art. 475 para. (1) of the Criminal Procedure Code, established during the criminal investigation and the trial of the case (the minor's age; the conditions in which the minor lives and is educated, their degree of intellectual, volitional, and psychological development, the particularities of character and temperament, their interests and needs; the influence of adults and other minors on the minor; the causes and conditions that contributed to the commission of the offense).

According to Art. 475 para. (3) of the Criminal Procedure Code, the criminal investigation body, the prosecutor, or, as the case may be, the court of law orders the drafting of

the pre-sentence psychosocial evaluation report of the minor, i.e., a complex analysis of the bio-psycho-sociology of the minor.

The minor's behavior is often the result of the environment, not of a stable criminal choice. Therefore, the judge must evaluate whether the act is the result of a real criminal urge or of age-related showmanship, the influence of the entourage, or educational deficiencies. Imprisonment becomes a measure of ultima ratio.

In the process of individualizing the punishment, the court is obliged to take into account, in the case of minors, the exact age, living and educational conditions, the influence of the family environment, and the level of psychological development—elements that do not have the same legal relevance in the case of adults.

In addition, minority constitutes a mandatory legal mitigating circumstance, unlike the situation of mature persons. According to Art. 76 para. (1) lit.b) Criminal Code, when establishing the punishment, the commission of the offense by a minor is considered a mitigating circumstance. At the same time, the minority of the person who committed the offense, in accordance with Art. 79 para. (1) Criminal Code, is considered an exceptional circumstance, a fact which gives the court the right to apply to the minor a punishment below the minimum limit provided by criminal law for the respective offense.

The punishment applied to the minor is, necessarily, milder. When establishing the minor's punishment, the court, in its judgment, is to argue each of the indicated circumstances (Art. 75 Criminal Code, Art. 475 Criminal Procedure Code) with an indication of the evidence that confirms or, as the case may be, refutes them, to give an assessment of the pre-sentence psychosocial evaluation report of the minor and, in case it does not agree with the conclusions and proposals in the report, it will motivate their rejection [8, p. 33].

Applying the death penalty [Note: usually "pedeapsa cu închisoare" in the text refers to imprisonment] or imprisonment to a minor must be the court's last solution and only if another punishment will not achieve its purpose [8, p.34]. In the same vein, in the Decision of the Plenum of the Supreme Court of Justice regarding judicial practice in criminal cases regarding minors No.39 of November 22, 2004, point 19, it is indicated that all measures provided by law should be taken to apply to the minor defendant a non-custodial punishment, or to establish a milder punishment than that provided by law (Art. 79 Criminal Code) [6].

1. Particularity of the Execution of Punishments. Through the particularities of the execution of punishments applied to minors by the court, priority is given to the execution of the prison sentence, as a form of criminal reaction with maximum impact on the minor's development, without excluding the existence of special execution rules also in the case of other criminal punishments applicable to this category of persons.

The execution of the prison sentence applied to minors, as a priority, targets the special detention regime of minors; execution of the punishment in institutions separate from adults; the emphasis on education, training, and social reintegration, not on repression; the reduced duration of punishments and the possibility of their review; adaptation of the execution regime to age particularities. According to Art. 72 para. (5) of the Criminal Code, minors execute the prison sentence in detention centers for minors and young people, taking into account the personality of the convict, criminal records, and the harmful degree of the offense committed.

This approach is justified, because deprivation of liberty most intensely affects the development of the minor's personality. International standards and the jurisprudence of the European Court of Human Rights (for example, the cases *Blokhin v. Russia*; *Bouamar v.*

Belgium) [12; 13] treat the detention of minors as a measure of last resort, being admissible only in exceptional circumstances and, if it is proportional, adapted to age and, only if it pursues a real educational goal, not sanctioning, being accompanied by adequate procedural guarantees.

Particularities also exist in the case of minors performing unpaid community service (duration, schedule, compatibility with studies) or the penalty of a fine (correlation with the material situation and with the role of legal representatives).

2. Educational Coercive Measures as an Alternative Solution. A central element of the criminal regime of minors is the possibility of applying educational coercive measures, provided for in Art. 104 Criminal Code, either as an alternative to punishment (Art. 93 CC), or as a substitute for criminal liability (Art. 54 CC), depending on the gravity of the act and the person of the minor. Mature persons do not benefit from such an alternative mechanism, their liability being realized exclusively through punishment.

Educational coercive measures are criminal law sanctions applicable to minors under the conditions of the law, with a view to their education and re-education. These measures reflect the modern orientation of juvenile criminal law toward restorative juvenile justice and the minimum intervention of criminal repression. They do not aim at sanctioning in the classic sense (repression), but at correcting conduct and preventing recidivism, making the minor responsible and strengthening their social ties. Educational coercive measures are situated in an intermediate zone between criminal law and child protection, having a sui generis legal nature, since, although they are qualified by the Criminal Code as safety measures and constitute criminal law sanctions (Art. 98 para. (2) Criminal Code), they approach through their purpose and content the mechanisms specific to child protection, without being confused with either criminal punishments or extra-penal protection measures.

Our legislator gives priority to educational measures over punitive ones. According to Art. 75 para. (3) Criminal Code, for the commission of a minor or less serious offense, the punishment is applied to the minor only if it is assessed that taking the educational measure is not sufficient for the minor's correction. This provision enshrines the principle of the subsidiary and exceptional nature of the criminal punishment applied to the minor, in relation to educational coercive measures. The norm establishes a rebuttable legal presumption in favor of educational measures, in the sense that, for minor and less serious offenses, the primary criminal reaction must be non-penal, and the punishment constitutes ultima ratio. Therefore, the punishment represents an exceptional measure, admissible only if the court demonstrates, through rigorous motivation, that educational measures cannot ensure the minor's correction.

The purpose of Art. 75 para. (3) Criminal Code is double: a) protecting the best interest of the minor, avoiding unnecessary criminal stigmatization; and b) directing the criminal liability of minors toward education and social reintegration, not toward repression.

3. Release of the Minor from Criminal Liability with the Application of Educational Coercive Measures. The Criminal Code enshrines the possibility of releasing the minor from criminal liability, with the application of educational coercive measures, when the gravity of the act, the person of the minor, and the circumstances of the case allow the purpose of the criminal law to be achieved without pronouncing a conviction.

It follows from the provisions of Art. 54 Criminal Code that the application of release from criminal liability of minors is possible only in case of compliance with the following cumulative conditions: a) the offense is committed for the first time; b) the offense committed is minor or less serious; c) at the criminal investigation or at the trial of the case it

is established that the process of correcting the minor is possible without the perpetrator being subject to criminal liability, taking into account the recommendations of the resocialization services formulated in the social investigation report.

From a doctrinal perspective, this institution represents a justified exception to the principle of the inevitability of criminal liability; based on the idea that early criminal stigmatization is incompatible with the best interest of the child and with the objective of social reintegration.

4. Release of the Minor from Criminal Punishment. Distinct from release from criminal liability, criminal legislation also provides for the release of the minor from punishment, in situations where the court finds that the effective application of the punishment is no longer necessary. This solution presupposes the existence of a conviction, but the suspension or replacement of the execution of the punishment, considering the educational progress achieved (Art. 90 and 93 Criminal Code).

Although the Criminal Code of the Republic of Moldova does not enshrine an autonomous normative regime for conviction with conditional suspension of execution of the punishment for minors, the particularities of its application result from the systemic interpretation of art. 90 Criminal Code in conjunction with Art. 485 of the Criminal Procedure Code and with the special principles of the criminal liability of minors. Through the provisions of Art. 485 para. (1) CPC, conditional suspension is given a distinct status in the minor's process, which is confirmed by the text "the court is to examine the possibility of conditional suspension of execution of the punishment by the minor". This wording is not neutral, but establishes a positive procedural obligation of the court, transforming suspension into a priority option, not an optional-random one. Compared to adults, suspension is a faculty; compared to minors, suspension is a mandatory analyzed alternative, which represents the first essential particularity.

In the case of the adult, Art. 90 para. (1) Criminal Code operates with the criterion "it is not rational for them to execute the punishment", and in the case of the minor, this formula must be reinterpreted in light of Art. 75 para. (3) Criminal Code (priority of educational measures), and Art. 93 Criminal Code (release of minors from punishment), as well as the principle of the best interest of the child. Thus, the "irrationality of executing the punishment" in the minor is not primarily related to the gravity of the act, but to the level of psychosocial development, the capacity for education in the community, the role of the family and the social environment, and the potential for reintegration without detention.

The motivation of the sentence is more demanding in the case of the minor. Although Art. 90 para. (1) of the Criminal Code requires the motivation of the suspension in general, in the case of the minor, the court must additionally motivate why the suspension is sufficient for the educational purpose of the punishment, how the probation conditions contribute to the formation of licit conduct, and why isolation from society is not necessary.

According to Art. 90 para. (61) Criminal Code, in the case of sentencing the minor with conditional suspension of execution of the punishment, participation in the probation program is mandatory. This is the only express particularity in the Criminal Code. The difference from the adult is structural. For the adult, the probation program is optional, and for the minor it is mandatory and involves a structured educational intervention.

Although the Criminal Code does not provide for distinct probation conditions for the minor, in practice and doctrine it is necessary to avoid excessively restrictive conditions; formulating obligations in a language accessible to the minor; correlating obligations with schooling, psychological counseling, and family involvement. At the same

time, the "identical" application of conditions as in the case of adults would violate the principle of proportionality and the principle of individualizing the punishment. Conviction with conditional suspension of execution of the punishment represents the typical form of avoiding the minor's detention. Its non-application must be explicitly justified, demonstrating why community measures are insufficient. Therefore, conditional suspension acquires, in the case of the minor, the character of a preferential measure, with a predominantly educational function, being necessarily accompanied by a probation program and subject to a more demanding standard of motivation and individualization than in the case of the adult.

Release of minors from punishment with the application of educational coercive measures is regulated by Art. 93 Criminal Code and detailed procedurally by Art. 485-486 of the Criminal Procedure Code. In material terms, Art. 93 Criminal Code establishes a presumption of preference for educational coercive measures (Art. 104 Criminal Code), when the minor has committed a minor, less serious, or serious offense and the court finds that the purposes of the punishment can be achieved without its execution. Release is not equivalent to the absence of criminal liability: the court pronounces a sentence of conviction, but substitutes the criminal punishment with educational coercive measures, appropriate to the age and personality of the minor.

If the Court of law has not applied the provisions of Art. 483 para. (5) of the Criminal Procedure Code, according to Art. 486-487 of the Criminal Procedure Code, it must examine, when adopting the sentence, first the possibility of releasing the minor from punishment in accordance with the provisions of Art. 93 of the Criminal Code. In this case, Art. 93 CC obliges the Court to examine the possibility of releasing the minor from criminal punishment not only for minor or less serious offenses, but also for serious offenses [8, p.31].

Thus, the court, when deliberating the sentence, must prioritize analyzing the possibility of releasing the minor from punishment, and in the situation where it establishes the conditions provided for in art. 93 Criminal Code, by adopting a conviction sentence, it orders the release of the minor convict from the criminal punishment and applies to them educational coercive measures provided for by Art. 104 Criminal Code (Art. 486-487 Code of Criminal Procedure).

Release from criminal punishment expresses the flexibility of the criminal reaction toward the minor, allowing its adjustment depending on the evolution of the subject's personality, oriented toward education and re-education, social reintegration, and preventing recidivism, in accordance with international standards regarding the character of last resort of the custodial criminal punishment in relation to minors. As we have shown, deprivation of the minor's liberty must be exceptional and protective.

A final essential particularity consists in the reduction of the criminal legal terms applicable to minors. The regime for minors is characterized by reduced terms regarding parole (conditional release) before the term (Art. 91 Criminal Code), the statute of limitations for criminal liability (Art. 60 Criminal Code), and the statute of limitations for the execution of the conviction sentence (Art. 97 Criminal Code).

For the application of parole before the term to minors, the fractions of the punishment that must be executed are smaller (at least one-third of the punishment term established for committing a minor or less serious offense or at least half of the term established for committing a serious offense), compared to the larger fractions in the case of adults (Art. 91 para. (6) of the Criminal Code).

The statute of limitations for criminal liability is reduced by half for persons who

were minors at the date of the offense (Art. 60 para. (7) Criminal Code). This reflects the idea that the social resonance of the act decreases faster, and the punishment applied late loses its educational function. The statute of limitations for the execution of the punishment is also reduced by half for persons who, at the date of the offense, were minors (Art. 97 para. (2) of the Criminal Code).

These reductions are justified doctrinally by the need to avoid the long-term consequences of criminal conviction that are disproportionately harmful to the minor, affecting their process of social formation. In the case of *Blokhin v. Russia* [12], the European Court of Human Rights emphasized that the effects of criminal repression on minors must be limited in time and intensity. The Court consolidated the standards regarding the protection of minors in criminal proceedings, stating that the deprivation of a child's liberty, in the absence of procedural guarantees and adequate medical care, constitutes concurrent violations of articles 3, 5, and 6 of the European Convention on Human Rights, emphasizing the state's obligation to adapt the justice system to the specific vulnerability of minors.

At the same time, the European Court of Human Rights formulated important standards, namely that the best interest of the child must be paramount; before detention, a medical assessment is necessary; children, especially those with disabilities, require increased procedural guarantees; the system must be adapted, not identical to that of adults.

Conclusions. The analysis of the legal regime of criminal liability of minors in the criminal law of the Republic of Moldova reveals the existence of an autonomous institution, based on the recognition of the bio-psycho-social particularities of the person in formation, on the principle of differentiating liability according to age and the level of psychosocial maturity of the subject of the offense, on the necessity for increased protection of the child, and on the priority orientation of the criminal reaction toward education, social reintegration, and prevention, and not toward repressiveness.

Compared to mature persons, minors benefit from a mitigated legal regime, characterized by the limitation of the sphere of criminal liability, the relativization of discernment, the humanization of sanctions, and the priority of educational coercive measures. The Criminal Code thus enshrines a coherent system, based on the principles of substantial differentiation from the regime applicable to adults, accentuated individualization, proportionality, humanism, and the best interest of the child, in accordance with constitutional and European standards. Minority does not exclude criminal liability, but confers upon it a distinct content and purpose, adapted to the developing personality of the perpetrator.

Proceedings against minors must be age-appropriate and guarantee effective participation. "Effective participation" implies that the minor is not just a spectator of the process, but a real participant, capable of understanding and exercising their rights. This wording, as already shown, comes from the jurisprudence of the European Court of Human Rights and refers to how a criminal trial or any judicial procedure involving a minor must be organized.

The limitation of the categories of punishments applicable to minors, the reduction of the term and amount of punishments, as well as the establishment of mechanisms such as release from criminal liability or from punishment, and the reduced terms for the statute of limitations and parole highlight the politico-criminal orientation toward reducing repression and favoring re-education.

In perspective, the efficiency of this regime depends on the consistent application of educational measures, the development of probation services, and the strengthening

of social reintegration mechanisms. In conclusion, the criminal liability of minors constitutes a special form, legally and criminologically justified, intended to protect the best interest of the child and to achieve the goals of the criminal law through appropriate and proportional means.

Abstract

In this article, the authors undertake a comprehensive analysis of the detainee's right to information, highlighting the international and national legal framework, the doctrinal correlations, and the directions for improving the mechanisms that guarantee this right. The study demonstrates that the detainee's right to information is a fundamental right, constitutionally guaranteed and further detailed through the penitentiary enforcement legislation of the Republic of Moldova. This right cannot be suppressed solely due to the deprivation of liberty but may only be limited in a proportional and justified manner. At the same time, the main issue regarding its effective realization lies in the deficient implementation of the existing regulations. The principal problems are related to the lack of access to legal information, the formalism of procedures, and disproportionate restrictions.

The conclusions emphasize that the free exercise of the right to information by each participant in social relations within the penitentiary enforcement sphere, primarily by convicted persons, represents a fundamental condition for the effectiveness of public oversight, as it provides the possibility to obtain the necessary information and to exert influence on state authorities. At the same time, it is important to take into account that persons held in places of detention have a limited scope of rights and freedoms, including with regard to informational rights, as this is necessary for ensuring the detention regime and for achieving the objectives of criminal punishment.

Keywords: right to information, detainees, imprisonment, penitentiary.

REALIZAREA DREPTULUI LA INFORMAȚIE ÎN PRIVINȚA PERSOANELOR CONDAMNATE LA PEDEAPSA CU ÎNCHISOARE

Abstract

În articol, autorii întreprind o analiză complexă a dreptului deținutului la informație, evidențiind cadrul normativ internațional și național, corelațiile doctrinare și direcțiile de perfecționare a mecanismelor de garantare a acestui drept. Studiul realizat a demonstrat că dreptul deținutului la informație este un drept fundamental, garantat constituțional și detaliat prin legislația execuțional-penală a Republicii Moldova. Acesta nu poate fi suprimat prin simplul fapt al privării de libertate, ci doar limitat în mod proporțional și justificat. Totodată, principala problemă privind realizarea sa efectivă rezidă în caracterul dificitar al implementării. Principalele probleme sunt legate de lipsa accesului la informație juridică, formalismul procedurilor și restricțiile disproporționate.

În concluzii se punctează că exercitarea liberă a dreptului la informație de către fiecare dintre participanții la raporturile sociale din sfera execuțional-penală, în primul rând de către persoanele condamnate, reprezintă o condiție de bază pentru eficiența controlului public, întrucât oferă posibilitatea obținerii informațiilor necesare și exercitării unei influențe asupra autorităților statului. Totodată, este important să se țină cont de faptul că persoanele aflate în locuri de detenție au un volum limitat de drepturi și libertăți, inclusiv în ceea ce privește drepturile informaționale, întrucât acest lucru este necesar pentru asigurarea regimului și realizarea scopurilor pedepsei penale.

Cuvinte-cheie: dreptul la informație, deținuți, pedeapsa cu închisoare, penitenciar.

Introduction. The right to information is recognized at the international level as a fundamental right, indispensable for the functioning of the rule of law and for the exercise of other human rights. In the case of persons deprived of liberty, this right acquires particular importance, as the lack of access to information amplifies the vulnerability inherent in detention.

When analyzing the right to information as an instrument for increasing the efficiency of public oversight, it must be taken into account that this right has a complex content and consists of numerous elements whose essence and position within the legal system have not been sufficiently studied.

The right to information has particular importance for persons held in places of detention. The effectiveness of the realization of this right determines, to a large extent, the success of protecting other rights and freedoms, as well as the effectiveness of public oversight over the penitentiary enforcement system.

To a significant extent, the outcome of the realization of the right under analysis depends on the quality of the regulatory framework in this field, as well as on its coherence, consistency, and completeness. In this context, the further analysis of the right to information should begin with a careful study of the legislation governing the social relations in question and of the degree to which this right is regulated under the conditions of places of detention.

At the same time, it is important to note that legal possibilities in the informational sphere differ depending on the person's belonging to one or another category of individuals held in places of detention. For this reason, this factor must be taken into account when analyzing the legislative framework.

Methods and materials applied. Within the scope of the present study, the following methods were applied: analysis, synthesis, comparison, and logical reasoning. The materials used consist of legislation and publications by researchers in the field.

Discussions and results obtained. The process of establishing the right to information is clearly reflected in a number of essential documents, including:

1. *The Universal Declaration of Human Rights* (1948) [1]. Article 19 proclaimed that every person has the right to seek, receive, and impart information and ideas through any media and regardless of state frontiers;

2. *The Convention for the Protection of Human Rights and Fundamental Freedoms* (1950) [2]. Article 10 confirmed the right of every person to freely receive and impart information and ideas without interference by public authorities and regardless of state frontiers;

3. *The International Covenant on Civil and Political Rights* (1966) [3]. Article 19 continued the process of international recognition of the right to information, establishing that every person has the right to seek, receive, and impart information and ideas of any kind, regardless of state frontiers, orally, in writing, in print, in the form of art, or through any other media of their choice.

Article 34 of the Constitution of the Republic of Moldova provides for the right to information, establishing that access to information of public interest may not be restricted [4]. The constitutional provision does not establish exceptions related to a person's status, which means that persons deprived of liberty are also holders of this right.

At the same time, article 54 of the Constitution allows the restriction of the exercise of certain rights and freedoms, but only under the conditions provided by law and with respect for the principles of proportionality and necessity in a democratic society [4]. Therefore, deprivation of liberty cannot justify the complete suppression of the right to information, but only certain reasonable limitations strictly determined by the requirements of the penitentiary regime and by the need to ensure order and security.

This constitutional provision constitutes the foundation of the informational legal status of persons held in places of detention.

Specialized literature pays increased attention to the rights of persons deprived of liberty, emphasizing that detention does not eliminate their status as subjects of law. Thus, V. Dongoroz notes that "a custodial sentence cannot have the effect of suppressing fundamental rights that are not incompatible with the state of detention" [5, p. 52].

Some authors emphasize that "the right to information has an instrumental function, as it facilitates the exercise of other fundamental rights, such as the right to defense, the right to petition, or access to justice" [6, p. 186]. In the case of detainees, access to information regarding their rights and obligations, the detention regime, and administrative or judicial procedures is indispensable for the protection of human dignity.

In turn, A. Boroi emphasizes that "the right to information represents a guarantee of the legality of the execution of the sentence, as it allows the detainee to become aware of and challenge possible abuses by the penitentiary administration" [7, p. 41]. Romanian authors also underline the role of information in the process of the social reintegration of the convicted person, considering it an educational and preventive instrument.

In Western doctrine, the detainee's right to information is analyzed in close connection with the European standards of human rights. In this regard, it is emphasized that "access to information constitutes an essential component of the observance of Article 10 of the European Convention on Human Rights, even within the penitentiary environment" [8, p. 214].

It is also noted that "the limitations imposed on detainees must be interpreted restrictively, and any interference with the right to information must be justified by imperative security considerations" [9, p. 97]. From this perspective, informing detainees is viewed as an element of good penitentiary governance and of the prevention of inhuman or degrading treatment.

The most extensive body of legislative regulation concerning the right to information, which details the fundamental norms and requirements mentioned above, has been adopted with regard to persons sentenced to imprisonment. This situation is explained by the fact that this category of citizens is subject to the most significant restrictions on informational rights and freedoms. The overwhelming majority of the norms that define the informational legal status of this category of persons are found in the penitentiary enforcement legislation of the Republic of Moldova.

Thus, the Execution Code of the Republic of Moldova provides that convicted persons benefit from all the rights, freedoms, and obligations of the citizens of the Republic of Moldova, with the exceptions and restrictions established by law [11, Art. 186 para. (1)].

Specifically, the penitentiary enforcement legislation guarantees:

– the right to be informed by the institution or authority responsible for the execu-

tion of the sentence, in a language that he or she understands, about his or her rights and obligations, the manner and conditions for the execution of the sentence, as well as about any modification of the manner and conditions for the execution of the sentence (Art. 169 para. (1) letter a) of the Execution Code of the Republic of Moldova);

– the right to submit petitions (requests, complaints, proposals, notifications) to the administration of the institution or authority responsible for the execution of the sentence or to hierarchically superior bodies, the court of law, the prosecutor's office, central and local public administration authorities, public associations, other institutions and organizations, including international ones (Art. 169 para. (1) letter c) of Execution Code of the Republic of Moldova).

Detainees exercise their right to information, including access to legal provisions and documents regarding the execution of custodial sentences or preventive detention, under the conditions stipulated by Art. 208 and 209 of the Execution Code.

According to Art. 208 of the Execution Code of the Republic of Moldova, the convicted person is ensured access to information disseminated through mass media.

The prison administration has the obligation to take all necessary measures to ensure the application of legal provisions regarding the free access to information for convicted persons.

The penitentiary ensures the reception of radio and television broadcasts. Within the limits of the detention regimes provided for in the Execution Code of the Republic of Moldova and in the Statute on the Execution of Sentences by Convicted Persons, the convicted person may use a radio set, television, personal cassette player, or any other devices authorized by the prison administration, provided that the payment for the consumed electrical energy is made.

The convicted person is allowed to purchase, through the trade network, literature, subscribe to and receive newspapers and magazines, without limitation as to their number, at the expense of their own funds or those of other persons.

The convicted person is prohibited from subscribing to, receiving, purchasing, possessing, or distributing publications that promote war, ethnic, national, racial, or religious intolerance, the cult of violence and cruelty, as well as publications of a pornographic nature. The convicted person is prohibited from accessing the Internet network [10, Art. 208].

Article 209 of the Execution Code of the Republic of Moldova provides for ensuring access to legal provisions and documents regarding the execution of custodial sentences. Thus, the provisions of the Criminal Code concerning the execution of the sentence, the provisions of the Execution Code, the Statute on the Execution of Sentences by Convicted Persons, the provisions of the Law on Access to Information of Public Interest, the provisions of orders issued on the basis of the Execution Code, and the provisions of the penitentiary's internal regulations, as well as any amendments thereto, are brought to the attention of convicted persons or are made available to them, in Romanian or in a language they understand, immediately after their admission to the penitentiary.

The texts of the legal provisions specified above are made available to convicted persons in penitentiaries, in accessible places. In the case of convicted persons who have communication impairments, the respective information is communicated to them through methods that allow them to understand it.

It should be noted that the convicted person is not deprived of the possibility of becoming familiar with the documents contained in the personal file. In this regard, Art. 201 para. (3) of the Execution Code of the Republic of Moldova provides that the person

sentenced to imprisonment and his or her defense counsel have access, in the presence of a person specifically designated by the prison director, to the personal file.

According to point 48 of the Statute on the Execution of Sentences by Convicted Persons, detainees must be informed about the existence of acts (documents) officially received by the penitentiary that introduce changes to their legal situation. These documents are:

- Referral documents to the court, summonses, or indictments;
- Documents constituting the grounds for detention;
- Documents that modify the grounds for detention [11, point 38].

Upon receiving documents that modify the legal status of the detainee, the special records department must inform the detainee of these changes, record the modification in the personal file and in the other documents, and communicate the change to the relevant services of the penitentiary in order to ensure the lawful application of the detention regime (point 49 of the Statute).

Informing detainees about the content of procedural acts issued by the court or by the criminal investigation body constitutes an obligation of the penitentiary administration (point 50 of the Statute).

According to Art. 213 para. (1) of the Execution Code of the Republic of Moldova, the convicted person has the right to short-term and long-term visits, which are granted in the manner and under the conditions established by the Execution Code and the Statute on the Execution of Sentences by Convicted Persons.

In this context, the possibility of exchanging information with relatives, friends, defense counsels, and state authorities contributes to achieving two objectives:

- The rehabilitation of the convicted person and the prevention of the commission of new offenses;
- Ensuring adequate legal protection for this category of persons, in accordance with the norms and requirements of a civilized society.

Without going into the details of each issue, it should be noted that the objectively necessary physical isolation of convicted persons must not lead to an absolute blockade of their social connections, as this could generate only negative consequences and may hinder the subsequent process of resocialization.

However, it is also important to note that persons sentenced to imprisonment have the right to transmit information only in the form of providing it (that is, they may transmit information to a specific person), but not in the form of dissemination (that is, to an unlimited circle of persons). This conclusion results from the content of the above-mentioned provisions of the Execution Code.

In our opinion, this restriction is necessary and does not violate the balance in the analyzed field, as it corresponds to the regime established in places of detention, associated with the objectively necessary isolation of convicted persons and with the prevention of the negative influence that certain groups of detainees may exert on society and on other citizens, including by preventing the preparation, planning, and commission of new offenses.

The exercise of the prerogative of access to information is also associated with a series of specific particularities determined by the need to ensure appropriate conditions of isolation in places of detention.

The creation of such conditions requires the administration of penitentiary institutions to exercise comprehensive control over any contacts of the convicted person, which is possible only if all means of communication that are insufficiently controllable,

especially laptops, tablets, and phones with access to the Internet network, are prohibited and confiscated.

On the other hand, offering convicted persons the possibility to regularly receive information about the most important events taking place in the country may have significant educational value and allows them to avoid losing connection with social life.

It should be noted that the detention regime in penitentiary institutions does not prevent convicted persons from carrying out creative activities, writing literary works, practicing visual arts, or engaging in other forms of expression. On the contrary, such activity is encouraged by the administration, as it represents a manifestation of the positive qualities and traits of the convicted person's personality.

The above considerations imply that this category of persons may create information that can potentially have social and material value, constituting an object of civil circulation. For this reason, the law must provide mechanisms and procedures through which convicted persons may exercise their right regarding the use of information.

Despite the arguments presented, adequate legal regulation of these processes is in fact lacking, the mentioned issue receiving insufficient attention in legal literature, while systematized scientific research on this topic is almost nonexistent.

The exercise by persons sentenced to imprisonment of the right to information and the related positive legal possibilities presents particularities determined by the legal status of this category of persons. The development of concrete possibilities that allow the convicted person to exercise the right to information and its related prerogatives contains significant potential for their correction and re-education, a potential that cannot be fully utilized without improving the legal framework of the analyzed field and without an appropriate organizational policy on the part of penitentiary administrations.

Thus, based on the above, the following characteristics of the right to information can be highlighted:

1. The analyzed right must be characterized as a complex right, composed of a set of prerogatives;

2. It has major political importance and represents one of the foundations of the democratic rule-of-law state;

3. It is derived from freedom of expression but currently has the status of a fundamental right;

4. It is a right recognized at the international level, enshrined in numerous international normative acts concerning human rights.

One of the main problems identified in the specialized doctrine consists in the discrepancy between the normative recognition of the right to information and its effective implementation in the penitentiary environment. Although the penitentiary enforcement legislation expressly enshrines this right, the practical mechanisms of implementation often remain merely formal.

Some authors address the issue from the perspective of the inefficiency of institutional mechanisms, indicating that „in the absence of independent information structures, the detainee remains exclusively dependent on the penitentiary administration, which creates a structural imbalance" [12, p. 91]. Others emphasize that incomplete or distorted information undermines the corrective purpose of punishment, since "resocialization presupposes awareness of legal rights and responsibilities" [13, p. 148].

Effective access to information implies not only passive information but also the possibility to consult relevant legislation, case law, and doctrine. In practice, penitentiary libraries are insufficiently equipped, and access to updated legal information is sporadic.

In this regard, it is emphasized that, in many penitentiary systems in Eastern Europe, the information provided to detainees is limited to the minimal communication of internal rules, without a clear explanation of their content and legal consequences. Thus, Boroi A. points out that "the rights of detainees are often proclaimed in abstract terms, without being accompanied by real instruments for their exercise" [7, p. 44]. It is also noted that access to information becomes illusory when the person does not have the real capacity to understand and make use of the information received [6, p. 189].

A major obstacle is the limited access to updated legislation and case law. According to a study published by Penal Reform International, the lack of legal information in detention directly affects the detainee's ability to challenge the legality of measures concerning him or her [14].

Reports by international NGOs, such as Amnesty International, highlight that detainees are not always effectively informed about complaint procedures [15]. This lack of information affects the effective nature of the right to an effective remedy guaranteed by Article 13 of the European Convention on Human Rights.

In this regard, the European Court of Human Rights has consistently held that the lack of access to relevant legal information may constitute an indirect violation of Articles 6 and 13 of the European Convention on Human Rights (case of Golder v. the United Kingdom, 1975) [16].

Furthermore, the reports of the European Committee for the Prevention of Torture (CPT) indicate that the information provided to detainees is often incomplete and formal. In the CPT Report regarding the Republic of Moldova (2020), it is stated that detainees are not always informed in a clear and accessible manner about their rights [17, para. 34].

Another critical aspect is the tendency of the penitentiary administration to justify restrictions regarding information by invoking general security reasons. Although security represents a legitimate aim, it cannot constitute a general and automatic argument. In this respect, the restriction of the fundamental rights of detainees must be interpreted restrictively and subjected to rigorous proportionality control.

Conclusions. The free exercise of the right to information by each participant in social relations within the penitentiary enforcement sphere, primarily by convicted persons, represents a basic condition for the effectiveness of public oversight, as it provides the possibility of obtaining the necessary information and exercising influence over state authorities.

At the same time, it is important to take into account that persons placed in places of detention have a limited scope of rights and freedoms, including informational rights, as this is necessary to ensure the detention regime and the achievement of the purposes of criminal punishment, within the limits that do not contradict Article 34 of the Constitution of the Republic of Moldova.

At the same time, the scope of rights and freedoms of each individual person depends directly on the type of penitentiary institution and on the legal status of the person in detention, respectively persons sentenced to imprisonment, suspects, accused persons, persons placed under administrative arrest, etc.

The detainee's right to information represents an essential guarantee of human dignity, of the legality of the execution of the sentence, and of social reintegration. The analysis carried out confirms that the main difficulties are not normative in nature, but rather institutional and practical.

The problems related to the implementation of the right to information and to public oversight over the penitentiary enforcement system are varied and concern a wide

spectrum of social relations. Considering the diversity of existing problems, deficiencies, and possible solutions – many of which have a particular character and concern distinct aspects of the right to information – it is necessary to highlight the main directions for the development of the analyzed right, as well as of public oversight as a whole:

- Improving the level of information provided to all categories of persons in places of detention, including ensuring their access to information regarding their rights and freedoms, the procedure and conditions for the execution of the sentence, and the penitentiary regime, as well as strengthening the legal liability of officials who violate these obligations;
- Aligning national practice with the standards developed by the European Court of Human Rights and international bodies;
- Training penitentiary staff regarding the respect for the right to information.

"Ştefan cel Mare" Academy of the Ministry of Internal Affairs,
Republic of Moldova
ORCID: 0000-0002-7711-022X

Abstract

The analysis of the legal object of the offence provided for in Article 290 of the Criminal Code of the Republic of Moldova highlights the complexity of the social values protected through the criminalization of acts concerning the illicit circulation of firearms and ammunition. Although, traditionally, this offence is associated with the protection of public security and public order, an in-depth analysis reveals the multifaceted and complex nature of the legal object, determined by the diversity of the modalities of commission provided by the criminal norm.

Thus, in addition to the social relations concerning the legal regime of firearms, certain incriminated conducts, such as theft or illegal commercialization, may also affect the right to property as well as the health of the person, while the illicit use or handling of firearms and ammunition may generate direct risks to human life.

Therefore, in this context, the idea of a complex legal object emerges, within which the protected social values are not limited to public security, but also include other fundamental social relations, affected differently depending on the specific nature of the incriminated conduct.

Keywords: legal object, social value, security and public order.

OBIECTUL JURIDIC AL INFRACȚIUNII PREVĂZUTE LA ARTICOLUL 290 COD PENAL AL REPUBLICII MOLDOVA

Abstract

Analiza obiectului juridic al infracțiunii prevăzute la art. 290 Cod penal al Republicii Moldova evidențiază complexitatea valorilor sociale protejate prin incriminarea faptelor ce vizează circuitul ilegal al armelor și munițiilor. Deși în mod tradițional, această infracțiune este asociată protecției securității și ordinii publice, însă o examinare aprofundată relevă caracterul plurivalent și complex al obiectului juridic, determinat de diversitatea modalităților de comitere prevăzute de norma penală.

Astfel, pe lângă relațiile sociale privind regimul juridic al armelor, anumite conduite incriminate, precum sustragerea sau comercializarea ilegală, pot aduce atingere și dreptului de proprietate, precum și sănătății persoanei în timp ce utilizarea sau manipularea ilicită a armelor și munițiilor poate genera riscuri directe pentru viața acesteia.

Prin urmare, în acest context, se conturează ideea unui obiect juridic complex, în cadrul căruia valorile sociale protejate nu se limitează la securitatea publică, ci includ și alte relații sociale fundamentale, afectate în mod diferit în funcție de specificul conduitei incriminate.

Cuvintele-cheie: obiect juridic, valoare socială, securitate și ordine publică.

Introduction. In the context of the growing criminal phenomenon associated with the illicit circulation of firearms and ammunition, the criminal law analysis of the social values protected through the criminalization of such acts acquires particular relevance, especially in terms of determining the content of the legal object of the offence provided for in Article 290 of the Criminal Code of the Republic of Moldova (Hereinafter – CC RM). The importance of this analysis is determined not only by the central role that the legal object occupies in the structure of the offence, but also by the need to ensure a correct and uniform interpretation of the criminal norm in judicial practice.

Although, traditionally, the analysed offence is associated with the protection of public security and public order, such an approach proves to be insufficient in relation to the complexity of the criminal phenomenon regulated by the norm. The diversity of the modalities of commission provided by Article 290 CC of the Republic of Moldova, as well as the nature of the material object involved, determine the incidence of distinct social values that go beyond the strict framework of public security.

In this context, the need emerges for a re-examination of the concept of the legal object of this offence, by reference to the totality of protected social values, as well as to the concrete manner in which they are affected depending on the specific nature of the incriminated conduct, and such an approach allows for highlighting the complex nature of the offence and contributes to the development of a more coherent interpretative framework better adapted to current criminogenic realities.

Methods and materials applied. Within the present study, the classical methods of criminal law research were employed, in particular the logical-legal analysis method, which allowed for the examination of the normative content of the provisions of Article 290 of the Criminal Code of the Republic of Moldova, as well as the systemic method, used to highlight the place and role of the legal object within the structure of the offence. Furthermore, the comparative method was applied, by reference to the opinions expressed in national and international doctrine, as well as the interpretative method, necessary for clarifying the meaning and scope of application of the legal concepts analyzed.

Discussions and results obtained. Any offence, viewed as a manifestation of non-compliance with fundamental norms of social conduct and of hostility towards the rules of social coexistence, essentially constitutes an attack against a fundamental social value protected by the state through its mere criminalization within criminal legislation, given that through the conduct prohibited by law, the offender affects these social relations and, at the same time, causes harm to the fundamental values upon which they are based.

In specialized doctrine [30, p.79], the totality of social values and relations guaranteed by criminal law and infringed by the commission of unlawful conduct forms what is referred to as the legal object of the offence, which represents an indispensable element of the structure of the offence, serving as the criterion that justifies criminalization and outlines the purpose of criminal law protection.

Thus, speaking about the structure of the corpus delicti, it is defined as the organized set of elements that compose it and the interdependent relationships between them, reflecting the manner in which criminal liability is manifested, and according to the opinion of the scholar A. Borodac, the structural basis of the corpus delicti consists in the system of its features, which is composed of four groups of features that explain four corresponding elements of the offence: the features characterizing the object and the subject of the offence, as well as its objective and subjective side [2, p.54].

In criminal law doctrine, two distinct conceptions have developed over time regarding the legal nature of the object of the offence, each of them being grounded in a differ-

ent interpretation of the relationship between social values and the interests protected by the criminal norm.

Thus, as noted by the author A.A. Piontkovsky, considered one of the developers of the doctrine of criminality in Soviet criminal law, the object of any offence is not composed of all social values, but only of those protected by the criminal-law coercive apparatus, given that "the social relations of a socialist society constitute a common object that is ultimately infringed by any offence provided for by Soviet legislation" [37, p.129].

This position was subsequently supported by the majority of authors and became generally recognized both in the theory and practice of criminal law [33, p.134]. Human life in society exists in the form of social relations, and if we refer to the structure of a specific social relation, it consists of three elements: subjects (participants or parties to a social relation), an object (the thing or good in connection with which the relations exist), as well as a social link between the participants (the content of the relation).

Within this theory, the object of an offence may be considered either as a system of typical, stable social relations of a certain kind taken as a whole, or as an individual social relationship disrupted by a specific offence [21, p.57].

A similar view is expressed by the author S. Brînză, according to whom the object of the offence is constituted by social values and social relations that require criminal protection, in whose consolidation and development society is interested, and which may be substantially harmed by the antisocial behavior of certain individuals or groups of persons [6, p.35].

In contrast, other authors, such as A.V. Naumov, promote the conception according to which, in addition to social relations, the object of an offence is recognized as consisting of those benefits (interests) that are infringed by a criminal act and are protected by criminal law [32, p.38].

In this context, the author A. Zosim states that the notion of "interest" has a broader character than that of "social value", as it encompasses the latter [19, p.511] and more accurately reflects the legal reality of what is protected by criminal law and what effectively constitutes the target of criminal conduct.

Thus, in this sense, "interest" expresses not only the axiological dimension of the social value, but also its practical purpose, allowing for a more flexible and better-adapted approach to the concept of the object of the offence. Consequently, in support of the second conception, the Romanian authors R.M. Stănoiu, I. Criga, and T. Dianu have also argued that "social values are not formed in a vacuum, but around certain realities which are objectified in specific interests, given that in all incriminated forms there will always be a generally protected interest, which the incriminating norm protects indirectly, and a specifically protected interest, which the incriminating norm protects directly" [18].

This thesis closely resembles the conception of V. Dongoroz, who considers that the object of criminal law protection is the interest safeguarded by the incriminating norm, which in turn may be of two kinds: the specifically protected interest and the generally protected interest [6, p.35].

Therefore, we consider that the notion of "value" is more appropriate and more comprehensive for defining the legal object of the offence, as it captures both the axiological foundation and the practical dimension of the social relations protected by criminal law, thus providing the concept of the legal object with greater consistency and a more precise applicability in judicial practice.

At the same time, unlike the notion of "interest", the concept of social value is not limited to an abstract or purely declarative dimension, but organically integrates the prac-

tical dimension of the social relations protected by criminal law, so that the social value manifests itself concretely within determined social relations and is capable of being infringed by criminal conduct, which allows for a clear identification of the legal object and its delimitation in the process of legal qualification of the act.

Furthermore, the use of the notion of "social value" provides the concept of the legal object with stability and coherence, avoiding the risk of excessive relativization of criminal protection, whereas the notion of "interest" is, by its nature, much more flexible and susceptible to subjective interpretations, as it may vary depending on the individual perceptions of the offender or the victim, given that what constitutes a major interest for one person may be irrelevant for another, and such variability risks affecting the objective, general, and impersonal character of the criminal norm.

Thus, criminal law, by its very nature, cannot be grounded on fluctuating criteria or on individual perceptions, but must relate to generally recognized social values, established and enshrined by law, and it is precisely this generality and objectivity of social values that justifies their use as a defining element of the legal object of the offence, ensuring the uniform application of criminal law and the predictability of criminal liability.

Therefore, criminal law doctrine [11, p.676; 35, p.163; 29, p.17] says consistently outlined a dual structure of the object of the offence, distinguishing between two categories of objects:

- *The legal object*: represents the immaterial, intangible dimension of the interests, values, and social relations protected, whose existence and functionality are threatened or effectively harmed by the criminal act or omission, which in turn is subdivided into the general legal object, the generic legal object, and the specific legal object, the latter being further divided, where appropriate, into the basic (primary) and the optional (secondary) legal object;

- *The material object*: designates the concrete support upon which the illicit conduct is exercised directly or indirectly, namely goods, things, the human body, animals, or other material or immaterial entities, through which the protected values and social relations are harmed or endangered.

Therefore, if we accept that the legal object of the offence, understood as the object of the unlawful encroachment, consists of the totality of social values protected by criminal law whose existence or functioning is endangered by the commission of the incriminated act, it becomes necessary to clarify the nature of these values and the manner in which the legislator has enshrined them normatively.

In this context, the national legislator has expressly established, in Article 2 of the Criminal Code of the Republic of Moldova, the scope of the fundamental values subject to criminal protection, providing that "criminal law protects, against offences, the person, his or her rights and freedoms, property, the environment, the constitutional order, the sovereignty, independence and territorial integrity of the Republic of Moldova, the peace and security of mankind, as well as the entire legal order" [10].

Therefore, among the criminal law provisions that establish and ensure the protection of public security, public order, and, more broadly, the entire legal order, a distinct place is occupied by the offence provided for in Article 290 of the Criminal Code of the Republic of Moldova. This incriminating norm establishes criminal liability for a series of unlawful conducts falling within the notion of "illegal handling of weapons", namely: carrying, possession, acquisition, manufacturing, repair, modification of construction or marking, as well as the illegal commercialization of firearms or ammunition and their essential components, to which the hypothesis of their theft is also added.

In turn, from the content of the aforementioned article, the general legal object (common to all offences) may also be deduced, namely the totality of the fundamental values of society, towards which criminal conduct is directed and which, by their very essence, require special protection by criminal law [31, p.92].

The generic (or group) legal object, as a component part of the general legal object, represents a set of homogeneous, interdependent, and complementary social values toward which the unlawful conduct provided for by a specific group of criminal law provisions is directed.

In specialized literature, the generic legal object is regarded as the intermediate level of criminal law protection, situated between the abstract and universal dimension of the general legal object and the concrete, particular form of the specific legal object.

According to the view of the Russian author V.Yu. Shevchenko, the generic object represents the common legal value that unites a group of similar offences and constitutes the basis for the codification and classification of the provisions contained in the Special Part of the Criminal Code into separate sections [41, p.17].

Based on this theoretical premise, the identification of the generic legal object of an offence is generally carried out by reference to the placement of the incriminating norm within the structure of the Special Part of the Criminal Code. In the case of national criminal legislation, Article 290 of the CC of RM is situated in Chapter XIII – "Offences against public security and public order", which allows the conclusion that the generic legal object of this offence consists of the social values relating to the maintenance of public security and public order as fundamental social values, existing in a relationship of functional and conceptual interdependence, each having its own existence while at the same time supporting one another in the realization of the legal order.

This fact therefore expresses, on the one hand, the general state of protection of society against dangers that could threaten life, bodily integrity, or the safety of the community, and, on the other hand, the set of rules of social coexistence that ensure the harmonious functioning of the community and the respect for the authority of the law.

Following the clarification of the theoretical premises outlined above, emphasis will be placed on an in-depth examination of the notions of "public security" and "public order", given that these concepts occupy a distinct place within the framework of the general theory of criminal law, as they are characterized by a high degree of abstraction and are also considered among the most complex and difficult categories used by the legislator in determining the object of the offence.

Precisely because of this conceptual nature, the issue of defining and delimiting the criminal-law content continues to generate doctrinal debates, the author V. Chiriță rightly stating that public security is a complex social category for which no unified conception has yet been developed, one that would be necessary for a complete and unanimously accepted determination of its essential elements as social values protected through criminal incriminations.

In this context, criminal law doctrine has devoted significant efforts to conceptualizing these notions, with numerous authors attempting to capture the essential dimensions of public security and public order, among whom the Russian author A.V. Gotovtsev considers that public order essentially reflects the protection of personal safety, while public security has a broader scope, encompassing not only the safeguarding of physical integrity, but also the protection of property and the ensuring of the proper functioning of sources of increased danger [24, p.23].

According to P.V. Zamoskovtsev, public safety, as a complex object of the offence, is

based on a unified need and interest to maintain public safety, where the objects of this interest are human life, health, and property [26, p.3].

In turn, A. Borodac defines public security as a normative system intended to protect the most important values of the individual, the material and spiritual values of society, the authority of official power, as well as the sovereignty and territorial integrity of the country [4, p.399].

A similar notion is also proposed by the authors A. Barbăneagră, Gh. Alecu, V. Berliba, et al., according to whom public security is an element of public order and represents a system of social relations that ensures the safety of citizens' life and health, as well as the prevention of material damage or other serious consequences in the process of using sources of increased social danger [1, p.643].

In a related approach, S. Brînza and V. Stati define public security through the prism of a factual state, emphasizing that it is reflected in the existence of a stable social order, free from major risks and disturbances that could endanger the normal functioning of society, and that when criminal law incriminates certain acts that affect public security, it reacts against a danger capable of producing collective effects, namely affecting the interests of an indeterminate, more or less significant, number of individuals [7, p.517].

The extensive analysis found in specialized literature is explained by the absence of a precise legal definition of the term "public security" in national law, given that the legislator has established through normative acts only the notion of "national security", defined as the totality of actions and measures undertaken to ensure the existence, stability, and sustainable development of the Republic of Moldova by protecting the sovereignty, independence, and unity of the state, the territorial integrity of the country, national values and interests, as well as fundamental rights and freedoms from threats and dangers, whether internal or external, of any nature [15].

Thus, it is established that public security, viewed as a set of fundamental social values, relations, and conditions protected by criminal law, ensures the existence of a state of stability, legality, and collective protection against major social dangers, expressing not only the safeguarding of life, bodily integrity, and the health of citizens, but also the protection of property, the proper functioning of sources of increased danger, the respect for the authority of the law, the maintenance of civil peace, and the defense of state sovereignty.

Thus, although at first glance public security appears to be a relatively well-regulated and defined legal institution, the precise delineation of its content and its relation to the concept of "public order" raises major theoretical and practical difficulties. This problem arises from the fact that the two notions are closely interdependent, yet at the same time retain certain distinctive features, which necessitates a separate analysis of each.

Public order, in a legal sense, is defined as a state of legality, balance, and social peace, through which public security and the safety of the individual, communities, and property are ensured, as well as public health and morality, and which allows for the exercise of fundamental rights and freedoms and the effective functioning of institutions within a rule-of-law state [13].

A similar notion is found in Russian doctrine, where, according to L.D. Gaukhman, "public order is a set of relations that determine the atmosphere of order and public tranquility in public places, ensuring the decent behavior of citizens therein, the normal functioning of public institutions and organizations, as well as the physical and moral integrity of the individual in the public sphere" [23, p.34].

V.S. Komissarov considers public security as a set of social relations that not only

regulate safe living conditions for society, but also maintain a sufficient level of security for its normal functioning [28].

The same ideas are supported by K.S. Belsky, who considers that "public order, as a political and legal category, signifies the well-being and organization of society as a whole, encompassing all spheres of social relations, the sustainability and stability of socio-economic institutions, and their orientation toward harmonizing social ties and optimizing social development on the basis of the social regulators used in society" [22, p.85].

The Russian author A.S. Pivovarov understands public order as "an important element of the legal framework for the life of citizens, including a system of social relations that arises and develops in the process of interaction among its participants, primarily in public places, and is regulated by legal and other social norms, the observance of which ensures the personal and public safety of individuals, as well as an atmosphere of calm, coherence, and regularity in public life" [36, p.54].

Ultimately, it can be concluded that public order should be understood as an organized set of normatively regulated social relations that ensure the maintenance of a climate of peace and stability in community life, guaranteeing the normal and balanced functioning of public authorities, state and public institutions, as well as the observance of rules of social conduct by citizens in all spheres of social life.

These doctrinal interpretations, although differing in emphasis and purpose, converge towards the common idea enshrined in national normative acts, according to which public order and public security represent a state of legality, stability, and civil peace ensured by public authorities and institutions that implement preventive and coercive measures to combat unlawful acts, protecting life and personal integrity, fundamental rights and freedoms, as well as property and public health, while maintaining public safety, ensuring respect for the law, and guaranteeing the efficient functioning of public authorities and institutions [15].

Thus, the comparative analysis of all definitions established in doctrine, corroborated with the relevant legal provisions, leads to the conclusion that, due to the high degree of social danger involved in the illegal handling of weapons, the commission of the offence provided for in Article 290 of the Criminal Code of the Republic of Moldova simultaneously affects both public order and public security.

In this regard, offences of illegal handling of weapons should not be viewed merely as simple acts endangering immediate safety, but also as structural threats to social order, as they undermine the general sense of security, generate a state of collective insecurity, and affect citizens' trust in the ability of authorities to guarantee legal and social stability, which is why we support the position of the national legislator to incriminate the offence provided for in Article 290 of the Criminal Code of the Republic of Moldova within the chapter dedicated to the protection of public security and public order.

Thus, insofar as the generic legal object of the offence results from the very title of the chapter that brings together the homogeneous social values and relations analyzed above, our attention turns to the immediate (or specific) legal object of the offence concerning the carrying, possession, acquisition, manufacturing, repair, modification of construction or marking, or the illegal commercialization of firearms or ammunition, their essential components, as well as their theft.

According to doctrine, the immediate legal object is understood as the social value against which the offender has acted [3, p.114], being rightly considered an essential element of every offence, thus having particular practical importance for the correct legal qualification of offences, as it allows for the individualization of a harmful act within a

group of offences, in other words, it enables the systematization of the offences within a chapter into a subsystem, namely of unlawful acts grouped under a similar generic legal object.

Thus, V.V. Bashilov considers that the direct object of the analysed offence is security in the sphere of the circulation of firearms, their main components, ammunition, explosives, and explosive devices [20, p.229], while the author S.U. Dikaev considers that it consists of "a set of relations that ensure public security against possible attacks through the illegal handling of weapons" [25, p.88].

A different view is expressed by A.N. Pavliuhin, who considers that the specific legal object of offences related to the illegal acquisition, transfer, sale, storage, transport, or carrying of firearms, their primary components, or ammunition is the safety of the population against the use, functioning, and effects of these objects [34, p.31], viewed as a specific domain of public security, consisting of the totality of social relations aimed at ensuring the safety of life and health of persons, compliance with the rules establishing the procedure for the acquisition, transfer, sale, storage, transport, or carrying of firearms, their primary components, or ammunition, intended to prevent their use in the commission of offences or accidents during their handling, and to guarantee the use of these objects in accordance with their intended purpose, exclusively for socially beneficial purposes.

In support of the above-mentioned author's view, the author O.A. Safonov also states that the immediate legal object is public security in the sphere of the circulation of firearms, ammunition, explosives, and explosive devices, while, according to the Russian author V.E. Stepenko, the immediate legal object of the offence is the ensuring of a state of protection of individuals and society against threats related to the illegal handling of weapons, devices, and dangerous substances specified by law [39, p.139].

A doctrinal view open to criticism is that expressed by S.U. Dikaev, who considers that the immediate legal object of the analysed offence consists of "a set of relations that ensure public security against possible violations through the illegal handling of weapons" [25, p.88].

Although this definition partially captures the essence of the protected social values, we consider it to be inaccurate and limited, as it reduces the scope of protection of the criminal norm solely to the preventive aspect of a potential endangerment of public security, whereas, in reality, the provision of Article 290 of the Criminal Code of the Republic of Moldova does not have merely the role of preventing the potential consequences of illegal handling of weapons, but substantially aims at the effective protection of public security as a complex legal value manifested in all spheres of social life, namely from public order and collective safety to the protection of life, bodily integrity, and the property of citizens.

According to Romanian doctrine, namely in the view of the authors V. Dongoroz, S. Kahane, I. Oancea et al., the specific legal object of the offence of non-compliance with the regime of weapons and ammunition, corresponding to the offence provided for in Article 290 of the Criminal Code of the Republic of Moldova, has a particularly complex and extensive content. It consists of the totality of social relations whose protection is ensured through the safeguarding of a complex of social values: public order, social security, life and bodily integrity of the person, public and private property, such protection being achieved through the regulation of activities relating to weapons and ammunition [12, p.291].

In national specialized literature, namely in the view of the author A. Barbăneagră

[1, p.643], in line with the doctrinal opinions expressed by S. Brînza and X. Ulianovschi, analyzing the offence in question, it is stated that the specific legal object of the offence of illegal carrying, possession, acquisition, manufacturing, repair, or commercialization of firearms and ammunition consists of the social relations concerning public security in the field of the circulation of firearms and their component parts, as well as in the field of the circulation of ammunition [5, p.563].

Based on the doctrinal analysis carried out and the corroboration of the opinions expressed in national and foreign specialized literature, we consider that the specific legal object of the offence provided for in Article 290 of the Criminal Code of the Republic of Moldova consists of the totality of social relations that ensure the protection and safeguarding of public security in the sphere of the circulation of firearms, their essential components, and ammunition, as an essential element of public order and collective safety, this legal object expressing the fundamental social interest in maintaining strict and lawful control over the regime of weapons, in order to prevent any form of illegal handling, use, or commercialization that could endanger life, bodily integrity, or the property of individuals.

The analysis of the specific legal object of the offence provided for in Article 290 CC of the Republic of Moldova highlights the fact that the criminal norm is aimed at protecting a complex of values and social relations, primarily subsumed under the idea of public security in the sphere of the circulation of firearms, their essential components, and ammunition.

At the same time, the delimitation of the specific legal object does not exhaust the analysis of the object of the offence in its entirety, since it captures only the general category of social relations that the criminal norm seeks to protect. In reality, any offence manifests itself through a concrete encroachment upon certain specific social relations, which can be identified and analyzed only by reference to the particular factual situation in which the act is committed. From this perspective, there arises the need for a more in-depth analysis, moving from the general level of criminal-law protection to the level of the social relations actually harmed.

As a rule, each offence is characterized by the existence of a single specific legal object determined by the main social value whose protection the criminal norm is oriented toward, although both doctrine and judicial practice reveal the existence of particular situations in which, through the commission of a single offence, several distinct social values are simultaneously affected. Under these conditions, specialized literature has outlined the classification of the specific legal object into several categories, conferring upon it a complex and multi-layered character.

Thus, a distinction is made between the primary specific legal object, consisting of the social value whose impairment is inevitable and consistently present in every typical act, and the optional (or secondary) specific legal object, represented by the social value that is not affected in all cases of the commission of the offence, but which may be harmed in certain concrete situations, depending on the factual circumstances of the act.

In relation to this distinction, the question arises regarding the identification of additional social values that may be harmed through the commission of the offence provided for in Article 290 of the Criminal Code of the Republic of Moldova, and in this regard, two relevant doctrinal approaches may be noted.

Thus, the Ukrainian author E.L. Strelțova, analyzing the corresponding provision in Article 263 of the Criminal Code of Ukraine, similar to Article 290 of the Criminal Code of the Republic of Moldova, which regulates criminal liability for the "illegal handling of

weapons, ammunition or explosives", concludes that the secondary specific legal object of the mentioned offence consists of the life and health of persons" [40, p.873] given the intrinsic danger associated with the unauthorized circulation of weapons.

This view has, however, been criticized by the author A. Serbinov, who emphasized that "through the commission of the offence provided for in Article 290 of the Criminal Code of the Republic of Moldova, the encroachment is directed against social relations deriving from public security, as a sui generis social value, while the life and health of persons are not in an organic derivation with public security" [16, p.212].

From our perspective, both views may be considered partially incomplete, given that the criminal provision of Article 290 CC of the Republic of Moldova, although it does not directly target the impairment of human life, may nevertheless, in certain situations, affect the social value represented by the health of the person, especially in cases where the offence manifests itself in the form of theft of weapons, which may be carried out through the use of physical and/or psychological violence, as in the case of robbery, namely the open taking of property by using violence that is not dangerous to the life or health of the person.

Therefore, we find that the secondary specific legal object of the offence of theft of weapons has a complex character, as its commission simultaneously affects the right to property and, in certain situations, the health or bodily integrity of the person.

In continuation of the analysis, we will examine in detail the factual modality of the offence provided for in Article 290 of the Criminal Code of the Republic of Moldova, namely the theft of firearms, their essential components, or ammunition, taking into account its specificity as a distinct form of manifestation of the objective side of the offence. In this context, our attention will focus on the legal object of the encroachment characteristic of this factual modality, as the theft of weapons involves a heightened degree of social danger, simultaneously affecting multiple values protected by criminal law.

In Russian specialized literature, the authors O.A. Safonov, D.N. Fartukov, and D.S. Chukin, analyzing the elements of the offence provided for in Article 226 of the Criminal Code of the Russian Federation, which establishes criminal liability for the theft or extortion of weapons, ammunition, explosives, and explosive devices, indicate that the primary specific legal object is public security in the field of firearms, ammunition, explosives, and explosive devices, as well as weapons of mass destruction, materials, or equipment that may be used for their manufacture, while the secondary or additional specific legal object is property and human health [38, p.116].

A similar view is also shared by the Russian author L.V. Ivanova, according to whom the primary specific legal object of the aforementioned offence consists of the social relations ensuring public security, namely the totality of social relations that provide safe living conditions for each member of society, public order, and the security of the individual, society, or the state, while the secondary (immediate) specific legal object consists of the social relations ensuring public security and property relations in the sphere of the circulation and control of firearms, ammunition, explosives, and explosive devices, as well as the health of the individual [27, p.15].

We fully support the doctrinal orientation expressed by the cited authors and consequently reject the restrictive interpretation that would limit the secondary specific legal object of theft to social relations concerning exclusively the possession of firearms, their component parts, or ammunition. This approach appears insufficient from two converging perspectives. On the one hand, even though the text of Article 290 of the Criminal Code of the Republic of Moldova does not contain an explicit enumeration of the modal-

ities of committing theft (e.g., theft, robbery, armed robbery, extortion, or other forms of offences), the spirit and meaning of the provision cannot be interpreted mechanically as a protection limited to property, and on the other hand, the definition provided by the legislator, according to which "the theft of firearms, ammunition, or explosive substances shall be understood as such unlawful actions aimed at their appropriation through various methods: theft, robbery, armed robbery, extortion, acts of banditry, etc" [14], clearly shows that the admissible factual modalities frequently involve the use of force or coercion.

For this reason, theft, considered in concreto, results in the simultaneous infringement of multiple legal values: on the one hand, the right of possession (through the patrimonial character of the object stolen), and on the other hand, the values relating to the bodily integrity of the person (when the theft is carried out through the use of violence or accompanied by the threat of such violence).

Therefore, reducing the secondary legal object to mere patrimonial protection overlooks the hybrid nature and the increased degree of social danger of this factual modality.

Conclusions. Finally, the correct and comprehensive interpretation of the provisions of Article 290 of the Criminal Code of the Republic of Moldova requires the recognition of the complex character of the secondary specific legal object, particularly in the case of theft, as it cannot be reduced exclusively to social relations concerning the possession and circulation of firearms and ammunition.

Thus, although these relations constitute the core of criminal law protection, the analysis shows that, depending on the specific modality of commission and the circumstances of the act, the sphere of affected social values legitimately extends to the health and bodily integrity of persons, as well as to other related social interests, and such an approach reflects the plurioffensive nature of the offence and allows for a more adequate understanding of the social danger it generates, while also justifying the application of a sanctioning regime proportionate to the complex degree of harmfulness of the act and contributing to ensuring a correct and coherent legal qualification in judicial practice.

ECHR STANDARDS ON THE DEFENCE AND REPRESENTATION OF LEGAL ENTITIES

Bogdan-Petru TANAS,
PhD student,
Criminal Investigation Officer Seconded,
Anti-Corruption Prosecutor's Office,
Republic of Moldova
ORCID: 0009-0005-4655-6703

Abstract

The article examines the standards of the European Court of Human Rights concerning the right to a fair trial for legal entities, with particular emphasis on defence and procedural representation in criminal matters. Although a legal entity has no physical existence and cannot participate directly in procedural acts, European case-law and modern national legislations recognise that it benefits, mutatis mutandis, from the essential guarantees of Article 6 of the European Convention on Human Rights. The study analyses the way in which these standards are reflected in the regulation of the Republic of Moldova, especially after the introduction of Article 521 into the Criminal Procedure Code and the extension of state guaranteed legal aid to legal entities.

At the same time, comparative solutions from France, Germany, the United States of America and Romania are examined in order to identify the mechanisms used to prevent conflicts of interest and to ensure an effective defence. The research shows that the right of defence of the legal entity cannot remain merely formal, but must be supported by clear procedural rules on the appointment of the representative, his or her replacement in cases of incompatibility, and the possibility of granting legal aid. In the end, it is concluded that ECHR standards require states not only to recognise, in the abstract, procedural guarantees for legal entities, but also to establish effective mechanisms capable of preventing a denial of defence in criminal cases.

Keywords: legal entity, ECHR, right of defence, procedural representation, fair trial, conflict of interests, criminal proceedings.

STANDARDELE CURȚII EUROPENE A DREPTURILOR OMULUI PRIVIND APĂRAREA ȘI REPREZENTAREA PERSOANELOR JURIDICE

Abstract

Articolul examinează standardele Curții Europene a Drepturilor Omului privind dreptul la un proces echitabil în privința persoanelor juridice, cu accent pe dimensiunea apărării și a reprezentării procesuale în materie penală. Deși persoana juridică nu posedă existență fizică și nu poate participa direct la actele procedurale, jurisprudența europeană și legislațiile naționale moderne recunosc că aceasta beneficiază, mutatis mutandis, de garanțiile esențiale ale art. 6 din Convenția Europeană a Drepturilor Omului. Studiul analizează modul în care aceste standarde se reflectă în reglementarea Republicii Moldova, în special după introducerea art. 521 în Codul de procedură penală și extinderea asistenței juridice garantate de stat pentru persoanele juridice.

Totodată, sunt examinate soluții comparative din Franța, Germania, Statele Unite ale Americii și România, în vederea identificării mecanismelor utilizate pentru prevenirea conflictelor de interese și asigurarea unei apărări efective. Cercetarea evidențiază că dreptul la apărare al persoanei juridice nu poate rămâne unul formal, ci trebuie susținut prin reguli procedurale clare privind desemnarea reprezentantului, înlocuirea acestuia în caz de incompatibilitate și posibilitatea acordării asistenței juridice. În final, se concluzionează că standardele CEDO impun statelor nu doar recunoașterea abstractă a garanțiilor procesuale pentru persoanele juridice, ci și instituirea unor mecanisme efective care să prevină denegarea de apărare în cauzele penale.

Cuvinte-cheie: persoană juridică, CEDO, drept la apărare, reprezentare procesuală, proces echitabil, conflict de interese, proces penal.

Introduction. The recognition of the criminal liability of the legal entity has naturally led to increased requirements concerning the protection of its procedural rights. Unlike the natural person, the legal entity cannot participate directly in criminal proceedings, cannot make statements in its own name and cannot exercise procedural rights personally. This particularity gives rise to the need for its representation by a natural person capable of expressing its procedural will and ensuring its defence.

At the conventional level, Article 6 of the European Convention on Human Rights enshrines the right to a fair trial, and the case-law of the European Court has extended the applicability of its essential guarantees to legal entities as well, insofar as such guarantees are compatible with their nature [1; 2]. Thus, access to justice, adversarial proceedings, equality of arms, a reasonable time and the presumption of innocence do not belong exclusively to natural persons, but also protect collective entities when they are involved in proceedings of a criminal nature [2; 3; 4].

The central issue, therefore, does not lie in the theoretical recognition of the rights of the legal entity, but in ensuring their effective exercise. In practice, the legal entity's right of defence may become illusory when its legal representative is involved in the same criminal case, when the entity refuses or omits to appoint a representative, or when the resources necessary to retain counsel are lacking. For precisely this reason, ECHR standards require states to adopt procedural mechanisms capable of removing conflicts of interest and ensuring the effective representation of the legal entity.

In the Republic of Moldova, this matter received clearer regulation after the adoption of Law No.1 of 6 February 2020, by which Article 521 was introduced into the Criminal Procedure Code and state guaranteed legal aid was extended to legal entities in certain situations [5; 6]. These new provisions are intended precisely to provide a procedural solution for cases in which the ordinary representation of the legal entity becomes impossible or incompatible with the requirements of a fair trial.

Methods and materials applied. The research is based on the use of the classical methods of legal science. First, the method of legal-normative analysis was applied through the examination of the provisions of the European Convention on Human Rights, the criminal procedural legislation of the Republic of Moldova and relevant regulations from comparative law [1; 5; 6; 8; 9; 10; 13]. This method made it possible to identify the rules structuring the defence and representation of the legal entity and to assess their compatibility with the requirements of Article 6 ECHR.

Second, the jurisprudential method was used by reference to judgments and interpretative documents relevant to the field of the fair trial, including the European Court's guide on Article 6 in criminal matters and case-law concerning collective entities [2; 3; 4]. This approach was necessary in order to highlight the concrete content of conventional standards and the manner of their application in the case of the legal entity.

Third, the research employed the comparative method by confronting the Moldovan model with the solutions regulated in France, Germany, the United States of America and Romania [8; 9; 10; 11; 13]. The purpose was to identify common elements and differences in regulation, as well as to draw conclusions useful for improving the national normative framework.

The documentary material used included normative acts, case-law, interpretative documents of the European Court and doctrinal works relevant to the right of defence and the representation of the legal entity in criminal proceedings [1]-[13].

Discussion and results obtained. I. ECHR standards on the defence of the legal entity in criminal proceedings. In the case-law of the European Court of Human Rights, the

idea has become firmly established that the notion of "everyone" in the Convention may also include legal entities when the nature of the right invoked permits such application. In criminal matters, this means that a legal entity may, in principle, invoke the requirements of a fair trial, including access to a court, adversarial proceedings, equality of arms and the examination of the case by an independent and impartial tribunal [1; 2].

The European Court's guide on Article 6 in criminal matters shows that procedural guarantees are not purely formal, but must be practical and effective [2]. In relation to the legal entity, this requirement presupposes the existence of a procedural mechanism through which the entity may participate usefully in the proceedings, state its position, challenge the accusations and benefit from adequate legal assistance. Since the legal entity does not act physically, the effectiveness of its rights depends directly on its representation.

In *Guisset v. France*, the Court analysed the applicability of the guarantees of Article 6 in sanctioning proceedings of a criminal nature, confirming that the requirements of a fair trial cannot be restricted merely through the formal classification of the proceedings under domestic law [3]. In the same logic, in Fortum Oil and Gas Oy v. Finland the possibility of a commercial company invoking the protection afforded by Article 6 and the related procedural guarantees was essentially accepted [4]. These landmarks confirm that the legal entity is not excluded from the sphere of conventional protection.

However, the application of Article 6 to legal entities is not identical to that carried out in respect of natural persons. Certain rights have, by their nature, a different content. For example, the right to remain silent and the privilege against self-incrimination have a distinct intensity in the case of collective entities, especially when pre-existing documents, accounting records or other materials expressing the activity of the company, rather than the psychological will of a natural person, are concerned [2; 12]. Therefore, ECHR standards must be interpreted in relation to the specific nature of the legal entity, without depriving its right to an effective defence of substance.

In this respect, one of the most important standards deriving from European case-law is the need to avoid conflicts of interest in representation. A person who is, at the same time, suspected or accused of the same act or of connected acts cannot credibly and loyally ensure the defence of the legal entity's interests. In such a situation, the entity's defence becomes merely formal and equality of arms is affected. Hence arises the positive obligation of the state to provide solutions for replacing the representative and, where appropriate, for ensuring legal assistance.

II. The Reflection of ECHR Standards in the Legislation of the Republic of Moldova. In the Republic of Moldova, Article 521 of the Criminal Procedure Code provides that the criminal investigation and trial of a case against a legal entity shall be carried out with the participation of its legal representative [5]. This rule is important not only because it recognises the necessity of representation, but also because it turns such presence into an indispensable procedural guarantee.

The Moldovan legislator has also regulated the situation of conflict of interest. If the criminal investigation or trial against the legal entity concerns the same act or connected acts also in relation to its legal representative, the legal entity is obliged, within a short time limit, to appoint another representative against whom no criminal proceedings are being conducted [5]. This solution is fully consistent with the standards of Article 6 ECHR, because it seeks to remove the risk of a defence compromised by divergent interests.

Moreover, the law establishes a subsidiary mechanism for the situation in which the legal entity does not appoint its representative. Upon the prosecutor's motion, the

investigating judge or the court may appoint a representative from among the persons managing the entity who are not targeted by the criminal proceedings [5]. Through this intervention, the state prevents procedural deadlock and reduces the danger that the lack of cooperation or organisational impossibility on the part of the legal entity may lead to a postponement of the proceedings or to their unfair conduct.

A further step, particularly relevant from the perspective of the right of defence, lies in the correlation between Article 521 CPC and Law No.198/2007 on state guaranteed legal aid. Through the amendments introduced, legal entities may, under certain conditions, benefit from the appointment of a lawyer from the state guaranteed legal aid system when there are no persons capable of representing them [6]. This solution offers a practical answer to the requirement of effective defence and brings national regulation closer to conventional standards.

The constitutional foundation of these developments can also be identified in Judgment No. 30 of 22 November 2018 of the Constitutional Court of the Republic of Moldova, which underlined that the legal entity's right of defence cannot be left unprotected where the appointment of a representative is impossible [7]. The Court highlighted the need for a fallback solution, thereby preparing the ground for the subsequent legislative amendments.

Therefore, the current Moldovan regulation reflects to a significant extent the ECHR standards concerning the defence of the legal entity. It establishes the compulsory participation of the representative, provides for his or her replacement in cases of conflict of interest and allows recourse to state guaranteed legal aid. From a practical perspective, however, further clarifications remain useful regarding the exact procedural status of the representative, the limits of his or her powers and the coordinated exercise of the defence together with the legal entity's lawyer.

III. Relevant Comparative Benchmarks. Comparative law confirms that the issue of the representation of the legal entity in criminal proceedings is common to several legal systems, even though the technical solutions differ.

In France, Article 706-43 of the Code de Procédure Pénale provides for the representation of the legal person by its legal representative and allows for the appointment of an agent where ordinary representation is not adequate [8]. The French model is important because of the emphasis it places on the continuity of representation and on judicial intervention where there is a risk of conflict of interest or the absence of a valid representative. In essence, French law recognises that the defence of the legal person cannot depend exclusively on the will of a person whose procedural situation may compromise the entity's interests.

In Germany, although there is no classic criminal liability of the legal entity in the sense known in other systems, the legislation allows the involvement of the entity in proceedings of a repressive nature, including through mechanisms such as pecuniary sanctions applied to associations and procedural participation in certain cases [9]. There, the legal entity may exercise procedural rights close to those of the accused, including through a representative and a lawyer. Even though the German system does not develop to the same extent an autonomous mechanism for the involuntary appointment of an independent representative, it confirms the need to recognise effective procedural guarantees for collective entities.

In the United States of America, corporations are mandatorily represented by lawyers, and judicial practice as well as internal investigation practice have developed special instruments for managing conflicts between the interests of the company and those of

employees or directors [10; 11]. Upjohn warnings serve precisely to clarify that the lawyer represents the corporate entity, not the natural persons interviewed during the investigation [11]. This practice illustrates, in a different manner, the same fundamental concern: the clear separation between the defence of the legal entity and the defence of the individual interests of the persons involved.

In Romania, Article 491(2) of the Criminal Procedure Code expressly regulates the situation in which criminal proceedings are also brought against the legal representative of the legal entity for the same act or for connected acts. In such cases, the legal entity must appoint an agent, and in the absence of such appointment, the agent is designated by the prosecutor, the preliminary chamber judge or the court from among authorised insolvency practitioners [13]. The Romanian solution is particularly relevant because it offers an express and technical regulation of the conflict of interest, which may constitute a useful benchmark for Moldovan law as well.

Comparative analysis shows that, beyond the diversity of legal systems, there is a common core of standards: the legal entity must have effective representation, conflicts of interest must be prevented, and the state must intervene when the internal mechanisms of the entity no longer ensure a real defence. This core is compatible with ECHR requirements and confirms the general direction of reforms in the Republic of Moldova.

IV. Persistent Issues and the Need to Strengthen the Normative Framework. Although the current framework of the Republic of Moldova represents real progress, the analysis shows that certain aspects may still be developed further. First, it would be useful to provide a clearer consecration of the rights and obligations of the representative of the legal entity, in a manner distinct from those of the representative of other participants in the proceedings. Such clarification would reduce practical uncertainties and strengthen the foreseeability of the rule.

Second, it would be appropriate to regulate more explicitly the relationship between the representative of the legal entity and its lawyer. In practice, expressing the entity's will and providing specialised legal assistance are distinct yet complementary functions. The absence of a clearer delineation may generate confusion regarding the competences of each.

Third, the experience of comparative law shows the usefulness of more explicit formulas for appointing an independent agent in cases of conflict of interest. Although Article 521 CPC already offers important solutions, the wording of a more detailed rule could contribute to the harmonisation of judicial practice and to the strengthening of the protection of the legal entity.

Finally, it must be underlined that the effectiveness of ECHR standards depends not only on the existence of the legal text, but also on its coherent application by criminal investigation bodies and courts. A rule allowing for the replacement of the representative, but applied formally or belatedly, does not satisfy the requirements of a fair trial. For this reason, the interpretation and application of domestic provisions must remain guided by the purpose of Article 6 ECHR: ensuring a real, not symbolic, defence.

Finally, the practical implications of ECHR standards are also reflected in the manner in which the powers of the prosecutor, the investigating judge and the trial court should be interpreted. These authorities cannot treat the issue of representation as a mere administrative formality, but must regard it as a condition of the legitimacy of criminal proceedings conducted against a legal entity. Comparative law points in the same direction: when the State intervenes to appoint a compatible proxy, to separate the interests of the company from those of its representative, or to ensure legal assistance, it

is not granting a procedural privilege, but implementing the minimum requirements of a fair trial [8; 10; 13].

At the same time, ECHR standards require that the defence of the legal entity be supported by specialised legal assistance whenever the complexity of the case so demands or whenever the entity's internal mechanisms can no longer ensure functional representation. In this respect, the correlation between Article 521 CPC and the rules on state guaranteed legal aid is of particular importance, because it offers a procedural remedy for situations in which the legal entity risks remaining without an authentic procedural voice. From this perspective, counsel is not an auxiliary element, but an essential guarantee of the effective nature of the defence [5; 6].

Consequently, whenever the legal representative is targeted in the same criminal case, is investigated for connected acts, or is in a situation affecting his or her procedural loyalty, the authorities must react promptly in order to prevent a violation of equality of arms. This requirement flows not only from the internal rules on appointing another representative, but also from the State's conventional obligation to organise the proceedings in a manner that allows the concrete exercise of procedural rights. In practice, this means the early identification of conflicts of interest and the immediate adoption of measures to replace the incompatible representative [2; 5; 7].

From a practical perspective, ECHR standards impose on criminal investigation bodies and courts a heightened duty of vigilance whenever a legal entity is involved in criminal proceedings. It is not sufficient merely to note, in a formal manner, that a legal representative exists; the authorities must verify whether the representation is real, effective and free from incompatibilities capable of undermining the right of defence. In the logic of Article 6 of the Convention, the defence becomes illusory when the entity is represented by a person whose procedural interests are opposed or competing with those of the legal entity [1; 2; 5].

V. Practical Implications of ECHR Standards for the Representation of Legal Entities in Criminal Proceedings. At the level of judicial practice, these requirements also call for the development of a uniform approach, including methodological guidance and consistent case-law on the application of Article 521 CPC. The earlier and more predictably the judicial authorities address questions of representation, the lower the risk of annulment of procedural acts, delays in the proceedings, and later allegations that the defence was merely apparent. Therefore, the effectiveness of ECHR standards depends not only on the existence of adequate norms, but also on their transformation into a stable procedural practice faithful to the requirements of a fair trial [2; 5; 13].

Moreover, ECHR standards encourage an approach oriented towards continuity of defence. In complex cases involving large volumes of documents, extensive economic activities, or several persons targeted simultaneously, the replacement of the representative should not produce a rupture in the legal entity's defence strategy. For this reason, the mechanisms for appointing a compatible representative and counsel must be applied sufficiently early so that the entity may preserve the institutional memory of the case and its capacity for procedural reaction [2; 6; 8; 10].

At the same time, effective representation has direct implications for the validity and usefulness of procedural acts carried out during the criminal investigation. The questioning of the representative, the communication of the accusation, the filing of motions, the waiver of certain requests, or the exercise of remedies must emanate from a person who legitimately expresses the procedural will of the entity. In the absence of this requirement, there is a risk that certain acts will later be challenged precisely because they were carried

out through an incompatible or insufficiently legitimised representative [1; 2; 5].

Another practical consequence concerns the need for express reasoning in procedural acts by which the conflict of interest is established and the replacement of the representative is ordered. A rigorous practice requires the prosecutor and the court to indicate not only the formal existence of a parallel procedural status, but also the concrete manner in which it may affect the representative's freedom of decision and the coherence of the legal entity's defence. Such reasoning is important both for procedural transparency and for subsequent judicial review of the lawfulness of the measure [2; 5; 7].

Conclusions. The standards of the European Court of Human Rights confirm that legal entities benefit, in criminal matters, from the fundamental guarantees of the right to a fair trial, insofar as these are compatible with the nature of collective entities. The right of defence of the legal entity cannot be conceived in the abstract, but must be supported by procedural mechanisms capable of enabling its effective participation in the proceedings.

In this context, procedural representation acquires a central role. When the legal representative is targeted in the same criminal case or when the legal entity cannot appoint a person capable of representing it, the risk that the defence will turn into a mere formality is obvious. For this reason, the standards derived from Article 6 ECHR impose on states the positive obligation to regulate fallback solutions capable of removing conflicts of interest and preventing a denial of defence.

The regulation of the Republic of Moldova, especially through Article 521 CPC and through the extension of state guaranteed legal aid, reflects these requirements to a considerable extent. It provides a clearer procedural mechanism than in the past and demonstrates the legislator's concern for ensuring an effective defence of the legal entity. At the same time, the comparative analysis reveals that the Moldovan model forms part of a broader European and international trend aimed at protecting procedural balance and the autonomy of the defence of collective entities.

Nevertheless, for full alignment with conventional standards, it remains necessary to improve certain aspects concerning the status of the representative, the delimitation of his or her powers vis-à-vis the lawyer, and the more detailed regulation of the appointment of an independent agent in cases of conflict of interest. Compliance with Article 6 ECHR in the criminal proceedings of the legal entity is not merely a theoretical requirement, but a practical condition for the legitimacy of the administration of justice.

Abstract

The correct and effective application of the legal rules contained in the Special Part of the Criminal Code constitutes an essential condition for the administration of justice and for ensuring legality in the activity of law-enforcement bodies. The legal classification of antisocial acts presupposes not only a thorough knowledge of statutory provisions, but also a rigorous capacity to interpret and delimit them in relation to concrete situations arising in objective reality. In this context, the offence of false identity raises a series of theoretical and practical difficulties, particularly in light of its apparent similarities with the offence of identity theft.

Although at first sight the two notions appear to designate the same legal reality, a careful analysis reveals essential differences both in terms of their constituent elements and in terms of their regulation. The frequent confusion between these offences, including among legal practitioners, highlights the need for conceptual and normative clarification.

At the same time, it should be noted that, unlike identity theft, which is widely recognised in international practice and legislation, the offence of false identity does not benefit from uniform regulation from a comparative-law perspective. This difference further underscores the importance of doctrinal and legal analysis of the two institutions. Accordingly, the present study aims to draw a clear distinction between the offence of false identity and that of identity theft, by emphasising the particularities of each and contributing to a better understanding and application of the relevant criminal-law rules.

Keywords: false identity, identity, attribution of identity, fictitious identity, personal data, use of identity, identity theft, stolen identity.

ASPECTE PRIVIND DELIMITAREA INFRACȚIUNII DE FALS DE IDENTITATE ȘI A FURTULUI DE IDENTITATE

Abstract

Aplicarea corectă și eficientă a normelor juridice din Partea Specială a Codului penal constituie o condiție esențială pentru realizarea actului de justiție și pentru asigurarea legalității în activitatea organelor de drept. Încadrarea juridică a faptelor antisociale presupune nu doar o cunoaștere temeinică a dispozițiilor legale, ci și o capacitate riguroasă de interpretare și delimitare a acestora în raport cu situațiile concrete din realitatea obiectivă. În acest context, infracțiunea de fals de identitate ridică o serie de dificultăți teoretice și practice, în special prin prisma asemănărilor aparente cu infracțiunea de furt de identitate.

Deși la prima vedere cele două noțiuni par a desemna aceeași realitate juridică, o analiză atentă relevă

existența unor diferențe esențiale atât sub aspectul conținutului constitutiv, cât și al reglementării acestora. Confuzia frecventă între aceste infracțiuni, inclusiv în rândul practicienilor dreptului, evidențiază necesitatea unei clarificări conceptuale și normative.

Totodată, se remarcă faptul că, spre deosebire de furtul de identitate, consacrat pe scară largă în practica și legislația internațională, infracțiunea de fals de identitate nu beneficiază de o reglementare uniformă în plan comparat. Această diferență accentuează importanța analizei doctrinare și juridice a celor două instituții. Prin urmare, prezentul studiu își propune să realizeze o delimitare clară între infracțiunea de fals de identitate și cea de furt de identitate, evidențiind particularitățile fiecăreia și contribuind la o mai bună înțelegere și aplicare a normelor penale incidente.

Cuvinte-cheie: fals de identitate, identitate, atribuirea identității, identitate falsă, date cu caracter personal, folosirea identității, furt de identitate, identitate furată.

Introduction. The Republic of Moldova, as a State that has progressively aligned its legislation with European standards, has developed a regulatory framework intended to govern offences related to identity. This statement follows from the fact that, on 6 June 2024, the Parliament of the Republic of Moldova adopted Law No.136 on the amendment of certain normative acts (hereinafter Law No.136/2024), by which the Criminal Code was supplemented with two offences specifically concerning the security of personal data: Article 1771, "False identity", and Article 2607, "Identity theft" [1, Art. 1 items 38) and 102)]. The introduction of these provisions represents a landmark in the evolution of national criminal law, marking the transition from a fragmented and indirect regulation of phenomena concerning false identity and identity theft toward a distinct, clear and autonomous incrimination adapted to contemporary realities.

This legislative orientation reflects not only the need to align with international requirements, but also the increasing importance of protecting identity in the context of technological development and the intensification of risks associated with the use of personal data.

Concurrently, the legislature has demonstrated a firm intention to modernise the regulatory framework in the field of personal data protection. Thus, on 25 July 2024, Law No.195 on the protection of personal data (hereinafter Law No.195/2024) was adopted, transposing into national legislation Regulation (EU) 2016/679 of the European Parliament and of the Council of 27 April 2016, known as the General Data Protection Regulation (GDPR), published in the Official Journal of the European Union L 119/1 of 4 May 2016. This law is due to enter into force on 23 August 2026, thereby consolidating the legal architecture for the protection of natural persons with regard to the processing of their personal data and ensuring the free movement of such data under conditions of security and transparency.

In this context, a progressive and coherent dynamic may be observed in the Republic of Moldova in the implementation of rules on the security of personal data, including by criminally sanctioning persons who unlawfully obtain and use the personal data of other persons. The legislature's decision to resort to the instrument of criminal law in order to combat such acts reflects an approach consistent with the fundamental principles of European criminal policy, according to which the applicable sanctions must be effective, proportionate and dissuasive, so as to discourage the commission of such acts and ensure real and effective protection of the fundamental rights of the person.

Discussions and results obtained. A first element distinguishing the offence of false identity from the offence of identity theft lies precisely in their systematic placement within the Special Part of the Criminal Code of the Republic of Moldova (hereinafter the CC RM), a placement which is not accidental, but rather reflects the deliberate choice of the legislature as to the social values that each incriminating norm seeks to protect.

Thus, the offence of false identity, provided for in Article 177[1] CC RM, was inserted by the legislature into Chapter V of the Special Part, entitled «Offences against political, labour and other constitutional rights of citizens» [2, Art. 177[1]]. The title of this chapter unequivocally indicates that the generic legal object of the offences regulated therein consists of social relations concerning the exercise of citizens' constitutional rights.

By contrast, the offence of identity theft, provided for in Article 260[7] CC RM, was placed by the legislature in Chapter XI of the Special Part, devoted to «Computer-related offences and offences in the field of electronic communications» [2, Art. 260[7]]. The title of this chapter accordingly reveals that the generic legal object of the offence of identity theft consists of social relations in the field of information technology and electronic communications, which gives this act a distinct legal nature, circumscribed to the sphere of cybercrime.

At the same time, it should be noted that identity theft belongs to the category of computer-related offences that impair the security of another person's identity, from which it follows that the subgroup legal object of this offence consists of social relations concerning the security of a person's identity in the electronic environment.

At first reading, both the offence of false identity and the offence of identity theft directly concern the identity of another person, which could lead to the conclusion that both offences share the same special legal object. This apparent convergence requires an in-depth analysis intended to clarify the distinct nature and content of the social values protected by each incriminating norm.

In order to elucidate this issue, it is necessary to look back at the arguments underlying the supplementation of the Criminal Code with these two provisions through the adoption of Law No.136/2024. Thus, according to the arguments submitted by the authors of one of the draft laws that formed the basis of this law, in support of the incrimination of false identity under Article 177[1] CC RM, it was stated that: «Through the prism of the incriminating norms under discussion, an attack is made upon the identity of the person, which is complemented by the right to private life provided for in Article 28 of the Constitution. In the same context, it was specified that, in the interpretative literature concerning the International Covenant on Civil and Political Rights, the notion of intimate and private life covers several essential aspects of human existence and autonomy, among which identity is expressly included. The latter is understood as a sphere of individual existence that presupposes the protection of life, physical and mental integrity, freedom of conscience and thought, as well as recognition of legal personality. The protection of private life also includes the safeguarding of the individual qualities of human existence, the manner in which a person manifests himself or herself and his or her identity, embodied, for example, in the name» [3, item 104].

Complementing these arguments, the provisions of Law No.195/2024, namely Article 1 paragraph (2), show that the purpose of this law is to ensure the protection of the fundamental rights and freedoms of natural persons and, in particular, the right to intimate, family and private life in connection with the processing of personal data [4, Art. 1]. At the same time, the definition of personal data laid down in Article 4 of the same law, in full concordance with Article 4 point 1) GDPR, indicates that such data means any information relating to an identified or identifiable natural person, by reference to elements such as a name, an identification number, location data, an online identifier or factors specific to his or her physical, physiological, genetic, mental, economic, cultural or social identity [4, Art. 4; 5, Art. 4].

Consequently, it may be observed that personal data are closely connected with the identity of the person, which makes it possible, on the basis of this correlation, to delimit

the special legal object of each of the offences under analysis.

From a constitutional perspective, it should be emphasised that the name, as a fundamental attribute for identifying a person, is not expressly provided for in the Supreme Law of the Republic of Moldova as a self-standing constitutional right. Nevertheless, it is protected within the sphere of the right enshrined in Article 28 of the Constitution of the Republic of Moldova, according to which the State shall respect and protect intimate, family and private life.

Accordingly, the special legal object of the offence provided for in Article 177[1] CC RM consists of social relations concerning the exercise, in accordance with Article 28 of the Constitution, of the right to intimate, family and private life, in terms of the public trust placed in findings concerning the identity of persons.

Thus, the specific social value protected through the incrimination of false identity is public trust in the identification of persons and in their real identity. In other words, the norm in Article 177[1] CC RM sanctions infringements of the credibility and authenticity of person-identification processes, ultimately protecting each individual's right to preserve intact and unaltered the identity attributed to him or her in relation to third parties or public authorities, so that no person may be falsely identified or have an identity other than the real one attributed to him or her.

By analogy, it might be argued, *a pari*, that the special legal object of the offence of identity theft would also be social relations concerning the protection of intimate, family and private life, in terms of the public trust placed in findings regarding the identity of persons, similarly to the offence provided for in Article 177[1] CC RM. Such a conclusion would, however, be erroneous and incompatible with the fundamental principles of criminal law.

A fortiori, it is not possible for two different offences to have the same special legal object, even if they are placed in the same chapter of the criminal law or are provided for in the same article or paragraph. Certain details and particularities, even apparently insignificant ones, will always make it possible to distinguish the special legal object of one offence from that of another offence, precisely because each incriminating norm seeks to protect a distinct social value [6, p.37].

Therefore, starting from the placement of the norm in Chapter XI of the Special Part of the CC RM, as well as from the constituent content of the incriminated act, the special legal object of the offence of identity theft is formed by social relations concerning the security of another person's identity, in terms of ensuring the inaccessibility of that identity in an electronic communication, in the absence of the unvitiated consent of its holder [7, p.37].

This delimitation highlights the computer-related and electronic dimension specific to the offence of identity theft, which differs fundamentally from false identity by the manner in which the protected social value is impaired: whereas false identity concerns public trust in the processes for identifying a person, identity theft concerns the security and inaccessibility of identity data in the electronic environment.

With regard to the immaterial object of the two offences, it is found that, in both cases, it is represented by the identity of the person, which constitutes a genuine similarity between the two antisocial acts, beyond their structural differences.

As regards the category of persons whose identities may form the object of these offences, doctrine has provided important clarifications. The authors S. Brînza and V. Stati, in a study devoted to the offence of false identity, specified that, although in a broad sense one may also speak of the identity of a legal person - as follows, for example, from Article 10 paragraph (2) point 4) of Law No.124 of 19 May 2022 on electronic identification

and trust services - only a natural person may be the victim of the offence provided for in Article 177[1] CC RM. This follows from the nature of the provisions in Chapter V of the Special Part of the CC RM, which protect exclusively the constitutional rights of citizens, that is, of natural persons, and not subjective rights in general [8, p.31; 9, Art. 10].

With respect to the offence of identity theft, the same authors have emphasised that, unlike Article 177[1] CC RM, the norm in Article 260[7] CC RM does not form part of a chapter of the criminal law in which acts directed exclusively against natural persons are incriminated. Moreover, according to the definition formulated by the Organisation for Economic Co-operation and Development (OECD), "identity theft occurs when someone obtains, transfers, possesses or uses personal information about a natural or legal person without permission, with the aim of committing fraud or other crimes" [7, p.37].

Nevertheless, from a systematic interpretation of Article 260[7] CC RM it follows that the identity targeted by the incriminating norm is exclusively that of a natural person and does not extend to a legal person. This conclusion is required by the fact that, according to the legal text, the user of the computer system is induced by the perpetrator to provide "personal data within an electronic communication", while the notion of personal data, as presented earlier in this paper, refers exclusively to information relating to an identified or identifiable natural person. Therefore, it does not follow from the normative content of Law No.195/2024 that such a legal regime would also be applicable to a legal person [7, p.37].

In the same vein, the national scholars S. Brinza and V. Stati have noted that a legal person does not hold personal data within the meaning of Article 260[7] CC RM, but only identification data, such as its name, tax code or registered office, which do not benefit from the specific legal regime of personal data and, therefore, are not protected by the norm under analysis [7, p.37].

By corroborating these doctrinal and normative arguments, a second similarity between the offence of false identity and the offence of identity theft becomes apparent: in both cases, a legal person cannot have the status of victim, the circle of injured persons being limited, expressly or implicitly, to natural persons.

The objective element is one of the most important elements of the constituent content of any offence, since it describes the external manifestation of criminal conduct, namely the concrete manner in which the perpetrator infringes the social value protected by the criminal norm. In the case of the offences of false identity and identity theft, the comparative analysis of the objective element reveals both elements of convergence and fundamental structural differences, which allow the two incriminated acts to be clearly delimited.

The objective element of the offence provided for in Article 177[1] CC RM has a complex structure, the central element of which is the prejudicial act, expressed in the action of unlawfully presenting oneself under a fictitious identity or of attributing such an identity to another person. Accordingly, the legislature provided for two alternative normative modalities of the prejudicial action, namely:

1) Unlawfully presenting oneself under a fictitious identity - a situation in which the perpetrator assumes a fictitious identity. Consequently, he or she identifies himself or herself before third parties or authorities under an identity other than the real one;

2) Unlawfully attributing a fictitious identity to another person - a situation in which the perpetrator, without substituting himself or herself, confers a fictitious identity upon a third person [10, p.668].

The alternative character of the two normative modalities means that, for the existence of the offence, it is sufficient for either of them to be carried out, without it being

necessary for them to be cumulatively fulfilled. At the same time, the examined modalities presuppose the commission of an unlawful action.

In another respect, a distinctive feature of the objective element of the offence of false identity is the method of commission, which in this norm acquires the value of a mandatory constituent element, thereby conferring typicality upon the act [8, p.33]. The legislature expressly and exhaustively provided for the following alternative methods of commission:

1) Using official documents issued in the name of another person – this method presupposes that the perpetrator uses, as a means of committing the offence, official documents that are registered not in his or her own name, but in the name of another person. This method, in our view, is traditional or classical and specific to the physical environment;

2) Registering user accounts on social media platforms, web portals, e-mail addresses, telephone numbers, access cards or other information-society services;

3) Using user accounts on social media platforms, web portals, e-mail addresses, telephone numbers, access cards or other information-society services [2, Art. 177[1]].

The second method concerns the process of generating and storing personal information under a fictitious identity or under the real identity of another person, materialised by creating digital entities within the following categories of information-society services: user accounts on social media platforms; web portals; e-mail addresses; telephone numbers; access cards; other information-society services [8, p.34]. In essence, this method presupposes an act of establishing a false digital presence, whereby the perpetrator creates, under an identity that does not belong to him or her, a virtual existence capable of producing legal effects. The act of registration usually involves providing the identity data of another person to the relevant platforms or service providers, which results in the association of that identity with the account or service thus created. Through this method, the prejudicial act is consummated at the moment when the registration process is completed, irrespective of whether that account or service is subsequently actually used.

The last method provided for by the legislature differs from the second in that it does not concern the creation of a new digital entity, but rather the activity of exploiting the functionalities offered by personal information stored within already existing accounts or services. In other words, this method presupposes the effective exercise of the attributes associated with the fictitious identity or with the identity belonging to another person, the perpetrator acting in the digital environment as if he or she were the legitimate holder of that identity. Such actions may include, by way of example: sending messages in another person's name, posting content under an identity that does not belong to the perpetrator, accessing information available through the account, managing its settings, as well as any other action involving the exploitation of the functionalities offered by the respective service for the purpose pursued by the perpetrator.

Unlike the registration method, in the case of the use of accounts the prejudicial act may be consummated continuously, throughout the period during which the perpetrator benefits from the functionalities of the service under the fictitious identity or under the identity of another person. This gives this modality a potentially more serious character from the perspective of the scope and persistence of the infringement of the protected social value, as the harm caused to the victim may accumulate and progressively worsen as the criminal activity continues.

The two methods described above have one essential common element, namely the means of committing the offence, which are identical in both cases. Thus, regardless of

whether the perpetrator registers or uses an account or a digital service, the technical means employed are the same: social media platforms, web portals, e-mail addresses, telephone numbers, access cards or other information-society services. The identity of the means used justifies the unitary legal treatment of the two methods within the same incriminating norm, the legislature opting for a regulation that exhaustively covers the entire cycle of criminal conduct in the digital environment – from the establishment of the false presence to its exploitation.

The objective element of the offence provided for in Article 260^7 CC RM is distinguished by a more elaborate structure compared with that of the offence of false identity, reflecting the complexity specific to offences in the field of electronic communications. The central element of the objective element consists in the action of obtaining another person's identity, understood as the process by which the perpetrator accesses, acquires or comes into total or partial possession of the data or characteristics forming the identity of another person [7, p.39].

It is essential to emphasise that not every obtaining of another person's identity falls within the scope of Article 260^7 CC RM. In order to be classified under this article, the action must have an unlawful character, which is expressly conferred by the secondary signs of the objective element [7, p.39].

Unlike the offence of false identity, the objective element of identity theft is constructed around secondary signs that confer unlawfulness on the action and that are, at the same time, mandatory constituent elements of the offence:

1) *The fraudulent manner of commission*: represents the first and most important secondary sign of the objective element. It presupposes that the identity is obtained by misleading the user of the computer system, by exploiting a state of appearance deliberately created by the perpetrator. The fraudulent character of the action is what confers unlawfulness on the act and distinguishes it from situations in which identity data are accessed legitimately;

2) *The means of commission*: the second secondary sign consists in the use of a computer or telecommunications system as the instrument through which the act is committed. This feature irreversibly anchors the offence of identity theft in the sphere of cybercrime and structurally distinguishes it from false identity, which may also be committed by a traditional method specific to the physical environment.

3) *The method of commission*: consists in misleading the user of the computer system due to the creation of a state of appearance, that is, by simulating false circumstances or entities (counterfeit websites, fraudulent e-mail messages, false interfaces, etc.) capable of inducing the victim to provide, voluntarily but under a vitiated will, his or her identity data.

The comparative analysis of the objective element of the two offences reveals essential structural differences, confirming that the legislature intended to incriminate two distinct criminal phenomena, even if they are apparently related. False identity is built around the idea of substitution or attribution of a fictitious identity, placing emphasis on the act of fraudulent presentation before third parties, irrespective of the environment in which it occurs. Identity theft, by contrast, is centred on the idea of unlawfully obtaining the identity data of a real person by exploiting computer means and the state of appearance created in the electronic environment.

Another significant difference lies in the role that the secondary signs of the objective element play in the structure of each norm: whereas in the offence of false identity the method of commission serves to circumscribe the concrete modalities for carrying out the action, in the offence of identity theft the secondary signs - the fraudulent man-

ner, the computer-related means and the method of deception - are those that confer unlawfulness on the prejudicial action itself, in the absence of which the act cannot be classified under Article 260^7 CC RM.

These findings are relevant not only from the perspective of the theory of criminal law, but also from a practical standpoint, since the correct delimitation of the objective element of the two offences constitutes the indispensable premise for an exact legal classification in judicial practice.

As regards the legal classification of the offences under analysis, in national doctrine the authors S. Brînza and V. Stati [7, p.42], [8, p.35] expressed the view, in the works mentioned in the present research, which we support, concerning the manner of classifying the offence in the case of concurrence between a part and a whole.

Thus, the two authors opined that, where the offence of false identity is committed in the context of another offence, it loses its individuality, being absorbed by the more serious offence. In such cases, in accordance with the rule laid down in Article 118 CC RM concerning concurrence between a part and a whole, criminal liability will be incurred not for the offence provided for in Article 177^1 CC RM, but for one of the acts specified in letter f) paragraph (1) Article 165, Articles 167, 168, 190, 196, 238, 248, 248^1 or others of the Criminal Code, as applicable. Conversely, in situations where an act is committed which by its nature cannot absorb false identity – such as, for example, murder, driving a means of transport while exceeding the permitted alcohol limit or while intoxicated by other substances, illegal circulation of drugs, ethnobotanicals or their analogues for the purpose of alienation, or other offences - there will be a concurrence of offences between the respective act and the offence provided for in Article 177^1 CC RM [8, p.35].

The same rule of classification applies, by analogy, to the offence of identity theft provided for in Article 260^7 CC RM. In this respect, the same authors, in another work, identified two distinct options for classifying the act, namely: 1) concurrence between the offence provided for in Article 260^7 CC RM and one of the offences provided for in letter f) paragraph (1) Article 165, Articles 167, 168, 190, 196, 238, 248, 248^1 or others of the Criminal Code; and 2) retaining exclusively one of the offences listed above, with the clarification that, in this case, identity theft constitutes the preparatory act for the subsequent offence, thereby losing its criminal autonomy [7, p.42].

With regard to the legal relationship between the offences provided for in Articles 177^1 and 260^7 CC RM, the authors mentioned above are of the opinion that the classification solution differs depending on the chronological sequence and the teleological link between the two acts. Thus, where the intention to commit false identity arose after the consummation of identity theft, the two offences each retain their own individuality and are to be retained in concurrence of offences, according to the general rules applicable to this institution [8, p.35].

By contrast, a different solution is required when, in order to carry out the intention to commit false identity, the perpetrator first obtains the identity of another person fraudulently, through computer or telecommunications systems, misleading the user by creating a state of appearance designed to induce him or her to provide personal data within an electronic communication. In such a hypothesis, identity theft loses its criminal individuality, not being a self-standing offence, but representing exclusively the preparatory act for the offence of false identity provided for in Article 177^1 CC RM; accordingly, only Article 177^1 CC RM is to be applied [7, p.42].

A significant element of similarity between the offence of false identity and the offence of identity theft lies in their formal nature, both offences being deemed consummated from the moment the prejudicial act is committed.

As regards the subjective element, both offences under analysis may be committed exclusively with direct intent, the perpetrator foreseeing the prejudicial character of his or her act and deliberately pursuing the production of its consequences. This common feature excludes the possibility of committing either offence through negligence or with indirect intent, reflecting the legislature's intention to sanction exclusively criminal conduct characterised by a high degree of determination and awareness in relation to the act committed.

Although both offences presuppose direct intent, the special purpose of each constitutes an essential criterion of delimitation, highlighting the distinct aim pursued by the perpetrator in each case.

In the case of the offence provided for in Article 177^1 CC RM, the legislature provided for a special purpose with a dual structure, composed of two components in a relationship of teleological subordination: the primary purpose - to mislead or maintain a person in error as to the identity of the perpetrator or of a third person; the secondary purpose – to produce a legal consequence, that is, to obtain an effect of a legal nature through the error created. The two components of the special purpose are cumulative and indispensable for the application of the norm in Article 177^1 CC RM. In the absence of either of them, the act cannot be classified under this article, because the absence of one of the purposes removes the subjective typicality of the offence [8, p.35].

In the case of the offence provided for in Article 260^7 CC RM, the special purpose consists in inducing the user of the computer system to provide personal data within an electronic communication [7, p.43]. Unlike the dual structure of the purpose provided for in Article 177^1 CC RM, in the case of identity theft the special purpose has a unitary character, directed exclusively toward obtaining the victim's identity data through electronic means.

An aspect of particular importance that deserves emphasis is that the purpose provided for in Article 260^7 CC RM must be achieved prior to the consummation of the offence. This requirement flows from the very constituent content of the act: insofar as the user of the computer system, although misled by the perpetrator, does not provide the latter with personal data within an electronic communication, the perpetrator will not be able to obtain the victim's identity, and the offence will not be consummated in the typical form provided by law [7, p.43]. Therefore, the achievement of the special purpose does not represent a consequence of the consummated offence, but a sine qua non condition of its very consummation.

With regard to the subject of the offence, we observe that the legislature opted for a differentiated regulation of the two incriminating norms, establishing a distinct framework for the persons who may have the status of subject. In the case of the offence provided for in Article 177^1 CC RM, the subject is circumscribed, being exclusively a responsible natural person who, at the time of committing the offence, has reached the age of 16 years [10, p.674].

A significant difference from the offence of false identity is found in the case of the offence provided for in Article 260^7 CC RM, whose subject has a broader scope. Thus, in the case of identity theft, the status of active subject may be held both by a responsible natural person who, at the time of committing the offence, has reached the age of 16 years, and by a legal person, with the exception of public authorities [7, p.43].

Conclusions. The research undertaken in the present study has shown that the offences of false identity and identity theft, introduced into the Criminal Code of the Republic of Moldova by Law No.136/2024, constitute two distinct incriminating norms which, although they directly concern the identity of a natural person, differ essentially in terms

of the protected social values, the structure of the objective and subjective elements, and the status of the subjects who may commit these offences.

The main similarities between the two offences lie in the fact that the immaterial object of both acts is represented by the identity of a natural person; a legal person cannot have the status of victim in these offences; both offences are formal and may be committed exclusively with direct intent.

Nevertheless, the two offences differ fundamentally in multiple respects. From the perspective of their normative placement, false identity is an offence against the constitutional rights of citizens, whereas identity theft belongs to the category of computer-related offences. The special legal object of false identity concerns public trust in the authenticity of identification processes, while that of identity theft protects the security of identity in the electronic environment. The objective element of the two offences differs in that false identity may be committed both in the physical and in the digital environment, whereas identity theft is committed exclusively through computer systems. The special purpose of false identity has a dual structure, presupposing deception and the production of a legal consequence, while the purpose of identity theft is unitary, directed toward obtaining the victim's personal data. At the same time, the subject of the offence of identity theft has a broader scope, including legal persons as well, unlike false identity, which may be committed exclusively by a natural person.

THE PRINCIPLES GOVERNING THE JUDICIAL INVESTIGATION DURING THE TRIAL ON THE MERITS OF CRIMINAL CASES

Vadim GRIBINCEA,
PhD Student,
"Ștefan cel Mare" Academy of the Ministry of Internal Affairs,
Prosecutor, Chișinău Municipality Prosecutor's Office,
Trainer, National Institute of Justice,
Republic of Moldova
ORCID: 0009-0009-6785-774X

Abstract

Judicial investigation represents a fundamental stage of the criminal process, during which the court directly examines the evidence in order to establish the factual situation and deliver a lawful and well-founded judgment, thereby contributing decisively to the discovery of the truth.

At this stage, the parties present and support their positions, while the judge forms his or her conviction based on the direct assessment of the evidence administered.

The conduct of the proceedings is governed by fundamental principles such as immediacy, orality, adversariality, equality of arms, and the publicity of hearings, which constitute essential guarantees of the right to a fair trial, in accordance with Article 6 of the European Convention on Human Rights.

These principles are not merely formal in nature; they ensure procedural balance, transparency, and the protection of the rights of all participants.

Their importance is decisive for the legality and fairness of the administration of justice, as their violation may lead to serious procedural sanctions, such as the nullity of acts or the annulment of the judgment.

Keywords: judicial investigation, principle of immediacy, principle of adversarial proceedings, principle of public hearings, principle of orality, principle of equality of arms in criminal proceedings.

PRINCIPIILE CARE GUVERNEAZĂ CERCETAREA JUDECĂTOREASCĂ LA EXAMINAREA ÎN FOND A CAUZELOR PENALE

Abstract

Cercetarea judecătorească reprezintă o etapă de bază a procesului penal, în cadrul căreia instanța examinează direct probele pentru a stabili situația de fapt și a pronunța o hotărâre legală și temeinică, contribuind în mod decisiv la aflarea adevărului.

În această etapă, părțile își expun și își susțin punctele de vedere, iar judecătorul își formează convingerea în baza analizei directe a probelor administrate.

Desfășurarea procesului este guvernată de principii fundamentale, precum nemijlocirea, oralitatea, contradictorialitatea, egalitatea părților și publicitatea ședințelor, care reprezintă garanții esențiale ale dreptului la un proces echitabil, în concordanță cu prevederile art. 6 din CEDO.

Aceste principii nu au doar un rol formal, ci asigură echilibrul procesual, transparența și respectarea drepturilor tuturor participanților.

Importanța lor este determinantă pentru legalitatea și corectitudinea actului de justiție, întrucât nerespectarea acestora poate atrage sancțiuni procesuale grave, precum nulitatea actelor sau anularea hotărârii.

Cuvinte-cheie: cercetare judecătorească, principiul nemijlocirii, principiul contradictorialității, principiul publicității ședinței de judecată, principiul oralității, principiul egalității armelor în procesul penal.

Introduction. Judicial investigation is the central stage of criminal proceedings, during which the court directly examines the evidence and establishes the circumstances of the case, based on the fundamental principles of criminal procedure.

These principles—publicity, orality, adversarial proceedings, immediacy, and equality of arms—are enshrined in the Criminal Procedure Code and in Article 6 of the European Convention on Human Rights, serving as guarantees of balance between the prosecution and the defense.

Overall, judicial investigation ensures the establishment of judicial truth, the substantiation of court decisions, and the maintenance of a balance between procedural efficiency and respect for the parties' procedural rights.

Methods and materials applied. In drafting this article, various theoretical, normative, and empirical sources were used. The study of the topic was carried out by applying scientific methods specific to the doctrine and theory of criminal procedure, including the logical method, comparative analysis, and the systemic approach, all of which contributed to a complex and in-depth examination of the subject.

Purpose of the research. The purpose of this research is to analyze the national legal framework, relevant case law, and doctrine concerning the principles governing judicial investigation in the trial on the merits of criminal cases.

Discussions and results obtained. Judicial investigation is the main stage of the trial of a criminal case, during which the court examines the evidence administered and, where necessary, admits new evidence in order to establish the truth. At this stage, the act, the defendant's guilt, criminal liability, and the damage caused are analyzed.

All evidence is directly examined by the court under conditions of publicity, orality, adversarial proceedings, and immediacy, thereby ensuring a fair and transparent process.

This stage has an essential role both procedurally and substantively, as it allows for the clarification of all the circumstances of the case and constitutes the basis of the court's judgment, directly contributing to the achievement of the fundamental purpose of criminal proceedings—establishing the truth and correctly applying the law.

The trial of a criminal case is conducted according to general and uniform rules, known as the general conditions for the adjudication of criminal cases. These rules provide a unified procedural framework, applicable regardless of the level of the competent court—whether a court of first instance, a court of appeal, or the Supreme Court of Justice.

The rules governing the investigation and resolution of a case are referred to as principles; they form the foundation of the entire criminal process and ensure its coherence at all stages. Principles have general applicability within criminal procedure, influencing all procedural institutions, unlike legal norms, which apply only to specific stages of the process.

In essence, criminal proceedings represent the totality of activities carried out by criminal investigation bodies and courts, with the participation of the parties involved. This entire activity is governed by fundamental principles enshrined in Chapter II of the Criminal Procedure Code, entitled "General Principles of Criminal Proceedings", which comprises a total of 22 principles.

However, the Criminal Procedure Code does not provide, in Article 6 entitled "Terms and expressions used in this Code", an explicit definition of the notion of "principle", which may be regarded as a legislative omission.

Although Chapter II of the General Part enshrines the general principles of criminal proceedings, judicial investigation in the Republic of Moldova is regulated by specific rules set out in Articles 314-316 of the Criminal Procedure Code, which establish the manner of examining cases and conducting this stage within the criminal process.

These principles go beyond their mere nature as procedural rules, representing fundamental guarantees of the right to a fair trial. They are fully consistent with the provisions of Article 6 of the European Convention on Human Rights, which enshrines the minimum standards of fairness in criminal proceedings and imposes on states the obligation to ensure a genuine balance between the interests of the prosecution and the rights of the defense.

The importance of these principles has been consistently emphasized in the case law of the European Court of Human Rights.

Thus, in Doorson v. the Netherlands (§ 70), the Court underlined the need to ensure a fair balance between the rights of the defense and the interests of witnesses or the prosecution.

In Bönisch v. Austria (§§ 31–35), it was held that the principle of equality of arms constitutes an essential component of a fair trial.

At the same time, in Luca v. Italy (§§ 38–45), the Court stressed the importance of respecting the adversarial principle and the genuine opportunity for the parties to challenge evidence.

A central place is held by the principle of immediacy of judicial investigation, which requires the court to directly examine all evidence administered in the case.

According to Article 314(1) of the Code of Criminal Procedure, during the examination of the case, the court must directly and comprehensively analyze the evidence presented by the parties or admitted at their request, including hearing the defendants, injured parties, and witnesses, examining material evidence, reading expert reports, records, and other documents, as well as verifying any other evidence provided by law.

The importance of this principle lies in the fact that the court must have direct and immediate contact with the entire body of evidence. For this reason, it is preferable that witnesses be heard in person before the court, and that material evidence be presented at the request of any party to the proceedings.

Immediacy allows the court to assess the credibility of evidence not only based on its content, but also on the manner in which it is presented. Thus, the court must form its own conviction on the basis of direct perception, not indirect assessment.

The judicial decision must be based exclusively on the evidence administered and examined during the court hearing, and not on evidence collected during the criminal investigation phase, in the absence of direct examination by the judge.

The importance of this principle is also reflected in the case law of the European Court of Human Rights, which has emphasized that the lack of direct examination of evidence may affect the fairness of the proceedings.

In Škaro v. Croatia (06.12.2016, §§ 23-24), the Court highlighted certain principles applicable in situations where there is a change in the composition of the trial panel, an aspect that may affect compliance with the principle of immediacy. The Court also emphasized that those responsible for determining the guilt or innocence of a defendant must, in principle, have the opportunity to directly hear victims, the accused, and witnesses in order to properly assess their credibility.

A relevant example from judicial practice concerning the non-observance of the principle of immediacy can be found in the case of C.A., accused of committing the offense provided for in Article 191(2)(c) of the Criminal Code. In that case, the court based its conviction on the statements of a witness heard on 6 July 2021 by a judge different from the one who delivered the judgment on 14 February 2025.

The court also relied on the statements of the representative of the injured party,

ICS "R.S.D.", C.O.V., given during the same hearing, which the defense had the opportunity to confront.

However, during the preliminary hearing and the judicial investigation, the defense requested the rehearing of the representative and other witnesses before the new panel of judges, invoking the need for the court to have direct contact, through immediate perception, with the entire body of evidence in the presence of the parties.

In reality, the court did not carry out such direct examination due to the impossibility of ensuring the presence of the representative and other witnesses, some of whom had already been heard by the initial panel during a public hearing.

This irregularity was subsequently remedied at the appellate stage, the higher court ordering the taking of the necessary evidence to ensure compliance with the principle of immediacy and the continuity of the judicial investigation, including by admitting requests for the hearing of persons whose statements had formed the basis of the judgment.

A similar situation is also found in the case of G.A. and I.V., in which the defendants were accused of committing the offense provided for in Article 264(3)(b) of the Criminal Code. In that case, the court based its judgment of 9 April 2025 on statements that were not directly taken by the judge who decided the case, but by another judge who had previously examined the file.

During the examination of the case on appeal before the Centru Court of Appeal, taking into account the acquittal of the defendant I.V., as well as the provisions of Article 415(2^1) of the Criminal Procedure Code, the criminal panel partially granted the request of the public prosecutor to hear witnesses. Consequently, it ordered the hearing only of those witnesses whose statements had been read out during the trial and used as a basis for the first-instance judgment, without having been directly examined by the judge.

Article 371 of the Criminal Procedure Code does not currently allow, in cases examined by a single judge, the reading of statements taken by a judge other than the one who is to decide the case.

The principle of orality complements immediacy and requires that criminal proceedings be conducted verbally before the court, with all evidence being presented, debated, and analyzed directly during the hearing. Thus, witnesses are heard directly by the judge, and relevant documents are brought to the court's attention through reading or oral presentation, the process taking the form of a judicial dialogue in which the parties present and challenge their arguments, having the opportunity to express and contest them directly.

This manner of conducting the judicial investigation ensures transparency, dynamism, and the adversarial nature of the proceedings, facilitating a full understanding of the circumstances of the case and a direct assessment of the positions of the participants. Orality governs the entire conduct of the trial, from the taking of evidence and hearing of witnesses to the presentation of final submissions, constituting the main means of communication between the court and the parties. Although it has a broader scope than immediacy, being characteristic of the entire hearing, it operates in close connection with the principle of adversarial proceedings, contributing to the realization of a fair trial.

Consequently, the judicial decision must be based exclusively on circumstances examined orally before the court, orality playing an essential role in guaranteeing publicity, immediacy, and the effective exercise of the parties' right to participate in the proceedings.

The principle of adversarial proceedings implies the right of the parties to be informed of all evidence and observations submitted to the court, to discuss them, and to express their position on them, so that no evidence capable of influencing the judgment is

examined without being subject to debate between the parties. In this respect, the court cannot rule on a criminal case before it has been subject to adversarial debate, as the right to decide may only be exercised after effectively guaranteeing the right of defense for both parties.

Thus, the judicial investigation is carried out through the confrontation of the arguments of the prosecution and the defense, each circumstance being analyzed and each piece of evidence verified from different perspectives, allowing the court to hear and assess all arguments in a balanced manner, both in support of the prosecution and in defense of the accused.

The conduct of the judicial investigation under adversarial conditions constitutes an implicit requirement of the right to a fair trial. Although this principle is not expressly stated in Article 6 of the European Convention on Human Rights, it has been consistently recognized in the case law of the European Court of Human Rights as a fundamental element of judicial proceedings. It is considered respected when the parties have a genuine opportunity to be informed of the evidence, to submit observations, and to debate the claims and objections raised by the opposing party.

The principle is also regarded as fulfilled when the defense has access to all evidence in the case, both incriminating and exculpatory. In this respect, the parties' right to be informed about the evidentiary material includes the right of access to the case file, as well as the right to know the facts retained and their legal classification—essential elements for the effective exercise of the right of defense.

Another principle under analysis is the principle of equality of arms in criminal proceedings, which, although it may at first appear to overlap with the adversarial principle, is in fact distinct, having its own content and function within the criminal process.

Although not expressly enshrined in the Constitution, the principle of equality of arms is recognized as an indispensable requirement of the right to a fair trial. It was first established in the case law of the European Court of Human Rights in the judgment of 27 June 1968 in *Neumeister v. Austria*, and its first violation was found in the judgment of 16 July 1971 in *Ringeisen v. Austria*.

The essence of this principle lies in guaranteeing each party a reasonable opportunity to present their case under conditions that do not place them at a substantial disadvantage vis-à-vis the opposing party. In this regard, the court has the obligation to ensure a balanced procedural framework, providing the parties with equal, sufficient, and appropriate means to support and argue their positions.

This principle is also enshrined in Article 24 of the Criminal Procedure Code, according to which the parties participating in the trial enjoy equal rights and equivalent opportunities to support their positions. At the same time, the court bases its judgment only on evidence to the examination of which the parties have had equal access.

The law further provides that the parties determine independently their positions and means of defense, acting independently of the court, which may, upon request, assist them in taking the necessary evidence under the conditions provided by law.

The principle of equality of arms, as developed in the case law of the European Court of Human Rights, represents an essential component of the right to a fair trial. In *Bulut v. Austria*, it was defined as the obligation to ensure each party a reasonable opportunity to present their case without being placed at a disadvantage compared to the opponent.

This principle aims to maintain procedural balance, guaranteeing equal access to evidence and the possibility to challenge it. Any imbalance must be demonstrated by the party invoking it.

Although it is a fundamental guarantee, the principle of equality of arms is not absolute, the Court recognizing the possibility of certain exceptions.

In conjunction with Article 6 § 3 (d) of the European Convention on Human Rights, this principle requires that the accused have an effective opportunity to challenge the prosecution's evidence and to examine witnesses, including by putting questions to them and verifying their credibility. If witness statements are merely read out during the hearing without the possibility of direct questioning, the defense may be disadvantaged, as it cannot fully exercise its right to challenge their credibility.

The trial stage generally offers the broadest procedural guarantees for the defense, including the hearing of witnesses, experts, and the presentation of its own evidence, being the stage in which the principles of adversarial proceedings and immediacy are effectively realized. The judge thus has the possibility to directly assess the reliability of the evidence, contributing to a fair resolution of the case.

However, the reading of witness statements is permitted in order to ensure the expediency of criminal proceedings, in objective situations such as the impossibility of securing their presence.

This solution prevents delays and maintains the efficiency of the process.

For the use of such statements to be compatible with the requirements of a fair trial, clear rules and procedural safeguards must exist to ensure a balance between procedural efficiency and the right of defense. The European Court of Human Rights has established in its case law the conditions under which statements made by witnesses at earlier stages of criminal proceedings may be used during trial.

A key reference is *Al-Khawaja and Tahery v. the United Kingdom*, in which the Court developed a three-step test for assessing the admissibility of such statements. In essence, it must be cumulatively verified: the existence of good reasons for the witness's absence and the diligence of the authorities in securing their presence; the decisive or determinative nature of the statement in the overall body of evidence; and the existence of sufficient procedural safeguards to compensate for the absence of the witness and ensure the fairness of the proceedings.

In subsequent case law, including *Schatschaschwili v. Germany*, the Court reaffirmed the need to respect the right to confrontation and the effective possibility of examining witnesses, even where they are not physically present before the court.

At the same time, in *Klimentyev v. Russia*, it was emphasized that although the presentation of evidence in a public hearing and in the presence of the accused is the rule, the use of statements from the investigation stage is not, in itself, incompatible with Article 6 of the Convention, provided that the rights of the defense are respected. This includes, in essence, the possibility for the accused to question witnesses, either at the time they are heard or at a later stage of the proceedings.

In *Rachdad v. France*, the Court held that in certain situations it may be necessary for judicial authorities to rely on statements made during the preliminary investigation. If the accused had an adequate and sufficient opportunity to challenge such statements, either when they were made or at a later stage, their use does not in itself violate Article 6 § 1 and § 3 (d). However, the rights of the defense are considered restricted in a manner incompatible with Article 6 when a conviction is based solely or decisively on statements made by a person whom the accused was unable to examine, either during the investigation phase or at trial.

Nevertheless, any derogation is admissible only if it does not affect the substance of the right of defense.

Based on the above, the difference between the principle of adversarial proceedings and the principle of equality of arms lies in their object and purpose, although both represent essential guarantees of the right to a fair trial. The adversarial principle concerns the manner in which criminal proceedings are conducted and implies the active participation of the parties, who have the right to be informed of all evidence, to discuss it, and to present their arguments before the court. It ensures the framework for an effective debate between the prosecution and the defense.

By contrast, the principle of equality of arms concerns procedural balance between the parties, guaranteeing them equal conditions in exercising their procedural rights so that neither is disadvantaged in presenting their case. Thus, adversarial proceedings represent the mechanism of judicial debate, while equality of arms constitutes the guarantee of balance within that debate.

The principle of publicity of court hearings is enshrined in Articles 18 and 316 of the Criminal Procedure Code of the Republic of Moldova and represents one of the fundamental guarantees of a fair and transparent criminal process. According to these provisions, court hearings are, as a rule, public, allowing access to any interested person, subject to certain legal limitations.

Article 18 provides that publicity may be restricted by a reasoned decision of the court in strictly determined situations, such as the protection of morality, public order, national security, private life, or the interests of minors, as well as where the interests of justice so require. In particular, in cases involving minors as victims or witnesses, their hearing is conducted in camera.

At the same time, even in non-public hearings, the court is obliged to observe procedural rules and the parties' rights, and judgments are always delivered in public. Article 316 further provides that any person may attend public hearings, except minors under 16 and persons carrying weapons, although the presiding judge may authorize their presence under certain conditions.

In cases of public interest, the media may make audio-video recordings or take photographs, provided that this does not affect the proper conduct of the proceedings or the rights of the participants. The court may also limit public access where the circumstances of the case so require.

The principle of publicity is also enshrined in constitutional provisions, with Article 117 establishing that court hearings are generally public, while closed hearings are permitted only in cases expressly provided by law and in strict compliance with procedural rules.

Publicity of hearings is a guarantee of transparency and public confidence in the administration of justice, ensuring access to proceedings and enabling social control over judicial activity. However, this principle is not absolute, as the law allows closed hearings under the conditions set out in Article 18(2) of the Criminal Procedure Code, in line with Article 6 § 1 of the European Convention on Human Rights. Such limitations are applied strictly depending on the circumstances of the case and are also reflected in the case law of the European Court of Human Rights.

The principle of publicity requires that criminal proceedings be conducted in open hearings accessible to the public and the press, ensuring transparency in the administration of justice. It plays an essential role in guaranteeing confidence in the courts, as it allows the public to observe how the parties' rights are respected and how procedural principles are applied. It also promotes a more responsible conduct of proceedings, as the parties present their arguments under public scrutiny.

Open justice fosters trust in judicial decisions, as citizens can understand not only

the outcome but also the reasoning behind it. Although exceptions exist, transparency remains the general rule, contributing to the protection of the right to a fair trial and the rights of participants.

Conclusions. Judicial investigation represents the central stage of criminal proceedings, in which the court directly examines the evidence and establishes the circumstances of the case based on the fundamental principles of criminal procedure.

These principles—publicity, orality, adversarial proceedings, immediacy, and equality of arms—constitute guarantees of a fair trial, enshrined in Article 6 of the European Convention on Human Rights and consolidated in the case law of the European Court of Human Rights. Adversarial proceedings and equality of arms ensure balance between the parties, while immediacy and orality allow the court to directly perceive the evidence.

The application of these principles may involve certain exceptions, such as limitations on publicity or the use of witness statements, but only under strictly regulated conditions and with due respect for the right of defense, in accordance with European jurisprudential standards (e.g., *Al-Khawaja and Tahery*, *Doorson*).

Overall, the effectiveness of criminal proceedings depends on maintaining a balance between respect for fundamental principles and the use of justified exceptions, in order to ensure a fair trial and the establishment of the truth.

Recommendations:

1. Legislative clarification of the notion of a criminal procedural principle, by supplementing Article 6 of the Code of Criminal Procedure, in order to avoid divergent interpretations in practice and doctrine.

2. More detailed regulation of the criteria for applying exceptions to the principle of immediacy, particularly in the case of reading witness statements, by explicitly incorporating the standards established in the case law of the European Court of Human Rights (notably the Al-Khawaja and Tahery test and subsequent jurisprudence).

3. Strengthening the guarantees of adversarial proceedings in relation to evidence taken prior to trial, by ensuring an effective opportunity to challenge and examine witnesses whenever possible.

4. Improving the regulation of the publicity of court hearings by establishing clearer criteria for its restriction, so that limitations on public access are proportionate and sufficiently reasoned.

5. Express harmonization of domestic legal provisions with European Convention standards, including explicit references to the principle of equality of arms and to the criteria of procedural fairness developed in the Court's case law.

These measures would contribute to increasing the predictability of procedural rules, strengthening the right of defense, and enhancing the guarantees of a fair criminal process in the Republic of Moldova.

Abstract

The paper examines the electronic report of finding the traffic contravention from the perspective of legality and procedural compliance, highlighting the gaps and inconsistencies in the normative framework of the Republic of Moldova. In the context of the accelerated digitization of public services and the implementation of e-government solutions, the use of electronic means in the activity of finding and sanctioning traffic contraventions raises a series of legal problems insufficiently regulated by the legislation in force.

The study analyzes the applicable legal framework, with reference to the provisions of the Contravention Code of the Republic of Moldova (Law No.218/2008), to the specific rules in the field of road traffic regulated by Law No.131/2007, as well as the provisions of Law No.91/2014 on electronic signature and electronic document. It is noted that the transposition of the classic procedure for drawing up the minutes into electronic format generates significant procedural vulnerabilities, in particular with regard to the formal requirements of the act, the method of communication to the offender and the guarantees of the rights of defence.

The paper identifies the main shortcomings of the current regulation, including the absence of clear rules on the probative value of electronic video recordings, the legal uncertainty regarding the electronic authentication of the ascertaining agent and the risks of nullity of the act in the context of judicial challenge.

Keywords: electronic report, traffic contravention, procedure, digitization, legality.

PROCESUL-VERBAL ELECTRONIC DE CONSTATARE A CONTRAVENȚIEI RUTIERE: ASPECTE DE LEGALITATE ȘI CONFORMITATE PROCEDURALĂ

Abstract

Lucrarea examinează procesul-verbal electronic de constatare a contravenției rutiere din perspectiva legalității și a conformității procedurale, evidențiind lacunele și inconsecvențele din cadrul normativ al Republicii Moldova. În contextul digitalizării accelerate a serviciilor publice și al implementării soluțiilor e-guvernare, utilizarea mijloacelor electronice în activitatea de constatare și sancționare a contravențiilor rutiere ridică o serie de probleme juridice insuficient reglementate de legislația în vigoare.

Studiul analizează cadrul legal aplicabil, cu referire la dispozițiile Codului contravențional al Republicii Moldova (Legea nr. 218/2008), la normele specifice din domeniul circulației rutiere reglementate de Legea nr. 131/2007, precum și la prevederile Legii nr. 91/2014 privind semnătura electronică și documentul electronic. Se constată că transpunerea procedurii clasice de întocmire a procesului-verbal în format electronic generează

vulnerabilități procedurale semnificative, în special cu privire la cerințele de formă ale actului, la modalitatea de comunicare către contravenient și la garanțiile dreptului la apărare.

Lucrarea identifică principalele deficiențe ale reglementării actuale, printre care absența unor norme clare privind valoarea probatorie a înregistrărilor video electronice, incertitudinea juridică referitoare la autentificarea electronică a agentului constatator și riscurile de nulitate a actului în cadrul contestării judiciare.

Cuvinte-cheie: proces-verbal electronic, contravenție rutieră, procedură, digitalizare, legalitate.

Introduction. The digital transformation of public administration has generated, in recent years, profound reconfigurations of the classic mechanisms for finding and sanctioning contraventions, including in the field of road traffic. The contravention report – a traditional legal instrument, enshrined in procedural norms dating back to the period of Soviet and post-Soviet contravention codifications, is today faced with a challenge of epistemic and normative nature: the transition from the written material support to the electronic form.

The replacement or completion of the classic report with its electronic version, automatically generated by road surveillance systems (fixed or mobile speed control cameras, license plate recognition systems, traffic light monitoring devices), raises a series of fundamental questions regarding the legality of the contravention act thus drawn up and its compliance with the procedural guarantees established in favor of the sanctioned person. However, the contravention report is not a simple administrative act of recording facts – it represents the enforceable title by which the contravention liability of a person is engaged, with all the related legal consequences [14].

The present research starts from the premise that the digitization of the contravention procedure, no matter how justified it may be from the perspective of administrative efficiency and the fight against the traffic crime phenomenon, cannot operate in the absence of a coherent regulatory framework and adequate procedural guarantees. The issue concerned has at least three distinct, but interdependent dimensions: (i) the dimension of formal legality, regarding the legal basis of the electronic report and its compatibility with the provisions of the Contravention Code; (ii) the evidentiary dimension, relating to the probative value of the approved technical means and the presumption of veracity of the digital recordings; and (iii) the dimension of the guarantees of the rights of defense, with emphasis on the effective possibility of the offender to challenge the sanctioning act and to benefit from a fair trial within the meaning of Art.6 of the European Convention on Human Rights.

The study is structured around the comparative analysis of the regulations in force, the relevant jurisprudence and the specialized doctrine, in order to identify the existing legislative gaps and to formulate proposals for *lege ferenda* aimed at ensuring a rational balance between the imperatives of procedural efficiency and the protection of the fundamental rights of the person subject to the contravention procedure.

Methods and materials applied. The investigation of the legality and procedural compliance aspects of the electronic traffic contravention report required the use of a set of methods and procedures specific to scientific legal research, selected in relation to the normative and interpretative nature of the object of study.

From the category of general research methods, the logical method was capitalized, through which coherent legal reasoning was constructed regarding the validity of the electronic contravention act, resorting to both the deductive procedure – from the general principles of contravention law to the concrete norm – and the inductive one, starting from jurisprudential solutions to general conclusions [1]. The historical method

allowed to follow the evolution of the contravention report in Moldovan law, from the Soviet regulations to the current normative framework, highlighting the continuity and ruptures that occurred in relation to the digitization of the procedure. The comparative method was applied by relating the domestic regulations to the legislative solutions adopted in Romania, France and Estonia, states with relevant experience in the field of automatic detection of traffic offences.

From the category of special legal methods, the dogmatic method was the central pillar of the research, materialized in the systematic analysis of the provisions of the Contravention Code of the Republic of Moldova No.218/2008; of the Law on Electronic Signature and Electronic Document No.91/2014; of the Road Traffic Regulation and of the secondary normative acts regarding the approval of technical means of ascertainment. The interpretation of these texts was carried out through grammatical, systematic and teleological procedures, in order to establish whether the electronic form of the report satisfies the requirements of formal and material legality imposed by the law. The case-law method complemented the normative analysis by examining the judgments of the national courts in cases challenging the automatically generated minutes, as well as the case-law of the European Court of Human Rights on the compatibility of automated contravention procedures with the guarantees of Article 6 of the Convention, in particular from the point of view of the presumption of innocence and the rights of an effective defence.

The materials used include primary national and international normative sources, specialized doctrine of Moldovan and comparative contravention law, relevant national and European jurisprudence, as well as technical standards of the International Organization of Legal Metrology (OIML) on the approval of measuring devices used in the automatic detection of traffic violations.

Discussions and results obtained. The contravention process, as a set of activities carried out by the competent authorities in order to ascertain the fact, identify the perpetrator and apply the sanction provided by law, is governed, in Moldovan law, by a set of fundamental principles with constitutional value: legality, adversarial nature, guarantee of the right to defense and presumption of innocence. The observance of these principles is not a procedural option, but a condition for the validity of the entire sanctioning process, the non-fulfillment of which entails the nullity of the issued acts and the impossibility of engaging contravention liability [12]. Within this principled framework, the contravention report occupies a central and unrepeatable position: it is not a simple act of record, but the legal title through which the finding of the fact materializes and triggers the contravention liability mechanism, producing direct and immediate effects on the rights and freedoms of the person concerned.

The digitalization and generalization of automatic road traffic surveillance systems have placed this traditional legal institution in front of a fundamental challenge, which is not only technical, but profoundly normative: under what conditions and with the observance of what guarantees can the contravention report migrate from the classic paper medium to the electronic environment, without this transformation affecting the legality of the act and the rights of the sanctioned person?

The finding of the contravention act represents the first and most important stage of the contravention process, since the validity of the entire procedural chain that follows depends on its correctness and legality: the preparation of the act of ascertainment, the examination of the case and the application of the sanction. In the absence of a legal finding, any subsequent act is vitiated, and the contravention liability cannot be validly

engaged. This procedural logic is reflected in the architecture of the Contravention Code of the Republic of Moldova No.218/2008, which dedicates a separate chapter to the regulation of the ascertainment process, establishing both the material and territorial competence of the ascertaining agents, as well as the formal and substantive conditions of the procedural acts issued at this stage.

According to Art. 440 para. (1) of the Contravention Code, the contravention process is the activity carried out by the competent authority, with the participation of the parties and other persons holding rights and obligations, with the purpose of establishing the contravention, examining the contravention case and solving it. The ascertaining agent - the public official vested by law with powers of ascertainment in a determined field – is the central actor of this stage, being the one who perceives the deed, identifies the perpetrator, administers the evidence and draws up the act of ascertainment. The competence of the ascertaining agents in the field of road traffic belongs mainly to the bodies of the Ministry of Internal Affairs, respectively to the traffic policemen, to whom the Contravention Code attributes, through art. 400, the competence to ascertain and examine the contraventions provided for in Chapter XIII of the First Book, dedicated to contraventions in the field of road traffic.

The procedural act by which the finding of the fact materializes is the report on the contravention, regulated by Articles 442 and 443 of the Contravention Code. Art.442 establishes that the report constitutes the basic act of the contravention procedure, and Art.443 exhaustively lists the mandatory elements of its content: the date and place of its preparation, the position, the name and surname of the ascertaining agent, the identity data of the offender, the description of the contravention act, the legal norm violated, the evidence administered, the objections of the offender and the signatures of the parties. Failure to comply with the content requirements provided by Article 443 entails, according to Article 445 of the Code, the nullity of the report, with the consequence of the impossibility of engaging the contravention liability based on an act hit by nullity.

This normative architecture was conceived in the logic of direct, direct ascertainment of the deed by a human agent: the ascertaining agent personally perceives the contravention, comes into contact with the offender, informs him of the deed retained, gives him the opportunity to formulate objections and records all this in a written document, which he personally signs and hands over to the offender [9]. This procedural dynamic contains, by itself, a set of implicit guarantees in favour of the sanctioned person: the possibility of knowing in real time the findings of the agent, of contesting them on the spot, of requesting the recording of objections and of identifying the author of the act. It is precisely these implicit guarantees that disappear in the context of the automatic finding and electronic form of the report, generating the legal vulnerabilities that the present research subjects to analysis.

In the field of road traffic, the general normative framework is completed by the Road Traffic Regulation approved by Government Decision No.357/2009, which establish the rules of conduct of traffic participants and constitute the material basis of the contraventions provided for in Chapter XIII of the Contravention Code. At the same time, the regulations on the approval and metrological verification of the technical equipment used in the automatic detection of traffic contraventions – fixed speed control cameras, license plate recognition systems, traffic light monitoring devices – complete the applicable regulatory framework, as the legality of the automatic finding is directly conditioned by the compliance with the technical and metrological requirements imposed on these equipment. Equipment that is not used according to the approval specifications or whose

metrological checks are expired produces records that have no probative value, which directly affects the legality of the report issued on the basis of them.

Therefore, the analysis of the legality and procedural compliance aspects of the electronic traffic contravention report cannot be restricted to the examination of the strictly procedural rules of the Contravention Code, but requires a systemic approach, which integrates both the provisions on the electronic form of the document, the special legislation on the electronic signature and the electronic document, the metrological regulations applicable to automatic detection equipment and European standards of the right to a fair trial. This systemic approach is the one that the present research follows in the following sections [12].

The legal recognition of the electronic form of the contravention report in Moldovan law represents a relatively recent legislative development, which occurred in the broader context of the policy of digitization of public services promoted by the Republic of Moldova in recent years, including within its European integration path. This evolution materialized by the introduction of paragraph (1^1) in Article 440 of the Contravention Code, a provision which, for the first time expressly and with a general vocation, enshrines the possibility for contravention facts to be established, examined and resolved in electronic form, together with the traditional written form on paper.

According to Art.440 para. (1^1), the contravention facts may be ascertained, examined and solved by the ascertaining agent in writing, on paper or in electronic form, or by converting the respective documentation into an easily accessible electronic format, including the use of the simple electronic signature, the concrete way of examining and solving the contravention cases in electronic form being established by Government decision. The text of the rule, although concise, produces legal effects of considerable magnitude, as it fundamentally modifies the procedural paradigm of the contravention finding, extended until the moment of its adoption exclusively on the written form on physical support.

From the perspective of the legislative technique, Art.440 para. (1^1) establishes three distinct and equivalent ways of carrying out the contravention procedure. The first is the classic written form, on paper, which still remains a valid option and is not replaced, but only completed by the other two. The second is the electronic form itself, in which the entire process of finding, examining and solving is carried out in a digital environment, without a physical medium [17]. The third is the hybrid form, consisting of converting classic documentation into an easily accessible electronic format, a pragmatic solution designed to facilitate the gradual transition from the traditional to the digital procedure, without imposing a sudden break with the existing administrative practice. This tripartition reflects a flexible and realistic approach of the legislator, which recognizes that the digitalization of the Moldovan public administration is not uniform and that not all competent authorities have, at the same time, the technical infrastructure necessary for the full implementation of the electronic form.

However, the rule contains two aspects of legislative technique that give rise to serious reservations from the perspective of legality and procedural safeguards. The first aspect concerns the standard of the electronic signature accepted for the authentication of the electronic report. Art.440 para. (1^1) refers exclusively to the simple electronic signature, without mentioning the advanced or qualified electronic signature, regulated by Law No.91/2014 on electronic signature and electronic document. However, in the hierarchy established by this particular law, the simple electronic signature represents the lowest level of security and authentication, not necessarily guaranteeing the certain iden-

tity of the signatory and the integrity of the document after signing. In a matter in which the act produces direct sanctioning consequences on the person, the acceptance of the simple electronic signature as a sufficient instrument for authenticating the contravention report appears as a questionable legislative option, likely to generate vulnerabilities both regarding the formal validity of the act and the possibility of its effective challenge by the offender. It is true that practical and financial arguments can justify this choice - the implementation of the qualified electronic signature at the level of all ascertaining agents involves significant costs and technical infrastructure, but the considerations of administrative efficiency cannot prevail, in a state of law, over the procedural guarantees of the sanctioned person.

The second problematic aspect concerns the delegation to the Government of the regulation of the concrete way of conducting the electronic contravention procedure. This delegation must be analyzed in the light of the principle of reserve of the organic law, enshrined in Art.72 para. (3) of the Constitution of the Republic of Moldova, according to which the organization and conduct of the contravention process is a matter reserved to the organic law. The Contravention Code itself is an organic law, adopted in compliance with this constitutional requirement. Allowing the Government to establish by decision – a normative act of lower rank than the organic law – the manner in which the contravention procedure is carried out in electronic form, including the related procedural guarantees, raises a serious problem of hierarchy of legal norms. The Constitutional Court of the Republic of Moldova has consistently held that the principle of legality obliges the legislator to clearly and predictably regulate the competence of the authorities in areas with a direct impact on the fundamental rights of the person, and the law must specify with sufficient clarity the extent of the discretion granted to the executive authorities, in order to provide the person with adequate protection against arbitrariness. The aspects related to the procedural rights of the offender, the conditions of validity of the electronic contravention act and the guarantees of the right to defense cannot be left, without raising problems of constitutionality, to the normative discretion of the Executive.

This vulnerability acquires an acute practical dimension given that, at the date of the present investigation, the Government decision provided by Art.440 para. (1^1) has either not been adopted in its full form or does not exhaustively cover all relevant procedural aspects of the electronic form, thus leaving a regulatory vacuum with direct consequences for administrative and judicial practice. Ascertaining agents applying the electronic procedure [4] in the absence of a complete and clear governmental framework, act in an area of legal uncertainty, with the risk that the issued documents will be annulled by the courts on the grounds of non-compliance with the legal process.

The special rule applicable in the field of road traffic is represented by Art.443^1 of the Contravention Code, which regulates the ascertainment of contraventions with the help of certified technical means or approved and metrologically verified technical means, operating in an automated regime. This norm mainly concerns the contraventions provided for in Art. 236 – Exceeding the speed of traffic, Art. 238 – Non-observance of light signals, and Art. 240 para. (2) of the Code, facts which, due to their instantaneous nature and the high frequency of their commit, are most effectively ascertained by automatic road surveillance systems [10]. Art. 443^1 introduces a procedure derogating from the general rule of direct finding, based on the self-notification of the ascertaining agent on the basis of the records produced by the approved technical equipment, and regulates the mechanism of identification of the driver of the vehicle when it cannot be made directly from the registration.

Corroboration of Art.440 para. (1¹) with Art.443¹ thus outlines the basic normative framework of the electronic report of finding the traffic contravention in Moldovan law. The critical analysis of this framework, from the perspective of formal legality, substantive legality and procedural compliance, is the subject of the following sections.

The formal legality of the traffic contravention report, regardless of the medium on which it is issued, paper or electronic, is conditioned by compliance with the imperative requirements of form and content established by the Contravention Code. This conditioning is not purely technical or administrative, but a substantial one: the formal requirements of the report are, in essence, procedural guarantees established in favor of the sanctioned person, the non-compliance of which entails, according to Art.445 of the Code, the nullity of the act and the impossibility of engaging contravention liability on its basis. The analysis of the formal legality of the electronic report therefore involves examining the compatibility of the electronic form with each of the mandatory requirements laid down by law, identifying the aspects where that compatibility is problematic and assessing the legal consequences of any inconsistencies.

Article 443 of the Contravention Code exhaustively lists the mandatory content elements of the report on the contravention. These include: the date and place of drawing up the document, the position, name and surname of the ascertaining agent, the identity data of the person in respect of whom the document is drawn up, the description of the contravention with the indication of the relevant circumstances, the legal norm violated, the evidence administered, the mention regarding the rights and obligations of the sanctioned person, his/her objections, if any, and the signatures of the ascertaining agent and the offender. Each of those elements fulfills a distinct legal function and contributes, as a whole, to ensuring that the contravention act is complete, authentic and effectively contestable.

The transposition of those requirements into the electronic form of the Minutes raises a number of specific difficulties on careful analysis. The first of these concerns the signature of the ascertaining agent. In the classic form, the handwritten signature of the ascertaining agent fulfills a double function: it certifies the identity of the author of the document and expresses the personal assumption of the recorded findings, engaging the official's liability for their accuracy and veracity. In electronic form, that function must be performed by the electronic signature, the type and level of security of which directly determines the degree of certainty as to the identity of the signatory and the integrity of the document. Or, as stated in the previous section, Art.440 para. (1¹) admits the simple electronic signature, which offers lower guarantees than those provided by the advanced or qualified electronic signature regulated by Law No.91/2014.

This legislative choice becomes even more problematic in the specific context of the automatic finding, regulated by Art.443¹, in which the report is not drawn up in the presence of the offender or as a result of the direct perception of the act by the ascertaining agent, but is generated on the basis of the recordings of an automated technical system. In this case, the electronic signature of the ascertaining agent no longer certifies the direct perception of the fact, but only the administrative validation of the technical data produced by the equipment. The signature guarantee function is therefore structurally diminished compared to the classic form, which makes the low level of security of the simple electronic signature all the more difficult to justify.

The second difficulty concerns the signature of the offender. In the classic procedure, the offender signs the report, confirming that he has become aware of its content, or refuses the signature, the refusal being recorded by the ascertaining agent. In elec-

tronic form, and in particular in the case of automatic finding, the offender is not present at the time of drawing up the document and therefore cannot sign the report at the time of its issuance. The Contravention Code provides, by Art.443 para. (8), the possibility of concluding the report in the absence of the offender, but this provision was designed for exceptional situations in the classic procedure, not as a general rule of automatic finding. Its extension to the electronic procedure, without explicit compensatory guarantees, may affect the right of the offender to know and challenge in real time the findings recorded in the act concerning him [15]. This issue has already generated jurisprudence at the national level: the Constitutional Court of the Republic of Moldova was notified of the exception of unconstitutionality of the text that allows the conclusion of the report in the absence of the person concerned, precisely in the context of a file on a contravention found with automated technical means, a sign that the normative tension identified in the present analysis is already reflected in the judicial practice.

The principle of legal equivalence between the electronic document and the paper document is enshrined in Law No.91/2014 on Electronic Signature and Electronic Document, which establishes that an electronic document signed with a qualified electronic signature has the same legal value as a document signed holographically on paper. This principle is essentially conditional: equivalence does not operate automatically and unconditionally for any electronic document, but only for those that meet the technical and legal requirements laid down by law, in particular the requirement of a qualified electronic signature.

The problem that arises in the context of the electronic contravention report is that Art.440 para. (1^1) admits the simple electronic signature, while Law No.91/2014 conditions full legal equivalence to the use of the qualified electronic signature. Therefore, an electronic contravention report signed with a simple electronic signature does not benefit, automatically and unconditionally, from the same legal value as the classic handwritten report. This inconsistency between the general rule – Law No.91/2014, and the special rule – Art.440 para. (1^1) of the Contravention Code – creates an area of legal ambiguity with direct practical consequences: the courts seized with appeals to the electronic minutes may reach divergent solutions regarding the legal value of the act, depending on the interpretation they adopt regarding the relationship between the two norms.

From the perspective of the principle of lex specialis derogat legi generali, it could be argued that Art.440 para. (1^1), as a special rule in contravention matters, derogates from the requirements of Law No.91/2014 and establishes its own regime of the electronic signature in the contravention procedure. This interpretation is technically possible, but it is not without risks: special rules derogating from general procedural safeguards are, by their nature, liable to be censured from the perspective of constitutionality and compatibility with European standards of the right to a fair trial. A derogation that reduces the level of security and authentication of the sanctioning act compared to the general standard applicable to electronic documents can only be justified by public interest arguments proportionate to its impact on the rights of the sanctioned person.

A distinct dimension of the formal legality of the electronic traffic contravention report is the requirements for homologation and metrological verification of the technical equipment used in the automatic finding. Art. 443^1 of the Contravention Code expressly conditions the legality of the automatic finding to the use of certified or approved and metrologically verified technical means, in accordance with the provisions of the applicable normative acts. That condition is not formal, but substantial: equipment not used in accordance with its technical approval specifications, whose metrological checks have

expired or which has not been correctly displayed at the time of the finding, produces records that have no probative value, with the direct consequence that the report issued on the basis of them is null and void.

The normative framework on the homologation and metrological verification of the equipment for the automatic ascertainment of traffic contraventions is regulated, in the Republic of Moldova, by secondary normative acts adopted on the basis of the Metrology Law No.19/2016, which establish the technical conditions that the measuring devices used for legal purposes, including in the contravention procedure, must meet. Compliance with the international standards of the International Organization of Legal Metrology is an essential benchmark in assessing the legality of the use of technical finding equipment, as these standards define the minimum requirements of accuracy, reliability and metrological traceability that measuring devices must meet in order for their results to be admissible as evidence in sanctioning proceedings.

From the perspective of the legality of the electronic report, the metrological issue has a particular significance: unlike the classic finding, in which the ascertaining agent can be heard on the conditions under which he used the technical means of ascertainment, in the case of automatic ascertainment, the information on the technical and metrological condition of the equipment at the time of registration is accessible to the offender only by express request addressed to the competent authority. However, the Contravention Code does not explicitly regulate the right of the offender to request and obtain this information during the appeal procedure, which generates the informational asymmetry identified as a central vulnerability of the current system, which the present research will return to in the analysis of procedural compliance.

If the formal legality of the electronic report concerns the conditions of form and content of the act, its substantive legality concerns a distinct and, from the perspective of the fundamental rights of the sanctioned person, more profound: to what extent does the content of the act reflect a certain factual reality, proven by legal and sufficient means of evidence, and under what conditions that reality may be called into question and overturned by the offender in the context of the challenge procedure. This dimension of legality is governed, in Moldovan contravention law, by two legal mechanisms with a direct impact on the procedural balance between the sanctioning authority and the sanctioned person: the presumption of veracity of the report and the presumption of liability of the vehicle owner established by Art.16[1] of the Contravention Code. Both mechanisms, designed in the logic of the classic declaration procedure, raise serious legal problems when applied in the context of automatic declaration and electronic report.

The report of finding the contravention benefits, in Moldovan law, from a presumption of relative truthfulness, according to which the findings recorded by the investigating officer are presumed to reflect the factual reality, until proven otherwise. That presumption, although not expressly set out in a single rule of the Contravention Code, is inferred from all the rules on the probative value of the report and from the settled case-law of the national courts, which have repeatedly held that the report constitutes the main means of proof in the contravention case and that it is the responsibility of the sanctioned person to overturn it.

The basis of this presumption lies in the special capacity of the ascertaining agent: he is a public official vested by law with powers of ascertainment, who acts in the exercise of his function and who, by his signature, personally assumes responsibility for the accuracy and veracity of the findings recorded. The presumption of veracity is, in essence, a presumption of good faith and professional competence of the civil servant, justified by

his special legal status and by the disciplinary, contravention or criminal liability that he may incur by recording false or inaccurate data in the official documents he draws up.

The fundamental problem that arises in the context of automatic finding is that this legal reason for the presumption of truthfulness is no longer fully applicable. The electronic report generated on the basis of the records of an automated technical system does not reflect the direct perception of the act by a human agent, but the result of a process of capturing, processing and interpreting the data carried out by a technical equipment, without the direct intervention of an official at the time of the finding. The ascertaining officer who subsequently validates the electronic report did not personally perceive the deed and can only guarantee, by his own signature, that the technical data produced by the equipment were correctly transposed into the contravention act, not that the equipment worked correctly, that the recording certainly concerns the vehicle and the alleged conduct or that the data were not altered in the process of transfer and processing.

Therefore, the extension of the presumption of veracity to the electronic automatic finding report operates, in reality, a double presumption: the presumption that the ascertaining agent acted correctly in validating the technical data and the presumption that the technical equipment functioned correctly at the time of registration. This double presumption, combined with the burden of proof to the contrary on the offender, creates a significant procedural imbalance, all the more serious as the sanctioned person does not have, within the current regulatory framework, clear and accessible procedural mechanisms through which to verify and challenge the technical functioning of the finding equipment. The Court seised of the challenge to such a report is, in turn, placed in the difficult position of assessing the legality and merits of an act whose evidentiary basis is of an exclusively technical nature, without having an explicit procedural framework allowing it to administer and evaluate the relevant technical evidence.

This issue is not specific exclusively to Moldovan law. The European Court of Human Rights has examined similar mechanisms for the automatic detection of traffic offences in its case-law and has held that the use of presumptions of fact or law in penalty matters is not, in principle, incompatible with Article 6(2) of the Convention, which guarantees the presumption of innocence, provided that such presumptions remain within reasonable limits, taking into account the seriousness of the stakes involved, and to persevere the effective right of defense of the accused person. The Court pointed out that States have a margin of discretion in establishing the presumptions applicable in contravention matters, but this margin is not unlimited and cannot lead to situations in which the sanctioned person is effectively deprived of the possibility of presenting his defence before an independent and impartial court. Applying these principles to the situation in Moldovan law, it can be concluded that the presumption of veracity of the electronic report, in the absence of clear procedural mechanisms allowing the offender access to the technical data of the equipment and their effective challenge, risks exceeding the limits of reasonableness imposed by European jurisprudence [6].

A second dimension of the material legality of the electronic traffic contravention report is the mechanism established by art. 16^1 of the Contravention Code, by which the contravention liability is extended, under certain conditions, to the owner of the vehicle with which the contravention was committed, regardless of his capacity as driver of the vehicle at the time of the act. According to this provision, the natural or legal person who owns the vehicle with which the contravention was committed is liable to contravention liability in the form of a fine if, within 60 working days from the receipt of the request provided for in Art. 443^1, he does not communicate the identity of the driver of the vehicle

at the time of the commission of the act.

This legal construction, although rational from the perspective of procedural efficiency and combating the traffic contravention phenomenon, raises a problem of principle of major constitutional significance: it operates, in essence, a derogation from the principle of personal liability, enshrined in Art.6 para. (1) of the Contravention Code, according to which only the person guilty of committing the contravention is liable to contravention liability. The owner of the vehicle can be held liable for the contravention not because he committed the contravention himself, but because he did not provide the authority with the information necessary to identify the actual offender. That liability is therefore indirect and objective, independent of the owner's guilt in relation to the contravention act itself.

The tension with the presumption of innocence, guaranteed by Article 21 of the Constitution of the Republic of Moldova and Article 6 paragraph 2 of the European Convention on Human Rights, is obvious: the mechanism established by Article 16^1 implicitly presumes that the owner of the vehicle is either the driver of the vehicle at the time of the crime, or at least able to provide the identity of the driver, thus placing on him the burden of proving that he is not in any of these situations. This reversal of the burden of proof, although not total - the owner can rebut the presumption by communicating the identity of the driver or by proving the objective impossibility of providing this information, affects the procedural balance to the detriment of the person concerned and can lead, in practice, to situations in which the owner of the vehicle is sanctioned without his guilt in relation to the contravention having been effectively established.

The European Court of Human Rights has examined similar mechanisms in cases concerning the liability of vehicle owners for automatically established traffic offences and has adopted a nuanced position: it has accepted, in principle, the compatibility of such mechanisms with Article 6 of the Convention, provided that the owner's obligation to provide information does not amount to an obligation to self-incriminate and that the owner has real and effective means of defence. In relation to the Moldovan regulation, a careful assessment is required of the extent to which the 60-working day period provided by Art. 16^1 is sufficient for the owner to identify and communicate the identity of the driver, especially in cases where the vehicle is used by several persons or where the owner is a legal entity with a large number of employees with access to the vehicles in the fleet.

A final dimension of substantive legality concerns the legal status of the recordings produced by automated technical equipment as a means of evidence in the contravention procedure. The Contravention Code regulates the admissible means of evidence in the contravention case by Art.420 et seq., listing among them: the report of finding, the statements of the parties, the statements of witnesses, documents, audio and video recordings, expert reports and other means provided by law. The recordings produced by automatic road surveillance systems fall, in principle, into the category of video recordings, but their technical particularities – automated nature, large volume of data, possibility of technical error 6 give them an evidentiary specificity that is not adequately reflected by the current regulatory framework.

The probative value of an automated recording depends, essentially, on the technical reliability of the equipment that produced it, on the integrity of the data in the storage and transfer process and on the correctness of their interpretation by the ascertaining agent. None of these conditions is explicitly and systematically verified in the current contravention procedure, which means that the court is put in a position to assess the probative value of the automatic registration without having a clear normative framework

indicating the relevant evaluation criteria and without the offender having had effective access to the technical information necessary to formulate documented objections. This regulatory gap represents, in our opinion, a systemic vulnerability of the current framework, which cannot be remedied by non-unitary judicial practice, but requires an express and coherent legislative intervention.

The comparative examination of the way in which other states have regulated the electronic traffic contravention report offers the Moldovan researcher not only a critical perspective on the legislative solutions adopted in legal systems with longer experience in the field, but also a repertoire of transferable good practices, insofar as they are compatible with the specifics of the domestic legal system. The comparative analysis does not aim at the mechanical import of foreign solutions, but at identifying the legal principles and mechanisms that have demonstrated efficiency in balancing the two apparently contradictory fundamental imperatives of any system of automatic finding of contraventions: the administrative efficiency of the sanctioning procedure and the effective guarantee of the rights of the sanctioned person.

France is one of the most mature European systems for automated traffic offence detection, with more than two decades of experience in operating an extensive fleet of fixed and mobile speed cameras. The French normative framework, structured around the Highway Code and the Code of Criminal Procedure, has solved the problem of identifying the driver of the vehicle through a mechanism similar to that established by Article 16^1 of the Moldovan Contravention Code, imposing on the owner of the vehicle the obligation to communicate the identity of the driver under penalty of a separate fine. The reference element of the French model, relevant for the present research, lies, however, not so much in the identification mechanism, but in the institutional and technical infrastructure that supports it: a centralised information system for the management of automatically ascertained traffic offences – Système de Contrôle Automatisé, which ensures the complete traceability of each recording, from the moment of capture to the issuance of the contravention act and its communication to the offender, and which allows the verification, at any time, of the technical and metrological condition of the finding equipment. That complete traceability of technical data represents, in the French system, the fundamental guarantee of the legality of electronic evidence and of procedural balance in the appeal procedure. The offender has access, through a dedicated electronic portal, to all the relevant technical data of the finding, including the photograph or video recording that substantiates the report, the identifier of the equipment and the date of its last metrological verification [21, p.135-146].

Romania has traveled, in the field of automatic ascertainment of traffic offences, a sinuous normative path, marked by numerous legislative changes and by an initially non-unitary jurisprudence on the validity of the reports issued based on the recordings of fixed speed cameras. The Romanian experience is relevant for the present research precisely because of the dysfunctions it generated, constituting a model to follow not so much through the solutions adopted, but through the negative lessons it offers. The lack of a clear regulatory framework on the approval of equipment, the absence of explicit regulations regarding the right of the offender to access the technical data of the finding and the uncertainty regarding the conditions of validity of the electronic report have generated, in Romanian judicial practice, a high rate of admission of appeals and a significant jurisprudential instability, with negative consequences both on the efficiency of the sanctioning system, and on citizens' trust in its legitimacy. The Romanian lesson for the Moldovan legislator is clear: the absence of a complete and coherent normative

framework does not produce administrative efficiency, but procedural chaos.

Estonia, recognized at European level as a model of e-government and digitization of public services, provides an example of the harmonious integration of the electronic contravention procedure into the broader architecture of digital administration. The specificity of the Estonian model lies in the fact that the digitalization of the contravention procedure has not been treated as an isolated issue of contravention law, but as a component of an integrated system of digital identity and electronic management of administrative documents, based on high cybersecurity standards and the use of the qualified electronic signature for all acts with legal effects on the rights of individuals. The electronic traffic offence report is, in the Estonian system, signed with a qualified electronic signature, stored in a secure government database and accessible to the offender through the national electronic services portal, which allows him to view the document, access the related technical evidence and file the appeal in electronic format, within the same integrated system. This systemic approach, based on high technical standards and real digital accessibility for the citizen, represents, in our opinion, the most relevant model for the Republic of Moldova, both in terms of its geographical and institutional proximity to the European space, and in terms of its compatibility with the digitization commitments assumed by the Republic of Moldova within the European integration process.

The analysis of the national regulatory framework, in conjunction with the comparative examination of the solutions adopted in the reference states, leads to the identification of a set of legislative interventions necessary to remedy the legal vulnerabilities found and to ensure a complete, coherent and compatible regulatory framework with the European standards of the right to a fair trial.

The first proposal aims to revise the standard of the electronic signature admitted for the authentication of the electronic contravention report. Art.440 para. (1^1) of the Contravention Code should be amended in the sense of imposing at least the advanced electronic signature, and preferably the qualified one, for the authentication of the electronic traffic contravention report. This amendment would ensure the full compatibility of the electronic contravention act with the requirements of Law No.91/2014 on the electronic signature and the electronic document, would guarantee the integrity and non-repudiation of the act and would eliminate the area of legal ambiguity generated by the current inconsistency between the two norms. The administrative costs of implementing the qualified electronic signature at the level of the ascertaining agents can be managed by staggering the implementation and by capitalizing on the digital identity infrastructure already existing in the Republic of Moldova.

The second proposal aims to expressly regulate the right of the offender to access the technical data of the automatic finding in the context of the appeal procedure. The Contravention Code should be supplemented by a provision explicitly recognising the right of the sanctioned person on the basis of an electronic report to request and obtain, within the time limit for appeal, the relevant technical information on the finding equipment used: the approval certificate, the metrological verification documents within the deadline, the unique identifier of the equipment and, where applicable, the operating logs of the system for the relevant period. This regulation would remedy the informational asymmetry identified as a central vulnerability of the current system and would ensure the offender the real, not just formal, possibility to prepare and defend his defense before the court.

The third proposal concerns the revision of the deadline for challenging the electronic traffic contravention report. The current term of 15 days provided by Article 448

of the Contravention Code, designed to challenge the classic reports, is insufficient for the preparation of a documented defense in the case of electronic reports based on automatic findings, which involves obtaining technical information, consulting a specialist and formulating specific objections. An extension of that period to at least 30 days, with the possibility of its suspension for the period during which the offender awaits the provision of the technical data requested to the authority, would ensure a fairer balance between the requirements of the effectiveness of the contravention procedure and the effective rights of defence of the sanctioned person.

The fourth proposal, of a structural nature, aims to develop an integrated regulatory framework on the electronic finding of traffic contraventions, which would bring together in a coherent normative act - either through a special law or through a separate chapter of the Contravention Code - all the rules applicable to this matter, currently dispersed in the Contravention Code, Law no. 91/2014, metrological legislation and secondary normative acts. This thematic codification would eliminate the legal uncertainty generated by the coexistence of dispersed and partially contradictory rules, would provide practitioners - ascertaining officers, lawyers, judges - with a clear and accessible regulatory framework and would strengthen the legitimacy of the system of automatic detection of traffic offences in the public perception, through regulatory transparency and legal predictability.

Conclusions. The research undertaken in the present study demonstrated that the electronic traffic contravention report represents, in the current Moldovan law, a legal institution in an early and incomplete regulatory stage, characterized by the significant gap between the reality of the contravention practice – in which the automatic detection of traffic contraventions is already a current operational tool – and the level of normative maturity of the legal framework that governs it, insufficiently articulated to respond coherently and completely to the requirements of legality and procedural compliance that a sanctioning procedure imposes in a state governed by the rule of law.

In the light of the above, the proposals for *a ferenda law* formulated in this study: 1) The revision of the electronic signature standard; 2) The urgent adoption of the Government decision provided by Art.440 para. (1^1); 3) The express regulation of the right of the offender to access the technical data of the finding; 4) The extension of the deadline for appealing and the elaboration of an integrated normative framework on the electronic recording of traffic offences. These are not mere technical amendments, but necessary and urgent legislative interventions to align the Moldovan contravention law with the constitutional and conventional requirements of the rule of law [7] and of the fair trial. The implementation of these proposals would also strengthen the public legitimacy of the automatic traffic offence detection system, the long-term effectiveness of which depends crucially on citizens' confidence in its legality and fairness.

Abstract

The distinction between legitimate reporting and entrapment in corruption cases raises significant legal challenges, stemming from the need to maintain a balance between the effectiveness of investigative activities and respect for the right to a fair trial. The analysis of the standards developed in the case-law of the ECtHR highlights the essential role of the principle of fairness in the administration of evidence in preventing the artificial creation of criminal situations by authorities. The credibility of evidence depends on the passive nature of state intervention and on the existence of an autonomous criminal intent on the part of the investigated person.

The study emphasizes the importance of examining the specific circumstances of each case, including the manner in which contact was initiated, the existence of pressure or repeated solicitations, and the prior criminal predisposition of the individual. It identifies the criteria used in ECtHR jurisprudence to determine entrapment, as well as the distinction between merely providing an opportunity and inducing criminal conduct. At the same time, the analysis of the legal framework in the Republic of Moldova and Romania reveals legislative gaps and inconsistent practices, resulting from the absence of an explicit legal definition of entrapment and of clear normative criteria for its delimitation.

In this context, the paper underlines the need to strengthen the domestic legal framework in order to ensure predictability and coherence in the application of criminal law, as well as full alignment with European standards concerning the guarantee of a fair trial.

Keywords: corruption, entrapment, denunciation, fairness in the administration of evidence, fair trial, ECtHR case-law.

STANDARDELE CtEDO PRIVIND PROVOCAREA ȘI LOIALITATEA ADMINISTRĂRII PROBELOR ÎN CAZURILE DE CORUPȚIE

Abstract

Delimitarea dintre denunțul legitim și provocarea la săvârșirea infracțiunii în cauzele de corupție ridică dificultăți juridice semnificative, generate de necesitatea menținerii unui echilibru între eficiența activității investigative și respectarea dreptului la un proces echitabil. Analiza standardelor dezvoltate în jurisprudența CtEDO evidențiază rolul esențial al principiului loialității administrării probelor în prevenirea creării artificiale a situațiilor infracționale de către autorități. Credibilitatea probatoriului depinde de caracterul pasiv al intervenției organelor statului și de existența unei intenții infracționale autonome a persoanei investigate.

Studiul relevă importanța examinării circumstanțelor concrete ale fiecărei cauze, inclusiv a modului de

inițiere a contactului, a existenței unor presiuni sau solicitări repetate și a predispoziției infracționale anterioare. Sunt evidențiate criteriile utilizate în jurisprudența CtEDO pentru identificarea provocării, precum și diferențele dintre oferirea unei simple oportunități și determinarea conduitei infracționale. Totodată, analiza cadrului normativ din Republica Moldova și România indică existența unor lacune legislative și a unor practici neuniforme, determinate de lipsa unei definiții legale explicite a provocării și a unor criterii normative clare de delimitare.

În acest context, se subliniază necesitatea consolidării cadrului normativ intern, în vederea asigurării previzibilității și coerenței aplicării dreptului penal, precum și a alinierii depline la standardele europene privind garantarea procesului echitabil.

Cuvinte-cheie: corupție, provocare, denunț, loialitatea administrării probelor, proces echitabil, jurisprudența CtEDO.

Introduction. Combating corruption is an essential condition for the proper functioning of the rule of law and for maintaining public trust in authorities. In this context, the use of denunciations and special investigative techniques must be carried out in compliance with the principle of fairness in the administration of evidence. The distinction between legitimate reporting and entrapment raises particular difficulties, as exceeding the passive role of authorities may lead to the artificial creation of criminal conduct. The case-law of the ECtHR, reflected in cases such as *Teixeira de Castro* [14], *Ramanauskas* [12], *Khudobin* [11] and *Sandu* [13], has established criteria for identifying entrapment and for assessing the impact of such evidence on the fairness of criminal proceedings. Compliance with these standards is necessary to guarantee the right to a fair trial, as enshrined in Article 6 of the ECHR, as well as to prevent abuses in criminal investigations.

The fight against corruption and organized crime objectively justifies the use of special investigative methods, including infiltration techniques and undercover operations. However, the ECtHR has emphasized that the use of such techniques cannot be separated from the inherent risk of entrapment, which is why it is essential that they remain within clear and controllable limits.

In this regard, legal doctrine has underlined that "the state must detect crimes, not encourage their commission. Law enforcement authorities must identify offences in preparation or in the process of being committed, but not create new offences by inducing an innocent person to commit them" [5].

Methods and materials applied. In the context of analyzing the distinction between legitimate reporting and entrapment, the research requires the use of appropriate methods aimed at ensuring an objective and rigorous assessment of the applicable legal standards, given the complexity of state intervention and the risk of interference with the right to a fair trial, which calls for a systematic and coherent approach.

In preparing this study, both general scientific and legal research methods were employed. The comparative method enabled the analysis of the legal frameworks of the Republic of Moldova and Romania, in relation to the standards developed in the case-law of the ECtHR. The methods of analysis and synthesis were used to examine the relevant legal doctrine and case-law, including landmark judgments such as *Teixeira de Castro*, *Ramanauskas*, *Khudobin*, and *Sandu*. In addition, logical methods, including deduction and induction, were applied in formulating the conclusions and de lege ferenda proposals.

The materials used in the research include national legislation, ECtHR case-law, as well as doctrinal opinions and solutions from the practice of national courts, all of which were examined in order to identify legislative gaps and interpretative trends. The cumulative application of these methods made it possible to develop a coherent analytical framework regarding the distinction between reporting and entrapment and to assess

their impact on the fairness of criminal proceedings.

Discussions and results obtained. The phenomenon of corruption represents one of the most serious threats to the rule of law, affecting not only the proper functioning of public institutions, but also citizens' trust in justice and in public authorities. In efforts to combat this form of criminality, the institution of denunciation plays a central role, through which acts of active corruption can be investigated and sanctioned. However, the distinction between legitimate reporting and entrapment in the commission of a corruption offence raises a number of particularly complex legal and ethical issues.

In the meaning of the ECtHR case-law, entrapment exists where state agents or persons acting at their request do not confine themselves to the passive investigation of criminal activity, but exert an influence such as to incite an individual to commit an offence which he or she would not have committed without such intervention, in order to make it possible to establish the offence and initiate criminal proceedings [6, point. 256].

Such conduct is contrary to the principle of fairness in the administration of evidence and undermines the right to a fair trial as guaranteed by Article 6 of the ECHR [4]. At the same time, the absence of clear criteria for distinguishing between reporting and entrapment has led, in judicial practice, to contradictory solutions and to the exclusion of essential evidence.

The ECtHR has consistently established the principle of fairness in the administration of evidence as an essential dimension of the right to a fair trial, guaranteed by Article 6 of the ECHR. According to this principle, state authorities are required to conduct investigative activities in a fair and proper manner, without artificially creating criminal situations and limiting themselves strictly to the detection of already existing offences. Exceeding these limits – by inciting or inducing a person to commit an offence which, in the absence of state intervention, he or she would not have committed – constitutes a form of entrapment that leads to the exclusion of the evidence thus obtained. The ECtHR has expressly emphasized that the role of law enforcement authorities is to carry out passive investigations and to collect evidence fairly, without substituting the individual's will through pressure, insistence, or repeated solicitations.

The admissibility of using informants, collaborators, and undercover agents is not unconditional. The Court has held that reliance on sources such as confidential informants may be compatible with the Convention at the investigative stage; however, the subsequent use of the results of such operations to justify a conviction raises distinct issues of fairness. Consequently, such measures are permissible only if they are accompanied by adequate and sufficient safeguards against abuse, in particular through the existence of clear and foreseeable procedures governing the authorization, implementation, and supervision of undercover operations.

The ECtHR judgment in *Teixeira de Castro v. Portugal* [14] constitutes a fundamental benchmark for defining the concept of entrapment. In this case, the Court found that undercover police officers had incited the applicant to supply drugs, even though he had not previously demonstrated any criminal predisposition. The European Court held that Article 6 of the ECHR had been violated, as the authorities had artificially created the offence, thereby undermining the fairness of the criminal proceedings. Through this judgment, the Court clearly distinguished between legitimate undercover investigative activity and prohibited entrapment, holding that the state cannot generate criminal situations solely in order to secure subsequent convictions.

The ECtHR draws a distinction between creating an opportunity to commit an offence and inducing its commission. The actions of authorities are permissible when they

merely provide an opportunity for the manifestation of an already existing criminal intent; however, they amount to entrapment when they themselves generate the criminal decision. The decisive element is not the participation of undercover agents, but the origin of the criminal intent.

Contemporary legal doctrine has noted that undercover operations raise difficulties not only from an evidentiary perspective, but also in terms of the legitimacy of state intervention in the criminal sphere.

Thus, Bruce L. Hay [8] emphasizes that the specific nature of such operations lies in the fact that authorities do not merely limit themselves to detecting offences, but may actively participate in their creation or facilitation, which raises serious issues of legitimacy. In his view, these operations fulfill two distinct functions: an informational one, aimed at identifying individuals predisposed to commit offences, and a preventive one, consisting in deterring criminal behavior by creating uncertainty as to the authenticity of criminal opportunities.

However, these two functions are not fully compatible, as investigative effectiveness requires the secrecy of the operation, whereas preventive effectiveness, on the contrary, implies public awareness of the existence of such methods.

An essential contribution of the author lies in highlighting the risk that such operations may lead to the erroneous identification of individuals who, in the absence of state intervention, would not have committed offences, thereby calling into question the fairness of their punishment. From this perspective, the undercover operation appears as a genuine behavioral test, in which the individual's reaction to a stimulus created by the authorities is used to infer his or her predisposition to commit offences [8].

In the same vein, Jonas Haeg [7] analyzes entrapment from the perspective of manipulation, showing that the state agent acts on the basis of concealed intentions, aiming not only to elicit a reaction from the targeted individual, but to induce that person to commit an offence for the purpose of subsequent punishment.

From this perspective, the problem does not lie solely in the fact that the state creates or stimulates criminal behavior, but also in the fact that the punishment subsequently imposed completes a prior manipulative conduct. Even if the entrapped person may remain culpable, their sanctioning becomes questionable in terms of the moral and legal legitimacy of state intervention.

A relevant thesis derived from this analysis is that the issue of entrapment cannot be explained solely by the absence of the individual's guilt, since, from a subjective perspective, the person reacts to a criminal opportunity similar to that created by a private individual. The legal difficulty, in reality, stems from the fact that the state, through its agents, actively intervenes in shaping the criminal situation and selectively determines who ends up committing the offence, which raises serious concerns regarding the legitimacy and fairness of the application of criminal law [7].

The ECtHR judgment in *Ramanauskas v. Lithuania* [12] brings to the forefront the role of informants in the investigation of corruption offences. The Court held that the involvement of informants is legitimate only insofar as they do not exert active inducement on the targeted individual. The ECtHR found that, in the absence of objective indications of prior criminal predisposition and where the person is subjected to repeated solicitations, the actions of the authorities and their collaborators amount to entrapment. This case-law establishes two fundamental criteria: the existence of prior criminal predisposition and the intensity of the pressure exerted by state agents or informants acting under their supervision.

In this context, the essential legal distinction between an undercover agent and an agent provocateur lies in the origin of the criminal intent. An undercover agent observes and documents an already existing criminal decision, whereas an agent provocateur induces its emergence. Therefore, it is not the participation of authorities in the material act that is prohibited, but the influence exerted on the formation of the criminal intent.

A particularly relevant thesis emerging from doctrinal analysis is that the issue of entrapment cannot be explained by the absence of the individual's guilt, since, from a subjective perspective, the person reacts to a criminal opportunity similar to that created by a private individual. In reality, the legal difficulty stems from the fact that the state, through its agents, actively intervenes in shaping the criminal situation and selectively determines who ultimately commits the offence, which raises serious concerns regarding the legitimacy and fairness of the application of criminal law [17].

A distinction must be made between situations in which the informant acts under the instructions and control of the authorities (in which case the standards on entrapment apply in full) and those in which the initiative belongs to a private individual who did not act under state control; in the latter case, the issue is examined primarily under the general rules governing the administration of evidence, rather than as a typical problem of police entrapment [6, point 251].

In the ECtHR judgment in Khudobin v. Russia [11], the Court found that state agents had exerted concrete forms of excessive pressure, through threats and repeated solicitations, until the applicant yielded and committed the offence. This conduct transformed the investigation into a strategy of coercion, incompatible with the principle of a fair trial. Accordingly, the Court reaffirmed that not only the direct initiative to instigate the commission of an offence, but also persistent insistence and continuous pressure may constitute elements of prohibited entrapment.

In the same vein, legal doctrine has emphasized that, in the context of corruption offences, the offering of a sum of money by an undercover investigator to the targeted individual exceeds the limits of passive conduct and constitutes a form of entrapment, as it directly influences the formation or consolidation of the criminal intent. Entrapment is considered to exist where there are no prior reasonable suspicions, the state agent exceeds the role of a passive observer, and there is a causal link between the agent's conduct and the commission of the offence, thereby transforming the investigative activity into a mechanism for creating the criminal act [11].

The ECtHR judgment in *Sandu v. Moldova* [13] represents a direct application of ECtHR standards at the national level. The Court emphasized that the use of undercover agents and informants in the Republic of Moldova must comply with the criteria already established in its case-law. It found that evidence obtained through the active incitement of the defendant cannot serve as a basis for a conviction, as such a practice would undermine the fairness of the criminal proceedings. Through this decision, the ECtHR highlighted the deficiencies of the national legal framework and imposed on national courts the obligation to apply European standards directly in matters of entrapment.

The consistent case-law of the ECtHR shows that the issue of entrapment is not merely a matter of evaluating evidence, but one of procedural fairness. Once the defendant raises the issue of entrapment, national courts are required to examine this claim effectively, by assessing the circumstances of the investigative operation, the manner of its authorization, the role of undercover agents, and the conduct of the informant. The lack of a genuine and thorough analysis of this defence in itself leads to a violation of Article 6 of the ECHR, regardless of the strength of the evidence obtained [9; 10].

By correlating the substantive and procedural standards developed in its case-law, the Court has shaped a genuine legal test for judicial entrapment.

The analysis of ECtHR case-law reveals a set of cumulative criteria that allow for the identification of situations of judicial entrapment:

– The absence of an objective criminal predisposition of the targeted individual prior to contact with state agents or their collaborators;

– The existence of repeated solicitations or pressures exceeding the passive role of the authorities;

– The criminal initiative originating primarily from state agents or from informants acting under their control;

– The lack of preparatory acts demonstrating the individual's autonomous intent to commit the offence;

– The use of state resources for the purpose of artificially creating the offence.

The cumulative fulfillment of these elements leads to the conclusion that judicial entrapment has occurred, and the use of evidence thus obtained compromises the fairness of the criminal proceedings as a whole, within the meaning of Article 6 of the ECHR. In such a situation, the violation cannot be considered remedied by a formal evaluation of the evidence or by upholding a conviction based on a reconstruction of evidence that preserves, directly or indirectly, the effects of the entrapment operation. The ECtHR standard requires that no conviction be based on an offence artificially created through the intervention of the authorities or their collaborators. The concrete procedural remedy (exclusion of evidence, termination of proceedings, acquittal, or other solutions provided by domestic law) must be effective and capable of removing the consequences of entrapment, ensuring that the individual is not convicted for an offence whose criminal initiative was generated by the state.

In order to ensure the effective application of ECtHR standards, the analysis of entrapment must be carried out through a structured examination of the evidentiary material. The court is required to examine, in sequence:

1) The existence of prior objective indications of criminal predisposition;

2) The manner in which contact between the agent/informant and the investigated person was initiated;

3) The development of the interaction and the possible existence of insistence or pressure;

4) The actual role of state authorities in determining the criminal decision;

5) Whether the offence would have been committed in the absence of state intervention.

Only by following these steps can it be determined whether the operation remained passive or, on the contrary, constituted judicial entrapment.

At the national level, Article 94 para. (1) point 11) of the Code of Criminal Procedure provides that "in criminal proceedings, the following shall not be admissible as evidence and shall therefore be excluded from the case file, may not be presented before the court, and may not serve as a basis for a judgment or other judicial decisions: ... data obtained through the provocation, facilitation, or encouragement of a person to commit an offence" [2].

In the same spirit, Article 36 para. (6) of Law No.59/2012 on special investigative activity expressly provides that an undercover investigator is prohibited from provoking the commission of offences [16]. This provision confirms the obligation of the state to limit itself to the detection and documentation of criminal acts, without actively intervening in

their determination. Therefore, the prohibition of entrapment is not only a requirement derived from ECtHR case-law, but also a positive rule of domestic law, which must be interpreted in conjunction with the principle of fairness in the administration of evidence.

In Romania, entrapment is considered a form of coercion and is prohibited under Article 101 para. (3) of the Code of Criminal Procedure, according to which: "... judicial authorities or other persons acting on their behalf are prohibited from provoking a person to commit or to continue committing a criminal offence for the purpose of obtaining evidence" [3]. The notion includes both direct incitement and forms of deceit or misleading suggestions. Entrapment may arise when state agents, including undercover investigators, exceed the legal framework.

Despite the prohibition established by the legislator regarding the entrapment of a person into committing an offence provided by criminal law, the legal frameworks of both states are affected by legislative gaps. In Romania, although the regulation exists at the procedural level, the Criminal Code does not define the constituent elements of entrapment nor does it establish the legal consequences of such conduct. In the Republic of Moldova, the situation is even more deficient, as the Code of Criminal Procedure provides only for the inadmissibility of evidence obtained through entrapment, without the substantive criminal law defining or expressly sanctioning this form of conduct.

The meaning of the term "entrapment" is likewise not defined in the criminal legislation of either state. Moreover, the Romanian Code of Criminal Procedure has been subject to considerable doctrinal criticism, with certain inconsistencies in its regulation being highlighted. Although it expressly enshrines the principle of fairness in the administration of evidence, prohibiting entrapment in the commission of offences, at the same time the same Code establishes less conventional methods of criminal investigation, such as allowing state agents to participate in authorized activities which would ordinarily be unlawful, for the purpose of gathering evidence, including by carrying out acts closely resembling the material elements of a corruption offence [18].

At the same time, despite the fact that the criminal legislation of the Republic of Moldova criminalizes the "demanding, accepting or receiving, personally or through an intermediary, by a public official or a foreign public official, of goods, services, privileges or advantages in any form not due to them, for themselves or for another person, or the acceptance of an offer or promise thereof, in order to perform or refrain from performing, delay or expedite an act in the exercise of their duties or contrary thereto", there is no definition or clear delimitation of entrapment in relation to the "acceptance" of such goods, services, privileges or advantages, as distinct from conduct that may be so qualified in cases where a proposal did not produce the specific effect of entrapment and did not determine the criminal conduct of the accused.

The identified legislative gap creates an interpretative space and leads to non-uniform solutions in judicial practice, thereby affecting the predictability and coherence of criminal law. In the absence of clear regulations, courts have been compelled to rely on ECtHR case-law, as well as on their own interpretations, in order to define the boundaries of the concept of entrapment.

In turn, the Plenum of the Supreme Court of Justice, relying on ECtHR case-law, emphasizes that: "the notion of judicial entrapment arises whenever the criminal investigation authorities go beyond the limits of mere passive observation of criminal conduct and exert a direct or indirect influence on the targeted individual, capable of inducing that person to commit an offence which, in the absence of such intervention, would not have occurred, the purpose of such conduct being to establish the alleged offence, to ob-

tain evidence, and to initiate criminal proceedings" [15].

Consequently, the notion of entrapment presupposes the existence of active actions by the authorities that create and direct the criminal situation, which leads to a serious violation of the principle of a fair trial enshrined in Article 6 of the ECHR and entails the exclusion of evidence obtained through such means.

In the ECtHR's case-law, the finding of entrapment does not lead only to the exclusion of evidence, but also affects the overall fairness of the criminal proceedings. A conviction based on an artificially created offence is, by its very nature, incompatible with Article 6 of the ECHR, even if other evidence might indicate guilt.

Accordingly, entrapment in the commission of an offence renders the evidence obtained unlawful, and such evidence must be excluded from the criminal proceedings. Moreover, legal doctrine has argued that, in such situations, the person should not be convicted, since criminal liability is determined by the intervention of the authorities rather than by the free and autonomous manifestation of the offender's will. Such an approach highlights that the issue of entrapment does not concern solely the legality of obtaining evidence, but also the very legitimacy of the state's punitive response [18].

Moreover, any allegation that the defendant was induced through entrapment to commit acts of corruption must be examined with particular rigor by the courts, with the burden resting on the investigative authorities and the prosecution to prove, beyond any reasonable doubt, the absence of such a situation. The court is required to verify whether the actions of the person acting as an agent provocateur produced the specific effect of entrapment - namely, whether they determined the defendant's criminal conduct - and to establish whether the offence would have been committed in the absence of such intervention, in accordance with the standards developed in the ECtHR's case-law on the right to a fair trial [15].

In analyzing the phenomenon of entrapment in corruption offences, it is essential to identify the source of the initiative to commit such acts. If the initiative for committing bribery (either giving or receiving a bribe) originates from the agent provocateur, the situation generally falls within the scope of entrapment of an offence provided by criminal law. Conversely, when the initiative for corrupt conduct does not originate from the agent provocateur, it cannot, in principle, be considered entrapment within the meaning of criminal law.

In the field of corruption offences, entrapment arises when the initiative belongs to the agent provocateur. This may manifest, on the one hand, through inducing the targeted person to request, accept, or receive, directly or through an intermediary, goods, services, privileges, or other undue advantages, for themselves or for another person, in exchange for performing, failing to perform, delaying, or expediting an act related to the exercise of official duties or even contrary thereto, including in the context of manipulating sporting events subject to betting. On the other hand, entrapment also exists where the initiative concerns the promise, offering, or giving, directly or through an intermediary, of undue benefits to the person to be corrupted, for themselves or for another person, with the purpose of influencing that person to act or refrain from acting, to delay or expedite the performance of an official duty, or to carry out an act contrary thereto.

In such situations, the central issue is not only the existence of the material act of corruption, but also the origin of the criminal intent and the decisive role of the agent provocateur in shaping the conduct. These elements cannot be inferred through presumptions or through a formal reading of the facts, but must be established by objective data regarding the initiation of contact, the content of the interactions, and the degree

of influence exerted on the targeted person. In the absence of a rigorous demonstration that the offence would have been committed even without the intervention of the agent provocateur, the assessment of guilt becomes uncertain, and the general rules of criminal procedure regarding the standard of proof and the interpretation of doubt become fully applicable.

According to Article 8 para. (3) of the Criminal Procedure Code: "conclusions regarding a person's guilt in the commission of an offence cannot be based on assumptions. All doubts in proving the accusation that cannot be removed, under the conditions of this Code, shall be interpreted in favor of the suspect, the accused, or the defendant" [2].

However, the current legal framework does not provide an explicit regulation of entrapment as a legal institution, which generates uncertainty in judicial practice and leads to non-uniform solutions. Thus, in the absence of a legal definition and clear criteria for its identification, courts are compelled to rely exclusively on ECtHR case-law, which reduces the predictability and coherence of the application of criminal law.

Legal doctrine has advocated for the legislative recognition of entrapment as a ground excluding the criminal nature of the act. In this regard, it has been proposed to amend Article 35 of the Criminal Code by including entrapment among the causes that remove criminal liability, as well as to regulate it expressly in the Criminal Code through a distinct provision. According to this approach, an act should not be considered a criminal offence where the person acted as a result of artificial inducement by another individual, in circumstances where the initiative belongs to the agent provocateur, and the apparent offender did not previously display criminal intent and was unaware of the induced nature of his or her conduct. In such circumstances, only an appearance of guilt is created, intended to be attributed to the entrapped person and to prejudice his or her interests [1].

In this regard, the proposed legislative intervention aims to regulate the effects of entrapment on the liability of the person who committed the offence under its influence, establishing that such a person cannot be held criminally liable.

However, in order to ensure a comprehensive legal framework, it is also necessary for the conduct of the agent provocateur to be expressly sanctioned by criminal law, since at present it is either ambiguously subsumed under certain offences or contraventions, or remains unpunished.

At the same time, the cited author considers it appropriate to introduce an autonomous offence for the conduct of the agent provocateur, by incorporating into the Criminal Code a specific provision concerning the artificial inducement to commit an offence provided by criminal law. According to this approach, the initiation of criminal conduct by a person who intends to attribute it to another individual - who, prior to the interaction, did not display any criminal predisposition and was unaware of the induced nature of his or her actions - should be subject to sanction. Such a situation involves the deliberate creation of an appearance of guilt with the purpose of prejudicing the interests of the entrapped person, insofar as the conduct does not meet the elements of other offences already provided by law. For such conduct, the application of criminal sanctions is envisaged, including a fine, community service, or imprisonment [1].

The adoption of such legislative amendments would contribute to the creation of a coherent and foreseeable legal framework, in which the boundaries between reporting and entrapment are clearly defined, and the application of criminal liability is carried out in a fair and proportionate manner.

In this logic, it is confirmed that undercover operations cannot be assessed solely in terms of their effectiveness in combating crime, but must also be examined from the per-

spective of the risks of abuse and their impact on the fundamental principles of criminal proceedings. The legitimacy of the state's response depends not only on the objective of combating corruption, but also on the means by which this objective is pursued, since the rule of law cannot tolerate the transformation of investigative activity into a mechanism for the artificial creation of offences.

Conclusions. The analysis carried out highlights that the distinction between legitimate reporting and entrapment represents one of the most sensitive and complex issues in the field of combating corruption. The consistent case-law of the ECtHR has established a clear standard: the state may detect and document offences, but it may not create them through active interventions aimed at artificially generating criminal intent. From the correlation of relevant judgments emerges a genuine legal test of entrapment, based on the existence of prior criminal predisposition, the origin of the criminal initiative, the intensity of the pressures exerted, and the autonomy of the will of the investigated person.

The research demonstrates that, although the legislation of the Republic of Moldova and Romania prohibits the use of evidence obtained through entrapment, the current regulation is incomplete and lacks an explicit normative definition of the institution. This gap generates legal uncertainty, non-uniform judicial practices, and an excessive reliance on ECtHR case-law to delineate the permissible limits of investigative activity.

At the same time, the findings of the study confirm that the issue of entrapment cannot be reduced solely to the analysis of the individual's guilt, but must be assessed in relation to the legitimacy of state intervention in shaping the criminal situation. To the extent that authorities exceed their role as passive observers and actively intervene in determining the conduct, the state's punitive response becomes questionable in terms of fairness and compliance with the requirements of Article 6 of the ECHR.

In this context, legislative intervention is necessary in order to introduce a legal definition of entrapment, to establish normative criteria for distinguishing between reporting and the artificial inducement of criminal conduct, and to expressly regulate its effects on criminal liability.

De lege ferenda, it is considered appropriate to recognize entrapment as a ground for excluding criminal liability for the person artificially induced, as well as to establish an autonomous offence for the conduct of the agent provocateur, insofar as such conduct deliberately creates an appearance of guilt. At the same time, it is necessary to strengthen judicial control over special investigative techniques and to clarify the burden of proof regarding the absence of entrapment, which should lie exclusively with the prosecution.

In essence, compliance with ECtHR standards does not limit the effectiveness of combating corruption, but rather confers legitimacy upon it. The balance between the efficiency of criminal repression and the protection of fundamental rights represents an indispensable condition for maintaining the moral and legal authority of the rule of law.

Abstract

This scientific study aims to assess the legal framework applicable to protected natural areas from the perspective of the effectiveness of legal norms designed to prevent, detect and sanction unlawful acts that affect protected natural values. The study is based on the premise that protected areas represent spaces subject to a special legal regime, within which biodiversity conservation, the protection of natural habitats and the maintenance of ecosystem balance require coherent regulatory mechanisms, functional institutions and effective instruments of administrative and judicial control.

In this context, the study examines normative, institutional and practical vulnerabilities that may facilitate environmental crime, including the fragmentation of regulations, the insufficient delimitation of the competences of public authorities, deficiencies in the monitoring system, the sometimes formal nature of ecological control, as well as the inconsistent application of legal liability.

The purpose of the research is to identify the dysfunctions that reduce the effectiveness of the legal protection of protected natural areas and to outline directions for strengthening the mechanisms aimed at preventing and combating environmental crime. The study highlights the need for an integrated, interdisciplinary and systemic approach, by correlating environmental law norms with the instruments of administrative, contraventional and criminal law, in order to ensure the real, effective and sustainable protection of natural heritage.

Keywords: state-protected natural areas, environmental crime, biodiversity, legal vulnerabilities, legal liability, environmental protection, ecological conservation.

EVALUAREA CADRULUI JURIDIC AL ARIILOR PROTEJATE DE STAT ȘI A VULNERABILITĂȚILOR CARE FACILITEAZĂ CRIMINALITATEA DE MEDIU

Abstract

Prezentul demers științific are ca obiect evaluarea cadrului juridic incident ariilor naturale protejate, din perspectiva eficienței normelor juridice destinate prevenirii, constatării și sancționării faptelor ilicite care aduc atingere valorilor naturale ocrotite. Studiul pornește de la premisa că ariile protejate constituie spații cu regim juridic special, în cadrul cărora conservarea biodiversității, protecția habitatelor naturale și menținerea echilibrului ecosistemic reclamă mecanisme normative coerente, instituții funcționale și instrumente eficiente de control administrativ și jurisdicțional. În acest context, sunt examinate vulnerabilitățile de ordin normativ, instituțional și aplicativ care pot favoriza manifestarea criminalității de mediu, între care se evidențiază fragmentarea reglementărilor, insuficienta delimitare a competențelor autorităților, carențele sistemului de moni-

torizare, caracterul uneori formal al controlului ecologic, precum și aplicarea neunitară a răspunderii juridice.

Finalitatea cercetării constă în identificarea disfuncționalităților care diminuează eficacitatea protecției juridice a ariilor naturale protejate și în conturarea unor direcții de consolidare a mecanismelor de prevenire și combatere a criminalității de mediu. Demersul relevă necesitatea unei abordări integrate, interdisciplinare și sistemice, prin corelarea normelor de drept al mediului cu instrumentele dreptului administrativ, contravențional și penal, în vederea asigurării unei protecții reale, efective și durabile a patrimoniului natural.

Cuvinte-cheie: arii naturale protejate de stat, criminalitate de mediu, biodiversitate, vulnerabilități juridice, răspundere juridică, protecția mediului, conservare ecologică.

Introduction. In the current context, the relationship between human activity and the natural environment has become one of society's essential concerns. Economic development can no longer be viewed separately from environmental protection, as it is necessary to strike a balance between the use of natural resources and their conservation for future generations. Therefore, the analysis of the legal regime of protected areas makes it possible to highlight the way in which environmental relations influence the formation and evolution of constitutional and legal norms. At the same time, such research reveals the capacity of law to effectively regulate the specific relations between society and nature, thereby contributing to the consolidation of a sustainable development model.

The benefits provided by nature often constitute effective and sustainable solutions for meeting human needs. For this reason, the integration of norms concerning ecosystem protection into environmental management policies represents an essential condition for balanced development.

Investment in a functional environment is often regarded as a luxury. This perception is largely determined by the lack of clarity of regulations concerning ecosystem protection and by the tendency to treat natural resources as being available indefinitely. Consequently, numerous public or economic decisions are adopted without an adequate assessment of their environmental effects. However, the excessive use of limited natural resources inevitably leads to the degradation of natural capital, affecting both ecological balance and the quality of present and future life.

Protected areas are the backbone of nature conservation; however, this type of "protection regime" is not sufficient to address the significant pressures affecting European biodiversity, such as semi-natural habitats and species whose survival ranges are linked to agricultural land lost through the abandonment of farming practices or the intensification of agriculture; large-scale alteration of freshwater systems; pollution; and unsustainable marine fishing. The clear benefits of protected areas can only be sustained through broader social changes.

By their nature and purpose, they constitute areas subject to a special legal regime, within which the public interest in environmental protection prevails over certain forms of economic exploitation that are incompatible with conservation objectives. In this regard, the protection of protected natural areas cannot be reduced to mere normative recognition; rather, it requires the existence of a coherent system of regulation, administration, monitoring, control and sanctioning of acts that affect the protected natural values.

The improper exploitation of the environment has caused many components of nature to lose their former appearance, qualities and structure; therefore, it became necessary to implement the concept of sustainable development.

The establishment of the protected areas fund aims to ensure the protection and conservation of natural objects and complexes for the present generation and future generations. This requires the effective correlation of organizational, economic and educa-

tional measures with potential anthropogenic activities, ensured through legal norms.

The topicality of the subject is determined by the intensification of pressures exerted on natural heritage, including illegal logging, poaching, unauthorized exploitation of natural resources, pollution, illegal construction, habitat degradation and other forms of unlawful conduct that may fall within the scope of environmental crime. These manifestations highlight not only the risk of irreversible damage to ecosystems, but also the existence of normative, institutional and practical vulnerabilities that limit the effectiveness of legal protection mechanisms.

The relevance of the research also results from the fact that, although the Republic of Moldova has a relatively complex regulatory framework in the field of protected natural areas, its practical application is affected by a series of institutional, administrative, economic and social vulnerabilities. According to the Yearbook of the Inspectorate for Environmental Protection – 2024 [1, p.121], the area of state-protected natural areas amounts to 66,995 ha, or 4.65% of the country's territory, and includes 387 sites, including 294 secular trees. According to this indicator, the Republic of Moldova ranks among the lowest in Europe.

The relatively low share of state-protected natural areas does not ensure the effective conservation of biological diversity in accordance with the requirements of international treaties in the field. Thus, as part of the response to the limited share of protected natural areas, as well as in order to address threats to biodiversity, the National Ecological Network was created, covering 11,113 km². The National Ecological Network emphasizes the importance of a landscape-level approach as a mechanism for conserving ecological processes and patterns. According to the National Development Strategy "European Moldova 2030", the target for expanding the network of protected areas is set at 10.0% of the country's territory by 2030 [2].

In this context, the assessment of the legal framework governing protected areas becomes necessary in order to identify the shortcomings that facilitate violations of the protection regime. The fragmentation of regulations, the overlapping or insufficient delimitation of the competences of public authorities, the formal nature of certain control mechanisms, the lack of effective monitoring, and the inconsistent application of legal liability are aspects that may reduce the state's capacity to prevent and combat environmental crime.

The purpose of the research is to analyse the legal framework applicable to protected natural areas from the perspective of its effectiveness in preventing, detecting and sanctioning unlawful acts affecting the environment. At the same time, the research aims to highlight the main vulnerabilities that facilitate environmental crime and to formulate guidelines aimed at strengthening the legal protection of natural heritage.

Therefore, the study aims to contribute to the substantiation of an integrated approach in which environmental law norms are correlated with the instruments of administrative, contraventional and criminal law, so that protected areas may benefit from real, effective and sustainable protection, also taking into account the well-known maxim: "think globally and act locally".

Methods and materials applied. In carrying out this scientific study, general and special methods of legal research were used, capable of ensuring a complex analysis of the regulatory framework applicable to protected natural areas and of the vulnerabilities that may facilitate environmental crime. The normative analysis method made it possible to examine the legal regulations relevant to environmental protection, biodiversity conservation and legal liability for unlawful acts committed within the perimeter of protected areas. At the same time, the systemic method was used to highlight the connections between the norms of environmental law, administrative law, contraventional law and

criminal law, in order to determine the degree of coherence and effectiveness of legal protection mechanisms.

Furthermore, the comparative method was applied in order to identify relevant normative and institutional benchmarks in the field of preventing and combating environmental crime, while the logical and deductive methods served to formulate conclusions regarding existing dysfunctions and directions for improving the legal framework. The research was based on the analysis of national legislation in the field of environmental protection and protected natural areas, relevant international instruments, specialised legal doctrine, as well as institutional materials concerning the administration, monitoring and control of activities carried out within protected areas.

Discussion and results obtained. One of the areas that has found adequate reflection in the legal regime of protection, both in international and national legislation, is the field of natural objects subject to a special protection regime or, in other words, specially protected natural areas. The legislation of the Republic of Moldova defines a ***protected natural area*** *as "a geographically delimited natural space, containing representative and rare natural elements, designated and regulated for the purpose of conserving and protecting all environmental factors within its boundaries*". However, in order to avoid certain difficulties in understanding this concept in relation to other similar notions, we consider it necessary to distinguish between the concept of a protected natural area and that of the fund of protected natural areas.

Thus, the notion of the "fund of protected areas" designates "*a much broader domain, consisting of the totality of natural areas in their diversity, as well as the objects and natural complexes protected by the state*".

Therefore, state-protected natural areas represent terrestrial, aquatic and/or underground areas with legally established boundaries and a special regime of protection and conservation, within which there are species of wild plants and animals, as well as biogeographical, landscape, geological, paleontological, speleological or other elements and formations of particular ecological, scientific or cultural value.

International, EU and national documents distinguish the following categories of protected areas, depending on the protection regime established: Category I — scientific reserves/strict nature reserves; Category II — natural parks; Category III — natural monuments/significant natural features; Category IV — nature conservation reserves/divided nature reserves/fauna sanctuaries; Category V — protected terrestrial or marine landscapes; Category VI — natural resource reserves; Category VII — natural biological regions/anthropological reserves; Category VIII — natural areas managed for multiple use/natural resource management areas; Category IX — biosphere reserves; Category X — natural properties of world heritage.

The establishment of protected areas occupies an important place among the methods and means of nature protection and conservation, by preserving and safeguarding representative natural samples so that they may be transmitted to future generations. In the same vein, Article 6 of the Law on the Fund of State-Protected Natural Areas [3] expressly enshrines the purpose of establishing this fund, aimed at regulating relations in the field of environmental protection; conserving natural objects and complexes for the present generation and future generations; carrying out an in-depth study of natural processes within biocoenoses, including important forest and steppe ecosystems, wetlands, breeding and hibernation sites and animal migration routes; restoring ecological balance in protected natural areas; maintaining the genetic fund within the biological capacities of natural objects and complexes; holding liable natural and legal persons who have caused

damage to protected natural areas; and ensuring compliance with international conventions and agreements concerning protected natural areas.

In the same context, it should be noted that the objects and complexes within the fund of protected areas are used for: the protection of the most representative natural areas; the preservation of the gene pool; biodiversity conservation; the preservation of the natural appearance of the geographical landscape; the protection of migration routes and breeding sites; the conduct of scientific research; the monitoring of protected natural areas; ecological, cultural and aesthetic education; and the recreation of citizens.

Therefore, it can be observed that these areas fulfill not only functions related to the conservation of biological diversity and the heterogeneity of environmental conditions, as well as socio-educational functions, but also an important scientific role through the research that may be carried out in these areas where ecological balance is not disturbed. This ensures a deeper understanding of the processes of biological productivity and of the stability of environmental protection.

With regard to the principles underlying the administration regime of the fund of protected areas, Article 19 of the Law [3] stipulates that: "The Government shall establish the entity responsible for the administration and management of protected natural areas, landscapes, Emerald sites and Natura 2000 sites, for ensuring the conservation of wild flora and fauna species, habitats and ecological corridors, as well as for their monitoring, management and protection".

The enshrinement of these principles constitutes a sectoral reflection of the constitutional obligations of the state to ensure the restoration and protection of the environment, as well as the maintenance of ecological balance [4, Art. 126 para. (2) lit. f], and the rational exploitation of land and other natural resources, in accordance with national interests [4, Art. 126 para. (2) lit. e].

The current regulatory and institutional framework concerning the protection and sustainable use of biological diversity is relatively well developed and has been progressively built in accordance with international commitments, including the CBD, Ramsar, CITES, Bonn and Bern Conventions, as well as the Republic of Moldova–European Union Association Agreement. The key normative acts include: Law No.1515/1993 on Environmental Protection; Law No.1538/1998 on the Fund of State-Protected Natural Areas; Law No.94/2007 on the National Ecological Network; Law No.325/2005 on the Red Book; Law No.149/2006 on the Fishery Fund; Law No.55/2024 on the Hunting Fund; and others. Environmental impact assessment instruments, regulated by Law No.11/2017, and strategic environmental assessment, regulated by Law No.86/2014, ensure the integration of conservation principles into planning.

However, the overall analysis of the regulatory framework and its implementation identifies a series of gaps and constraints that affect the effectiveness of conservation policies:

— The fragmentation and overlapping of institutional competences among environmental, agricultural, forestry and local public administration authorities, which complicates the uniform application of legal provisions and the integrated management of ecosystems;

— The lack of a coherent framework for ecosystem-based management, reducing the capacity for long-term planning and for maintaining ecosystem services; regulations remain largely focused on species and habitats, without a clear intersectoral approach;

— The insufficiency of economic and financial mechanisms aimed at stimulating biodiversity conservation, such as payments for ecosystem services, compensation measures and fiscal incentives, which limits the application of the "beneficiary pays" principle;

— Gaps in the updating and digitalisation of national databases, including registers of species and habitats, hunting and fishery inventories, affecting the accuracy of monitoring and reporting;

— The weak correlation between framework legislation and secondary legislation, especially between regulations on environmental protection, water management, agricultural and forestry land management, generating inconsistencies and divergent interpretations;

— Limited institutional capacities and human resources, particularly at local level, which affect the enforcement of norms, planning and compliance control;

— The absence of clear financing mechanisms for the management of protected areas, as the status of many areas remains merely formal in the absence of management plans and effective monitoring.

In the context of the Republic of Moldova's accession process to the European Union and of the commitments undertaken within the accession negotiations, particularly in the field of environmental protection, biodiversity conservation and the sustainable use of natural resources, the Draft Biodiversity Programme for 2026-2030 establishes the institutional, legal and operational framework necessary for the establishment, development and functioning of the Natura 2000 network as an integral part of the national biodiversity conservation system. It ensures the progressive alignment of national legislation, policies and practices with the standards and requirements of the European Union acquis. The Programme also highlights the need to overcome the limited approach focused exclusively on protected areas and to move towards an integrated ecosystem-based approach [5].

At the same time, the National Programme for Forest Extension and Rehabilitation for the period 2023-2032 (hereinafter – NPFER) [6] was conceptualised in order to achieve these objectives and to address socio-economic, ecological and climate-related challenges. The NPFER is aligned with global commitments and trends related to forests and land use, including the Glasgow Leaders' Declaration on Forests and Land Use, the United Nations Strategic Plan for Forests 2017-2030, and the European Green Deal. Taking into account the specific nature of the forestry sector, as well as the objectives established, the NPFER cannot be implemented within a medium-term period of 3-5 years. The achievement of the objectives set for the forestry sector in the "European Moldova 2030" Strategy and in the Government Activity Programme "Moldova of Good Times" requires a period of at least 10 years.

During 2024, forestry entities subordinated to the "Moldsilva" Agency afforested 4,292 ha within the framework of the NPFER (*Table* No.1).

The Inspectorate for Environmental Protection is empowered, under the provisions

of the Regulation on the organisation and functioning of the Inspectorate for Environmental Protection, approved by Government Decision No.548/2018, to carry out state supervision and control in the field of environmental protection and the rational use of natural resources, and to perform its functions in several areas, including the protection of flora, fauna and protected natural areas [7, Art. 8, point 8.4].

The results of state control concerning environmental protection under the "Flora" section are presented in *Table* No.2.

Tabelul 2: The results of state control concerning environmental protection under the "Flora" section

Legal Liability. The establishment of the fund of protected areas aims to ensure the protection and conservation of natural objects and complexes for the present generation and future generations. This presupposes an effective correlation between organisational, economic and educational measures and potential anthropogenic activities, ensured through legal norms.

Thus, the law expressly provides for the civil, administrative or criminal liability of natural and legal persons who have caused damage to protected areas [3, Art. 98 para. (1)].

For the establishment of environmental liability, the provisions of Law No.107/2025 on environmental liability in relation to the prevention and remedying of environmental damage shall apply [3, Art. 98 para. (3)].

"*Material damage caused by natural and legal persons to the objects and complexes within the fund of protected areas shall be compensated in the manner established by the legislation in force*" [3, Art. 99 para. (1)].

Such a situation is generated by the right of every person to benefit from a healthy and balanced ecological environment, enshrined in Article 37 of the Constitution of the Republic of Moldova [3]. Thus, although in the vast majority of cases, pursuant to the provisions of Article 166 of the Civil Procedure Code of the Republic of Moldova [8], which establishes that "anyone who claims a right against another person or has an interest in

establishing the existence or non-existence of a right must file a statement of claim with the competent court", the person bringing an action is required to demonstrate their own injured personal interest, an aspect which is most often reflected in the impairment of an individual interest or right, nevertheless, in cases involving damage caused to objects and complexes within the fund of protected areas, such an approach is no longer appropriate.

This is explained by the fact that the interest in maintaining the integrity of the objects and complexes forming part of the fund of state-protected natural areas must be analysed from the perspective of the need to ensure ecological balance, as a value of general public interest. Indeed, the protection of these natural objectives is not merely an obligation of public authorities, but also a legal guarantee for the exercise of the fundamental right to a healthy environment.

In this regard, the beneficiary of constitutional protection is not exclusively the citizen of the Republic of Moldova, but any person located on the territory of the state, irrespective of citizenship or national affiliation. This interpretation follows from the wording of Article 37 of the Constitution of the Republic of Moldova [3], which enshrines the right to a healthy environment by using the phrase "every human being", thereby conferring upon the constitutional norm a universal and non-discriminatory character.

Therefore, where, through the statement of claim, the claimant formulates claims concerning compensation for damage caused to the environment, the court is not entitled to make the admissibility of the action conditional upon the indication of a specific real right allegedly infringed by the harmful act. This is because ecological damage does not exclusively affect an individual patrimonial right, but infringes upon a public interest in environmental protection, including the right of every person to a healthy environment.

When analysing a person's right to an ecologically balanced environment, it is not sufficient merely to recognise its universal character; it is also necessary to acknowledge the effective possibility for the holders of this right to seek its protection through administrative or judicial means.

Therefore, the fact that a natural or legal person has referred the matter to the court or to the competent authority in order to obtain compensation for damage caused to objects and complexes within the fund of protected areas, and that the claim has been admitted, does not exclude the right of other persons to formulate similar claims, insofar as the ecological damage has not been fully remedied. Where the measures ordered do not fully cover the damage caused to the environment, other interested persons may request the supplementation of the claims, intervene in the proceedings or initiate a separate action, in order to ensure the effective and full remediation of ecological damage.

With regard to the right of the author of the damage to repair the harm in kind, as well as the right of the injured person to request such a form of reparation, both enshrined as general rules of civil liability, it should be specified that, in matters concerning damage caused to objects and complexes within the fund of state-protected natural areas, the application of this rule is limited.

This particularity results from the complex nature of ecological damage, which may affect ecosystems, habitats, species, soils, waters, natural formations and interdependent ecological processes. The restoration of the previous state cannot be left exclusively to the discretion of the perpetrator, as it requires specialised scientific and technical knowledge.

In such a situation, the only possibility for achieving reparation is based on the rule of compensation by equivalent value.

It follows from the foregoing that, in the case of damage caused to objects and com-

plexes within the fund of state-protected natural areas, both the authority competent to conduct the preliminary settlement procedure and the court must give priority to analysing reparation by equivalent value.

Thus, the object of the examination shall relate either to the value of the expenses necessary to remove the harmful consequences or to the amount of compensation established according to the criteria provided by law for environmental damage. In such situations, the emphasis is not placed on the perpetrator's right to choose the method of reparation, but on ensuring effective, proportionate compensation that complies with the special legal regime of protected natural areas.

In another respect, the hypothesis in which environmental damage is caused intentionally, through unlawful conduct consciously assumed by the perpetrator, cannot be excluded. This category includes acts such as poaching, unauthorised fishing, the capture or destruction of specimens of wild fauna, as well as the unauthorised import or export of rare species or of species included in the Red Book. Such actions affect not only the economic value of natural resources, but also biodiversity, ecological balance and the integrity of protected natural objects and complexes. Therefore, the prevention, respectively the anticipation, of environmental damage constitutes an essential prerogative of the democratic state.

A brief analysis of Law No.407/2006 on hunting and the protection of the hunting fund in Romania makes it possible to observe that the Romanian legislature expressly establishes the list of wild fauna species of hunting interest for which hunting is prohibited, as well as the amount of compensation applicable in the event of unlawful acts, including poaching or illegal hunting. At the same time, the Romanian regulatory framework enshrines procedural mechanisms concerning the identification and assessment of damage caused by specimens of fauna species of hunting interest.

In this regard, the assessment of the damage falls within the competence of a specially established commission, composed of representatives of the administrative-territorial unit within whose jurisdiction the damage occurred, of the county directorate for agriculture, as well as of the territorial structure of the central public authority competent in the field of hunting or environmental protection, as the case may be. The failure to appoint representatives of the competent institutions entails contraventional liability, thereby giving the procedure a mandatory and functional character.

By comparison, national regulations [9, Annex 6] provide for payments collected for damage caused by natural and legal persons through the hunting, acquisition, sale, possession, unlawful export or destruction of game animals. However, the amount of these payments is considerably lower than the compensation provided under Romanian legislation. For example, for the destruction of an elk, the national framework establishes a payment of 500 conventional units, equivalent to approximately EUR 1,200, whereas Law No.407/2006 provides for compensation of EUR 20,000.

Under these circumstances, it is necessary to formulate a *de lege ferenda* proposal regarding the revision of the national regulatory framework, with a view to bringing it closer to the standards of Romanian hunting legislation, particularly in terms of assessing damage per specimen hunted illegally. Increasing the amount of compensation would contribute not only to the harmonisation of national legislation with European requirements in the field of biodiversity protection, but also to the strengthening of the preventive function of legal liability, discouraging the commission of unlawful acts directed against wild fauna and protected natural areas [10, p.87].

"*Reparation for damage caused to objects and complexes within the fund of protected*

areas shall be carried out voluntarily or by court judgment" [3, Art. 99].

Legal action constitutes the procedural means by which the right to claim reparation for damage caused to objects and complexes within the fund of state-protected natural areas is enforced, where the author of the harmful act refuses to repair such damage within the framework of the prior extrajudicial procedure.

In the civil procedural law of the Republic of Moldova, the statement of claim represents the main instrument through which an interested person seeks the protection of an infringed or contested right, freedom or legitimate interest. In matters concerning damage caused to protected areas, it has a patrimonial character, as it seeks to compel the perpetrator to compensate for the damage caused to protected natural values.

At the same time, the right to request reparation for damage must not be linked exclusively to the existence of a real right over the affected property. Any person may invoke the need to repair ecological damage on the basis of the fundamental right to a healthy and ecologically balanced environment.

The extent of compensation shall be determined according to the value of the direct damage, as well as the foreseeable and unforeseeable consequences of the unlawful act, including those that may materialise in the future. In this matter, the principle of full reparation of damage applies, so that compensation reflects the seriousness of the harm caused to the objects and complexes within the fund of protected areas and seeks, as far as possible, to restore the affected ecological balance.

In cases where restoration in kind is impossible, such as when an animal within a protected natural area has perished, the claim for reparation of the damage may only seek as its exclusive object, compensation in the form of a monetary equivalent.

In matters concerning damage caused to objects and complexes within the fund of state-protected natural areas, the liability of the author of the harmful act is, in principle, objective in nature and independent of fault. Therefore, the injured person is not required to prove the perpetrator's guilt, it being sufficient to establish the unlawful act, the damage and the causal link between them. In such cases, liability may be incurred regardless of the form of guilt, discernment, age or mental state of the author of the damage, insofar as the special law does not provide otherwise.

At the same time, the court determines the method of compensation in relation to the nature of the damage and the circumstances of the case. Thus, in the case of injury to an animal within a protected area, reparation may consist of covering the expenses necessary for its treatment and recovery. By contrast, in the case of the animal's killing, compensation does not represent merely the monetary equivalent of the lost specimen, but also a form of covering the ecological damage generated by its removal from the natural environment and by the impairment of the ecosystem balance of the protected area.

Here, as mentioned previously, even if reparation in kind may be carried out personally by the perpetrator, the appropriateness of applying such a method is nevertheless examined by the court in each individual case. In any event, reparation by equivalent value represents the basic form of compensation. From the perspective of appropriateness, reparation through the perpetrator's own actions may be admitted only where the perpetrator is a specialist in this field and their occupation is specifically related to the treatment of animals or to the restoration of the natural conditions of wildlife habitats.

It should be specified that only the court may order such a method of reparation. Likewise, the court also determines the amount of reparation by monetary equivalent. It does so according to the extent of the damage as assessed on the date of delivery of the judgment.

Taking into account the continuous nature of natural processes, as well as the fact that the nature and extent of the damage caused to the animal kingdom cannot always be fully known, the claimant may also, after the adoption of the judgment, file a claim for compensation concerning damage that arose after the delivery of that judgment [10, p.111].

In a case [11] examined by the national court, it was established that, on 29 December 2022, Calugareanu D.G., pursuing the purpose of illegal hunting, being aware of the prejudicial nature of his actions, foreseeing their consequences and consciously accepting the occurrence of such consequences, without the appropriate hunting authorisation and without being included in any group of hunters authorised to hunt, during a prohibited period and time, intentionally installed several metal snares on a fence located in the "Plaiul Fagului" Reserve, Ungheni district, Rădenii Vechi village, with the purpose of capturing a wild animal.

It is noted that the civil action brought within the criminal proceedings has as its object the engagement of tort liability of the persons responsible under civil law for the damage caused by the commission of the act forming the subject matter of the criminal action. The Court notes that, on 15 February 2022, the injured party, the State Enterprise "Plaiul Fagului" Natural Reserve, located in Rădenii Vechi village, Ungheni district, IDNO: *****, filed a civil action against the defendant Calugareanu D.G., seeking recovery of the material damage caused by the offence in the amount of 12,000 lei (case file, pp.37-40).

In this regard, the Court finds that the conditions for tort liability are met in the present case, since, through the defendant's unlawful act, according to the indictment, he directly caused patrimonial damage in the amount of 12,000 lei. Thus, it is noted that, in criminal proceedings, the civil action constitutes a means of repairing the damage caused by the offence, and its exercise requires the cumulative fulfillment of certain conditions.

Based on the foregoing, the court concludes that the claim filed by the injured party, the State Enterprise "Plaiul Fagului" Natural Reserve, concerning the recovery of material damage in the amount of 12,000 lei, is well-founded and, for these reasons, shall be admitted in full.

As a result, the Court found Calugareanu D.G., guilty and convicted him under Article 233 para. (1) of the Criminal Code of the Republic of Moldova, sentencing him to 1 (one) year of imprisonment, to be served in a semi-closed penitentiary, with conditional suspension of the sentence for a probation period of 1 (one) year, and ordering him to pay the damage caused in the amount of 12,000 (twelve thousand) lei.

With regard to the above-mentioned aspects, we conclude that the administration of justice requires a clear delimitation of the competences of courts and of the authorities involved in identifying, assessing and repairing damage caused to objects and complexes within the fund of state-protected natural areas, in order to avoid any overlapping of powers or the existence of uncovered areas.

Where the damage is caused by several persons, they shall be jointly and severally liable for the entire damage. The claimant may bring the action against any of the perpetrators, without being obliged to identify all of them by name, and may seek full reparation of the damage. The defendant who has fulfilled the compensation obligation subsequently has the right of recourse against the other co-authors.

However, it is necessary to distinguish between the main action and the recourse action. In the main action, liability for damage caused to protected areas is assessed according to the special rules of environmental law, including on the basis of objective liability, independent of fault. By contrast, in the recourse action, the rules of civil law governing relations between joint and several debtors apply, with the court examining

not the ecological damage itself, but the allocation of the pecuniary obligation among the co-authors of the harmful act.

The Contraventional and Criminal Regime Applicable to Acts Committed within Protected Areas. The legal protection of state-protected natural areas is ensured not only through rules of administration and conservation, but also through mechanisms of legal liability. In this regard, the Contravention Code of the Republic of Moldova provides sanctions for violations of the protection regime applicable to objects and complexes within the fund of state-protected natural areas. Article 141 of the Contravention Code [12] sanctions violations of the protection regime of objects and complexes within the fund of state-protected natural areas.

At the same time, the law [3, Art.98 para. (2)], expressly provides for the acts that are considered contraventions, unless they constitute offences under the law, as follows:

a) The use of protected natural areas for purposes other than those provided for by this Law;

b) The approval of the development of planned activities within state-protected natural areas and Emerald sites without their prior submission to the environmental impact assessment procedure and/or, where applicable, biodiversity assessment, in accordance with Law No.86/2014 on Environmental Impact Assessment;

c) The deterioration or destruction of protected natural areas;

d) The failure to eliminate the ecological consequences of accidents, disasters and other destructive phenomena;

e) The introduction of plants and animals alien to the respective area, which pollute the native gene pool;

f) The violation of the rules on the export of plants and animals placed under state protection;

g) The unauthorised execution of any development or construction works;

h) The discharge of industrial and household waste into waters or onto land, as well as its storage within protected natural areas and their protection zones;

i) The use of chemicals in protection zones beyond the permitted limits;

j) The unauthorised harvesting of forest fruits and berries, mushrooms, medicinal plants, seeds and aquatic organisms;

k) The unauthorised relocation of the boundaries of protected natural areas;

l) The damage, removal or erasure of boundary, geodetic or topographic markers, warning panels or signs;

m) The entry of unauthorised persons, with or without motor vehicles, into strictly protected zones;

n) Camping in prohibited areas;

o) Grazing in prohibited areas;

p) The unauthorised organisation and carrying out of economic, tourism and recreational activities;

r) Photographing or filming for commercial purposes without the payment of the required fees.

Therefore, the contraventional norm has both a preventive and a sanctioning role. It applies in situations where unlawful acts do not reach the level of social danger required to constitute a criminal offence, but nevertheless affect the special protection regime.

In more serious cases, criminal liability becomes applicable. The Criminal Code of the Republic of Moldova [13] contains a chapter dedicated to environmental offences, aimed at protecting the environment, natural resources and ecological balance.

It is important to mention that, in the Environmental Strategy for 2024-2030, our state acknowledges that the sanctions regime for non-compliance with environmental legislation contains several weaknesses that require interventions for improvement. The sanctions applied for non-compliance with environmental legislation are not sufficiently severe, do not fully reflect and are not proportionate to the damage caused to the environment, and do not encourage compliance with the law, even though, in recent years, amendments have been made to the Criminal Code of the Republic of Moldova No.985/2002 and to the Contravention Code of the Republic of Moldova No.218/2008, with a view to strengthening the environmental sanctions system. Environmental fines are also too low and do not determine economic operators and companies to reduce pollution levels, to comply with and observe environmental requirements, which involve costs significantly higher than the value of the fines currently applied [2, p. 17].

In turn, the methodologies for calculating environmental payments and the instructions for assessing environmental damage are outdated, no longer correspond to the current requirements of the country and do not take into account the impact of emissions on the environment, the extent of damage resulting from the use of natural resources, or the real financial cost of compensating environmental damage. There is also a differentiated approach by cities and areas regarding the amount of payments for the same types of pollution, which does not encourage the abandonment of polluting technologies, but rather creates the premises for locating environmentally harmful installations in areas with a lower level of pollution payments. Therefore, changes in the application of environmental payments must be implemented as soon as possible and should aim to encourage compliance with and observance of environmental requirements [2, p.18].

Therefore, from a criminal law perspective, environmental crime committed within protected areas presents increased gravity, as it affects not only an individual natural asset, but an entire ecological system protected by law. The damage is not limited to the economic value of the destroyed resource, but also includes the loss of biodiversity, habitat degradation, the impairment of ecosystem functions, the diminution of the scientific and landscape value of the territory, as well as the reduction of its natural regeneration capacity.

Sanctioning vulnerability also manifests itself when contraventional sanctions are not sufficiently deterrent in relation to the economic benefits obtained through the illegal exploitation of resources. If the fine is lower than the profit resulting from illegal logging, illegal hunting, unauthorised fishing or land use, the legal norm loses its preventive character. Under such circumstances, perpetrators may regard the sanction as a "cost of illegal activity", which diminishes the effectiveness of legal protection.

A distinct problem is the difficulty of assessing ecological damage. In the case of protected areas, the damage is not always immediately visible and cannot be reduced to the material value of the felled trees or extracted resources. Habitat degradation, species disappearance, soil damage, ecosystem fragmentation and the loss of ecological functions constitute complex, sometimes irreversible damage, requiring specialised expertise. In the absence of clear and uniformly applied methodologies, the establishment of liability may become difficult.

In addition to these issues, there is also the insufficiency of technical equipment. Combating environmental crime requires the use of modern technologies, such as GIS systems, drones, surveillance cameras, digital databases, applications for reporting violations, interactive maps and updated registers of protected areas. Without such instruments, control remains predominantly reactive and dependent on citizens' reports or

occasional inspections.

Comparative Analysis of Legislation and Practices in EU Countries. At the European level, the Natura 2000 Network represents the main instrument of nature conservation policy, being composed of Special Protection Areas for birds — SPAs, designated under the Birds Directive, and Special Areas of Conservation — SACs, established pursuant to the Habitats Directive.

SPAs are designated directly by the Member States and notified to the European Commission, whereas SACs involve a staged procedure: the proposal of sites of Community importance, their selection at European level and the establishment of definitive protection by the states. Consequently, the level of protection may vary depending on the category of the area, the conservation objectives and the measures applied at national level.

In Germany, the Federal Nature Conservation Act — *Bundesnaturschutzgesetz* [14] — regulates the main categories of protected areas and establishes specific conservation objectives. Among these, the most relevant are national parks, nature reserves — N*aturschutzgebiete*, NSG — and protected landscapes — *Landschaftsschutzgebiete*, LSG.

The legal regime differs depending on the protection category. Thus, national parks imply a high level of conservation, with severe limitations on economic activities, while nature reserves prohibit, pursuant to § 23 BNatSchG, activities likely to destroy, damage or alter the protected area or its components.

For protected landscapes (*Landschaftsschutzgebiete*, LSG), the level of protection is lower compared to national parks and nature reserves. Pursuant to § 26 BNatSchG, their purpose is to maintain, develop or restore the functionality of ecosystems, their capacity for regeneration and the sustainable use of natural resources.

In this regard, German legislation establishes certain rules and prohibitions applicable to activities, including agricultural activities, in order to achieve conservation objectives. Unlike the European model, which is predominantly focused on achieving conservation outcomes, the German regulation of national protected areas is more strongly conduct-oriented, directly establishing the actions that are permitted, limited or prohibited.

In Germany, restrictions on the use of agricultural land within protected areas vary depending on the objectives of each area and are generally established through individual normative acts.

Nature reserves and protected landscapes frequently prohibit construction works, the exploitation of mineral resources and the removal of landscape elements. Conditions may also be imposed regarding the water regime, mowing, grazing, the period of land use and livestock density.

According to § 14 BNatSchG, activities that affect protection objectives are considered interventions in nature and must be avoided or compensated. However, agriculture carried out in accordance with good agricultural practices is not, as a rule, classified as an intervention under the so-called "agricultural clause", without excluding the possibility of establishing special restrictions for certain protected areas.

It is also relevant to provide a concise presentation of the regime of protected natural areas in Romania, a state characterised by remarkable biodiversity, determined by its geographical position and the diversity of its landforms.

The Carpathian Mountains and the Danube Delta are included in WWF's "Global 2000" [15] among the 200 most important Ecoregions in the world for the conservation of habitats and biodiversity. Following Romania's accession to the European Union, protect-

ed natural areas continued to expand.

Since human activities — economic, social and cultural — are interdependent with the natural environment, the development of protected areas must be based on the principle of conservation integrated with sustainable development.

In multifunctional landscapes, ecosystem protection may coexist with the responsible use of resources, so that economic and social services are maintained without compromising biodiversity. In this regard, the valorisation of ecosystem services must be correlated with sustainable economic activities, since individual and collective well-being depends directly on the quality of the environment and the effectiveness of conservation measures.

Another example of this kind is Sweden [16], where an active environmental policy is implemented both at state level and at public level. The main objectives of this policy are health protection, the conservation of natural biological diversity, environmental management aimed at its optimisation, and the protection of natural and cultural landscapes. The country implements an energy conservation programme and promotes the predominant use of environmentally safe energy sources, including biomass and alternative sources. Strict restrictions have been introduced on emissions of harmful substances from vehicles. A decision has also been taken to gradually phase out nuclear energy.

Another example is the Netherlands, whose Constitution also contains a special article on the protection and improvement of the environment, aimed at enhancing the quality of life. In this country, the public environmental organisation "Children of the Earth" operates actively and implements, in the field of environmental management [17], an action plan based on scientific principles.

Certain successes have also been achieved in France, whose environmental system is much more centralised. The Czech Republic is an example of a country where protected landscape areas form the basis of the national system of protected areas, although three national parks have also been established in the northern and southern border regions [18]. France has developed a slightly different system of protected areas, including national parks, regional parks and nature reserves [19].

In conclusion, the effective implementation of the European Union's sustainable development strategy requires the consolidation of a coherent environmental policy that is integrated and adapted to new ecological, economic and social realities. Such a policy must be based on the principle of concentrating institutional efforts and on effective cooperation between the structures of the European Union, the Member States and the supranational actors involved in the field of environmental protection.

At the same time, the development of environmental policy must reflect its multifactorial and participatory nature, taking into account the simultaneous involvement of public authorities, the economic sector, civil society and environmental protection organisations. Within this framework, the conservation of the natural environment and the guarantee of ecological security must prevail over circumstantial economic interests, constituting essential premises for sustainable development at European level.

Conclusions. A clean and healthy environment represents a fundamental condition for the observance of human rights enshrined in the Constitution of the Republic of Moldova, such as the right to life and the right to physical and moral health. Maintaining the quality of the main components of the environment — air, water, soil, flora and fauna — is essential for ensuring sustainable development.

In this context, protected natural areas play a crucial role, contributing to the conservation of biodiversity, ecosystems and rare habitats, as well as to the protection of

plant and animal species. Through the special restrictions applied, they maintain ecological balance, protect natural, geological and cultural heritage, support the fight against climate change and provide opportunities for scientific research, education and recreation, while ensuring the sustainable use of natural resources.

The implementation of adaptation measures in environmental conservation management at local level represents a complex process, determined by the ecological, social, economic and institutional particularities of each region or country. For this reason, the identification of effective solutions requires a transdisciplinary approach that integrates legal, ecological, administrative and socio-economic perspectives.

This research synthesises the main difficulties concerning the implementation of recommendations in the field of protected natural areas at the level of national legislation, formulating conclusions and proposals regarding their monitoring, the assessment of the vulnerability of protected areas, the improvement of current and future management practices, as well as the consolidation of the legal and policy framework applicable to biodiversity conservation.

International case studies on the effectiveness of protected areas increasingly highlight the interdependence between socio-economic outcomes and environmental conservation objectives. The effective protection of biodiversity cannot be achieved exclusively through restrictive measures; rather, it requires institutional support, local cooperation and the involvement of communities located in the vicinity of protected areas.

In this regard, protected areas must contribute, directly or indirectly, to the economic well-being of local communities through activities compatible with conservation, such as ecotourism, environmental education, the sustainable use of resources and the development of ecosystem services. However, although the importance of the socio-economic dimension is increasingly recognised, research that rigorously assesses the impact of protected areas on local communities remains relatively limited, especially in the context of developing states.

Local public administration represents an essential link in the application of environmental legal norms, as it is in direct contact both with the population and with the immediate users of natural resources. Through this position, local authorities can promptly identify risks of degradation, prevent violations of the protection regime and contribute to the effective conservation of protected natural areas located within the boundaries of localities.

In this regard, the legislation of the Republic of Moldova must provide for a clear mechanism for holding local public authorities accountable, complemented by the continuous training of civil servants in the field of biodiversity protection. This mechanism must be based on transparency, access to environmental information, the up-to-date nature of data and the involvement of citizens in local ecological issues and biodiversity protection, from the perspective of the benefits they provide.

Contemporary constitutional and environmental legislation is characterised by the recognition of environmental protection as a fundamental objective of the state, as well as by the grounding of the right to a healthy environment in essential ecological principles, such as the principle of minimum intrusion, the principle of environmental conservation and, last but not least, the principle of cooperation.

At the same time, the effectiveness of protected natural areas depends on the implementation of special management, monitoring and ecological restoration programmes. The ecological, social and economic issues generated by habitat connectivity and the integration of protected areas into the landscape require the adaptation of biodiversity

conservation strategies at different levels of implementation: national, regional and local.

In this context, the Information System "Register of Protected Natural Areas" (hereinafter – IS RPNA) and the Regulation on the manner of maintaining the Register of Protected Natural Areas should be implemented. This would allow existing information to be consolidated into a single platform, reducing data fragmentation and providing a solid basis for decision-making in the field of environmental protection. At the same time, the information system would support interinstitutional cooperation and facilitate the fulfilment of the Republic of Moldova's international commitments in the field of biodiversity conservation.

The Register would also contribute to compliance with international reporting obligations, simplifying the process of alignment with European standards. In addition, the integrated data would provide solid support for the development of public policies and for decision-making in the field of environmental protection. The system will facilitate the identification of vulnerable areas, the adoption of conservation measures and rapid access to data, supporting evidence-based decisions and the sustainable management of natural resources. At the same time, transparency and interoperability will hold institutions accountable and involve local communities in environmental protection [20].

The implementation of the IS RPNA will bring significant benefits to the public sector, providing an efficient tool for managing data on the protected natural areas of the Republic of Moldova. The system will contribute to reducing the time and resources required for verifying and updating information, ensuring a single and reliable record, and will facilitate data exchange and interoperability among public institutions and with other state information systems through the MConnect platform. This will lead to an increase in the quality of public services and to the modernisation of information management concerning protected natural areas [20].

Abstract

The article analyzes the theoretical foundations of crime prevention within modern criminal policy. It highlights prevention as a key component of penal policy, alongside sanctions and reintegration measures, as reflected in European recommendations, including those of the Council of Europe. Prevention is understood both in a legal-penal sense (general and special prevention through sanctions) and in a sociological-criminological sense (addressing causes of crime).

The study emphasizes three dimensions of criminal policy in the Republic of Moldova: legislation and sanctions, specialized prevention institutions, and societal reaction to crime. It also discusses limitations of preventive policies, such as the impossibility of fully eliminating crime, difficulties in evaluating results, high costs, and potential restrictions on individual freedoms.

The work further examines general and special prevention, social and situational prevention, juvenile delinquency policies, and European standards. It underlines the importance of proportionality, rehabilitation, and community involvement in crime prevention strategies.

Finally, it concludes that modern criminal law balances social defense with individual rights, focusing on reducing crime through integrated, evidence-based and cooperative approaches.

Keywords: crime prevention, criminal policy, general prevention, special prevention, juvenile delinquency, social reintegration, criminal sanctions, Council of Europe.

FUNDAMENTELE TEORETICE ALE PREVENIRII CRIMINALITĂȚII ÎN CADRUL POLITICILOR MODERNE DE PREVENIRE ȘI COMBATERE: PROBLEME ȘI PERSPECTIVE

Abstract

Articolul analizează fundamentele teoretice ale prevenirii infracționalității în cadrul politicii penale contemporane. Acesta evidențiază prevenirea ca o componentă esențială a politicii penale, alături de sancțiuni și măsurile de reintegrare socială, astfel cum rezultă din recomandările europene, inclusiv cele ale Consiliului Europei.

Prevenirea este înțeleasă atât în sens juridico-penal, prin prevenția generală și specială realizată prin intermediul sancțiunilor, cât și în sens sociologic și criminologic, prin abordarea cauzelor și factorilor care generează criminalitatea.

Studiul evidențiază trei dimensiuni ale politicii penale în Republic of Moldova: legislația și sistemul sancționator, instituțiile specializate de prevenire și reacția societății față de fenomenul infracțional. Totodată, sunt analizate limitele politicilor preventive, precum imposibilitatea eliminării complete a criminalității, dificultățile de evaluare a rezultatelor, costurile ridicate și potențialele restrângeri ale libertăților individuale.

De asemenea, lucrarea examinează prevenirea generală și specială, prevenirea socială și situațională, politicile privind delincvența juvenilă și standardele europene în materie. Se subliniază importanța principiilor proporționalității, reabilitării și implicării comunității în strategiile de prevenire a infracționalității.

În concluzie, studiul arată că dreptul penal modern urmărește realizarea unui echilibru între apărarea socială și respectarea drepturilor individuale, având ca obiectiv reducerea criminalității prin abordări integrate, fundamentate pe dovezi și bazate pe cooperare instituțională și socială.

Cuvint- cheie: prevenirea criminalității, politică penală, prevenție generală, prevenție specială, delincvență juvenilă, reintegrare socială, sancțiuni penale, Consiliul Europei.

Introduction. From a scientific perspective, crime prevention is a set of measures integrated into criminal policy, aimed at limiting the possibility of committing crimes. It constitutes a distinct instrument of criminal policy, along with other components such as sanctions and social reintegration measures. In this regard, Council of Europe Recommendation R(87)7 stresses that prevention includes, in addition to alternative punishments, support for victims, decriminalisation, social reintegration and treatment of offenders.

In criminology, prevention is understood in a narrower sense, mainly targeting actions on the causes of crime. It has a collective, non-coercive and proactive character, acting before the criminal acts occur, unlike measures aimed at protecting victims.

The theoretical foundations of prevention are based on the idea that human personality and behavior can be influenced by education and by changing social contexts, which can significantly reduce the risk of committing a criminal act. However, the effectiveness of these policies is limited by the diversity of the criminal phenomenon, the unpredictability of human behavior and the high costs of some interventions.

At the same time, the effectiveness of prevention programmes depends on the existence of essential conditions, such as political will, the allocation of adequate financial resources, the use of relevant statistics, the adoption of a long-term perspective, and the active involvement of institutions, the private sector and citizens.

Methods and materials applied. The paper was developed using the method of doctrinal and comparative analysis, based on the study of the specialized literature in the field of criminology and criminal law, national normative acts and recommendations of the Council of Europe. Also, the method of synthesis was applied, for the integration of information from various sources, and the method of legal interpretation, in order to clarify the concepts regarding crime prevention and its forms in the context of modern criminal policy.

Discussions and results obtained. I. Preventive Penal Policy: Notion and Objectives. In defining and evaluating the concept of criminal crime prevention policy, it is necessary to take into account three dimensions [1, p.224]. Within the framework of modern policies to prevent and combat crime in the Republic of Moldova, three main dimensions can be highlighted. The first dimension refers to the criminal legislation in force and the system of sanctions applied to persons who commit crimes. The second dimension includes institutions specialized in crime prevention and in exercising specialized social control over the criminal phenomenon. The third dimension concerns society's reaction and attitude towards crime and delinquency.

In relation to these dimensions, the normative framework and the penitentiary system in the Republic of Moldova aim both to control and reduce the criminal phenomenon,

as well as to protect fundamental social values. They also aim not only to sanction criminal behaviors, but also to resocialize and reintegrate convicted persons, reflecting the balance between the repressive and preventive-educational function of criminal policy.

By developing a theory of prevention, a series of problems are generated regarding conceptual classifications, but also the elaboration of a set of measures that create effective prevention models, strategies and techniques, which have a neutralizing social purpose on crime [2, p.201-202].

In the doctrine, the opinion has been formed according to which the notion of prevention has two connotations [1, p.87]. First of all, it is a legal-criminal one, which takes into account the effect that the criminal legislation, through the incriminations and sanctions provided, has on the conduct and behavior of individuals in a society. In this case, a distinction is made between general and special prevention. Secondly, we are talking about a sociological and criminological connotation, which refers to the set of activities that are carried out in order to identify, explain and diminish the causes and general and special conditions.

It should be noted, however, that the effectiveness of preventive policy may be affected by certain inherent limits, such as the impossibility of completely eliminating delinquency, for the simple reason that it is part of any society [4, pp.218-220]. Therefore, the scientific objective of any prevention action is to limit the criminal phenomenon and a more rational and efficient mobilization of resources to combat criminal behavior.

Another limitation affecting the effectiveness of crime prevention policies is the difficulty of knowing and accurately assessing the effects of measures applied in preventive programmes. This problem is determined both by the complexity of the social environment and by the multidimensional nature of prevention interventions.

Another important factor is the impossibility of completely eliminating the root causes of delinquency. However, they can be diminished through interventions at individual, social and group levels, without being able to be completely eradicated.

Preventive measures also often involve the use of specialised techniques that entail high costs, which makes it difficult to apply them on a large scale. In certain situations, such actions can generate perceptions of insecurity among the population or lead to the restriction of individual freedoms, as is the case with electronic surveillance.

In this regard, the principle of preventing the commission of the acts provided for by the criminal law highlights the need for a balance between the effectiveness of prevention measures and the observance of fundamental rights and freedoms, “the entire legal-criminal regulation must ensure, on the one hand, the achievement of the general preventive function of the criminal law, and, on the other hand, the prevention of the commission of new acts provided for by the criminal law, as a result of the application of criminal law sanctions. The achievement of the purpose of the criminal law must take place, mainly, through the prevention of the acts provided for by the criminal law, as a result of knowledge and observance of the law or as a result of the preventive measures provided by the law for this purpose. The application and implementation of criminal law sanctions must be based on the need to prevent the commission of new antisocial acts, both by those to whom such sanctions have been applied, and by other persons” [5, p.51].

The function of criminal law is to prevent crimes, by carrying out both general and special prevention, aimed at avoiding recidivism. To this end, criminal sanctions are the main instruments for controlling crime, although they are not the only means and not always the most effective.

In this context, criminal sanctions reflect the balance between the freedom of the individual and the need for social defense, based on different political-ideological options.

Thus, in some criminal law systems, emphasis is placed on the intimidating and repressive nature of punishment, while in others the function of re-education and social reintegration of the convicted person predominates.

The primary function of preventing the commission of crimes (general prevention) is based on a sanctioning rigor that finds its most drastic expressions in the death penalty, in the sentence of life imprisonment, in the cruelty and inhuman treatment of the execution of the sentence. The criminal law of liberty, without abdicating the requirement of defending society against crime, disapproves of any idea of public vendetta, of disproportionate punishment, of inhuman execution of punishment [5, p.4].

In the area of crime prevention, the Council of Europe has drawn up a number of specific recommendations. Relevant is Recommendation (1987)19 of the Committee of Ministers of the Council of Europe, which refers to the following important aspects. Member States must include prevention as a permanent mission in government programmes and set out concrete actions to prevent crime. They must also establish, encourage and maintain crime prevention bodies at national, regional and local level and establish and promote prevention programmes aimed at solutions to crime-specific problems, reducing the possibilities of committing crimes and increasing the risk for offenders of being discovered. Finally, the Member States must promote and encourage research with a view to international cooperation in the field of prevention. In the context of these concerns for crime prevention, a European prevention model has been configured, which overcomes the existing differences at national level regarding preventive strategies.

This model capitalizes on a concept of "small-scale prevention, which involves the mobilization of local resources", which reveals: the establishment of an effective partnership between the police, local authorities and residents; the decentralization of strategies and the implementation of programs that co-opt interested local bodies; the search for means to increase citizens' trust in public authorities; the development of programs that include measures to reduce criminal opportunities, as well as the discouragement of committing them; the search for effective solutions for minor acts, especially those in the family, and their informal resolution; limiting the crimes committed by young people, which can be punished with detention, and finding alternative, local solutions [6, p.169-170].

II. Principles of Criminal Crime Prevention Policy. The principles of preventive criminal policy aim to give rigour to preventive actions, to the extent that they are respected and materialized in the practices of European countries [4, p. 160-163].

2.1. Principle of Determined Scope. That principle highlights the fact that preventive action must be carried out in a given territory. This was the structure on which action will be taken with a set of measures including socio-cultural optimization, professional integration, habitat improvement, etc. This should not be meant to diminish the role of state institutions, which continue to be partners in the fight against crime. From this idea, a new principle emerged, which is detailed below.

2.2. The Principle of Partnership. This principle imposes the requirement of cooperation at local and regional level of citizens, local representatives, but also of specialists in order to ensure better security both at local and regional level, but also in order to prevent the commission of criminal acts.

It is increasingly important for the public to participate in the achievement of crime prevention objectives. Thus, the new policies focus on obtaining the support of the public in several areas and directions of activity, among which I mention social prevention with all its components, including criminal prevention, general and special. Another direction in which public participation is desired is the design and implementation of means and methods of social reaction against delinquency. I also mention here the reform of the

punishment system, at least in the individualization of punishments through measures that can be applied within the community and at the same time specific measures for the treatment of delinquents.

2.3. The Principle of Contracting. This principle brings to the fore the state as the main pillar of elaboration and application of preventive measures, with the following clarifications. First of all, even if these are problems identified by the local investigation and security apparatus, it is necessary that the preventive approach has continuity over time, continuity that can only be offered by the state, through the financial support that is very much needed in the fight against crime. This facilitates both the emergence at national, regional or local level of public bodies for the coordination and planning of prevention, the development and support of concrete programmes and research in the field of prevention, as well as cooperation at all levels, including international cooperation in the field of crime prevention.

It is very important that these aspects are correlated with the dynamics of the social reality that highlight both the multiplication of risk factors such as the economic and financial crisis, unemployment, the reduction of the possibilities of social integration of young people through professional insertion, etc., and the increase in the crime rate. In this context, a more effective application of the measures included in the prevention programmes is necessary.

III. Types of preventive actions. 3.1. Prevention of delinquency in general and juvenile delinquency. As it is appreciated in the specialized literature, delinquency is "a severe form of social deviance that affects the values and social relations protected by the legal norms of a criminal nature" [7, p.13]. And this designates "the set of acts that violate the criminal law" [8, p.2-4]. The significance of delinquency is seen differently in Europe, unlike the position of American authors. Thus, according to the European authors, only criminal acts fall within the scope of delinquency, even in the case of juvenile delinquency, while the American authors are of the opinion that in addition to these, delinquency also includes "contraventions, as well as civil, disciplinary and even banal acts of violation of moral rules or politeness" [8, p.2-4].

Delinquent behavior is distinguished by the fact that it has a series of negative consequences because it can harm the interests of society as a whole. At the same time, this behavior has a destructive, deliberate and antisocial purpose, and the act committed is subject to prohibitions or constraints formulated by the criminal law.

Being a complex phenomenon, delinquency includes statistical, legal and sociological aspects, as well as psychological, economic, cultural and prospective aspects [9, p.166]. Thus, the statistical dimension highlights the state and dynamics of delinquency in time and space, by evaluating it in environments, proscenities and indices of different crimes, and by correlating them with a series of cultural, social, geographical and ecological indicators and variables. The legal dimension highlights the type of legal norms that are violated by antisocial acts, the social dangerousness of delinquents, the seriousness of the damages caused, the intensity and type of sanctions adopted, but also the ways of resocialization of delinquents. The psychological dimension is the one that brings to the fore the structure of the personality of the delinquent individual, the motivation and motive for committing the crime, the attitude of the delinquent towards the committed act, and the sociological dimension is centered on the identification, explanation and social prevention of crimes, in relation to the multiple aspects of maladjustment, disorganization and deviance existing in society and to the forms of social reaction to the various crimes. As for the prospective dimension, it highlights the evolution of delinquency as well as the predisposition of certain individuals or social groups towards crime. Finally,

when we talk about the economic dimension, we refer to the cost of crime, or the direct but also indirect consequences that crime has from a material and moral point of view.

There is currently a return to the traditional concepts of murder, criminal, criminality [8, p.3]. Crime is a form of social deviance that includes all antisocial manifestations, which harm the most important values and social relations protected by criminal norms: life, the person and its integrity, public order, individual rights and freedoms, etc. The general and specific characteristics of the various antisocial acts that are circumscribed to the crime phenomenon are defined by the criminal norms, which determine differences from one country to another and from one legislative system to another, regarding the criminalization of various antisocial acts and their punishment [1, p.72].

Crime involves a series of problems and aspects addressed at a theoretical, practical and methodological level; these approaches allow the identification and explanation of the causes and conditions that generate crime in society, but also the finding of appropriate solutions to ensure the prevention and reduction of potential sources of crime [10, p.7-9]. In recent decades, both internationally and at European level, there has been an increase in the crime rate and an aggravation of current forms of crime, which requires an interdisciplinary approach to this phenomenon by lawyers, criminologists, sociologists, psychologists, specialists with positions of responsibility in the field of law enforcement and crime prevention, as well as an active participation of the community in the prevention activity [11, p.25-26].

Among the main elements to be taken into account in the field of crime and delinquency in general, there are also the clarifications regarding the elements defining juvenile delinquency, which have particularities determined by certain biological, psychological and social characteristics of minors who have committed crimes, which the legislator took into account when regulating their criminal liability [10, p.16-17]; on the basis of these characteristics, measures are established to prevent and combat crimes among minors, measures which must meet the requirements regarding their coherence, efficiency and adequacy to the concrete reality.

In order to develop prevention measures in harmony with these requirements, it is necessary to know the factors that favor juvenile delinquency, to make an in-depth analysis of them in the broad context of the dynamics of juvenile delinquency, but also to identify the material, financial and human resources, which would make it possible to reduce the action of these factors.

Among the main causal factors mentioned by the literature are the dysfunctions of the process of schooling, social understanding and social control, which can be caused by certain links in the chain of the process of socialization, understanding and control manifest contradictions whose dysfunctions can influence the criminal behavior of minors. It should be noted, however, that each offence or antisocial behavioural act of the minor is determined by the specificity of the circumstances of each minor.

Another causal factor mentioned in the literature is the deficient character of the educational function at the family level, manifested by tense family situations that are resolved by means that, as a rule, provoke attitudes of rejection on the part of the child, the lack of affectivity and communication in the relationship between parents and children and sometimes, the low level of school education of the parents, which generate limitations of the educational process and which affect the possibilities and prospects of the minor for socio-professional integration.

3.2. Prevention of Juvenile Delinquency at International Level. At both the international and European levels,, special attention is devoted to the issue of juvenile delinquency and, implicitly, to solutions aimed mainly at controlling and reducing the level of

juvenile delinquency. Thus, a series of measures were adopted in this regard, following several congresses and conventions.

On the occasion of the first UN Congress for the Prevention of Crime and the Treatment of Offenders, held in Geneva in 1955, the issue of establishing a common definition of all states, the notion of delinquency, was addressed. At the Second United Nations Congress on the Prevention of Crime and the Treatment of Offenders, held in London in 1960, a Recommendation was adopted, which establishes that the notion of juvenile delinquency should be used only in the case of acts provided for by the criminal law.

3.3. Prevention of Juvenile Delinquency at European Level. As for the European regulations on juvenile delinquency, they are reflected in the European Convention on the Rights of the Child, adopted in Strasbourg on 25 January 1996, in accordance with the provisions of the UN Convention on the Rights of the Child. The doctrine emphasizes that the acts committed by minors present a lower degree of social danger than those committed by adults, which justifies a differentiated regime of criminal liability and sanctions.

Consequently, the focus is mainly on prevention, both ante-delict and post-delict, as well as on the re-education of minors. They are considered easier to influence and reintegrate socially because their mental and behavioral development is still ongoing and antisocial behaviors are not fully reinforced.

Thus, the legislation provides for a special sanctioning regime for minors, in which the main purpose is education and social reintegration, the sanction having a subsidiary character. Re-education institutions are a specific instrument through which society expresses both its reaction to juvenile delinquency and its orientation towards the recovery and social reintegration of minors [12, p.2-4].

3.4. General Prevention and Special Prevention. The purpose of punishment derives from the vital necessity of social defense against crimes, and punishment achieves the purpose of prevention both by its simple provision in the criminal law, and by its concrete application to the offender and therefore by the exemplarity that is given to other persons. Thus, the premise reflects that criminal law sanctions cannot fulfill their purpose of preventing the commission of new crimes, respectively of new acts provided by the criminal law, both on the part of the perpetrator and on the part of other persons, and can only influence the conscience of the offender unless they are perfectly adapted to the individual case, to the particularities of the person of the perpetrator but also to his needs to correct and re-educate or to the requirements for removing the state of danger [4, p.52].

A very important thing is the fact that the punishment can be applied concretely, only if it is provided for by law, only to a criminal and only by the judicial bodies, in order to prevent the commission of new crimes, it being an instrument of law, because it is based on justice [12, p.39].

The doctrine discusses not only the purpose of punishment, which emphasizes the complementarity of the two forms of prevention, the general and the special, but also the purposes of punishment, in order to better highlight the distinction between general prevention and special prevention [13, pp.238-239].

General prevention is achieved by providing for the punishment in the criminal norm and by knowing it by the members of society, which determines either compliance with the law or fear of sanction. At the same time, the concrete application of penalties helps to strengthen the preventive effect, as examples of sanctions can discourage other people from committing crimes. The main goal of general prevention is to avoid the transformation of potential criminal behavior into actual criminal behavior.

Within it, a distinction is made between negative general prevention and positive general prevention. Negative prevention is based on the effect of intimidation and de-

terrence, but its effectiveness depends on the effective and proportionate application of sanctions, and compliance with this ratio is essential in the rule of law. At the same time, the exaggeration of the repressive character can lead to disproportionate sanctions and illiberal effects, which is why a balance between severity and legality is necessary.

Positive general prevention emphasizes the educational function of criminal law, considering that punishment contributes to the formation and strengthening of the legal and moral conscience of citizens. In this perspective, criminal law has a role of collective education, strengthening respect for the law and protected social values.

The special prevention aims to prevent recidivism, respectively to avoid the commission of new crimes by the convicted person. This is achieved through the re-educational function and, in some cases, through the intimidating effect of punishment. By executing the sanction, the offender is subject to measures designed to positively influence behavior, conscience and discipline, with the aim of social reintegration and compliance with the rules of conduct. A difference between the two types of prevention is that, unlike special prevention, general prevention is achieved only through the function of intimidation of punishment [14, p.54-68].

The main objective of special prevention, both in its negative and positive forms, is to prevent recidivism, respectively to avoid the commission of new crimes by the same convicted person. Various techniques are used to achieve this goal, such as intimidation, special negative prevention and special positive prevention.

Intimidation manifests itself through a psychological coercion, consisting of the application of a sanction designed to discourage the repetition of criminal behavior. Special negative prevention is of a direct coercive nature, helping to neutralise the dangerousness of the offender, in particular by means of measures involving deprivation of liberty, such as imprisonment, which materially prevent the commission of new offences.

Positive special prevention aims to influence the offender's behavior through re-education and moral correction, with the purpose of his social reintegration.

At the same time, the doctrine expresses some objections to special prevention, in the sense that it cannot be absolute in relation to the other functions of punishment. From this perspective, modern criminal law systems maintain a balance between the special preventive purpose and the guaranteeing principles of the rule of law, which explains the maintenance of the minimum and maximum limits of custodial sentences. Such limits, put in contact with the objective gravity of the crimes in question, reflect a proportional relationship between the crime and the sanction, expressing the guarantee requirement to put limits on the pressure of individual rights "sacrificed" by the criminal sanction, limits that must be respected [15, p.163-168].

3.5. Social Prevention and Situational Prevention. In order to comply with the Council of Europe's recommendations in the field of crime prevention, member states are obliged to develop coherent and effective criminal policies, mainly aimed at preventing the criminal phenomenon. These include both social prevention, achieved through socio-economic, educational and information measures for the population, and situational prevention, focused on reducing the opportunities and means of committing crimes. At the same time, preventive policies aim at sanctioning and individualizing punishments, social reintegration of offenders, as well as supporting victims.

Social prevention involves identifying the factors that favor delinquency and implementing programs aimed at reducing their impact. In this process, the institutions of socialization and social control are involved, which contribute to identifying and combating the sources of crime, reducing social damage and restoring social order.

This model starts from the idea that delinquency reflects dysfunctions of the social

environment, which requires intervention on their root causes. Thus, social prevention targets both vulnerable groups and risk situations, as well as social actors such as individuals, families, groups and institutions, aiming to reduce criminogenic factors and strengthen solidarity and social responsibility. Applied experiences, including the model developed in France in the 1980s, highlight the importance of cooperation between the police, authorities and social organizations in the implementation of preventive programs. The effectiveness of these programmes depends on the economic, social and cultural resources available, as well as on their adaptation to the specific needs of the community.

Situational prevention, in turn, aims to reduce the opportunities to commit crimes by involving the community and the public in activities to prevent and neutralize delinquent behaviors.

For this reason, an important aspect that must be respected is the information of the public and individuals in certain criminogenic areas about the potential but also the real dangers of committing crimes, as well as about the existence of risk factors in certain areas [1, p.227].

The situational prevention model is also relevant for crime prevention policies in the Republic of Moldova, being oriented towards reducing the opportunities to commit crimes by intervening on risk situations and by protecting potential victims, in order to reduce the phenomenon of victimization.

In this regard, community partnership initiatives can be mentioned, in which citizens are encouraged to collaborate with the police in identifying and reporting suspicious behavior within local communities. Such models imply a permanent cooperation between the population and public order institutions, in which the police have the role of coordinating, informing and guiding preventive actions.

At the same time, the police bodies contribute by providing information on the evolution of crime and by making prevention recommendations to the population. The effectiveness of these measures depends on the local specificity, the level of community involvement and inter-institutional cooperation, with the effect of reducing the feeling of insecurity among citizens.

3.6. Defensive Prevention and Emancipatory Prevention. An important aspect revealed by the Romanian criminal policy is that one of the most recent typologies regarding the means and objectives of prevention reflects two forms of prevention. It is, first of all, about defensive prevention, a prevention focused on the values of fear and exclusion, which raises the problem of dealing with a certain undesirable situation, through its consequences. Secondly, we are talking about emancipatory prevention which, being focused on the values of inclusion and integration, trusts in the spontaneous possibilities of the population, as being prepared to react to any type of problem [4, p.225].

Lately, there has been a transformation of criminal law in the sense that, while classical criminal law isolates the guilty person from what surrounds him and analyzes especially his will at the moment when he committed the crime, the new criminal law targets social beings who have obligations to the community and sees in the criminal, person who harms the social order.

According to the classical school, according to Aristotle, the act is contained in thought, and murder is always considered as the externalization of a guilty thought and the criminal as an intelligent and free individual who commits evil being aware that he is committing it and intending to commit it. Thus, the murderer is responsible, because the act is conscious and voluntary, and punishment, in the classical sense of the word, is the only and main remedy for the crime and the only reasonable compensation for the act committed. The departure from the principle of personality of responsibility and punish-

ment could lead to the punishment of the innocent and to the non-punishment proportional to the gravity of the facts, of the guilty.

In the debate on criminal law as the extreme ratio of social policy, emphasis is placed on the idea that the use of the criminal instrument is justified only in cases of strict necessity for the repression of socially dangerous behaviors, for which the means available in other branches of law have proven to be inadequate.

The defensive character of criminal law is opportunely revalued in the face of apparently progressive, but substantially illiberal conceptions that concern it and label it as an instrument of social promotion, as an instrument propulsive of new ethical-social concepts.

Taking into account these considerations, it is necessary that the criminal sanction be adequate for the achievement of the protection objectives envisaged: hence the need to collect empirical-criminological data capable of indicating either the real effectiveness of the various sanctioning instruments or the existence of a relevant consensus regarding criminalization; Also, this leads to the need for a subsequent assessment in relation to the degree of (in)tolerability of the damage to an asset. This is particularly about the way in which the complex assessment that the legislator has to make is viewed, as well as the complex and delicate task of selecting punishable behaviour.

The approach to criminalization is not without consistent tensions. The propulsive function of the criminal law reveals that it is conceived as an instrument that contributes to the realization of the model and goals of social promotion prefigured in the Constitution. The need to value criminal law in an emancipatory perspective indicated by Art. 3 para. (2) of the Italian Constitution must not be misunderstood, namely, criminal law cannot be used as an instrument of social transformation or as an instrument capable of leading to the acquisition of future goods. Criminal law, by its nature, tends to guarantee or strengthen the protection of already existing goods, goods that the social conscience perceives as in need of protection.

Lately, there has been an evolution of criminal law, in the sense of moving from the classic model, centered on the analysis of the will of the offender at the time of committing the act, to a modern model that regards the criminal as a social subject with obligations towards the community, and the criminal act as an infringement of the social order.

According to the classical school, inspired by Aristotelian thought, crime is the result of a conscious and voluntary action, and the offender is considered a free and responsible individual. In this context, punishment is the main instrument of social reaction, having a retributive and preventive role, being considered the only adequate compensation for the committed act. At the same time, the importance of respecting the principle of personality of criminal liability is emphasized, in order to avoid punishing innocent persons or the disproportion between the act and the punishment.

In contemporary debates on criminal law as the *ultima ratio* of social policy, it is stated that criminal intervention is justified only in situations where other branches of law cannot ensure the effective protection of social values.

In this context, criminal law retains a defensive character, being an instrument for the protection of existing social values, and not a means of social transformation or promotion of ethical-social models. The use of criminal sanctions must be based on criminological data and the assessment of the degree of social danger, so that criminalisation is justified and proportionate.

At the same time, the criminalization process involves a careful selection of the behaviors sanctioned by criminal law, given the tensions between the need for social protection and the respect for fundamental freedoms. Criminal law does not have the role of

creating new social values, but of protecting and consolidating the assets already recognized by society as necessary for legal protection.

Conclusion. Overall, crime prevention is a fundamental element of modern criminal policy, at the intersection of legal, criminological and sociological approaches. The analysis highlights the fact that prevention is not limited to the application of criminal sanctions, but includes a complex of social, institutional and situational measures aimed at reducing criminogenic factors and strengthening social order.

The study highlights the existence of a diversity of forms of prevention – general, special, social and situational – each with specific mechanisms and purposes, but which function in a complementary system. At the same time, the evolution of criminal law reflects the transition from a strictly retributive model to one oriented towards prevention, social reintegration and the protection of existing social values.

It was also found that the effectiveness of prevention policies is influenced by a number of factors, such as available resources, institutional cooperation, community involvement and adaptation of measures to social realities. At the same time, the inherent limits of prevention confirm the need for a balance between the effectiveness of criminal intervention and respect for fundamental rights and freedoms.

Finally, crime prevention is emerging as a complex and dynamic field, which requires an interdisciplinary approach and a continuous improvement of social and legal response mechanisms, in order to ensure an effective protection of social values and to strengthen community security.

FROM CYBERCRIME TO AI-ENABLED CRIME: ADAPTING THE LEGAL FRAMEWORK IN THE EUROPEAN AND INTERNATIONAL CONTEXT

Andreea Nicoleta DRAGOMIR,
PhD, University Lecturer,
Faculty of Law,
"Lucian Blaga" University of Sibiu,
Romania
ORCID: 0000-0002-9358-8098

Abstract

This article examines the transition from traditional cybercrime to new forms of crime enabled by artificial intelligence, focusing on how emerging technologies influence prevention and response strategies. As digitalisation accelerates, artificial intelligence is becoming both a tool used by public authorities and a risk vector exploited by criminal actors.

The research explores the main legal challenges arising from the use of AI in unlawful activities, including the automation of cyberattacks, information manipulation, and deepfakes. It also discusses the shortcomings of the EU and international regulatory landscape, including the need to adapt cross-border judicial cooperation instruments.

The paper argues for integrated approaches that reconcile the need for effective state intervention with the protection of fundamental rights, emphasising the importance of coherent regulation and institutional cooperation in addressing new forms of digital crime.

Keywords: artificial intelligence, cybercrime, criminal liability, AI Act, judicial cooperation.

DE LA CRIMINALITATEA INFORMATICĂ LA CRIMINALITATEA ASISTATĂ DE INTELIGENȚĂ ARTIFICIALĂ: ADAPTAREA CADRULUI JURIDIC ÎN SPAȚIUL EUROPEAN ȘI INTERNAȚIONAL

Abstract

Prezenta lucrare examinează tranziția de la criminalitatea cibernetică tradițională la noi infracțiuni facilitate de inteligența artificială, concentrându-se pe modul în care noile tehnologii influențează strategiile de prevenire și răspuns. Datorită accelerării digitalizării, inteligența artificială devine atât un instrument folosit de autorități, cât și un vector de risc exploatat de actorii criminali.

Se explorează principalele provocări legale generate de utilizarea IA în activități ilicite, inclusiv automatizarea atacurilor cibernetice, manipularea informațională și utilizarea deepfake-urilor. De asemenea, se discută despre deficiențele peisajului de reglementare al UE și internațional, cum ar fi necesitatea de a adapta instrumentele de cooperare judiciară transfrontalieră.

Susținem abordări integrate, care să reconcilieze necesitatea intervenției eficiente a statului cu preocuparea pentru drepturile fundamentale, pledând pentru importanța unei reglementări coerente și a cooperării instituționale în gestionarea noilor forme de criminalitate digitală.

Cuvinte-cheie: inteligență artificială, criminalitate cibernetică, răspundere penală, AI Act, cooperare judiciară.

Introduction. Although the technological evolution of recent decades is often viewed through the lens of the diversification of digital tools, reality points to a much deeper transformation: a paradigm shift in the very nature of criminality. While the history of cybercrime was largely limited to unauthorised access, electronic fraud, or data theft—acts in which technology played a simple, passive role—the rise of artificial intelligence (AI) has inaugurated a new era. Today, technology is no longer merely an instrument; it has become an active agent, capable of contributing to the initiation and execution of unlawful acts. Scholars have increasingly used the term "AI-enabled crime" to describe this phenomenon. The term does not refer to mere automation, but rather to scenarios in which AI systems facilitate, optimise, or even directly execute actions that violate criminal law [1, p.90-91]. The break from traditional forms of cybercrime is fundamental: whereas in the past human intervention was decisive at every stage, machine learning algorithms introduce a degree of autonomy and adaptability that generates unpredictable behaviour and often escapes the operator's direct control.

This shift is no longer confined to abstract theory. Empirical evidence and recent applications already outline alarming trends. Machine learning-based systems have demonstrated the ability to generate hyper-personalised phishing attacks by exploiting publicly available data to manipulate victims, achieving a success rate significantly higher than that of traditional methods [1, p.90]. Similarly, in financial markets, algorithmic agents have autonomously developed manipulative strategies, such as placing fictitious orders (spoofing), by learning from rewards received in the trading environment [1, p.98].

These examples illustrate a double effect: AI not only amplifies the efficiency of known criminal mechanisms, but also creates entirely new patterns of unlawful conduct. The challenge for criminal law is considerable. Our justice system is founded on the voluntariness of human conduct and on the existence of clearly identifiable guilt, structured around the concepts of actus reus and mens rea. Yet, in the case of autonomous systems, the link between the human actor and the material result becomes diluted. The functional autonomy of AI may produce a dissociation between the act committed and human intent, thereby undermining the classical mechanisms for attributing criminal liability [1, p.95-96]. It becomes increasingly difficult to sanction a person for an unlawful result that he or she neither directly intended nor could reasonably have anticipated.

Paradoxically, even the use of AI for defensive purposes—for the prevention and combating of crime—is not free from legal risks. The opacity of algorithmic decision-making processes, known in doctrine as the "black box" metaphor, undermines the transparency required for a fair trial, making it more difficult to understand how certain incriminating predictions are generated [2, pp.568-569]. Moreover, reliance on historical datasets for model training risks institutionalising existing prejudices, leading to indirect discrimination and violating the principle of equality before the law [3, p.624-625].

In light of these realities, it becomes increasingly evident that the current legal arsenal is insufficient. The criminal norms presently in force were designed to regulate direct human action in a context where the causal relationship among the offender, the act, and the result was linear and clear. AI-enabled crime disrupts this relationship, introducing critical variables such as system autonomy, decisional opacity, and the cross-border nature of digital operations.

Against this background, the present paper proceeds on the basis of the hypothesis that the current legal framework lacks the necessary tools for the effective prevention and sanctioning of AI-enabled crime. The analysis that follows aims to examine the vulnerabilities of the existing regulatory framework and outline concrete directions for

adapting criminal law and international cooperation to address the new forms of illegality generated by the artificial intelligence revolution.

Methods and materials applied. Within this doctrinal-analytical framework, the present paper aims to assess the impact of artificial intelligence (AI) on traditional forms of criminalisation and international cooperation within the criminal justice system. It combines classical legal analysis with elements of interdisciplinary research to examine the technical complexity of "AI-enabled crime". The methodological approach is predominantly qualitative, focusing primarily on the interpretation of legal norms in light of technological developments, rather than on a quantitative analysis of the criminal phenomenon itself.

First, the *method of doctrinal analysis* was employed by examining specialised literature on the interaction between AI and criminal behaviour. The reviewed studies highlight the capacity of AI systems to generate or facilitate criminal acts, while also emphasising the challenges inherent in subsuming such conduct within the traditional framework of criminal liability [1, p.90-91]. This allowed the conceptualisation of "AI-enabled crime" and the identification of its distinctive features compared with traditional cybercrime, particularly the decision-making autonomy of algorithms.

Second, a *comparative analysis* was conducted in order to connect technological developments with the current European regulatory framework. The study highlights recent legislative initiatives, in particular the Artificial Intelligence Act (AI Act), which classifies AI systems based on risk and imposes stringent requirements on high-risk systems [4]. This approach reveals the tension between static, prevention-oriented regulation and the rapidly evolving nature of cybercriminal attack vectors.

In addition, the research draws on institutional documents concerning the protection of fundamental rights. The European Union Agency for Fundamental Rights has noted that the use of AI in automated decision-making based on historical data may significantly affect fundamental rights, including equality and non-discrimination, particularly given the vulnerability of such datasets [5]. These findings support the need for strict procedural safeguards in any future criminal law regulation addressing AI.

Furthermore, the *case study method* was employed to provide a concrete illustration of the operational strategies underlying AI-enabled crime. The scenarios examined include:

- The automated generation of highly personalised phishing attacks targeting victims based on specific psychological vulnerabilities [1, p.90];

- The use of algorithmic agents to manipulate financial markets through high-frequency trading for fraudulent purposes [1, p.98].

As highlighted in the specialised literature, there is an inherent tension between technological efficiency and the preservation of the fundamental values underpinning the rule of law, necessitating a reconsideration of liability frameworks [6]. International reports confirm that AI not only automates such activities but also amplifies them, exponentially increasing both the scale and the complexity of investigations [7].

With regard to implications for criminal law, the analysis incorporates studies examining the impact of digital "algorithmic opacity" (the so-called "black box") on decision-making transparency and the right to a fair trial [2, pp.568-569]. At the same time, particular attention has been paid to the risk that algorithmic systems used in criminal justice—such as recidivism risk assessment tools—may reinforce existing biases, thereby undermining the presumption of innocence and the principle of non-discrimination [3, p.624-625].

Finally, the *normative analysis* evaluated the adequacy of the existing legal framework. It identified the limitations of traditional concepts of guilt and imputability in situations where harmful outcomes are generated, wholly or partially, by autonomous algorithmic processes, without direct and foreseeable human involvement.

Discussions and results obtained. In the present analysis, two levels of AI involvement in criminal activity are distinguished:

(i) AI as a tool (tool-based crime), and

(ii) AI as an autonomous agent (autonomy-driven conduct).

I. Reconfiguration of Criminal Typologies. The analysis demonstrates that artificial intelligence (AI) does not merely produce a quantitative scaling of criminality, but rather brings about a qualitative transformation of the criminal modus operandi. We are witnessing a shift from passive tools (static software) to active agents capable of making autonomous decisions.

In the field of fraud, the difference is considerable. Traditional phishing, based on generic templates, has been replaced by hyper-personalised attacks generated by large language models (LLMs). These systems analyse the victim's digital footprint in order to create credible narratives, thereby reducing offenders' operational costs and increasing the success rate [1, p.90]. From a legal perspective, such conduct may fall within the scope of the offence of fraud; however, the automated nature of the interaction complicates the identification of the subjective element. According to Europol's IOCTA 2023 report, approximately 40% of social engineering attacks in 2025 involved AI-generated content that was almost indistinguishable from human communication [8].

In the sphere of financial crime, high-frequency trading (HFT) algorithms can execute market-manipulation strategies (e.g., spoofing, layering) at speeds that cannot be monitored by direct human intervention. Here, fraudulent intent (dolus) becomes diffuse: the unlawful result is produced by an algorithmic "black box" that has learned to maximise profit through illicit methods, without any explicit instruction to that effect from the programmer [1, p.98].

Moreover, the emergence of deepfake technology has created new attack vectors. The use of audio-video synthesis to mislead decision-makers (e.g. CEO fraud) or for sexual blackmail represents a legal grey area. Although the offences relating to forgery and fraud remain, in abstract terms, applicable when automatically generated content is used, establishing authorship and proving the subjective element becomes problematic in light of the functional autonomy of AI systems [7].

A distinct challenge, with direct implications for the administration of evidence in criminal proceedings, concerns the erosion of trust in digital content. Generative technologies have lowered the threshold for creating false evidence (audio and video deepfakes), which can deceive even forensic experts without specialised forensic tools. This phenomenon creates the risk of an "authenticity crisis", in which any digital evidence may be contested as AI-generated even when it is genuine (known as the "liar's dividend"). In the absence of standardised protocols for certifying content origin (provenance) and of digital forensics laboratories equipped with AI countermeasures, the integrity of the justice process is compromised. Recent scholarship suggests the need to reconsider the rules governing the burden of proof in certain contexts or to introduce presumptions of authenticity for blockchain-certified content to prevent procedural deadlocks [11].

II. The Crisis of Traditional Models of Criminal Liability. The central challenge identified lies in the incompatibility between AI autonomy and the bipartite structure of the offence (actus reus + mens rea).

The functional autonomy of "black box" systems may lead to a dissociation between human action and the harmful result. Where an algorithm generates a criminal consequence unforeseen and unintended by the developer, the traditional causal chain breaks down. This creates the risk of a "fragmentation of liability", in which no human actor (neither the developer nor the user) cumulatively satisfies the constituent elements of a specific criminal offence [1, p.95-96].

The difficulty of establishing guilt is further aggravated by the lack of predictability. In criminal law, negligence presupposes the possibility of foreseeing the result. However, in the case of complex neural networks evolving through machine learning, the final behaviour may be unpredictable even to their creators. The imposition of criminal sanctions in the absence of a clear link of psychological causality would violate the principle of the personal nature of criminal liability, transforming punishment into a form of strict liability incompatible with the European rule of law.

Solutions proposed in doctrine, such as granting an "electronic legal personality" to advanced AI systems, remain controversial. Although such a measure might resolve the problem of imputability, it could also dilute the responsibility of the actual human actors involved (developers, corporations), thereby providing them with a convenient legal shield [10].

III. Impact on Fundamental Rights and on the Right to a Fair Trial. The use of AI in criminal justice, while promising in terms of efficiency, introduces systemic risks for human rights, particularly through opacity and algorithmic discrimination.

The "black box" phenomenon drastically limits decisional transparency. If an algorithm for assessing the risk of recidivism recommends a severe preventive measure, but its internal reasoning remains inaccessible ("unexplainable"), the rights of defence and to a fair trial (Article 6 ECHR) are compromised. The accused cannot challenge a rationale that even the expert cannot fully decode [2, p.568-569].

Even more seriously, algorithms trained on historical data tend to perpetuate existing social biases. Empirical studies have shown that criminal profiling systems may generate higher error rates for certain minority groups or socio-economic categories, not because of any explicit discriminatory intention, but because of distortions in the training datasets [3, p.624-625]. This violates the principle of equality before the law and the presumption of innocence, transforming statistical prejudice into de facto judicial verdicts.

The EU Artificial Intelligence Act seeks to remedy these shortcomings by prohibiting certain uses (e.g., social scoring) and imposing strict obligations for transparency and human oversight on high-risk systems used in law enforcement [4]. Nevertheless, the effectiveness of these measures depends on national authorities' ability to conduct technical audits of algorithms, a competence that is often underdeveloped in current judicial systems.

In this context, Regulation (EU) 2024/1689 (the AI Act) marks a turning point by classifying AI systems used in law enforcement, the administration of justice, and border management as high-risk. Under Annex III of the Regulation, these systems are subject to strict obligations before being placed on the market: conformity assessment, the use of high-quality training datasets to minimise bias, detailed technical documentation and, crucially, effective human oversight (human-in-the-loop). At the same time, however, the AI Act remains predominantly an ex ante (preventive) regulatory instrument. It does not define new offences or establish direct regimes of criminal liability, leaving Member States with the difficult task of aligning these administrative requirements with national criminal codes to sanction the malicious or negligent use of prohibited systems [12].

IV. Directions for Adapting the Legal Framework and International Cooperation. The gap between the speed of technological innovation and the slowness of the legislative process requires a structured response on several interconnected levels.

First, clarifying the regime of imputability requires adopting legal provisions that establish presumptions of liability for AI developers and operators. In the absence of legal personality for artificial intelligence itself, the law must clearly define the duty of care owed by those who place autonomous systems on the market, criminally sanctioning any known security defect or negligence in training algorithms that leads to the commission of offences [10]. This adaptation must also be reflected at the national level, where the Romanian Criminal Code, in its current form, defines offences and modes of participation exclusively through the prism of human conduct [14]. The Romanian legislator will therefore have to consider introducing specific forms of professional negligence applicable to AI developers, or extending corporate criminal liability for security defects in commercialised software products, to avoid the risk that European norms remain dead letters in judicial practice. As of 2026, aligning the AI Act's requirements with national criminal law remains an ongoing consolidation process. In most Member States, including Romania, there are still no specific criminal provisions addressing the abusive use of artificial intelligence systems, which leads to the indirect application of existing legal norms. In practice, judicial authorities are required to adapt traditional offences—such as fraud, computer-related forgery, or illegal access to computer systems—to situations in which unlawful conduct is mediated or amplified by autonomous systems.

This approach creates interpretative difficulties, particularly with regard to establishing causality and culpability. In the absence of explicit legislative intervention, there is a risk of developing inconsistent judicial practices, underscoring the need for normative clarification, either through amendments to criminal codes or the adoption of specific legal instruments.

In this context, the legal concept of a "presumption of vigilance" must also be translated into verifiable technical terms. An abstract obligation of diligence is not sufficient; it must be operationalised through a set of technological risk indicators that can be objectively assessed. From a technical perspective, such diligence would require comprehensive documentation covering the entire lifecycle of the AI system, including bias audits of training datasets, robustness testing against potential misuse, and mechanisms to ensure the traceability of algorithmic decisions.

In the case of systems classified as "high-risk", adequate documentation should demonstrate, for example, the diversity and quality of the datasets used, the methods employed to detect and mitigate algorithmic bias, and the existence of human intervention procedures in critical situations. In the absence of such elements, the obligation of vigilance remains purely formal, and legal liability becomes difficult to effectively establish.

Second, adapting judicial cooperation is becoming urgent, given that AI-enabled crime is inherently transnational and that current mechanisms of mutual legal assistance are often too slow to counter automated attacks unfolding within milliseconds. Although the Convention on Cybercrime (the Budapest Convention) remains the cornerstone of international cooperation, it was drafted in a pre-AI era and lacks specific provisions for preserving evidence generated by autonomous systems or attributing liability in cases involving cross-border algorithms [13]. It is therefore necessary to adopt an Additional Protocol to this Convention, specifically devoted to artificial intelligence that facilitates the rapid exchange of data and direct cooperation between national authorities and AI service providers, irrespective of jurisdiction [7].

Beyond the need to adopt such a protocol, its effectiveness depends directly on the integration of common technical standards. A protocol dedicated to artificial intelligence should explicitly provide for technical mechanisms enabling the rapid preservation and exchange of digital evidence. In practical terms, this could involve developing standardised interfaces (APIs) between judicial authorities and AI service providers, enabling the immediate freezing and transmission of relevant data in cross-border cases.

At the same time, technologies such as blockchain could ensure the certification of data provenance, thereby guaranteeing the integrity and authenticity of digital evidence. In the absence of such technical solutions, judicial cooperation risks remaining dependent on slow procedural mechanisms, which are incompatible with the speed and complexity of AI-enabled criminal activity.

Finally, the implementation of AI in justice must be subject to strict procedural and ethical safeguards, including mandatory independent audits and a right to an explanation for any automated decision that affects fundamental rights. The efficiency of crime control cannot justify sacrificing the principles of the rule of law [5]. In essence, criminal law should not prohibit technology as such, but regulate its responsible use, because without rapid legislative harmonisation at the European level and strengthened international cooperation, the risk that offenders will exploit the legal "grey zones" of AI will grow exponentially, undermining public safety and trust in the justice system.

Conclusions. This paper is grounded in the fundamental question posed at the outset: Can the current criminal law framework effectively address the transition from traditional cybercrime to AI-enabled crime? The analysis indicates that, although existing instruments—such as the Budapest Convention—provide a solid foundation for addressing classical cybercrime, the autonomy of algorithms and the opacity of artificial intelligence systems render them insufficient in this new context. As identified throughout this study, responding to these challenges does not require abandoning the classical principles of criminal law; rather, it calls for their reinterpretation and extension along three interconnected strategic directions.

First, it is necessary to redefine responsibility through legislative measures that clearly establish the chain of liability for autonomous systems. In the absence of an "electronic legal personality," the law should introduce a presumption of vigilance for developers and operators, requiring them to bear criminal responsibility for negligence in the design or training of algorithms that generate foreseeable criminal consequences. This approach would help eliminate the zone of impunity created by the technical complexity of so-called "black box" systems.

Moreover, the modernisation of judicial cooperation instruments has become imperative. AI-enabled crime operates at a speed that far exceeds the capabilities of traditional mechanisms of mutual legal assistance. In this context, adopting an additional protocol to the Budapest Convention, specifically focused on artificial intelligence, would be essential. Such a protocol should ensure the immediate preservation of digital evidence and facilitate real-time information exchange between national authorities and AI service providers, regardless of jurisdiction.

Finally, the use of AI within the criminal justice system must be grounded in auditable transparency and subject to strict safeguards for fundamental rights. Any algorithm-based judicial or law enforcement decision should be accompanied by a clear explanation, ensuring a "right to explanation" and thereby safeguarding the right to defence and preventing systemic discrimination. Although the European Regulation on Artificial Intelligence (AI Act) represents a necessary first step, it must be closely aligned with na-

tional criminal codes in order to ensure the effective sanctioning of abuses.

Ultimately, adapting the legal architecture is not merely desirable but essential for preserving the rule of law in the digital age. In the absence of rapid legislative harmonisation at the European level and proactive international coordination, the criminal justice system risks becoming both reactive and ineffective, exposing society to asymmetric, automated, and difficult-to-attribute threats. The future of criminal law depends on the legislator's ability to anticipate technological developments, not merely to follow them.

Abstract

This article examines the relevance of the European Court of Human Rights' case-law to the investigation and punishment of computer-related fraud, with particular emphasis on the Convention limits applicable to digital surveillance and electronic evidence.

The paper starts from the premise that, although the Court does not adjudicate cybercrime offences as such and does not create an autonomous criminal policy model in this field, its case-law substantially shapes the European legal framework through the standards developed under Articles 8, 6 and 7 of the European Convention on Human Rights. From that perspective, the study argues that the Court's relevance in the field of computer-related fraud lies primarily in controlling the proportionality of state interference, protecting digital privacy, safeguarding adversarial proceedings and equality of arms in relation to digital evidence, and preserving the requirements of legal certainty and foreseeability in criminal law.

Keywords: computer-related fraud, cybercrime, digital evidence, privacy, fair trial, Budapest Convention, international cooperation.

INCIDENȚA ART. 8 DIN ChEDO CU PRIVIRE LA INFRACȚIUNEA DE FRAUDĂ INFORMATICĂ: LIMITELE INVESTIGAȚIEI DIGITALE ȘI EXIGENȚELE UNUI PROCES ECHITABIL

Abstract

Prezentul studiu analizează relevanța jurisprudenței Curții Europene a Drepturilor Omului pentru investigarea și sancționarea fraudei informatice, din perspectiva limitelor convenționale impuse utilizării tehnologiilor de supraveghere și administrării probelor digitale.

Lucrarea pornește de la premisa că, deși Curtea nu judecă direct infracțiuni informatice și nu configurează un model autonom de politică penală în materie, jurisprudența sa influențează decisiv cadrul juridic european prin standardele dezvoltate în aplicarea articolelor 8, 6 și 7 din Convenție. Din această perspectivă, cercetarea urmărește să evidențieze că relevanța CEDO în domeniul fraudei informatice constă mai ales în controlul proporționalității ingerințelor statului, în protecția vieții private digitale, în exigențele contradictorialității și egalității armelor în raport cu probele electronice, precum și în menținerea cerințelor de claritate și previzibilitate ale normei penale.

Cuvinte-cheie: fraudă informatică criminalitate informatică, probe digitale, viață private, proces echitabil, Convenția de la Budapesta, cooperare internațională.

Introduction. The rapid expansion of digital technologies has profoundly changed not only the way economic and social activities are carried out, but also the forms in which criminality manifests itself. In this new context, computer fraud has emerged as one of the most dynamic and difficult-to-control forms of crime, as it exploits both the technical vulnerabilities of information systems and the legal difficulties generated by the cross-border nature of the digital environment [1, pp. 1-2]. It is no longer merely a technological adaptation of classical fraud, but rather a type of unlawful conduct that simultaneously raises issues of jurisdiction, evidence, international cooperation and the protection of fundamental rights [34, pp. 148-149].

From a legal perspective, combating computer fraud cannot be reduced to the mere expansion of the state's repressive powers. On the contrary, the effectiveness of digital investigations depends on the ability of authorities to act within a normative framework that allows access to electronic evidence, the monitoring of certain communications or the use of computer data, without turning these instruments into a space of arbitrariness [4, pp. 25-26]. It is precisely at this point that the case-law of the European Court of Human Rights becomes relevant. Although the Court does not adjudicate cybercrime offences as such, it establishes the conventional standards against which the means used by states in investigating and sanctioning such acts must be assessed [28, pp. 2-3].

This the study aims to determine the extent to which ECtHR case-law influences the manner in which European states may investigate computer fraud without exceeding the limits imposed by the Convention. The hypothesis of the paper is that the relevance of the ECtHR in this field does not lie in the direct regulation of cybercrime, but in the configuration of a set of legal requirements concerning the protection of private life, the legality of interferences, the administration of digital evidence and the guarantees of a fair trial [27, p. 8]. In other words, the Court does not provide a criminal-law model of computer fraud, but rather a model for controlling state power in the context of digital investigations.

The analysis of the relevant case-law of the European Court of Human Rights, combined with the examination of the main European and international instruments in the field of cybercrime, forms the basis of the present research [28, p. 144].

From a methodological perspective, the study combines normative analysis with case-law analysis, while also taking into account a critical doctrinal perspective. Its objective is not to provide an exhaustive inventory of the forms of computer fraud, but to highlight the legal standards that condition the legitimacy of the state's response to this phenomenon.

Discussions and results obtained. I. Computer Fraud between Technological Specificity and Legal Vulnerability. Computer fraud differs from traditional forms of fraud through the nature of the environment in which it is committed, the instruments used and the particular manner in which the harmful result is produced. In the digital environment, obtaining an unlawful patrimonial advantage does not always require direct contact with the victim or the physical presence of the perpetrator in a specific place. Instead, it may result from the manipulation of information systems, deception through electronic means, the compromise of authentication data or the fraudulent use of payment and communication infrastructures [2, p. 79].

This form of criminality has a strongly adaptive character. Methods of operation evolve alongside technology, and the speed with which new digital tools emerge often makes the normative response of states slower than the dynamics of the acts under investigation [32, p. 127]. From this perspective, the fundamental challenge is not merely the

criminalisation of conduct, but the maintenance of a functional correspondence between the legal norm, technological reality and the requirements of the protection of fundamental rights.

Moreover, computer fraud almost always has a transnational dimension. The perpetrator may act from one jurisdiction, the technical infrastructure may be located in another, while the victims and evidence may be dispersed across several states. Such a structure complicates the determination of jurisdiction, access to data, cooperation between authorities and the use of electronic evidence [34, p. 144]. Consequently, the legal response to computer fraud cannot be conceived exclusively in terms of domestic criminal law, but requires an articulation between criminal law, criminal procedure, judicial cooperation and the European protection of human rights.

At the same time, the phenomenon produces a major economic and social impact. Patrimonial damage, the erosion of trust in digital infrastructures and the increase of risks to the security of electronic transactions transform computer fraud into a problem that goes beyond the strictly criminal sphere [31, p. 4]. For this reason, its prevention and repression require an integrated approach, in which repressive instruments are complemented by technical measures, international cooperation and digital education [41]. However, legitimate this objective may be, it cannot automatically justify the unlimited expansion of surveillance or data collection. In a state governed by the rule of law, the effectiveness of combating cybercrime must be assessed in relation to the conventional limits of state intervention [8].

In order to provide continuous education, training and information in the field of cybercrime, it is necessary to: develop and implement training programs dedicated to employees with investigative and criminal prosecution duties, prosecutors, judges and technical personnel [35, p. 510].

II. The European Legal Framework: Between Normative Harmonisation and Conventional Control. At European level, the fight against cybercrime is carried out through a multi-layered legal architecture. At its foundation lies the Budapest Convention on Cybercrime, which represented the first international instrument with a comprehensive scope in this field, by establishing common standards concerning both the criminalisation of offences and international cooperation, as well as the procedural powers necessary for their investigation [4]. The importance of the Convention lies not only in its harmonising function, but also in the fact that it expressly reflects the need to strike a balance between law-enforcement interests and respect for fundamental rights.

European Union law complements this framework through legal instruments concerning the security of networks and information systems, data protection, access to electronic evidence, and operational cooperation between Member States. Naturally, these instruments do not replace domestic law, but they create pressure towards normative and institutional convergence, especially with regard to responses to new forms of digital crime [6]. On the other hand, normative harmonisation does not eliminate the risk of imbalances between the repressive logic of criminal law enforcement and the requirements of human rights protection, thus highlighting the distinct role of the European Court of Human Rights.

The Court does not define cybercrimes and does not establish the constituent elements of computer fraud; its function is entirely different: to review whether, in the process of preventing, investigating and sanctioning such offences, states comply with the guarantees of the Convention [28, p. 3].

From this perspective, the case-law of the European Court of Human Rights be-

comes relevant not because it constructs a criminal law of cybercrime, but because it establishes the legality parameters of the state's response. The interception of communications, the monitoring of internet use, access to digital data, the storage of information concerning online activity, the use of technical surveillance measures and the use of electronic evidence all fall within an area in which Article 8 and Article 6 of the Convention acquire decisive importance [13]. In certain situations, Article 7 also becomes relevant, especially where technological developments risk creating tension with the requirements of clarity and foreseeability of criminal law provisions [25].

Therefore, the European legal framework in the field of computer fraud cannot be understood merely by listing the applicable legal instruments. It must also be analysed from the perspective of the conventional control exercised by the Court, which requires states to demonstrate that the effectiveness of digital investigations is not achieved through the unjustified sacrifice of individual freedoms [10].

III. CEDO Case-Law and the Standards Applicable to Digital Investigations. 3.1. Protection of Private Life and the Limits of Electronic Monitoring. A first perspective relevant to the investigation of computer fraud concerns the protection of private life and correspondence in the digital environment. In Copland v. the United Kingdom, the Court held that the monitoring of a person's electronic communications, including e-mail and internet use, falls within the scope of protection of Article 8 of the Convention. The importance of this judgment does not lie in its direct connection with computer fraud, but in the clarification of an essential principle: information generated through the use of communication technologies is not excluded from conventional protection merely because it is produced in a professional or digital environment [13].

This approach is particularly important in the field of investigations concerning computer fraud, since the gathering of evidence often involves access to communications data, online activity history or the content of electronic exchanges. In such situations, the Court requires that the interference be prescribed by law, pursue a legitimate aim and be necessary in a democratic society [26]. It follows that the technical effectiveness of monitoring is not sufficient; it must be accompanied and reinforced by a clear normative framework and by safeguards against arbitrariness.

The same logic can also be found in Bărbulescu v. Romania, in which the Court emphasised the obligation of national authorities to ensure a fair balance between the employer's legitimate interest and the employee's right to private life and correspondence. Although the case belongs to the field of labour law, its value goes beyond the strict framework of professional relationships. It highlights that the mere technical possibility of monitoring does not, in itself, justify the legitimacy of such interference. For the field of computer fraud, this conclusion is important because it shows that the monitoring of communications and digital behaviour must be subject to a rigorous proportionality review [7].

Consequently, the Court's case-law suggests that the protection of private life in the digital environment does not operate as an absolute obstacle to criminal investigations, but as a criterion for disciplining them. The state may use technical monitoring tools, but only insofar as the legal basis, the aim pursued and the procedural safeguards prevent the investigation from turning into excessive surveillance [10].

3.2. Legality and the Use of Digital Evidence. A second central and relevant idea concerns the legality of evidence and the relationship between irregularities in obtaining it and the requirements of a fair trial. In *Khan v. the United Kingdom*, the Court held that Article 6 does not, as a general rule, establish an autonomous system for the admissibility

of evidence, since this matter falls primarily within the scope of domestic law. The decisive issue is whether the proceedings, assessed as a whole, were fair [15].

This approach has important consequences for the use of digital evidence in computer fraud cases. In practice, electronic data may be obtained through methods that raise issues of legality, authenticity or reliability. However, an irregularity in the method by which evidence was obtained does not automatically lead to the conclusion that Article 6 has been violated. Rather, the Court examines whether the accused party was able to challenge the evidence, whether the court critically assessed its credibility and whether the proceedings as a whole provided sufficient safeguards [15].

In *Bykov v. Russia*, the Court emphasised the need for adequate safeguards against abuses in the use of covert methods of obtaining evidence [9]. The relevance of this case-law to the digital environment is clear. In the current context, technical instruments for data collection, recording, digital infiltration or access to information systems allows authorities a high degree of intrusion. In the absence of clear limits and effective control, such instruments may become incompatible with the requirements of the Convention [10].

Therefore, the issue of digital evidence is not limited to the question of whether such evidence is useful or effective. It also requires an assessment of the legality of the manner in which it was obtained, the conditions under which it may be challenged and the institutional safeguards accompanying its use in criminal proceedings.

3.3. The Right to a Fair Trial and the Adversarial Principle in the Digital Era. The right to a fair trial acquires a particular significance in the field of cybercrime, since digital evidence may be technical, opaque and difficult for the accused person to understand. In *Schenk v. Switzerland*, the Court held that the use of unlawfully obtained evidence does not automatically amount to a violation of Article 6, provided that the proceedings, viewed as a whole, remain fair [20]. This idea has been consistently reiterated in subsequent case-law and constitutes an important point of reference in the assessment of electronic evidence [15].

In relation to such evidence, the requirements of Article 6 imply more than the mere formal presence of the evidence in the case file. The accused person must have an effective opportunity to know, understand and challenge the digital material used against him or her. The adversarial principle and equality of arms become essential where the evidence is highly technical, produced by complex information systems or derived from technical operations that the party cannot easily verify [11].

This means that, in matters concerning computer fraud, the fairness of the proceedings depends not only on the formal legality of data collection, but also on the conditions under which such data are introduced, explained and challenged before the Court. The more technical and less immediately accessible the digital evidence is, the more important the role of the court becomes in ensuring the effective exercise of the rights of the defence [14].

3.4. Article 7 and the Requirement of Foreseeability of Criminal Law. Although studies on computer fraud usually focus on Article 8 and Article 6, Article 7 of the Convention is also relevant. The principle of legality of offences and penalties requires criminal law provisions to be sufficiently clear and foreseeable so as to enable individuals to understand the legal consequences of their conduct [17]. In the field of cybercrime, this requirement may become problematic precisely because of the accelerated pace of technological change [32, p. 4].

Computer fraud is an area in which new patterns of conduct often emerge before

legal terminology and legislative techniques have had time to adapt. In such a context, the temptation to use excessively broad formulations may increase. However, such an approach risks weakening the foreseeability of the law and undermining legal certainty. The relevance of Article 7 lies precisely in recalling that the modernisation of criminal law cannot be achieved by sacrificing the requirement of clarity [17].

From this perspective, the contribution of the European Court of Human Rights is indirect but essential: it warns that the need for legislative adaptation to new technological realities does not exempt the state from the obligation to formulate criminal law provisions compatible with the requirements of legality [27].

3.5. The Real Relevance of ECtHR Case-Law for Combating Computer Fraud. The Court's case-law does not provide an autonomous model of criminal policy in the field of computer fraud. It does not determine which investigative techniques are the most effective, nor does it define operational strategies for combating digital crime. Its relevance is, however, fundamental at another level: that of the legitimate limitation of state power and of conditioning the use of technological instruments on compliance with conventional guarantees [28].

In this respect, the impact of the European Convention on Human Rights on the fight against computer fraud is structural. The Court requires states to construct their investigative practices in a manner compatible with private life, the legality of interferences, adversarial proceedings, the rights of the defence and the foreseeability of the legal norm. This influence is all the more important as digital investigations tend to expand the state's capacity to collect, correlate and use large volumes of information [27].

Therefore, the Court's real contribution does not consist in reducing the effectiveness of the fight against cybercrime, but in preventing it from shifting towards a security model devoid of safeguards. In a democratic society, the effectiveness of repression cannot be achieved by suspending rights, but only by integrating them into the very logic of the criminal-law response [16].

IV. Current Problems and Challenges in Combating Computer Fraud. The fight against computer fraud currently faces a permanent tension between the rapid pace of technological transformation and the relative inertia of legal mechanisms. Offenders use encryption, anonymised infrastructures, advanced social engineering and, increasingly, tools based on artificial intelligence, which complicates the identification of perpetrators, the location of evidence and the documentation of offences [29, pp. 12-13]. Consequently, law-enforcement authorities are placed in a position where technical superiority no longer belongs exclusively to public authority.

Another major difficulty concerns access to electronic evidence. Relevant data may be dispersed across borders, held by private providers, encrypted or stored for limited periods of time. In this context, delays in international cooperation may decisively affect the effectiveness of the investigation [34, p. 47]. However, the operational pressure generated by these difficulties may encourage insufficiently regulated intrusive measures, which is why conventional control remains indispensable [10].

The problem of normative fragmentation also persists. Although harmonisation instruments exist, differences between national legislations, procedural standards and institutional practices continue to create a space of legal vulnerability that can be exploited by criminal networks [40, p. 147]. For this reason, international cooperation should not be understood merely as an instrument of assistance between authorities, but as a structural element of the effective fight against computer fraud [3, Art. 23].

The preventive dimension must not be ignored either. Insufficient digital literacy,

users' vulnerability to online manipulation techniques and excessive trust in platforms and electronic means facilitate the expansion of computer fraud [21, pp. 4-5]. In the absence of a minimum culture of digital security, criminal repression inevitably remains belated.

Under these circumstances, an effective legal response cannot be exclusively punitive. An integrated approach is necessary, combining legislative adaptation, the strengthening of international cooperation, the development of technical investigative capacities and the digital education of users. Only such a combination can realistically reduce the gap between the mobility of cybercrime and the state's capacity to respond within the limits of the rule of law [41].

Conclusions. The analysis carried out in this study highlights that computer fraud represents one of the most complex manifestations of contemporary crime, both through the technological specificity of its methods of commission and through the legal and procedural difficulties it generates. The adaptable nature of this phenomenon, its frequently transnational dimension and the central role of digital evidence mean that the state's response cannot be conceived exclusively in terms of classical criminal repression. Combating computer fraud necessarily requires a constant adjustment of the relationship between the effectiveness of investigations and respect for fundamental rights.

The study has shown that the relevance of the case-law of the European Court of Human Rights in this field does not lie in the direct regulation of computer fraud, but in the establishment of legal standards applicable to state intervention in the digital environment. From this perspective, the Court functions as an essential benchmark for assessing the legitimacy of surveillance measures, the use of electronic evidence and the manner in which authorities exercise their powers during criminal investigations. Its contribution is therefore one of delimitation and control, as it imposes clear limits regarding interferences with private life, the requirements of procedural fairness and the demands of legality.

An important finding of the research is that the protection of private life remains a central element even in the context of intensified digital investigative measures. The monitoring of communications, access to data and the use of modern technical means are not, in themselves, incompatible with the need to combat computer fraud, but they become legitimate only insofar as they are clearly regulated, proportionate to the aim pursued and subject to effective safeguards against arbitrariness. At the same time, the use of digital evidence requires increased attention from the perspective of the right to a fair trial, since its technical complexity may genuinely affect the accused person's ability to know, understand and challenge it.

The study also highlights that the rapid evolution of technology does not diminish the importance of the principle of legality, but rather reinforces its relevance. The adaptation of legislation to new forms of cybercrime is necessary, yet it cannot take place at the expense of the clarity and foreseeability of criminal law provisions. In the absence of sufficiently precise criminal offences and coherent procedural rules, the legal response risks becoming unstable and vulnerable from the perspective of fundamental rights protection.

At the same time, the transnational dimension of computer fraud confirms that the effectiveness of its prevention and repression depends essentially on international cooperation. However, the need for speed and efficiency in exchanging data and obtaining evidence cannot justify the circumvention of legal safeguards. On the contrary, it is precisely in the context of cross-border cooperation that maintaining a balance between the repressive interest and the protection of individual freedoms becomes essential.

Ultimately, computer fraud requires a model of legal response based on the complementarity between effectiveness and safeguards. The case-law of the European Court of Human Rights provides the necessary benchmarks for constructing this balance, demonstrating that the protection of fundamental rights is not an obstacle to combating cybercrime, but a condition of its legitimacy. Only through the coherent integration of these standards into legislation, judicial practice and the activity of criminal investigation authorities can an effective, proportionate response compatible with the requirements of the rule of law be built.

Abstract

In this article, we will examine the more or less noticeable effects of the return decision, as regulated by Emergency Ordinance No.194/2002 on the status of foreigners in Romania (hereinafter – E.O. 194/2002).

The decision to return foreigners must be subject to rigorous legal scrutiny to ensure unequivocal respect for their fundamental rights. The practice of Romanian authorities is often characterized by a formalistic and expedited approach, frequently indicating a lack of concern for the safeguards provided by European and international law regarding the protection of persons in vulnerable situations. The disregard for the principle of proportionality, the lack of effective remedies, and the arbitrary application of measures that relate more to the operational activities of institutions than to administrative acts reflect a chronic failure to align legislation and administrative practices with the standards set by the Court of Justice of the European Union and the European Court of Human Rights.

In this context, an urgent review of the regulatory and procedural framework is required so that the Romanian state can truly fulfill its international obligations and respect human dignity.

Keywords: return, decision, effects, migration, illegal, fundamental rights.

DESPRE EFECTELE DECIZIEI DE RETURNARE

Abstract

În conținutul articolului, vom analiza efectele mai mult sau mai puțin sesizabile ale deciziei de returnare, reglementată prin Ordonanța de urgență nr. 194/2002 privind regimul străinilor în România (în continuare OUG 194/2002).

Decizia de returnare a străinilor trebuie să fie supusă unui control juridic riguros, care să asigure respectarea neechivocă a drepturilor fundamentale ale acestora. Practica autorităților române se caracterizată adesea printr-o abordare formalistă și expeditivă, denotă adesea o preocupare precară pentru garanțiile oferite de dreptul european și internațional în materie de protecție a persoanelor aflate în situație de vulnerabilitate. Ignorarea principiului proporționalității, lipsa unor căi de atac efective și aplicarea arbitrară a măsurilor ce țin mai mult de activitatea operativă a instituțiilor decât de actul administrativ reflectă un deficit cronic în alinierea legislației și a practicilor administrative la standardele impuse de Curtea de Justiție a Uniunii Europene și de Curtea Europeană a Drepturilor Omului.

În acest context, se impune o reconsiderare urgentă a cadrului normativ și procedural, astfel încât statul român să își asume cu adevărat obligațiile internaționale și respectarea demnității umane.

Cuvinte-cheie: returnare, decizie, efecte, migrație, ilegal, drepturi fundamentale.

Introduction. In this article, we aim to provide some clarification regarding the more or less noticeable effects of the administrative act known as a return decision, as provided for in Emergency Ordinance No.194/2002 on the status of foreigners in Romania (hereinafter – E.O. 194/2002).

Methods and materials applied. The present article is based on the provisions of the following legislative acts and relevant legal instruments: Government Emergency Ordinance No.194 of December 12, 2002, on the Status of Foreigners in Romania; Government Ordinance No.44 of January 29, 2004, on the social integration of foreigners who have been granted international protection or a right of residence in Romania, as well as of citizens of Member States of the European Union and the European Economic Area; Law No.122 of May 4, 2006, on asylum in Romania; Government Ordinance No.25 of August 26, 2014, on the employment and posting of foreigners within the territory of Romania and amending and supplementing certain legislative acts regarding the status of foreigners in Romania; European case law.

Discussions and results obtained. The return decision is the administrative act issued by the General Inspectorate for Immigration, through which it is officially established that a foreign national's stay on the territory of the state is illegal, and following this determination, the foreign national is imperatively required to leave the national territory within a set timeframe, under penalty of the application of appropriate coercive measures, in accordance with applicable national and international legal regulations. This constitutes a measure to regulate migration flows, aimed at ensuring compliance with the rules governing residence on the territory of the state, and is issued following an assessment of the circumstances of the foreign national's stay (by the same authorities) and in accordance with the legal procedures in force.

The administrative act cannot be separated from the operation itself. Return is the process by which a foreign national is returned, either voluntarily or under escort, to a third country, which may be, as the case may be, the country of origin, a transit country designated under international agreements to which Romania or the European Union is a party, or any other third country to which the person concerned chooses to return, provided that the country in question agrees to accept the individual. This process is carried out in accordance with the principles of protecting the fundamental rights of the individual, ensuring that the foreign national's return is conducted in a dignified and respectful manner, taking into account their personal circumstances, as well as international standards regarding the protection of human rights. Return may be accompanied by assistance measures, including counseling or financial support, to facilitate the foreign national's reintegration in the destination country, in accordance with the principles of humanity and international law.

A return decision is an administrative act of particular importance, by which the termination of a foreign national's right of residence in Romania is established, following the identification of circumstances that contravene applicable legal and international regulations. The grounds for such a measure are varied and include, among other things, situations in which the foreign national did not meet the legal requirements at the time of entry into the country, used false documents or provided incorrect information, facilitated the illegal entry of other persons, violated customs regulations or attempted to cross the borders illegally, or entered Romania during a pre-existing ban. Furthermore, violating the stated purpose of entry or regulations regarding the employment of foreigners, as well as the imposition of a measure prohibiting subsequent entry or a declaration of undesirability, constitute sufficient grounds for issuing such a decision. Specifically, through

the return decision, the competent authorities establish the foreign national's obligation to leave Romanian territory, formally and transparently communicating to them the legal basis for the measure ordered, in order to ensure respect for the individual's fundamental rights, as well as public security and order (although, as we will show below, the latter take precedence over the former).

The decision to annul or revoke the right of residence is an administrative act that terminates a foreign national's right to remain in the country, in accordance with applicable legal regulations. In this regard, this measure is communicated in a fair and transparent manner by the General Inspectorate for Immigration through a return decision, an official document by which the competent authorities notify the foreign national present on Romanian territory of the termination of their right of residence. It is essential to emphasize that, through this return decision, the foreign national is informed not only of the revocation of their permission to remain on the territory of the state, but also of the obligation to leave the country, thereby establishing the procedural framework necessary to ensure the fair respect of their rights. This procedure must be conducted in accordance with the principles of legality, transparency, and proportionality, ensuring that the foreign national is fully aware of the reasons underlying this measure and has the opportunity to challenge the decision before the competent authorities, in accordance with their right to a fair hearing and with international standards protecting fundamental human rights.

Article 81 of Government Emergency Ordinance No.194/2002 establishes the framework under which the General Inspectorate for Immigration may order the return of a foreign national who is residing illegally in Romania by issuing a clear administrative decision, in accordance with applicable national and international regulations. Thus, return may be ordered in various cases, including illegal entry into Romanian territory, failure to comply with legal conditions for entry and stay, expiration of residence documents, or in situations where the foreign national has been declared undesirable or where the temporary protection granted by a decision of the Council of the European Union has ceased. It is essential to emphasize that in applying this measure, the authorities must strictly adhere to the principle of proportionality [1], ensuring that the return measure is not more severe than necessary, taking into account the specific circumstances of each individual case. Additionally, further protection is provided to foreign nationals who are subject to procedures for taking charge by another European Union member state or to procedures for extending their right of residence, as it is possible to postpone the issuance of the return decision until the completion of such procedures. In all cases, the foreign national must be properly informed of their rights and options, and the measures ordered must be fair and in accordance with international standards regarding the protection of fundamental rights.

Article 82 of Government Emergency Ordinance No.194/2022 establishes a fundamental prohibition on the measure of return, based on the essential principle of protecting the rights of the individual—particularly those of foreign nationals—through the application of the principle of proportionality [2], which requires a careful and balanced assessment of the circumstances of each case [3]. In this regard, the legislature has provided for a series of situations in which return cannot be ordered, even in the context of an illegal stay, reflecting a constant concern for the observance of fundamental human rights principles. Thus, the return measure is prohibited when the foreign national is a minor and has a parent with a right of residence in Romania, or when he or she is the parent of a minor Romanian citizen who is dependent on him or her, which reflects the paramount protection of family unity and the child's right to remain with his or her par-

ent. Furthermore, the prohibition on return applies to a foreign national married to a Romanian citizen or to a foreign national with a long-term right of residence, highlighting the importance of maintaining a stable and legal family relationship within the national territory. Similarly, protection is extended to foreigners over the age of 65, recognizing the need for humane treatment and protection of the vulnerable, in accordance with the principles of humanity.

Furthermore, in cases where one of these circumstances favorable to the foreign national arises after the return order has already been issued, but before its enforcement, the competent authorities, namely the General Inspectorate for Immigration, are required to revoke the return decision, thereby ensuring that individual rights are adequately protected, without resorting to the application of a disproportionate or unfair measure. These regulations therefore guarantee a fair and favorable framework for the foreign national, and the procedure must not be an unjustified coercive mechanism, but one that takes into account the personal circumstances of each person involved.

In this context, exceptions are made, for example, in cases where the foreign national poses a threat to public order, national security, or public health, or where the foreign national refuses to comply with measures imposed by medical authorities; however, these situations are exceptional and must not serve as a pretext for the arbitrary application of the return measure.

In conclusion, the prohibition on return is an essential safeguard for foreigners in vulnerable situations, ensuring that any administrative measure, including the return decision, complies with the principle of proportionality, which requires that the authorities' interventions be appropriately calibrated, respect the individual's fundamental rights, and be reviewed primarily at the administrative level, but also at the judicial level, thereby protecting the balance between public order and respect for human rights. Return, in its legal-administrative sense, constitutes a measure of last resort, a solution that may be ordered only in circumstances of indisputable gravity and only after all alternative mechanisms—whether preventive, corrective, or integrative—have been exhausted. In accordance with the principles of legality, proportionality, and necessity, any return procedure must be subject to a thorough and rigorous analysis, grounded in both the principle of good administration and the imperatives of protecting fundamental rights. Any decision in this regard must be the result of a thorough assessment, in which both the impossibility of any other reasonable solution and the imperative nature of the measure are demonstrated completely and transparently, without omission, and in an indisputable manner.

In a comprehensive and transparent manner, without omission, and beyond any doubt, both the impossibility of any other reasonable solution and the imperative nature of the measure. In light of the requirements imposed by the legal and administrative order, return may only be implemented as an exceptional measure, justified by circumstances of absolute urgency, in accordance with applicable legal norms and under the strict supervision of the competent authorities.

Article 83 of Government Emergency Ordinance 194/2022 apparently regulates in detail and rigorously the procedural framework of the return decision, emphasizing both the importance of transparency and the need to comply with the highest standards of formality and legality, which are essential for protecting the fundamental rights of the foreign national. The return decision, in essence, constitutes an administrative act through which the General Inspectorate for Immigration confirms the foreign national's illegal stay on Romanian territory and establishes their obligation to return, including the deadline for voluntary departure. In this context, the authorities are required to draft

the decision in a complete, accurate, and detailed manner [4], so as to reflect the exact reasons that led to the finding of illegal residence, as well as the method of implementing the return measure, thereby complying with the mandatory principle of transparency and access to justice through this content.

In this context, the return decision must be drawn up in two copies—one in Romanian and the other in a language of international circulation—thus ensuring effective and accessible communication that guarantees the foreign national a clear understanding of the measure applied and the reasoning behind it. This formality is not merely a procedural obligation but also a demonstration of respect for the fundamental rights of the individual concerned, while simultaneously facilitating access to the legal remedies provided by law. Thus, the authorities are required to provide complete and accurate information, including the factual and legal details underlying the decision, as well as all necessary information regarding the courts competent to adjudicate on the return decision and the available remedies, all of which contribute to creating a fair and transparent legal framework. In this regard, the competent authorities have a positive obligation to provide the data subject with a detailed, complete, and unambiguous statement of the factual and legal grounds underlying the measure ordered, avoiding any omission that could affect the right to a defense.

Furthermore, in our view, the decision must clearly and comprehensibly set forth all information regarding the courts competent to review the legality of the measure, the available remedies, and the applicable time limits, so that the addressee may effectively exercise their right to an effective remedy. In practice, these requirements are not always properly met, which creates significant risks of procedural irregularities. In a state governed by the rule of law, courts must be able to exercise effective and thorough review of the legality of the administrative decision, with the ability to critically examine and fully assess the arguments of the issuing authority. The omission of essential elements from the return decision may limit the courts' ability to exercise genuine judicial review, thereby undermining the fairness of the proceedings. It is therefore imperative that the authorities fulfill their obligation to ensure a clear legal framework by providing all necessary information in a comprehensive and accessible manner, so that the procedural rights of the individuals concerned are fully respected and the courts have all the necessary elements to conduct a rigorous and effective judicial review.

Furthermore, to ensure effective protection of the foreign national's rights, if he or she does not understand Romanian or a language of international circulation, the authorities are required to provide an appropriate translation of the main elements of the return decision, ensuring that the foreign national is fully informed of the measure applied to them and of the possibility to challenge this decision.

It is important to note that this detailed procedural framework, which includes written or oral translation, does not apply directly only to foreigners who have crossed the border of Romania or another European Union member state illegally. In such cases, the authorities are required to provide the foreign nationals with an explanatory sheet in several internationally used languages.

Thus, the decision-making process regarding return must be conducted with a high level of legality, transparency, and formality, which clearly guarantees the foreign national's procedural rights and protects the principle of proportionality. In this way, the authorities allow the courts, if necessary, to review and validate, through judicial proceedings, the arguments and reasoning underlying the return measure, thereby contributing to a just and equitable system of law enforcement.

Article 831 of Government Emergency Ordinance No.194/2022, which regulates the technical measures applied to foreigners subject to return decisions, completely alters the direction of the legal framework governing return operations and raises deep skepticism regarding the authorities' genuine commitment to truly respect the fundamental rights of the persons affected by these measures. We consider that this legal provision is likely to create the risk of exceeding the legal limits established to protect human rights. This provision suggests an approach that appears to aim more at consolidating a system of control, with potentially serious future consequences, where the foreign national is categorized, and their personal data—including fingerprints and photographs—can be turned into a tool for perpetuating constant surveillance, with the risk of abuses that may exceed the limits of a reasonable application of the law.

It can be truly problematic that such technical measures are implemented without offering any real guarantee that the personal data of foreigners will not be used in a way that compromises their rights, sometimes without any clear or proportionate justification, especially when the individual is subject to return. In fact, rather than being an act aimed at protecting the individual, fingerprinting and photographing them under the Schengen Information System (SIS) appears to be a bureaucratic labeling exercise, intended not only to ensure their return but also to create a "digital footprint" that will remain stored forever, paving the way for the use of this information for purposes that are, in most cases, impossible to anticipate.

In light of these regulations, a highly pertinent question arises: what, in reality, constitutes proportionality when a foreign national becomes the subject of an international database that could potentially be used against them in an uncertain future? Can such an action by the authorities be considered "proportionate" when it is applied without a genuine review of all circumstances and without the authorities being required to truly explain the rationale behind this operation? It can therefore be argued that the process undermines the principles of proportionality [5] and fairness [6], raising questions about the actual effectiveness of the measures in relation to their long-term impact on the rights and freedoms of foreigners.

In the context of the regulations set forth in Article 83[1], since the two procedures for registering the foreign national are not clearly defined as individual administrative acts that can be separately challenged in court, it is nearly impossible not to note the absence of clear and effective procedural safeguards before the authorities to protect the fundamental rights of the foreign national subject to the return measure, not only before the administration, but also, and crucially, before the courts.

In fact, even at the administrative level, there is no real transparency regarding the reasons given for fingerprinting and photographing foreign nationals, and the authorities tactfully avoid providing clear explanations as to how this data will be used in the future. In any case, in the face of such a regulatory act, not even a court of law seems truly capable of protecting the individual's rights, given that the procedural mechanisms intended to safeguard the foreign national's interests are ambiguous.

Fingerprinting and photographing, as technical measures ordered by the competent authorities, do not constitute administrative acts in the strict sense of the term [7], but rather represent preparatory acts necessary for subsequent proceedings. This legal classification has significant consequences for the possibility of challenging these measures before the administrative court. According to the general principles of administrative law, an act is subject to judicial review if it produces direct legal effects on a person's rights and freedoms. However, fingerprinting and photographing measures do not, in and of

themselves, have an autonomous decision-making character, but rather constitute mere technical and material operations that prepare the way for the adoption of subsequent administrative acts.

From this perspective, case law tends to exclude them from the scope of administrative acts proper, which makes it impossible to challenge them directly before the administrative court. This situation creates a genuine gap in access to justice, as the person affected by these measures has no effective remedy to challenge them before they produce further legal effects, which contravenes the fundamental right to a fair trial, enshrined in Article 6 of the European Convention on Human Rights. In the absence of a judicial remedy, the risk of unjustified interference with the individual's fundamental rights becomes evident, and effective judicial protection is seriously undermined.

The legal regime applicable to fingerprinting and photographing measures requires a reassessment from the perspective of necessary procedural safeguards, so that any person subject to these measures may benefit from real and effective access to justice, in accordance with international standards on the protection of human rights. In such a situation, the fundamental rights of the foreign national could be violated, without any means of seeking an objective review of the measures applied.

Thus, in addition to the fact that the system is built around the idea that a foreign national has little chance of challenging such a measure, he or she effectively becomes a cog in an administrative machine where their fundamental rights may remain without any real protection, even in the courts. Thus, it is evident that, although in theory there are regulations that should guarantee respect for the foreign national's rights, in reality, these prove to be merely a formality that can derail the return process.

It should be noted that neither Regulation (Eu) 2018/1860 of the European Parliament And of the Council of 28 November 2018 on the Use of the Schengen Information System for the Return of Illegally Staying Third-Country Nationals Nor Regulation (Eu) 2018/1861 of the European Parliament and of the Council of 28 November 2018 on the establishment, operation, and use of the Schengen Information System (SIS) in the field of border checks, amending the Convention implementing the Schengen Agreement, and amending and repealing Regulation (EC) No. 1987/2006, contain provisions allowing for the separate challenge of these two technical operations in administrative litigation.

In conclusion, the technical measures imposed by European regulations should be viewed with a great deal of skepticism, given the potential risks of abuse and misuse of personal data—risks that could seriously affect the rights of foreigners—without the authorities being sufficiently transparent or accountable in addressing these concerns.

Article 84 of Government Emergency Ordinance 194/2022 is a product of administrative formalism. Viewing this text with legal detachment, we are faced with a classic example of how to create a procedure that appears fair at first glance but which, in practice, may function as a mechanism to obstruct fundamental rights. The "notification" of the return decision is issued by the General Inspectorate for Immigration, which delivers a copy of the decision to the foreign national. It is strictly stipulated that the decision may be delivered either by hand, against signature (an ideal scenario, which assumes that the foreign national and the official will meet at exactly the right time), or by mail, with a return receipt, which, in theory, seems reasonable. But in reality? The precarious living conditions of foreigners, the bureaucratic difficulties in updating an address, and, above all, the fact that a person subject to return may be in an extremely vulnerable situation, without constant access to mail, are completely ignored. In the case of "notification" by posting, the authority's effort appears to be minimal, as it is highly likely that the recipi-

ents are not even aware of its existence. The final means of publicizing the return decision, if service fails (which, unsurprisingly, happens often), is that the decision is "communicated" by posting at the headquarters of the General Inspectorate for Immigration. Thus, in the spirit of procedural absurdity, the foreign national in question is presumed to have the daily habit of voluntarily checking the bulletin boards of the very institution that has just ordered their removal. This method, which reduces the act of notification to a mere formality, constitutes an administrative avoidance of actual contact with the affected person, thereby ensuring that procedural rights remain a mere theoretical ideal. All these tactics stem from the absolute presumption of inaccessibility—the foreign national cannot be held responsible for failing to receive a document of which they are unaware. The legislature introduces a list of situations in which service is presumed to be impossible, but these constitute a series of procedural pitfalls for the foreign national: if the foreign national refuses to accept the document, if the foreign national no longer resides at the declared address, or if the foreign national has not declared an address.

In conclusion, this is a highly sophisticated administrative mechanism that can block a foreign national's access to the courts. The provisions of this article do not, in reality, regulate a notification procedure, but rather an administrative mechanism for effectively avoiding actual notification. The foreign national is placed in a procedural maze where they are required to comply with rules they cannot know or follow and are sometimes accused of non-cooperation. Through a combination of rigid formalism and legal fiction, the state manages to transform the communication of a decision into a purely symbolic act, thereby emptying of content the procedural safeguards that should protect the person concerned.

Moving on to Article 88 of Government Emergency Ordinance 194/2022 regarding "voluntary" departure, it can be observed that, if we were to refer strictly to the title of this article, it appears we are dealing with a genuine expression of the foreign national's will before the Romanian administrative apparatus. Thus, the foreign national is offered the "opportunity" to "voluntarily" comply with the obligation to return. The deadlines for voluntary departure, however, are merely the bureaucratic timing of the expulsion, and we consider them insufficient. Article 88(2) and (3) precisely outline the period that the authorities are willing to grant a foreign national to get their affairs in order.

The distinction between 15 days and 30 days, although it appears to reflect some differentiation in factual circumstances, is in fact a superficial concession calculated strictly on the basis of how "guilty" the foreign national is for their own situation of illegality. Thus, those who have been "detected" without a right of residence are granted a 15-day period, whereas those who had a somewhat legal relationship with the state—but whose right of residence was annulled, revoked, or denied—receive 30 days, a grace period that is supposed to be sufficient to put their lives, belongings, housing, employment, and, possibly, their family in order.

Through voluntary departure, the foreign national is offered the choice between leaving Romania with a modicum of dignity (but within a timeframe strictly dictated by the authorities) and being removed under escort. However, this "voluntary" departure is not a real option, but merely a less brutal procedural version of an administrative expulsion that has already been decided.

An examination of Article 96 of Government Emergency Ordinance 194/2022 regarding the suspension of the enforcement of the return obligation reveals a reality quite different from the one presented—we are dealing with enhanced protection of the foreign national's rights, which underscores respect for the individual and compliance with in-

ternational norms. According to Article 96(1), the Romanian state suspends the enforcement of the decision only in situations where the return decision is in direct conflict with fundamental norms of international law or with norms of humanitarian law. For example, return is temporarily halted if the foreign national risks being sent to a state where they could be tortured or subjected to inhuman treatment (subparagraph a)).

Another situation in which the authorities decide to suspend the return process is the foreign national's state of health (subparagraph b)). In other words, Romania does not deport individuals whose medical condition makes return "impossible". Furthermore, the regulation provides that return is suspended if the foreign national is the parent of a minor enrolled in school (lit. c)), but only for the duration of the school year. This provision raises the following dilemma: once the school year ends, is it perfectly acceptable for the minor to be separated from his or her parent?

Article 96(2) reminds us that any suspension of the obligation to return is only temporary. According to paragraph (3), once it is determined that the circumstances justifying the suspension have ceased to exist, the foreign national is placed back on the path to expulsion, without benefiting from an individualized reassessment of their situation. Of course, in a gesture of administrative transparency, the authorities are required to inform the foreign national, "in writing" of the termination of the suspension (para. 4), which brings the foreign national back to the issue of "notification" of the return decision. The suspension of return is permitted only under extremely restrictive conditions and only for the duration of temporary circumstances. There is no guarantee that, once these circumstances cease, the foreign national's situation will be reassessed in good faith or that the authorities will take into account any new circumstances that may arise. Thus, this article must ensure that it reflects a genuine intention to protect the individual's interests. Ultimately, expulsion must respect the principle of proportionality of the measure.

Article 97 of Government Emergency Ordinance 194/2022 outlines the rules and safeguards applicable during the suspension of the obligation to return. Thus, what is presented as a generous list of safeguards is closer to minimum legal obligations. The so-called preservation of family unity (lit. a)) is a statement of principle that appears to indicate that the Romanian state does not carry out deportations in the manner of undemocratic regimes, where families are torn apart without hesitation.

In the case of providing emergency medical care and basic treatment for illness (lit. b)), the emphasis on the term "emergency" speaks volumes. In practice, the Romanian state declares that foreigners awaiting return will receive this benefit, but unfortunately, any other type of medical care that goes beyond the strictly necessary "basic treatment of the illness" [8] is not taken into account (e.g., complex treatments, chronic medication, post-operative rehabilitation, etc.). A phrase so vague that it can be interpreted as a way to restrict access to medical services.

Granting minors access to the education system (lit. c)) is a provision that, at first glance, seems reasonable, but which hides a difficult question: what happens after return? Is the minor's educational continuity guaranteed, or does this right disappear the moment the parent is deported? Taking into account the special needs of vulnerable persons (lit. d)) is another way of ensuring that the rights of foreigners are respected during the suspension of the obligation to return. What exactly does "taking into account" these needs mean? Are there actual support mechanisms in place at the level of the competent authorities? Without a clear definition of the applicable protective measures, this principle could remain an empty rhetorical exercise, intended only to give the illusion of genuine concern.

Thus, what is presented as a set of rights is, in reality, a list of strictly limited administrative concessions. The foreign national is temporarily protected and tolerated, and these "guarantees" are intended to provide them with a dignified life and ensure that the return process does not become too brutal.

Conclusions. In light of the above considerations, the decision to return foreigners must be subject to rigorous judicial review to ensure unequivocal respect for their fundamental rights. The practice of Romanian authorities, often characterized by a formalistic and expedited approach, must not reflect a lack of concern for the safeguards provided by European and international law regarding the protection of persons in vulnerable situations. The legislative possibility of disregarding the principle of proportionality, the lack of effective remedies, and the potential for arbitrary application of measures constitute a shortcoming in aligning legislation and administrative practices with the standards set by the Court of Justice of the European Union and the European Court of Human Rights. In this context, a reconsideration of the regulatory and procedural framework is necessary so that the Romanian state can ensure respect for the rights of foreigners, in accordance with the requirements of international obligations, prioritizing human dignity over administrative urgency.

RECENT APPROACHES TO ASYLUM POLICIES: COMPARATIVE ANALYSIS

Adrian BĂNCILĂ,
PhD, Associate Professor,
Faculty of Police,
"Alexandru Ioan Cuza" Police Academy, Bucharest,
Romania
ORCID: 0009-0000-0743-8708

Abstract

The paper presents the profound changes in approaches to international protection in the context of global records of forced displacement, estimated at over 120 million people in 2024. The comparative analysis concerns asylum policies in the European Union (EU), the United Kingdom of Great Britain and Northern Ireland (UK) and the United States of America (USA). The research results highlight a common feature, namely generalized and unspoken restriction, characterized by the acceleration of border procedures, the outsourcing of migration management to third countries and the expansion of the concept of "safe third country".

The main aspects studied are the new migration and asylum regulations (for the EU, with mandatory border procedures and a new solidarity mechanism), the post-Brexit divergence and administrative efforts to reduce decision-making backlogs (in the case of the UK) and the dramatic reorientation of policies starting with 2025, including the suspension of refugee resettlement programs (for the USA).

The paper's conclusions highlight the tension between the normative architecture of the 1951 Geneva Convention and current sociopolitical pressures, raising essential questions about the future of international protection.

Keywords: asylum policies, migration, new EU pact, outsourcing, international law, comparative analysis.

ABORDĂRI RECENTE ÎN MATERIA POLITICILOR DE AZIL: ANALIZĂ COMPARATĂ

Abstract

Lucrarea prezintă schimbările profunde ale abordărilor cu privire la protecția internațională în contextul recordurilor globale de deplasare forțată, estimate la peste 120 de milioane de persoane în anul 2024. Analiza comparată privește politicile de azil în Uniunea Europeană (UE), Regatul Unit al Marii Britanii și Irlandei de Nord (UK) și Statele Unite ale Americii (SUA). Rezultatul cercetării evidențiază o caracteristică comună și anume restrângere generalizată și neverbalizată, caracterizată prin accelerarea procedurilor la frontieră, externalizarea managementului migrației către state terțe și extinderea conceptului de „țară terță sigură".

Principalele aspecte studiate sunt noile reglementări privind migrația și azilul (pentru UE, cu proceduri obligatorii la frontieră și un nou mecanism de solidaritate), divergența post-Brexit și eforturile administrative de reducere a restanțelor decizionale (în cazul UK) și reorientarea dramatică a politicilor începând cu anul 2025, inclusiv suspendarea programelor de relocare a refugiaților (pentru SUA).

Concluziile lucrării subliniază tensiunea dintre arhitectura normativă a Convenției de la Geneva din 1951 și presiunile sociopolitice actuale, ridicând întrebări esențiale despre viitorul protecției internaționale.

Cuvinte-cheie: politici de azil, migrație, noul pact UE, externalizare, drept internațional, analiză comparativă.

Introduction. The international asylum system, as inherited from the second half of the 20th century, is currently being asked more and more frequently and with greater urgency a fundamental question: does this framework correspond to its original purpose? We believe that this question should represent at least one of the starting points for analyses focused on recent developments in the field of international protection. Anticipating to some extent the content of this material, we cannot ignore that the post-war international landscape, in which the normative framework surrounding the 1951 Geneva Convention relating to the Status of Refugees was built, is confronted with geopolitical and demographic realities radically different from those that formed the basis of its enactment. In this paper, we propose to carry out a detailed comparative analysis of the way in which three major democratic jurisdictions – the European Union (hereinafter, EU), the United Kingdom of Great Britain and Northern Ireland (hereinafter, UK) and the United States of America (hereinafter – USA) – relate to the not-so-simple issue of granting international protection. We intend to present, with particular attention, two approaches that in our view constitute true "bridgeheads" for the medium-term perspective of refugee law: the Danish model, as an expression of the most restrictive approach possible within the European legal space, and the outsourcing of migration management to third countries, examined through the lens of the case study of the Protocol between Italy and the Republic of Albania on this topic.

We believe that, in all three systems that are the subject of the presentation, we are witnessing the application in a convergent manner of a strategy of "procedural restrictionism", in other words: the restriction of practical access to asylum through administrative and procedural mechanisms, while the formal right to request international protection is preserved; the convergence of the systems analyzed towards this strategy of procedural restrictionism and the maintenance at the formal level of international commitments assumed in the past constitute the central thesis of this work. This strategy presents numerous flaws as it creates large deficits in the functioning of the rule of law, generates judicial delays and, as the outsourcing experience demonstrates, frequently fails precisely in its operational terms.

Methods and materials applied. The research uses a qualitative methodology, based on a comparative analysis of the asylum systems in the European Union, the United Kingdom and the United States of America. The methods applied include:

a) *Documentary analysis* of the relevant legislative instruments (the 1951 Geneva Convention and the 1967 Protocol, the EU Regulations under the New Pact on Migration and Asylum, the British legislation Illegal Migration Act 2023 and the Safety of Rwanda Act 2024, as well as the American executive regulations on asylum);

b) *Jurisprudential analysis* of the judgments of the Court of Justice of the European Union, the Supreme Court of the United Kingdom, the European Court of Human Rights and the American federal courts;

c) *The case study* of the Italy-Albania Protocol of November 2023, examined as a paradigmatic example of the challenges raised by the outsourcing of asylum procedures;

d) *Analysis of statistical data* provided by UNHCR, EUAA and competent national authorities for the period 2022-2025.

Discussions and results obtained. I. The Global Context of Forced Displacement. According to estimates by the United Nations High Commissioner for Refugees (UNHCR), by mid-2024, forced displacement characterized the situation of over 120 million people globally, a number that, from a European perspective, exceeds the combined populations of France and Spain. Also, from a refugee law perspective, in the EU alone, approximately

one million applications for international protection were registered in 2024, according to the European Union Agency for Asylum [1].

From a simple analysis of the text of the 1951 Geneva Convention, it can be deduced that the international act was adopted for a specific type of applicant: the individual fleeing individual persecution that can be defined by reference to race, religion, nationality, political opinion or membership of a particular social group [2]. Now, returning to the numbers mentioned, what is important for this analysis is not so much the quantity or volume of displacements, but rather their quality or structural nature. We believe that the entire regulatory framework of refugee law is built around this particular model that was fully applicable, from a socio-historical perspective, at the time of the adoption of the Convention.

We currently observe population displacement caused by combinations of conflicts (not necessarily of the military nature of those to which the Convention refers), agricultural collapse induced by climate change, state fragility (the so-called "failed" states, "narcostates", etc.) and economic despair, which do not clearly fit into any of the five grounds provided for by the Convention. This structural dissonance between the construction of refugee law, built on the pillar, valid in 1951, of a post-war European context, and the 21st century reality of displacement constitutes the essential background of each policy option examined below [3, p.3].

II. The European Union: From the Common European Asylum System to the Pact on Migration and Asylum. Managing a multitude of systems (and, implicitly, national approaches and policies in the field of refugee protection) was not feasible for European communities, which is why the EU, starting from the international legal order, on the path of its own development and transformation into a unique construction at international level, starting from the Dublin Convention, built the Common European Asylum System (CEAS). The purpose of the CEAS was from the very beginning that of the EU's main coordinated legal response to the challenge of harmonizing refugee protection in the 27 (currently, in relation to the UK's exit from the EU in 2020, our emphasis) Member States. Therefore, continuously and progressively developed since 1999, the CEAS had as its objective the achievement of convergence in reception, qualification and procedure standards. The result is a remarkable one, namely a common interstate legal area of protection, governed by jointly adopted legal norms.

The legislator cannot, however, anticipate the multitude of situations that may arise in practice, nor can he today, for understandable reasons of legal certainty, devise excessively general and abstract regulations intended to be applied over the years through the interpretation of legal experts and case law such as the Law of the Twelve Tables. International life at the end of the 20th and beginning of the 21st centuries has proven considerably more complex. The iterations of the Dublin Regulation, which assigns responsibility for examining an asylum application to the state of first irregular entry, have created an inherent structural inequity: disproportionate administrative and financial pressure on peripheral Member States such as Greece, Italy, Bulgaria and Malta, while facilitating secondary movement to Northern and Western Europe. The refugee crisis of 2015, with over a million arrivals in a single year, exposed these structural deficiencies with particular acuity [4, p.17].

2.1. Pact on Migration and Asylum. After almost four years of protracted interinstitutional negotiations, the European Union adopted the New Pact on Migration and Asylum in May 2024. The European Parliament approved the package on 10 April 2024; the Council endorsed it on 14 May 2024. The instruments entered into force in June 2024,

with a two-year transition period before full application, scheduled for June 2026 [5].

The Pact comprises a dozen legislative instruments, the most significant of which are: 1) The Asylum Procedure Regulation (EU 2024/1348) – which introduces mandatory border admissibility procedures; 2) The Asylum and Migration Management Regulation (EU 2024/1351) – which establishes a new solidarity mechanism; 3) The Screening Regulation – which creates a pre-screening process for all irregular arrivals (EU 2024/1356); and 4) The Border Return Regulation (EU 2024/1349). In relation to the brief list above, we would like to highlight the Asylum Procedure Regulation (EU 2024/1348) because, from our perspective, it represents, through the way it defines solidarity at European level in the field of migration and asylum, a real turning point in the European architecture in this area [6].

We appreciate, from studying the construction of the European legal norms that make up the pact we are referring to, that at the heart of the regulation lies a new approach of carefully controlled restrictionism. By this concept we understand the contradiction between the form and substance of the regulation; in other words, the form (which refers to the right to international protection) does not match the substance (which results in a significant restriction of the rights of applicants for international protection and a most likely result in the rejection of their application). We argue our position by arguing that, although formal legal channels are preserved and the right to seek asylum is not abolished, in fact, the procedural acceleration at the borders, the extended application of the concept of "safe third country" and mandatory border procedures for applicants from countries with recognition rates below 20% together restrict the practical and effective scope of access to asylum in ways that the formal preservation of the right does not highlight [7].

The public reception of the new regulations is mixed, with criticisms not lacking for the restriction of procedural rights and the risk of deportation of individuals before the completion of appeal procedures. The opinions expressed characterize the trajectory of the Pact as a shift from a protection-focused model to a management-focused one [8].

III. The United Kingdom: Post-Brexit Divergence and the Limits of Unilateralism. The UK's exit from the EU and, consequently, the break of this state with long democratic and liberal traditions from the legal order built by the European Communities has made possible the emergence of an extremely interesting case study in contemporary asylum governance that answers the question of what happens when a major liberal democracy regains full control over the regulation of its immigration system.

The answer, so far, has been a very interesting one. The Conservative government's most ambitious restrictive initiative, the Rwanda policy, aimed at transferring asylum seekers who had arrived irregularly in Rwanda for processing outside British territory. The UK Supreme Court invalidated this policy in November 2023, ruling that Rwanda could not be considered a safe third country under international and domestic law [9]. Subsequently, the parliamentary majority passed the Safety of Rwanda Act 2024 as an alternative legislative solution, declaring Rwanda a safe third country under the sovereign prerogatives of any state to assess a particular matter [10]. However, the newly installed Labour government abandoned the policy entirely upon taking office.

The current UK approach is based on three pillars: increasing returns of failed applicants; reforming the appeals system to reduce delays; and, crucially, adjusting the nature of refugee protection towards a temporary model. Protection is increasingly formulated as being conditional on the continued impossibility of safe return. This logic is analytically significantly closer to the Danish approach, an aspect acknowledged and reinforced even

by the authorities who cite the Danish experience and praise the deterrent effects of this policy on migrants and people smugglers [11].

The UK has set out to reduce the historic backlog of applications for international protection and the UK Government's statement on migration and asylum highlights clear administrative performance in this regard. As a result, around 85,000 initial decisions have been made since July 2024, reducing the backlog by 47% since the peak in June 2023. Returns have increased by 10% in the twelve months to October 2025, with over 48,000 total returns recorded since July 2024. However, it is important to note that of the 58,000 applications rejected between June 2024 and June 2025, fewer than 11,000 people have actually been returned [11]. We wanted to highlight the gap between legal rejection and physical return because these figures do not represent marginal statistical mentions but constitute the central operational challenge of restrictive asylum policy, a challenge that no jurisdiction examined has successfully resolved.

IV. United States: Executive Power, Judicial Coercion, and the Imbalance between Them. The American asylum system operates within a constitutional framework that is fundamentally different from both the European supranational model and the structure of British parliamentary sovereignty. Executive power over immigration is considerable but not unlimited, being embedded in the much-discussed system of checks and balances and subject to judicial review. In recent years, the relationship between the judiciary and the executive has come to characterize American asylum policy.

4.1. The Biden Administration: Convergence toward Restriction. Between 2021 and 2025, American asylum policy has been characterized by what we believe can be described as reluctant restrictionism. Coming after a first Trump administration (2016-2020) and taking over a US deeply divided on deep issues and still in shock after the violence that engulfed the US parliament building, despite initial commitments to restore a humanitarian approach, the Biden administration introduced, in May 2023, the "circumvention of legal channels" rule – a regulation that establishes a relative presumption of ineligibility for asylum for persons who have transited third countries without seeking protection or who have not used designated legal channels, including the CBP One application system [12, p.31320]. The structural similarity of this rule to the European concept of "safe third country" is analytically significant and suggests that the convergent logic of procedural restrictionism operates in different legal and political systems.

In January 2025, Presidential Proclamation 10888 further restricted access to asylum at the southern border. Defensive asylum applications tripled between fiscal years 2022 and 2024, reaching approximately 897,000 in 2024, while in 2025 the trend was maintained, albeit slightly lower (approximately 831,000) [13, p.8].

4.2. The Trump Administration (2025–present): The Abrupt Restriction. The return of the Trump administration in January 2025 produced what we believe should be characterized not as a continuation of the restrictionist trend, but as a qualitative break with it. Refugee resettlement has been effectively suspended, with the admissions cap set at 7,500 for fiscal year 2026, the lowest in the program's 45-year history, down from a peak of over 100,000 admissions in fiscal year 2024. Humanitarian permit programs for Cuban, Haitian, Nicaraguan, and Venezuelan nationals, which had admitted approximately 532,000 people, have been terminated. Asylum decisions were suspended entirely in December 2025. The result is a system that is no longer just restrictive in its procedures but restrictive in its very willingness to accept [14]. If willingness to accept is the raison d'être of this system, its fundamental limitation may entail the de facto abolition of the system.

V. The Danish Model: The Exception in the European Legal Area. Denmark occupies a unique position in the legal system of the European Union (until a few years ago it could be argued in favour of sharing this position with Ireland but in the context in which the latter preferred to join fully, opt-in, the Union architecture such an opinion no longer has support, our mention). According to Protocol No.22 to the Treaty on the Functioning of the European Union (TFEU), the Danish opt-out protocol, Denmark does not participate in EU measures adopted under Title V of the TFEU, which covers the Area of Freedom, Security and Justice. In concrete terms, this means that Denmark is not bound by the Dublin Regulation, the Qualification Directive, the Asylum Procedures Directive or, crucially, the New Pact on Migration and Asylum [15].

It is important to specify the limitations of the opt-out clauses applicable to Denmark after the Edinburgh Council and in the context of the adoption of the Treaty of Amsterdam. Denmark, as a state that has ratified the 1951 Geneva Convention and its 1967 Additional Protocol, is equally bound by all EU Member States that are signatories to this international convention. It is a member of the Council of Europe and consequently respects and applies the European Convention on Human Rights. On the subject of international protection, the Kingdom of Denmark has concluded parallel agreements with the EU, and has incorporated the Dublin III rules into national law on an intergovernmental basis. However, Denmark has the legal autonomy to legislate on asylum in ways that would, for other Member States, constitute direct violations of EU secondary law. This autonomy has been exercised with remarkable consistency over the past decade – and with cross-party political support that distinguishes the Danish approach from the politically contested restrictionism observed in other jurisdictions.

Regarding the new Pact on Migration and Asylum and how Denmark relates to the major change in European policies, the specific position of the kingdom is defined by the use of its legal reservations to EU asylum legislation, but the country has chosen to adhere to essential components such as the Screening Regulation, the reformed Eurodac system and certain responsibility rules of the Asylum and Migration Management Regulation through parallel agreements and Schengen cooperation. However, Denmark is not obliged to participate in the new solidarity mechanism aimed at the relocation of migrants, and is currently working on a national legislative proposal to be implemented by early 2026 [16]. In this context, the Danish Refugee Council, an internationally recognized non-governmental organization, expresses concern that the new Pact could restrict the fundamental rights of asylum seekers. The organisation's main recommendations aim at broadening the definition of family to prevent the separation of asylum seekers who live and make their household together and ensuring access to free and individual legal assistance from the earliest stages of the border procedure. They also insist that the best interests of the child should take precedence by immediately appointing a guardian for unaccompanied minors and advocate for humane reception conditions instead of detention, which should remain a measure of last resort. Finally, the Danish Refugee Council stresses that the movement of migrants between Member States should be addressed by improving living conditions, not sanctions. While a common European system is necessary, it must put human rights and judicial oversight first to ensure that administrative efficiency does not undermine the real protection of refugees [16].

5.1. Smykkeloven – confiscation of jewellery from asylum seekers. The term "smykeloven", the jewellery laws, entered the international discourse in January 2016, when the Danish Parliament passed legislation authorising the authorities to confiscate cash and valuables exceeding approximately 10,000 Danish kroner from newly arrived

asylum seekers, in order to compensate for the costs of receiving them. The law exempted objects of sentimental value, but the public communication dimension was extremely strong. Denmark was signalling, both to potential asylum seekers and to its own citizens (and electorate, see the observation in the previous paragraph regarding the cross-party approach to restrictive policies with mostly marginal opponents in contrast to the strong opposition positions in EU states, our mention), that the costs of reception would be borne, to the extent legally possible, by the newcomers themselves [17].

Smykelove has attracted significant international criticism, including comparisons with absolutely appalling historical precedents. For the present analysis, however, we must address two questions analytically; first, is the policy compatible with the specific provisions of the 1951 Convention? Second, is it operationally effective as a deterrent?

On the first question, UNHCR has concluded that confiscation of property does not, in itself, violate the specific provisions of the 1951 Convention, provided that they are otherwise complied with. The Convention does not contain a general guarantee that asylum seekers will retain their personal property during the reception period [18].

On the second question, operational effectiveness, the evidence is considerably more ambiguous. The number of arrivals in Denmark has decreased since 2015, but this decrease is influenced by multiple simultaneous factors: border controls reintroduced by other Schengen states, the EU-Turkey Statement of March 2016 and general surveillance and protection measures along the Western Balkans route. Furthermore, the application of this law in the period 2016-2025 did not bring significant revenues to the Danish state budget and by excluding Ukrainian refugees from the special confiscation after 2022, all the premises were created, in some opinions, to find discrimination between refugees according to the nationality criterion. Therefore, quantifying the specific deterrent effect of the aforementioned provisions is, analytically, very difficult [16].

5.2. Temporary Protection and the Cessation Clause: The Syrian Question. The most legally significant element of the contemporary Danish asylum framework is its approach to the duration and nature of protection. In 2021, Denmark became the first European state to start revoking residence permits granted to Syrian refugees, based on the finding that the situation in certain parts of Syria, in particular the Damascus region, had improved sufficiently to make return safe.

This decision was based on an interpretation of the cessation clause in Article 1C(5) of the 1951 Convention, which provides that refugee status ceases when "the circumstances in connection with which the person was recognised as a refugee have ceased to exist" [2, Article 1C(5)]. Denmark's application of this clause to Syria was significant and noteworthy for at least two reasons. First, the Danish state failed to take into account that the armed conflict in Syria was continuing in other parts of the country and second, the Danish state did not receive any formal recommendation from UNHCR that Syria, or even the Damascus region specifically targeted for this purpose, was safe for return. The Danish authority competent for international protection processed over 500 revocation cases and cancelled a not inconsiderable number of protection permits. The problem that arose is that many people whose permits were revoked did not, in practice, return to Syria, creating a category of people on Danish territory without valid refugee status and without a real possibility of return [19].

This result is not a marginal anomaly but illustrates a structural tension that runs through the entire contemporary agenda of restrictionism: the gap between the legal cessation of status and the practical ability to effect return. Denmark has encountered, on a smaller scale, exactly the same dynamics that produce the British gap between 58,000

rejections and 11,000 returns mentioned above. In essence, we conclude that legal restrictionism and operational effectiveness are not the same thing, and this is an element visible to ordinary citizens and capitalized on in electoral elections.

5.3. Denmark's "Fair and Realistic" Policy. The "Fair and Realistic" immigration policy (Retfærdig og Realistisk), launched in 2018 by the Danish Social Democratic Party, marks a significant shift towards stricter regulations, despite its leftist orientation. Thus, in addition to asset confiscation measures, the Danish approach is characterized by a coherent set of restrictive policies that target all stages of the migration process. In terms of admission, Denmark has introduced significantly stricter rules for entry into the country, including limiting non-Western immigration and postponing family reunification by imposing minimum ages for spouses and substantial income requirements. Also in this context is the proposal (a precursor to the idea later taken up by the UK and detailed above) to process asylum applications in centres located outside Europe, with Rwanda being one of the countries nominated in this regard. In terms of integration, Danish legislation makes the granting of social assistance conditional on participation in 37 hours of work or vocational training per week. In a particularly controversial move, certain residential areas with a high concentration of immigrants have been officially declared "vulnerable areas", a designation that makes them eligible for administrative measures such as the demolition of social housing and the restriction of freedom of assembly for events where Danish is not spoken. In parallel with these domestic measures, Denmark has significantly increased development aid to countries of origin, aiming to address the root causes of migration – a component often ignored in critical analyses of the Danish model, but which completes the picture of a migration policy that is deeply coherent in its restrictive and, at the same time, preventive logic.

This policy, which has significantly reduced the number of asylum seekers, has been criticised for its character, which in some opinions deviates from the humanitarian nature of refugee law, but has managed to regain support from left-wing voters and has influenced European discussions on migration [20].

This ambition is directly relevant to the EU-wide debate, as it prefigured – and, to a certain extent, inspired – both the UK's Rwanda Policy and the EU's externalisation agreements. The transfer of experience between these systems is explicit: Danish officials have been consulted by other European governments; the Danish approach has been cited in European Parliament debates; and the conceptual vocabulary of off-territorial processing has migrated from the Australian context – where it is operational from where it has been operational since 2013 on Nauru and Manus Islands – via Denmark, in the mainstream European political discourse [21].

VI. Outsourcing: The Italy-Albania Case Study. Outsourcing, the delegation of migration management to third states, is not new in itself in international law but is currently surprising in its scale, systematization and integration into the formal legal architecture of democratic states. In our opinion, the most significant and edifying current example is the Protocol between Italy and the Republic of Albania.

As we have stated on another occasion [22], the agreement signed between Italy and Albania in November 2023 represented yet another attempt by a state (this time an EU member) to outsource migration management procedures. Through the agreement, Italy obtained Albania's agreement to build and manage two asylum seeker processing centers on Albanian territory, in the towns of Shëngjin and Gjadër. The stated aim was to reduce the migratory pressure on the Italian asylum system and to speed up the processing of people from countries considered "safe" [23].

The centres in Shëngjin and Gjadër were created to temporarily house adult men arriving by sea in Italy, with a view to processing asylum applications within a rapid 28-day timeframe. This project involves administrative collaboration between Italy and Albania, with the support of Frontex, but raises serious legal dilemmas regarding compliance with EU law and the Geneva Convention. Although the management takes place outside Italian territory, critics point out that Italy remains responsible for guaranteeing the fundamental and procedural rights of migrants, while also pointing out the absence of an effective monitoring mechanism to prevent possible abuses [23].

The implementation of the Protocol has been, by any objective assessment, an operational failure – and the reasons for this failure are structurally instructive, precisely because they reveal the inherent limitations of the outsourcing model as it was conceived. Initial estimates for the implementation of the project ranged from €670 million to €830 million over a five-year period, including construction, personnel, security and logistics costs. Subsequent reports indicated significant budget overruns, with over €74 million spent on infrastructure alone, while some contracts were awarded directly, without a public tender. This approach raised suspicions about the lack of transparency and efficiency of public spending [23].

In implementing the agreement, the Italian authorities attempted to transfer three groups of migrants to Albania between 2023 and 2025. After Italian courts blocked the return procedures for the first two groups (from 2023 and 2024, with around 30 people being managed) [22], the Italian authorities attempted a third time to operationalise the agreement in January 2025 [23]. On 28 January 2025, an Italian military vessel, Cassiopea, transported 49 migrants (from Bangladesh, Egypt, Ivory Coast and Gambia) from international waters to the port of Shëngjin, Albania, for processing at the Gjadër centre. On the same day, following the provisions of the agreement, 5 of them (including minors and people with medical problems) were sent to Italy to continue the procedures, leaving 44 people in the Republic of Albania for processing at the said centre. The requests to remain on Italian territory of 43 of them were rejected through an accelerated procedure, with only one migrant receiving a favourable solution. On the occasion of judging the appeals filed by them, the Court of Rome ordered the suspension of the detention procedures of the 43 migrants, requesting that the decision in their case be taken after the ruling of the Court of Justice of the European Union on the compatibility of Italian legislation with that of the Union. The Italian court's referral was the subject of cases C-758/24 and C-759/24 before the Court of Justice of the European Union [23].

The Court of Justice of the European Union considered that the lack of publicity and verifiability of the sources used by the legislature to designate a country as "safe" infringes the right to an effective remedy. The asylum seeker and the national court must have access to the sources of information used in order to be able to challenge their reliability, relevance and timeliness. This requirement is in line with the case-law in cases C-564/181 and C-406/222, where the Court insisted on the substantial nature of procedural guarantees [24].

This decision revealed a fundamental incompatibility between the political ambition of outsourcing and the legal constraints imposed by secondary EU law, constraints that apply to the Italian authorities even when they are physically operating on Albanian territory. The concept of an "Italian jurisdictional enclave" did not suspend, in practice, the applicability of EU asylum law. It imported all the protective constraints of EU law into the Albanian facility. The geography of outsourcing did not determine its legal architecture. The Italian government responded by issuing executive decrees designating additional

countries as "safe" and by enacting legislation that, in the government's interpretation, limited judicial review of these designations. This strategy was, as I have shown above, inconsistent with the requirements of EU law [24].

6.1. Four structural lessons. The Italy-Albania case offers four essential lessons for any future analysis of outsourcing:

1) First, the geography of outsourcing does not determine its legal architecture. Moving processing to a third country does not place it outside the applicable legal framework, if the processing state remains bound by that framework. This is the fundamental legal miscalculation common to both the Italian model and the British Rwanda policy [24].

2) Second, the designation of a "safe country" is not a policy option isolated from judicial review and consequently the court must be provided with all the verifiable factual means and conditions to conduct a coherent objective examination. The gap between the political claim of safety and the legal standard of safety is, structurally, the point at which outsourcing agreements fail [24].

3) Third, the operational costs of failed outsourcing are not negligible. The Italy-Albania Protocol cost substantial public resources, the construction and equipment of buildings, maintenance, staffing and litigation management, for a system that processed a negligible number of cases [23].

4) Fourth, outsourcing agreements with neighboring states create structural dependencies that go beyond the specific context of migration policy. Albania's candidacy for EU membership, its bilateral relationship with Italy, its membership of the North Atlantic Treaty Organization, its economic ties with the Italian diaspora, these are not irrelevant to the sustainability and political economy of the Protocol. Migration agreements are never just about migration. They are embedded in broader geopolitical relations, and the obligations and asymmetries they create persist [22].

Conclusions. The analysis undertaken in this paper allows for the formulation of a set of structural conclusions regarding the contemporary evolution of asylum policies in the jurisdictions examined.

1) The first conclusion is one of convergence. In three very different legal and constitutional systems – the supranational law of the European Union, British parliamentary sovereignty and the constitutional separation of powers in the United States – we observe the same dominant strategy: the progressive restriction of practical access to asylum through procedural mechanisms, while the formal right to seek international protection is preserved. In our view, this is not a coincidence but reflects a calculated political logic that attempts to manage public concern about immigration without overtly violating international legal commitments. Procedural restrictionism is, in a sense, the art of maintaining the letter of international law while modifying its practical substance [7].

2) The second conclusion is one of structural instability. Procedural restrictionism does not resolve the underlying tensions between the volume of movements and the administrative capacity of receiving states. It postpones them, in judicial delays, in the gap between rejections and returns, in the operational failure of outsourcing agreements. The Danish experience with the revocation of the status of Syrians, the British experience with the Rwanda Policy, and the Italian experience with the Albania Protocol all illustrate, from different angles, the same fundamental dynamic: legal form and operational substance have diverged to the point where the system maintains its architecture while emptying its function.

3) The third conclusion is the most unpleasant and therefore perhaps the most important. The 1951 Geneva Convention was designed for a specific historical moment and

a specific type of applicant. Its concepts were appropriate for that moment. They are increasingly inadequate for the world of 2026. The question of whether the Convention requires systemic reform or whether its existing flexibility is sufficient to accommodate contemporary patterns of movement is no longer a marginal academic debate. It is, in our view, a central question of international refugee law that, unlike most legal questions, cannot be answered by courts alone [21, p.45].

THE CONCEPT, CONTENT AND SYSTEM OF FORENSIC SUPPORT FOR THE INVESTIGATION (EXAMINATION) OF CRIMES CONCERNING SEXUAL LIFE

Olesea BLAȘCU,
PhD Student, Moldova State University,
University Assistant, Faculty of Law and Public Administration,
"Bogdan Petriceicu Hasdeu" University Center of Cahul,
Technical University of Moldova
ORCID: 0000-0001-6601-6951

Abstract

The investigation of crimes infringing upon sexual life constitutes one of the most complex and sensitive areas of criminal prosecution activity, given the specific nature of the protected legal interest, the particularities of the evidentiary process, and the profound impact on the injured party. Judicial and prosecutorial practice demonstrates that the effectiveness and quality of the detection and investigation of such crimes depend essentially on the level of criminalistic support provided to the investigative process, in correlation with contemporary achievements of science and technology. In this context, the study of the concept, content, and system of criminalistic support for the investigation of crimes concerning sexual life acquires particular importance from both theoretical and practical perspectives. The concept of "criminalistic support for the investigation of crimes", established in specialized literature and increasingly employed in the practice of criminal prosecution bodies, reflects the necessity of a systemic, integrated, and scientifically grounded approach to investigative activities.

The relevance of this study is determined by the dynamics of criminality in the field of sexual crimes, the diversification of methods of their commission, as well as the heightened requirements regarding the protection of the fundamental rights of victims and other participants in criminal proceedings. Modern criminalistic support implies not only the application of technical forensic means but also the use of methods, tactical procedures, and methodological recommendations adapted to the specific features of these categories of crimes. Therefore, an in-depth analysis of the concept, content, and system of criminalistic support for the investigation of crimes concerning sexual life is indispensable for optimizing the activity of criminal prosecution bodies, increasing the effectiveness of evidence-gathering, and ensuring an objective, comprehensive investigation in accordance with contemporary standards of forensic science.

Keywords: crime, sexual life, investigation, system, criminalistic support, criminal prosecution body, information technologies, criminalistic characteristic, tactics, forensic technique, planning, organization.

NOȚIUNEA, CONȚINUTUL ȘI SISTEMUL ASIGURĂRII CRIMINALISTICE A INVESTIGĂRII (CERCETĂRII) INFRACȚIUNILOR PRIVIND VIAȚA SEXUALĂ

Abstract

Investigarea infracțiunilor ce aduc atingere vieții sexuale reprezintă una dintre cele mai complexe și sensibile direcții ale activității de urmărire penală, dat fiind specificul obiectului juridic protejat, particularitățile probatoriului și impactul profund asupra persoanei vătămate. Practica judiciară și de urmărire penală demonstrează că eficiența și calitatea activității de descoperire și cercetare a acestor infracțiuni depind în mod esențial de nivelul asigurării criminalistice a procesului de investigare, raportat la realizările contemporane ale științei și tehnicii. În acest context, studiul noțiunii, conținutului și sistemului asigurării criminalistice a investigării infracțiunilor privind viața sexuală capătă o importanță deosebită atât din perspectivă teoretică, cât și practică. Conceptul de „asigurare criminalistică a investigării infracțiunilor", consacrat în literatura de specialitate și tot mai frecvent utilizat în practica organelor de urmărire penală, reflectă necesitatea unei abordări sistemice, integrate și fundamentate științific a activităților de cercetare penală.

Actualitatea studiului este determinată de dinamica fenomenului infracțional în domeniul infracțiunilor sexuale, de diversificarea modurilor de comitere a acestora, precum și de exigențele sporite privind respectarea drepturilor fundamentale ale victimelor și ale persoanelor implicate în procesul penal. Asigurarea criminalistică modernă presupune nu doar aplicarea mijloacelor tehnico-criminalistice, ci și utilizarea metodelor, procedeelor tactice și recomandărilor metodologice adaptate particularităților acestor categorii de infracțiuni. Prin urmare, analiza aprofundată a noțiunii, conținutului și sistemului asigurării criminalistice a investigării infracțiunilor privind viața sexuală este indispensabilă pentru optimizarea activității organelor de urmărire penală, creșterea eficienței probării și asigurarea unei investigări obiective, complete și conforme standardelor moderne ale științei criminalistice.

Cuvinte-cheie: infracțiune, viață sexuală, investigare, sistem, asigurare criminalistică, organ de urmărire penală, tehnologii informaționale, caracteristică criminalistică, tactică, tehnică criminalistică, planificare, organizare.

Introduction. In the opinion of M. Gheorghiță, "The conduct of illicit activity, like any human activity, is accompanied by certain persons and characterized by a spatio-temporal framework, resulting in the production of material changes in the surrounding environment and in the creation of traces of the actions performed. The examination thereof is capable of directing the investigation toward the clarification of issues of interest, specific to the type of illicit activity" [3, p.69].

The activity of detecting and investigating crimes can be qualitative and effective only insofar as it is criminalistically supported at the level of contemporary achievements of science and technology. Addressing the prospects for the development of forensic science, N.A. Selivanov emphasized: "The introduction of new concepts and the improvement of existing ones contribute to a deeper understanding of the object of forensic science, to the emergence of new directions of research, to the expansion of the spectrum of theoretical theses and methodological recommendations, as well as to a more solid assimilation and active use of forensic knowledge" [10, p.189].

"A qualified investigation of crimes", maintains researcher M. Gheorghiță, "presupposes not only skill in the detection, recording, and collection of evidence, but also its thorough and continuous analysis in order to obtain additional data; on this basis, it entails exercising control over the course of the investigation (prior knowledge of the direction of the inquiry, the volume and state of the case at any stage), and adopting well-founded decisions regarding the continuation of criminal prosecution" [2, p.60].

The author S. Doraș states that "The timely detection and comprehensive investigation of acts constituting crimes requires organized work, the conduct of all investigative activities in an orderly manner, according to a judicious plan and based on factual data" [1, p.281]. Researchers Gh. Golubenco and V. Colodrovschi argue that "Within the system of measures to counteract crimes, the methods and technical-forensic means play an important role. These effectively contribute to the detection and collection of traces of the crime and the perpetrator, enable the acquisition of useful information for the pursuit of offenders and the proof of their guilt, while also ensuring a high level of documentation of factual circumstances and evidentiary procedures" [12, p.5].

The detection of crimes, identification, and criminal prosecution of offenders often involve extensive and diverse activities, requiring the mobilization of significant human and material resources [11, p.210; 13, p.52]. In this context, it is fully justified to speak of the concept of "criminalistic support for the investigation of crimes", which in recent years has been firmly integrated into the terminological apparatus of forensic science. The notion of "criminalistic support for the investigation of crimes" was introduced into the scientific discourse and first defined in 1979 by V.G. Kolomațkii, who characterized it as

"a system for implementing, in the practical activity of responsible persons, subdivisions, services, and internal affairs bodies tasked with maintaining public order and combating crime, forensic knowledge materialized in the capacity of practitioners to utilize scientific, methodological, and tactical forensic recommendations, technical-forensic means, as well as the technologies for their application" [7, p.62].

Essentially, a similar definition of criminalistic support for the investigation of crimes was formulated by R.S. Belkin, who considered it "a system of forensic knowledge, skills, and abilities based on such knowledge of law enforcement personnel, oriented toward the application of forensic means, methods, and technologies for the prevention, detection, and investigation of crimes" [15, p.26].

Within the content of this system, R.S. Belkin included: forensic knowledge, forensic science, and forensic techniques. The specification of the term "science" through the use of the notion of "knowledge" is fully justified, since criminalistic support constitutes a distinct category within forensic science. Currently, the prevailing view in forensic science is that criminalistic support represents a complex activity in terms of its content, aimed at creating conditions for the continuous preparation of law enforcement bodies for the efficient use of forensic methods, means, and recommendations in order to detect and investigate crimes [6, p.14].

A.F. Volînskii notes that, in the definition of criminalistic support for the detection and investigation of crimes formulated by V.G. Kolomaţkii, the essence and content of this scientific category are not fully reflected, as it is limited to the exclusive sphere of activity of internal affairs bodies, and not of all law enforcement agencies, and, in terms of content, it is reduced solely to the issues of applying forensic knowledge in the practice of detecting and investigating crimes [30, p.116].

However, in order to implement anything in particular, it is first necessary to develop, create, and establish a procedure for its use, as well as to materialize the legal value of the results obtained [6, p.15]. At the same time, V.G. Kolomaţkii and R.S. Belkin focus exclusively on forensic techniques, although the doctrine of criminalistic support encompasses all branches of forensic science; moreover, to a certain extent, like forensic science as a whole, it is enriched by contributions from provisions originating in other fields of scientific knowledge.

In fact, in addressing the notion of criminalistic support for the detection and investigation of crimes, V.P. Lavrov aligns with the position expressed by A.F. Volînskii [17, p.6]. Subsequently, this definition—sometimes with minor editorial clarifications, but preserving its essence—was supported by K.E. Demin, A.S. Shatalov, A.V. Shmonin, and others [28, p.2].

According to A.P. Paţkevici, criminalistic support for the investigation of crimes is understood as "the activity of responsible personnel and subdivisions of internal affairs bodies, characterized by a comprehensive approach to solving interdependent tasks of a legal, organizational, material-technical, and instructional-methodological nature, which arise in the process of investigating crimes" [9, p.171].

It appears that the author A.P. Paţkevici attempted to consolidate certain provisions of this category, drawn from R.S. Belkin and A.F. Volînskii, but overlooked the distinction between criminalistic support—which involves the implementation of a specific system of actions to prepare internal affairs bodies for the detection and investigation of crimes—and criminalistic accompaniment, which is the application of forensic methods, means, and recommendations in the day-to-day practice of detecting and investigating crimes. In this context, a certain analogy can be observed with the tactics of conducting criminal

prosecution actions: preparation is required first, and only then is implementation undertaken.

The foregoing allows the conclusion that the notion of "criminalistic support" encompasses not only scientific and technical aspects, but also legal, organizational, methodological, and tactical dimensions of forensic science and practice. Essentially, it constitutes an activity aimed at the interdependent resolution of issues related to the organization of crime detection and investigation, in the broadest sense of the term. In this context, the subjects of criminalistic support are the individuals with responsibilities directly involved in the detection and investigation of crimes. Primarily, these are the persons conducting criminal prosecution or participating in its execution (criminal investigators, prosecutors, and investigative officers). However, in a broader sense, the creation of conditions for the continuous preparation of law enforcement bodies to utilize forensic methods and means also involves legislative authorities, as well as scientific research institutions and educational establishments [14, pp.60-66].

Consequently, those bodies that establish criminal policy and organize its implementation—from the development of forensic methods, means, and recommendations, to their introduction into criminal prosecution practice, and ultimately to the generalization of the results of their use—play a central role. In this context, forensic science does not act merely as a formal "executor" of legal provisions, but, above all, as the "beneficiary" and "designer" of appropriate methods and means, as well as of the organizational and legal forms for their application in practical activity. In performing these functions, it relies on the results of studying the regularities of the mechanisms and modes of manifestation of criminal activity [21, p.33], on data from the forensic characterization of crimes [24, p.34], and on a synthesis of the practice of investigating crimes and conducting specific criminal prosecution actions [18, pp.22-23].

The purpose and objectives of criminalistic support for the investigation of crimes are presented differently in the scientific literature. Generally, they are considered in relation to creating conditions for the efficient utilization of forensic potential in addressing specific tasks within a particular sphere of law enforcement activity [25, pp.31-33].

Methods and materials applied. The theoretical and methodological foundation of the present research is constituted by a body of concepts, theories, and scientific studies in the fields of forensic science, criminal law, and criminal procedural law, which enable the investigation and analysis of criminalistic support for the investigation of crimes concerning sexual life.

In this context, the research is based on the study of specialized literature, including both classical and contemporary works by forensic scholars. The research methodology relies on a combination of doctrinal analysis, legal and forensic synthesis, and a comparative-analytical approach. This approach has made it possible to identify practices and gaps in the application of forensic methods in the investigation of sexual crimes, as well as to formulate recommendations for optimizing the process of criminalistic support in the forensic investigation of the crimes under study.

In accordance with contemporary approaches in forensic science, the research aims not only at the conceptual and theoretical definition of criminalistic support, but also at identifying practical solutions for optimizing the preparation, application, and development of forensic methods, means, and recommendations in the investigation of sexual crimes. By combining these elements, the theoretical and methodological foundation of the research provides the necessary basis for a systematic analysis of the components of criminalistic support, with a view to evaluating the effectiveness of investigative practice

in cases of crimes concerning sexual life and formulating scientifically grounded, practical recommendations in the targeted field.

Discussion and results obtained. Sexual freedom is an important attribute of human personality and a significant social value. The social danger posed by crimes concerning sexual life consists, first and foremost, in the harm directly inflicted on the victim, whether female or male, considered individually. The violation of sexual freedom creates a state of social insecurity, a particularly dangerous imbalance threatening the very existence of society. For this reason, as author M. Ruiu argues: "the repression of the aforementioned crimes is a necessity, society being interested in creating a framework for the normal conduct of sexual relations" [5, p.141].

According to S. Doraș, "...the issue of combating sexual crimes and ensuring the inviolability of the person's sexual sphere must be perceived and addressed vigilantly, as a primary concern in the context of society's evolution toward a democratic state governed by the rule of law" [1, p.575]. Moreover, in the opinion of M. Gheorghiță, "the diversity of forms in which sexual crimes are committed necessitates operational and in-depth investigations of these crimes, the analysis of data concerning the personality of the victim and of the perpetrator, regarding the nature of the relationships between them as a whole, and the construction of a criminalistic model of sexual assaults" [2, p.187].

The particularities of certain types of crimes, as well as the circumstances, mechanisms, and modes of their commission, naturally determine the specific nature of criminalistic support for their investigation. This is particularly evident in the criminalistic support of the investigation of crimes concerning sexual life—intentional acts established by criminal law that endanger sexual integrity, the normal physical and psychological development of children, the sexual freedom of adults, or the orderly conduct of sexual relations in society [27, p.144; 29, p.18; 26, p.58; 20, p.47; 22, pp.21-22].

Thus, taking into account the approaches existing in doctrine regarding the definition and content of criminalistic support for the investigation of crimes, as well as the particularities of this category of crimes, it is considered appropriate to treat criminalistic support for the investigation of crimes concerning sexual life as "a complex professional activity, based on forensic knowledge, performed by responsible personnel within law enforcement bodies, aimed at creating conditions for their continuous preparation for the efficient use of forensic methods, means, and recommendations in the process of identifying, detecting, and investigating sexual crimes and other sexual assaults associated with serious violations of moral norms governing sexual conduct" [27, p.144; 29, pp.142--144].

In essence, not only is the definition of criminalistic support for the investigation of crimes proposed by A.F. Volînskii shared, but also his approach to structuring this scientific category. According to his view, from a formal-structural perspective, this system essentially reproduces the structure of forensic science itself: the theoretical foundations of criminalistic support, technical-forensic support, tactical-forensic support, and methodological-forensic support. At the same time, he emphasizes that "...the content of these components should not be confused with the content of the corresponding sections of forensic science, as doing so would call into question the delimitation of criminalistic support as a specific type of activity and, simultaneously, as a distinct scientific-applied category" [6, p.25].

Such an opinion is considered acceptable in the theory of criminalistic support for the detection and investigation of crimes and in defining the system of criminalistic support for the investigation of crimes concerning sexual life. It is presented in the form of the following blocks: 1) theoretical foundations of criminalistic support for the investiga-

tion of crimes concerning sexual life; 2) technical-forensic support for the investigation of sexual crimes; 3) tactical-forensic support for the investigation of sexual crimes; and 4) methodological-forensic support for the investigation of crimes concerning sexual life [23, pp.50–51].

Consequently, the content of the system of criminalistic support for the investigation of crimes concerning sexual life consists of legal, organizational, scientific-technical, scientific-methodological, scientific-tactical, and instructional-methodological characteristics relating to the development, implementation, and concrete application of forensic methods, means, and recommendations, aimed at the efficient investigation of crimes within this category. Therefore, it is considered important to pay detailed attention to their content, which is determined on the basis of the tasks that must be addressed in the process of investigating and detecting this type of crime [27, pp.145-148].

The theoretical foundation of criminalistic support for the investigation of crimes constitutes a system of scientific provisions regarding its notion, content, tasks, and functions as a type of activity, the forms of its implementation, as well as its place and role within forensic science [6, p.25]. Within this "foundation", the notion and content of criminalistic support for the investigation of crimes are defined; the theoretical basis of its tasks and functions is established, issues concerning the organization and legal regulation of investigation are identified, and the necessary measures for their resolution are substantiated. The theoretical provisions developed can serve as a basis for the formation of criminalistic support for the investigation of crimes concerning sexual life [23, pp.51-52].

Legal (normative) support primarily represents the legislative regulation of the conditions and procedures for the use of forensic methods, means, and recommendations in the process of detecting and investigating sexual crimes. Legal support holds a priority importance over other elements of criminalistic support, because even the most advanced, scientifically grounded forensic methods, means, and recommendations remain the „property of their developers" if their use is not authorized or if the procedure for their application is not established and regulated by criminal procedural legislation [27, p.145].

Organizational support for the investigation of crimes concerning sexual life represents an essential element of the mechanism for implementing legal provisions regarding the application and use of forensic methods, means, and recommendations in the investigation of these types of crimes. It presupposes a systemic approach to studying the corresponding needs of practice, as well as the scientific-technical and material possibilities for meeting these needs and applying them in practical activity [6, p.28].

Organizational support is manifested primarily in the overall organization of crime investigations and is aimed at creating favorable conditions for this purpose. This includes considerations such as the detection of crimes from fresh traces, the interaction between criminal investigation officers and investigative officers, the planning of criminal prosecution, and related matters [27, p. 146].

It should be emphasized that both legal and organizational support, within the system of criminalistic support for the investigation of sexual crimes, involve addressing tasks that, formally, do not fall within the direct object of forensic science. However, it is generally considered that the role of this science lies in analyzing and studying the practice of applying legal, organizational, scientific-methodological, and other elements of the relevant scientific category, identifying arising problems, their interdependencies, and their influence on the condition and effectiveness of the use of forensic methods, means, and recommendations in the activities of law enforcement bodies concerning the detec-

tion and investigation of this type of crime.

Based on the data obtained, forensic researchers conduct corresponding studies to improve the forensic methods and means in use, develop proposals for addressing existing problems, and initiate their examination within competent bodies and institutions, scientific research centers, and other specialized structures. In this regard, criminalistic support represents a clear example of an innovative approach to solving problems in forensic theory and practice—from the identification of an issue, through its study, to the effective improvement of the practices of criminal prosecution bodies [23, pp.58-59].

Scientific-technical, scientific-tactical, and scientific-methodological support for the investigation of crimes concerning sexual life, within the system of criminalistic support for the detection and investigation of these types of crimes, is characterized primarily by the identification and study of modern achievements in the natural and technical sciences and their adaptation to addressing the tasks of forensic practice. On this basis, existing methods and means are improved, new ones are created, and recommendations are developed regarding their use for the collection, examination, and utilization of evidence. At the same time, forensic techniques—which form the foundation of scientific-technical support [4] and, to a certain extent, also of scientific-methodological and scientific-tactical support—are the most dynamic in their development and, therefore, respond most rapidly to the continuously changing needs of criminal prosecution practice [27, pp.147-148].

This is explained by the fact that, under the influence of scientific and technological progress, the means and methods of committing crimes evolve, thereby compelling forensic researchers to develop increasingly advanced technical tools, often in combination with tactical procedures and recommendations regarding their use for the aforementioned purposes. At the same time, forensic techniques, as an element of the system of criminalistic support, are regarded not only as a category of forensic science and a section thereof, but also as a set of technical means necessary for the application of forensic knowledge and of the skills and abilities acquired through forensic training, aimed at the collection, examination, and utilization of evidentiary information in the process of detecting and investigating sexual crimes [16, p.70].

Within this approach, R.S. Belkin emphasized that "...it is justified to include in this set all technical means that may be used today and in the future by criminal investigation officers, prosecutors, investigative officers, experts, forensic specialists, and other employees of law enforcement bodies" [15, pp.67-68].

At the foundation of scientific-methodological support for the investigation of sexual crimes lies a specific forensic methodology. However, without diminishing its importance, it should be noted that this methodology was developed in the previous century and currently does not fully meet the requirements of modern investigative practice. As a result of the digital transformation of society, offenders have acquired the ability to select potential victims remotely according to their sexual preferences and to commit illicit sexual acts against them. Furthermore, it should be noted that, for the conduct of a qualitative investigation, a criminal investigation officer (or prosecutor) requires knowledge of the methodology for investigating all types of sexual crimes, not just each type individually. This is because investigative practice reveals cases in which offenders commit multiple sexual assaults, beginning with the satisfaction of sexual needs through non-violent means and culminating in acts committed with threats or violence, which naturally necessitates both a distinct evaluation from the perspective of criminal law and knowledge of certain particularities in investigating these acts [23, pp.60-61].

Instructional-methodological support entails the forensic training of criminal investigation officers, prosecutors, investigative officers, experts, forensic specialists, and other subjects involved in investigating crimes concerning sexual life. This training must be aimed at the professional acquisition of forensic methods, means, and recommendations, as well as at the development of practical skills and competencies necessary for the proper investigation of these categories of crimes [27, p.148].

Conclusions and recommendations. The analysis of the notion, content, and system of criminalistic support for the investigation of crimes concerning sexual life reveals that, despite theoretical and normative progress, the current level of criminalistic support does not fully meet the requirements and actual needs of criminal prosecution practice. The complexity of these crimes, the heightened degree of victimization, and the increasingly frequent use of information technologies in committing the targeted crimes necessitate a modern, interdisciplinary, and systemic approach to the investigative process.

It has been observed that the insufficient correlation between scientific achievements in forensic science, criminal law, and criminal procedural law, on the one hand, and the development of information technologies, on the other, negatively affects the efficiency of detecting and investigating sexual crimes. The slow and fragmented development of technical-scientific support, particularly in the IT sphere, leads to difficulties in identifying, recording, and utilizing digital evidence, as well as in documenting criminal activities conducted online.

At the same time, the professional training of subjects involved in the investigation of crimes concerning sexual life—including aspects related to forensic science and technology—is not always adequately adapted to the new forms and methods of committing these crimes. This situation confirms the necessity for the continuous improvement of the system of criminalistic support, as an indispensable element for conducting efficient, objective, and contemporaneously standard-compliant criminal investigations.

In order to optimize criminalistic support for the investigation of crimes concerning sexual life, it is necessary to implement a comprehensive set of theoretical, normative, and practical measures, among which the following are highlighted:

a) Improvement of the criminal procedural normative framework, through the clear and detailed regulation of procedures for obtaining, recording, seizing, and utilizing digital information stored on electronic media or derived from electronic communication networks and Internet resources;

b) Strengthening scientific-technical support for the activities of criminal prosecution bodies, through the development of modern forensic tools and methods aimed at identifying, documenting, and analyzing traces of sexual crimes committed in the digital environment;

c) Establishment and development of an effective mechanism for interdisciplinary collaboration among specialists in information technologies, forensic science, and criminal procedural law, in order to develop unified and coherent solutions for combating sexual crimes;

d) Legislative regulation of the genetic registry of individuals who have committed sexual crimes, with respect for fundamental human rights guarantees, as an additional instrument for the prevention and detection of such acts;

e) Reorganization and enhancement of the professional training and continuous development system for employees of criminal prosecution bodies, by emphasizing practical components and developing competencies in digital forensics and the use of information technologies;

f) Development of specialized criminalistic methodological recommendations, aimed at identifying signs of preparation and commission of sexual crimes, including those occurring in virtual environments and on digital platforms.

LEGAL AND CRIMINAL LAW DELIMITATION OF THE OFFENCES UNDER ARTICLES 257 AND 257[1] OF CRIMINAL CODE OF THE REPUBLIC OF MOLDOVA: THEORETICAL ASPECTS AND PRACTICAL IMPLICATIONS

Snejana CIOCHINĂ,
PhD Student,
University of European Studies of Moldova
ORCID: 0000-0002-4838-642X

Abstract

The article examines the legal-criminal delimitation of the offences provided for in Article 257 and Article 257[1] of the Criminal Code of the Republic of Moldova, from the perspective of their normative content and the criteria of legal classification applicable in practice. The research is grounded in the interpretation of the legal provisions, highlighting the essential differences between the two offences. Thus, Article 257 concerns acts related to the defective execution of construction works and the non-compliance with technical requirements, conditioned by the occurrence of concrete harmful consequences, whereas Article 257[1] sanctions the violation of construction execution rules in relation to buildings of five or more storeys, where the social danger arises from the very nature and scale of the works carried out in breach of legal norms.

The study identifies clear delimitation criteria, such as the object of regulation, the specific nature of the incriminated conduct, the moment of completion of the offence, and the nature of the harmful result. In conclusion, interpretative benchmarks are outlined to ensure correct legal classification and a uniform practical application of criminal law.

Keywords: criminal liability, defective construction works, legal-criminal delimitation, urban planning and construction.

DELIMITAREA JURIDICO-PENALĂ A INFRACȚIUNILOR PREVĂZUTE LA ART. 257 ȘI ART. 257[1] DIN CODUL PENAL AL REPUBLICII MOLDOVA: ASPECTE TEORETICE ȘU IMPLICAȚII PRACTICE

Abstract

Articolul analizează delimitarea juridico-penală a infracțiunilor prevăzute la art. 257 și art. 257[1] din Codul penal al Republicii Moldova, din perspectiva conținutului normativ și a criteriilor de calificare juridică aplicabile în practică. Demersul este fundamentat pe interpretarea dispozițiilor legale, fiind evidențiate diferențele esențiale dintre cele două incriminări. Astfel, art. 257 vizează faptele de executare necalitativă a construcțiilor și nerespectarea cerințelor tehnice, condiționate de producerea unor consecințe prejudiciabile concrete, în timp ce art. 257[1] sancționează încălcarea regulilor de executare a construcțiilor cu cinci sau mai multe etaje, unde pericolul social rezultă din însăși natura și amploarea lucrărilor realizate cu abatere de la normele legale.

Cercetarea relevă criterii clare de delimitare, precum obiectul reglementării, specificul conduitei incriminate, momentul consumării infracțiunii și natura urmării prejudiciabile. În concluzie, se remarcă repere interpretative menite să asigure o calificare juridică corectă și aplicare practică unitară.

Cuvinte-cheie: construcții necalitative, delimitare juridico-penală, răspundere penală, urbanism și construcții.

Introduction. The construction sector is one of the legal fields characterized by a high degree of regulatory complexity, where the interplay between technical regulations, urban planning requirements, and public safety imperatives gives rise to a multi-layered legal protection framework. In this context, criminal law serves as a last resort, intended to punish acts and conduct that go beyond mere administrative offenses and significantly affect fundamental social values, such as life, personal integrity, construction safety, and real estate assets.

Within the legal system, the Criminal Code of the Republic of Moldova protects these values, primarily through the provisions of Article 257, which establishes criminal liability for the substandard execution of construction works and the commissioning of buildings. This provision establishes a general framework for criminal liability, focused primarily on the final phase of the investment process—namely, the moment the building is put into use and, consequently, when the technical risk materializes.

However, legislative developments and the accelerated pace of urbanization have highlighted the inadequacy of an approach focused exclusively on the final result of construction, particularly with regard to high-rise buildings, which are characterized by a heightened level of structural and social risk. In this regard, through subsequent legislative action, Article 257¹ of the Criminal Code of the Republic of Moldova was enacted as a special provision aimed at the criminal oversight of the entire construction process for buildings with five or more stories, including the design, verification, authorization, execution, and acceptance stages, in accordance with applicable urban planning and technical requirements.

The relationship between the two criminal offenses raises a particularly relevant legal-criminal issue, stemming from the need for a rigorous delimitation of their scope of application. Although both provisions fall within the same substantive domain—construction activity—they differ in terms of the structure of the protected legal object, the material object, the timing of the offense's commission within the investment process, and the scope of the special subject. In the absence of clear criteria for differentiation, the practice of applying the law risks generating divergent classifications or inconsistent interpretations.

In this context, the present study aims to provide a systematic and integrated analysis of the normative content of Articles 257 and 257¹ of the Criminal Code of the Republic of Moldova [1], with reference to the constituent elements of the offenses and their function of criminal-legal protection. The central objective is to identify the criteria for distinguishing between the provisions, as well as to highlight the consequences of this distinction on the legal classification of acts in judicial practice.

The importance of this research stems from the need to ensure interpretive consistency in criminal matters, in a field where errors in classification can have significant consequences both for legal principles and for the effectiveness of the mechanism protecting social values. Consequently, the analysis of the relationship between Articles 257 and 257¹ of the Criminal Code of the Republic of Moldova is not merely a matter of legislative technique, but an essential condition for the uniform and predictable application of criminal law in the field of construction.

Methods and materials used. This scientific study is based on the use of a set of research methods specific to the field of criminal law, adapted to the subject matter of the study, as well as a comparative and delimiting analysis of the provisions of Articles 257 and 257¹ of the Criminal Code of the Republic of Moldova. To this end, the method of criminal-legal analysis was employed, involving an examination of the normative content

of the relevant legal provisions and the identification of the constituent elements of the offenses under analysis. The method of systemic interpretation allowed for the correlation of criminal norms with extra-criminal regulations, particularly with the provisions of the Urban Planning and Construction Code, in order to highlight their complementary nature. Furthermore, the comparative method was used to delineate the scope of application of criminal norms from that of administrative offense norms, and the case study method facilitated the practical illustration of the criteria for legal classification.

The empirical data for this study consists of relevant legislation, such as the Criminal Code of the Republic of Moldova, the Code of Administrative Offenses, and the Urban Planning and Construction Code, as well as key scholarly works in the field and national judicial practice, which were used to validate the theoretical conclusions drawn.

Discussions and results obtained. A criminal-law analysis of the provisions of Articles 257 and 257[1] of the Criminal Code of the Republic of Moldova, conducted through the lens of defining the normative content and constituent elements, highlights the existence of a complex legislative framework based on the concept of differentiated protection of social relations in the construction sector. This protection is structured progressively, depending on the nature of the violated obligations, the timing of the unlawful conduct within the investment cycle, and the severity of the resulting consequences, which gives the analyzed provisions systemic coherence and distinct applicability in practice.

In this context, Article 257 of the Criminal Code of the Republic of Moldova serves as a general provision governing criminal liability for failure to comply with quality requirements in construction. An analysis of paragraph (1) reveals that the ***specific legal object consists*** of social relations concerning the compliance of construction projects put into use with quality requirements, which places this provision within the sphere of protecting interests related to the safety, functionality, and reliability of construction projects [2, p.633]. The material object is defined broadly, encompassing both residential buildings and industrial facilities or those in strategic sectors such as transportation and energy, without any express limitation based on size or height. The essential condition is that they be substandard, unfinished, or non-compliant with the design, which highlights the technical and regulatory nature of the violation [2, p.634].

The victim of the offense is typically the construction investor, which reflects the financial and contractual nature of the protected relationships. At the same time, this framework does not preclude the existence of indirect victims, in cases where non-compliance creates risks for users or third parties [3, p.144].

In this regard, the Urban Planning and Construction Code of the Republic of Moldova defines the term “investor” as follows: a natural or legal person who finances and, where applicable, carries out the construction of a new building or modifications to an existing building, within the meaning of this Code [4].

The objective element of the offense provided for in paragraph (1) of Article 257 of the Criminal Code of the Republic of Moldova consists in the act of putting non-compliant structures into use, which gives the offense a formal character. The offense is completed at the moment the building is put into use, regardless of whether any harmful consequences occur, which underscores the preventive nature of the provision [2, p. 635]. The subjective aspect is characterized by direct intent, and the motive for the offense is frequently negligence in fulfilling professional obligations, which indicates culpability specific to the construction sector, where technical requirements are particularly high.

The subject of the offense is specific, consisting of responsible individuals or legal entities (with the exception of public authorities) who perform duties in the construction

sector, such as: *heads of construction organizations, site managers, or persons responsible for quality control.* This limitation of the specific subject reflects the necessity of holding a functional position that allows for direct influence over the quality of construction. Thus, "site manager" refers to the natural person designated by the contractor to oversee the execution of construction work and ensure its completion in accordance with the project [5, p.67].

Furthermore, paragraph (2) of Article 257 of the Criminal Code of the Republic of Moldova introduces a distinct criminal offense, the *legal object* of which is the social relations concerning the prevention of the continuation of works that have been improperly executed and halted by inspection authorities [2, p. 637]. This provision addresses a different stage of the investment process, namely the phase of intervention by the regulatory authorities, and penalizes the conduct of disregarding the orders issued by them. *The material object* consists of non-compliant construction works, and the objective aspect consists of the act of continuing such works despite the prohibition.

This criminal offense has particular legal significance, as it is not limited to penalizing technical non-compliance but also aims to protect the authority and control mechanisms in the construction sector, thereby strengthening discipline in this field. The subject is, in this case as well, specific, being the person responsible for halting the works and for enforcing the requirements, which implies a pre-existing legal obligation to comply.

The aggravated forms provided for in paragraph (3) of Article 257 of the Criminal Code of the Republic of Moldova reflect an extension of criminal protection depending on the severity of the consequences. Consequently, the legislature distinguishes between several forms of the offense, in accordance with the following provisions:

- *In the case of subparagraph (a) of paragraph (3) of Article 257* CC RM, the specific legal object is complex in nature, encompassing both social relations concerning the safety, strength, and stability of structures, as well as those concerning a person's health and physical integrity. The material object is also complex, comprising both the structure and the person's body. The harmful consequence consists of serious injury to health or loss of working capacity, and the offense is of a material nature, with its commission occurring upon the occurrence of the result;
- *In the case of subparagraph (b) of paragraph (3) of Article 257* CC RM, the emphasis is on the protection of the integrity of the building, the harmful consequence consisting of its total or partial destruction, while subparagraph (c) extends protection to important facilities and equipment;
- *In the case of subparagraph (d) of paragraph (3) of Article 257* CC RM, it introduces the criterion of substantial damage, highlighting the financial dimension of criminal liability [2, pp.640-648].

In all these scenarios, the objective aspect involves a combination of actions (design, inspection, assessment, construction, or modification) and omissions (failure to comply with technical standards), and it is necessary to establish a causal link between the act and the result. The subjective aspect is mixed, characterized by direct intent regarding the act and negligence regarding the consequences, which reflects the specific nature of professional negligence in the construction sector.

With regard to the offense provided for in para. (4) of Art. 257 of the Criminal Code of the Republic of Moldova, which constitutes the most serious aggravated form of the offense, namely where the act results in the death of a person. In this scenario, the legal object takes on a complex nature, encompassing social relations pertaining to the person's life, and the offense is a material one, with its commission occurring upon the death

of the person.

In analyzing the constituent elements of the offense specified in Article 257 of the Criminal Code of the Republic of Moldova, it is important to refer to the relevant provisions of the Urban Planning and Construction Code of the Republic of Moldova (CUC) [4], which detail the powers, obligations, and nature of each specific element of the offense, as follows:

- Designer – Art. 55–57; Art. 119–127; Art. 133–136, etc., CUC RM;
- Project reviewer – Art. 129, 132, 171, etc., CUC RM;
- Certified technical expert – Art. 136, Art. 150, Art. 182–186, Art. 204, etc., CUC RM;
- Construction site manager – Art. 168–171, Art. 180–186, etc., CUC RM.

Accordingly, this law governs the conduct, activities, responsibilities, rights, and obligations of certified professionals involved in the authorization, execution of design and construction works, post-construction use of buildings, quality assurance of buildings, construction materials, and products, and the exercise of state control over compliance with regulations in land use planning and urban planning, as well as the authorization regime for construction.

In contrast, Article 257¹ of the Criminal Code of the Republic of Moldova establishes a special provision, introduced in the context of legislative developments through the Draft Law on Amending the Criminal Code of the Republic of Moldova No.985 of April 18, 2002. This provision reflects the need to adapt the criminal framework to contemporary urban realities, characterized by the development of high-rise and complex buildings [6].

Legal scholars Stati V. and Brînza S. point out, in their analysis of the provisions of Article 257¹ of the Criminal Code of the Republic of Moldova, that the criminalization of the improper execution of construction works in the case of buildings with a height exceeding five stories responds to a pressing social need, generated by the proliferation of violations in this area and the increased risks to public safety. The authors emphasize the systemic nature of the provision, which is integrated into the broader context of recent legislative reforms in the field of urban planning and construction, as well as its role in holding all parties involved in the investment process accountable—from design through to project acceptance. At the same time, it is argued that the legal provision does not constitute excessive criminalization; on the contrary, it is distinguished by a clear demarcation from other forms of legal liability, being characterized by its specific subject matter, the complex nature of the act, and the special status of the subject, which confirms its nature as a special criminal provision intended to protect social relations in the highly hazardous field of construction [7, pp.12-18].

Against this doctrinal backdrop, it is only natural to proceed to an in-depth analysis of the criminal law aspects of the offense provided for in Article 257¹ of the Criminal Code of the Republic of Moldova, with a view to rigorously defining its constituent elements and the characteristics that distinguish it within the criminal law system.

Consequently, the specific legal object of the offense provided for in Article 257¹ of the Criminal Code of the Republic of Moldova consists of the social relations regarding the compliance of the processes of design, verification, expert assessment, authorization, execution, and acceptance of buildings with five or more stories, in relation to construction regulations, urban planning documentation, and the requirements established by the urban planning certificate and the building permit [2, p.652]. This formulation highlights the complex and multidimensional nature of the provision, which goes beyond the strictly technical sphere and incorporates urban planning requirements.

The scope of the offense is limited to buildings with five or more stories, which in-

dicates a clear legislative choice to subject buildings with a major urban impact to a more stringent criminal regime. The objective aspect consists of a range of acts and omissions that cover the entire operational chain of the construction process, from design to final acceptance.

Consequently, the applicability of Article 257[1] of the Criminal Code of the Republic of Moldova is contingent upon the specific nature of the legal requirements violated, such that this provision cannot apply in cases where the offenses committed by the perpetrator concern indicators other than those expressly provided for by the legislature, namely: height restrictions, street alignment, standardized population density indices, and the regulatory distance between buildings. In such situations, depending on the circumstances of the act and its severity, the legal classification is to be determined by reference to other criminal provisions, such as Articles 223, 228, or 257 of the Criminal Code, or to the relevant provisions of the Code of Administrative Offenses, including subparagraphs (f) or (g) of paragraph (1) of Art. 93; Art. 94; para. (2) of Art. 109; para. (2) and (3) of Art. 113; para. (2) of Art. 115; para. (10) of Art. 119; Art. 134[1]; Art. 144; para. (4) of Art. 155[1]; Art. 172; Art. 177; Art. 179, and other applicable provisions [8].

Thus, we provide an example from judicial practice where the facts do not constitute criminal offenses but meet the criteria for an administrative offense as follows: *On July 11, 2024, at approximately 8:20 a.m., the chief specialist at the Trușeni City Hall was informed by a resident of the village of Dumbrava, Trușeni commune, The resident reported that the owner of the property with cadastral number 000.777.888, located in Trușeni IP, lot no. 4, with an area of 0.0226 ha, had begun constructing a house without the necessary permits, without a building permit, and without complying with legal requirements at the initial stage of construction. These facts were subsequently established in the report on the administrative violation CB 003013 dated August 20, 2024, and the investigating officer from the Trușeni Commune City Hall, G.S., found that G.A., on the private land with cadastral number 000. 777.888, located in IP Trușeni, lot no. 4, had commenced and carried out the construction of a vacation cottage without a building permit, including two sewer lines, on public land within the safety zone. Furthermore, to establish the existence of the alleged violation attributed to G.A. and to determine his guilt, the investigating officer examined the following documents and evidence: Report No. CB 003013 dated August 20, 2024; the purchase and sale agreement; extract from the Real Estate Registry; photographic record of the construction site; Order No. 959 of August 13, 2024, pursuant to which G.A. is required to demolish the structures and restore the site to its original condition; minutes of the hearing of witness M.A., according to which the latter stated that on August 13, 2024, G.A. was issued an order to demolish the structures and restore the site to its original condition, a requirement with which the latter has not complied and continues to carry out construction despite its illegality; minutes of the hearing of witness G.S., according to which the latter stated that upon visiting the site, he found that G.A. had constructed, on public land and without the necessary permits, three cesspools for the collection of wastewater within the road safety and protection zone. Thus, based on the totality of the evidence in the administrative offense case presented and examined during the court hearing, the court finds that the acts committed by G.A. satisfy the elements of the offense provided for in Article 179 of the Code of Administrative Offenses, namely the performance of construction work without a permit* [9].

The example from judicial practice cited above clearly confirms the criterion for distinguishing between the scope of application of Article 257[1] of the Criminal Code of the Republic of Moldova and that of the administrative offense provisions, in particular Article 179 of the Code of Administrative Offenses. Therefore, although the conduct of the

perpetrator G.A. constitutes a clear violation of the legal regime governing construction permits, consisting of the construction of a building without a permit, as well as "*the performance of related works (sewer lines) on public land and in protected areas, it does not meet the conditions for criminal liability set forth in Article 257¹ of the Criminal Code of the Republic of Moldova*". However, the case materials do not indicate a violation of the specific and restrictive criteria set forth in this provision, such as: height regulations, street alignment, standard density, or distances between buildings, but rather exclusively a failure to comply with the permitting regime, which correctly gives rise to administrative liability.

Consequently, the legal classification made by the court pursuant to Article 179 of the Code of Administrative Offenses appears to be in accordance with the principle of legality in criminal law, thereby avoiding an unjustified expansion of the scope of criminal liability. This solution also reflects the need for a restrictive interpretation of criminal law provisions, in accordance with their nature as a last resort, reserved exclusively for acts that pose a high degree of social danger and that fall precisely within the legal definition.

From this perspective, by correlating the analysis of the case with the legal nature of the offense, it can be observed that the mere performance of the works without authorization, in the absence of harmful consequences or a violation of essential urban planning indicators, is not sufficient to attract criminal liability under Art. 257¹ of Criminal Code of the Republic of Moldova. In its standard form, this offense is formal in nature, with completion occurring at the moment the act is committed, without the need for a harmful consequence to occur. However, in the scenario described in paragraph (3), when the act causes serious injury or the death of a person, the offense takes on a material character, approaching, in this respect, the aggravated forms provided for in Article 257 of the Criminal Code, which highlights an escalation of legal liability depending on the severity of the resulting harm.

A key distinguishing feature is paragraph (2) of Article 257¹ CC RM, which introduces an aggravating circumstance based on the commission of the offense in protected areas, reflecting the expansion of the scope of protected social values to include the environment and built heritage. The scope of the offense is defined even more broadly than in Article 257 CC RM, including, in addition to construction professionals, the issuer of the building permit, the contractor, and the investor, which reflects a broader distribution of criminal liability [2, pp.655-656].

Therefore, the legal and criminal distinction between Articles 257 and 257¹ of the Criminal Code of the Republic of Moldova is made by reference to the material object, the nature of the obligations violated, the time of the offense, and the scope of the specific subjects. In this regard, Article 257 is a general provision aimed at ensuring construction quality and penalizing various harmful consequences, while Article 257¹ is a special provision with a pronounced preventive character, focused on urban planning compliance and the control of high-rise buildings. In our view, this distinction is essential for the correct legal classification of the facts and for the consistent application of criminal law in the field of construction.

Last but not least, it must be emphasized that the application of the criminal provisions under review cannot be carried out in isolation, but requires indispensable coordination with the provisions of the Urban Planning and Construction Code of the Republic of Moldova, which constitutes the primary regulatory framework governing the design, authorization, construction, and acceptance of buildings. Thus, the offenses provided for in Articles 257 and 257¹ of the Criminal Code implicitly refer to special technical and legal

regulations, as their typical content is determined by the violation of obligations established in non-criminal legislation. In this regard, the Urban Planning and Construction Code establish standards of legality and quality, while criminal law serves as a sanctioning instrument in the event of their violation, thereby reinforcing the subsidiary and complementary nature of criminal law.

At the same time, from the perspective of legal classification, it is clear that a rigorous analysis of the constituent elements of the offense is essential to ensure that the facts are correctly classified. However, criminal liability can be established only to the extent that the typical conditions set forth in criminal law are cumulatively met; otherwise, other forms of legal liability apply. In this context, the principle of legality requires avoiding the unjustified expansion of criminal liability, necessitating a strict distinction between the criminal and administrative spheres. Finally, in the event that the act does not meet the constituent elements of a crime, it must be correctly classified within the scope of administrative liability, in accordance with the provisions of the Code of Administrative Offenses. This solution reflects the application of the principle of proportionality and the principle that criminal law is a last resort, ensuring a legal response commensurate with the degree of social danger posed by the act and avoiding the unjustified overlap of forms of liability.

Conclusions. The criminal law analysis of the provisions of Articles 257 and 257¹ of the Criminal Code of the Republic of Moldova highlights the existence of a coherent regulatory framework, structured around distinctions in liability based on the nature of the obligations violated, the stage of the investment process at which the unlawful conduct occurs, and the severity of the resulting consequences. From this perspective, Article 257 CC RM emerges as a general provision, aimed at protecting construction quality standards and sanctioning various harmful outcomes, whereas Article 257¹ CC RM constitutes a special provision with a predominantly preventive function, intended to ensure urban planning compliance in the case of high-impact construction projects. The distinction between the two provisions is made by reference to the subject matter, the content of the legal obligations violated, and the scope of the active subjects, which allows for the avoidance of overlaps and ensures uniform application in practice. At the same time, it has been found that the application of criminal provisions is contingent upon their alignment with non-criminal legislation, particularly the Urban Planning and Construction Code of the Republic of Moldova, which defines the technical and legal standards whose violation gives rise to criminal liability. Furthermore, this analysis does not exhaust all the difficulties in interpreting the provisions, and an in-depth study of the evolving judicial practice is necessary.

A key finding of this research is the need to uphold the principle of legality, given that criminal liability can only arise if all the constituent elements of the offense are cumulatively met. In the absence of these elements, the acts should fall under the scope of administrative liability, which ensures the proportionality of the legal response and prevents excessive criminalization. Therefore, we believe that the evolution of the regulatory framework in this area should be oriented toward an explicit clarification of the criteria for distinguishing between criminal and administrative liability, with a view to ensuring a uniform and predictable legal practice.

In conclusion, the provisions analyzed reflect a modern legislative approach adapted to the realities of the construction sector; however, their effective application depends on a rigorous interpretation and clear distinction between the various forms of legal liability, in order to guarantee the legality of legal relationships and the effective protection

of the social values being safeguarded.

VIOLENCE FROM THE NEUROPSYCHOENDOCRINE AND IMMUNOPHYSIOLOGICAL PERSPECTIVE

Mariana Irina MAGIRESCU CERNAT,
PhD Candidate,
"Ştefan cel Mare" Academy of Ministry of Internal Affairs,
Criminologist,
Università Internazionale di Studi Sociali – UNINTESS,
Mantova, Italia
ORCID: 0009-0003-0406-2137

Abstract

The objective of this study is to analyze the interaction between neuropsychoendocrine and immunophysiological vulnerability and environmental factors in the genesis of violent behavior, in order to optimize risk assessment and the prevention of violent crime.

Research data indicate that prefrontal cortex dysfunction, amygdala hyperactivity, HPA axis imbalance, chronic neuroinflammation, and autonomic nervous system hyporeactivity correlate with impulsivity, emotional regulation deficits, and violent recidivism. The analysis highlights the differentiation of the biological profile between reactive and instrumental violence. Biological vulnerability increases the likelihood of intense emotional activation, but a deficit in regulation turns that activation into aggressive action.

The results support the need for an integrated, multi-level approach in the assessment of perpetrators of violent offenses. Knowledge of the individual psycho-neuro-physiological profile allows for anticipating moments of imbalance and for grounding preventive interventions. The most modifiable target of prevention is the development of emotional regulation skills.

The central proposal is to develop neurophysiological screening protocols applicable during the assessment phase, combined with self-regulation and frustration tolerance programs run by specialized associations. In cases with suspicion of pseudopsychopathy and a documented history of prefrontal lesions, the use of neuroimaging is justified as an auxiliary tool in assessing criminal responsibility.

Keywords: neuropsychoendocrinology, immunophysiology, violent behavior, criminality, HPA axis, hormone levels, prefrontal cortex, emotional regulation deficit.

VIOLENȚA DIN PERSPECTIVA NEUROPSIHOENDOCRINĂ ȘI FIZIOLOGICĂ

Abstract

Obiectivul acestui studiu este de a analiza interacțiunea dintre vulnerabilitatea neuropsihoendocrină și imunofiziologică și factorii de mediu în geneza comportamentului violent, în vederea optimizării evaluării riscului și a prevenirii criminalității violente.

Datele de cercetare indică faptul că disfuncțiile cortexului prefrontal, hiperactivitatea amigdalei, dezechilibrul axei HPA, neuroinflamația cronică și hiporeactivitatea sistemului nervos autonom se corelează cu impulsivitatea, deficitele de reglare emoțională și recidiva violentă. Analiza evidențiază diferențierea profilului biologic între violența reactivă și cea instrumentală. Vulnerabilitatea biologică crește probabilitatea unei activări emoționale intense, însă un deficit de reglare transformă această activare în comportament agresiv.

Rezultatele susțin necesitatea unei abordări integrate, multi-nivel, în evaluarea autorilor infracțiunilor violente. Cunoașterea profilului psiho-neuro-fiziologic individual permite anticiparea momentelor de dezechilibru și fundamentarea intervențiilor preventive. Cel mai modificabil obiectiv al prevenirii este dezvoltarea abilităților de reglare emoțională.

Propunerea centrală este dezvoltarea unor protocoale de screening neurofiziologic aplicabile în etapa de evaluare, combinate cu programe de autoreglare și toleranță la frustrare implementate de asociații specializate. În cazurile în care există suspiciuni de pseudopsihopatie și un istoric documentat de leziuni prefrontale, utili-

zarea neuroimagisticii este justificată ca instrument auxiliar în evaluarea responsabilității penale.

Cuvinte-cheie: neuropsihoendocrinologie, imunofiziologie, comportament violent, criminalitate, axa HPA, nivel hormonal, cortex prefrontal, deficit de reglare emoțională.

Introduction. Violent criminality constitutes a multifactorial phenomenon that cannot be explained exclusively through socio-legal approaches but requires an integrated analysis of factors ranging from the neural level to the endocrine and immunophysiological levels. In the contemporary approach, criminology and criminal law must examine violent behavior from a biosocial perspective through integrative models. Aggressive behavior results from the continuous interaction between brain structures, psychological processes, hormonal profiles, and immunophysiological reactivity, all of which are modulated by environmental factors and criminal opportunities.

From a criminological perspective, this model does not replace the analysis of social factors but complements it, providing a nuanced understanding of the differences between individuals and their distinct reactions to the same risk factors.

The relevance of this approach in criminal investigation and judicial proceedings lies in its capacity to clarify and individualize the fundamental distinction between pathological violence, reactive aggression (impulsive and emotional), instrumental violence (premeditated and goal-oriented), and acquired pseudopsychopathy.

The latter refers to an alteration of social cognition and behavioral control resulting from brain injuries, typically affecting the orbitofrontal or temporal regions, while the individual's general intellectual functioning remains preserved. Lesions of the prefrontal cortex—the brain region responsible for self-control—have been associated in the scientific literature with disinhibition syndrome, characterized by impulsive and poorly regulated behavior.

Each of these typologies is associated with distinct neurobiological patterns, carrying direct implications for the assessment of recidivism risk. This perspective requires the personalization of preventive interventions and the scientific substantiation of judicial decisions.

Depending on the circumstances of each case, sentencing should be individualized through the recognition of mitigating or aggravating factors, exemption from criminal liability where the offender lacked criminal responsibility at the time of the offense, or where responsibility was significantly impaired by structural neural abnormalities. Appropriate social and medical measures should also be implemented according to the specific disorder involved, ensuring a fair and well-founded application of the law.

Pathological cases are generally easier to identify and require medical certification in order to exclude criminal liability and impose security measures of a medical nature. Such cases are associated with delusional disorders and psychotic illnesses, where aggressive acts are driven by persecutory delusions or command hallucinations rather than criminal intent or an antisocial personality structure. These situations fall primarily within the domain of clinical psychopathology.

Defining violent criminality through behavioral typologies makes it possible to move beyond a purely descriptive legal framework. The integration of multidisciplinary data becomes essential in transitioning from an explanatory criminology to an empirical criminology grounded in observational evidence derived from scientific research.

According to contemporary criminological theory, biological vulnerability should not be regarded as a deterministic cause of criminal behavior but rather as a factor that influences an individual's threshold for frustration, chronic stress, and social pressure.

Advances in neuroscience, psychophysiology, and behavioral genetics over recent decades have demonstrated that "the biological substrate plays a significant role in the etiology of violence" [1], without negating the multifactorial nature of violent behavior or the individual's capacity for self-regulation.

The multilevel approach integrates social factors into a more complex causal framework, emphasizing that biology establishes probabilities, psychology mediates decision-making, and the environment activates vulnerability.

Thus, "biological factors constitute a predisposition which, in interaction with environmental stressors, increases the likelihood of violent behavior" [2].

The aim of this paper is to synthesize the existing evidence regarding these levels of analysis, highlighting how they converge in the profiles of individuals exhibiting violent behavior, while also proposing new methods of prevention.

Research methodology. The methodology employed is an integrative review of the scientific literature. International databases were consulted, covering the period from 1990 to the present, with priority given to meta-analyses, longitudinal studies, psychophysiological research, and neuroimaging studies (fMRI, PET). The analysis focused on the comparative synthesis of data regarding the association between biological markers (neural, neurochemical, hormonal, and autonomic) and different typologies of violence within the framework of behavioral disorders.

This approach allows for a transition from a general description of the phenomenon to a functional differentiation of the mechanisms involved in the manifestation of violent behavior.

Discussions and results obtained. I. Neurobiological Level. The activity and structure of the prefrontal cortex, the limbic system, and particularly the amygdala have a major, and sometimes exclusive, impact on the transition to violent behavior, as occurs in acquired pseudopsychopathy, where neural circuits no longer permit adequate deliberation before action.

Research in neuroscience has highlighted the decisive role of the prefrontal cortex in impulse inhibition and moral judgment.

A concrete contribution is made by the involvement of the entire limbic system (the amygdala, hippocampus, hypothalamus, cingulate gyrus, nucleus accumbens, insular cortex, and thalamus), as, in the presence of a stimulus perceived as threatening, provocative, or frustrating, the amygdala initiates the emotional response by activating the hypothalamus, which mediates the autonomic fight-or-flight reaction. The hippocampus contextualizes the stimulus by relating it to affective memory; the anterior cingulate gyrus processes emotional conflict and modulates attention; the insular cortex integrates visceral signals associated with the conscious awareness of fear; and the nucleus accumbens may facilitate impulsive responses through the evaluation of motivational salience.

The amygdala mediates threat detection and fear conditioning. Studies have found that individuals displaying instrumental aggression and psychopathic traits exhibit amygdala hypoactivity.

Emotional impulses are generated by subcortical structures, while the prefrontal cortex (PFC) primarily serves an inhibitory control function over them.

In particular, the orbitofrontal and ventromedial regions of the prefrontal cortex perform the "essential inhibitory control function over emotional impulses" [3].

Instrumental violence, characteristic of psychopathy, reflects a chronic insensitivity to stress. Low basal cortisol levels and attenuated physiological reactivity indicate a congenital or acquired hyporeactivity to fear. This neurobiological deficit reduces the deterrent value of punishment and facilitates persistent and calculated antisocial behavior.

"Neuroimaging studies have demonstrated reductions in prefrontal volume among violent recidivist offenders" [4], while amygdala hypoactivity "explains insensitivity to punishment" [5].

Consistent reductions in gray matter volume have been observed in the prefrontal cortex, amygdala, and hippocampus of violent individuals. Moreover, prefrontal hypoactivation during moral reasoning has been found to be functionally associated with the frequency of aggressive behavior.

Reactive aggressors exhibit amygdala hyperactivation, consistent with the hostile attribution bias observed when interpreting ambiguous stimuli. Etiologically, this pattern is associated with a history of trauma or early-life adversity. It is characterized by elevated basal cortisol levels and an exaggerated response to social stressors. This phenotype reflects hypervigilance within the brain's threat-detection system and correlates with hyperactivity of the hypothalamic-pituitary-adrenal (HPA) axis.

Accordingly, an individual's capacity for effective emotional regulation depends on the functional connectivity between the prefrontal cortex and the amygdala; "dysfunction within this circuit significantly increases the risk of aggressive escalation" [6].

Of particular relevance to criminology is the finding that structural or functional deficits of the prefrontal cortex, especially within the ventromedial and orbitofrontal regions, compromise higher-order regulatory processes and inhibitory control over limbic structures. Under such conditions, the threshold for behavioral activation decreases and the likelihood of impulsive aggressive acts increases, particularly in situations involving provocation, stress, or intoxication.

The prefrontal cortex does not generate either prosocial or antisocial behavior; rather, it serves an inhibitory control function over subcortical impulses. When this inhibitory brake is impaired, whether structurally or functionally, the threshold for violent action is substantially lowered and the risk of violent behavior increases.

Functional and structural neuroimaging studies have identified deficits preferentially localized within the ventromedial prefrontal cortex, a region critical for integrating emotional signals originating from the amygdala with cognitive representations of future consequences. When connectivity with the amygdala is disrupted, individuals may experience aggressive impulses without being able to adequately anticipate their consequences, resulting in a direct transition from impulse to action with diminished inhibitory control.

Within a criminological framework, acquired sociopathy, also referred to as pseudopsychopathy, must also be considered. This condition involves an alteration of social cognition and inhibitory control resulting from structural damage to ventromedial prefrontal networks, while general intellectual functioning remains preserved.

From the case of Phineas Gage in 1848 to the present day, numerous such cases have been documented. Prefrontal dysfunction manifests through social disinhibition, impulsivity, reduced empathy, and impaired decision-making based on future consequences, despite the preservation of general cognitive abilities. These individuals understand social norms; therefore, the deficit is not one of ignorance but of behavioral implementation. They know how they should act, yet often experience a diminished capacity to inhibit inappropriate behavior. This distinction is crucial for understanding the limitations of purely educational interventions among populations with prefrontal dysfunction. It also supports the development of legal procedures that allow defendants to present evidence regarding their specific neurobiological circumstances and enable courts to assess aggravating and mitigating factors, while considering socially integrative measures rather than exclusively punitive sanctions where appropriate.

From a criminal law perspective, the prosecution of violent individuals within this

category requires rigorous individualization of the factual circumstances. The identification of a neurobiological dysfunction does not fall within the competence of law enforcement authorities; however, investigators are responsible for documenting the concrete characteristics of the violent act. Such findings may provide a basis for requests by the defense, the prosecution, or the court to order structural and functional neuroimaging assessments.

The amygdala and the prefrontal cortex are connected through bidirectional pathways. Under normal conditions, the prefrontal cortex regulates amygdala activity and contributes to a realistic assessment of potential threats. In reactive aggression, this regulatory control becomes impaired and the amygdala assumes dominance, a process commonly referred to as an "amygdala hijack".

Therefore, the amygdala and the broader limbic system do not independently generate violent behavior. Rather, they provide its emotional and motivational components. Whether a response becomes defensive or offensive depends on the integrity of prefrontal regulatory control and on the individual's prior experiences.

II. Psychological Level. At the psychological level, traits such as high impulsivity, low empathy, and deficits in emotional regulation consistently correlate with:

- *Violent antecedents*, which highlight vulnerability factors that contributed to the criminal history, in both reactive and instrumental violence;
- *Unexpected aggressive manifestations in certain situations*, which explain disproportionate and unplanned reactions in cases of reactive violence;
- *Increased risk of future violent reactions*, which supports the predictive value of the profile in assessing recidivism risk, for both reactive acts and goal-directed instrumental acts.

These traits function as mediators between external stimuli and violent behavior. Rigid cognitive schemas distort the interpretation of social situations, while lack of affective empathy reduces moral inhibition and the capacity to resonate with the suffering inflicted on the victim by the perpetrator.

When emotional regulation is deficient, frustration is no longer managed cognitively, and psychological tension is transformed into violent motor discharges. These are perceived by the subject as the only means of release, as a response to fear, often unmotivated, triggered by stimuli perceived as psychological or physical threat.

III. Endocrinological Level. At the endocrinological level, violent behavior can be analyzed through the hypothalamic-pituitary-adrenal axis - HPA, a hormonal system that modulates the threshold of aggressive reactivity and the response to perceived threat.

3.1. The Hypothalamic-Pituitary-Adrenal Axis as a System for Modulating Reactivity and its Role in Violence Typologies. The HPA axis represents the main neuroendocrine system involved in regulating the stress response. The function of this axis does not consist of directly determining violent behavior, but of modulating the threshold of reactivity to threatening stimuli and sensitivity to aversive consequences.

Activation of the HPA axis initiates a sequential hormonal cascade: the hypothalamic paraventricular nuclei secrete corticotropin-releasing hormone – CRH, which stimulates the anterior pituitary to release adrenocorticotropic hormone – ACTH, and ACTH determines cortisol secretion at the level of the adrenal cortex. Cortisol exerts effects on neuronal excitability and on limbic circuits involved in threat processing, thus contributing to the calibration of the behavioral response.

3.2. Differential Neuroendocrine Profiles of Violence. Depending on the type of violence manifested, the activity profile of the HPA axis shows clear differentiations.

Reactive violence correlates with HPA axis hyperactivity and with elevated basal

cortisol levels. This profile reflects hypersensitivity to perceived threat and reduced capacity for emotional regulation, correlated with a low threshold of frustration tolerance. From a behavioral perspective, violence appears impulsive, as an immediate response to anger or fear, in the context of prefrontal control being overwhelmed by amygdalar hyperactivity. The violent act is defensive or punitive, without prior planning. The neurobiological basis consists of emotional regulation dysfunction.

Instrumental/psychopathic violence is associated with chronic HPA axis hypoactivity and with low resting heart rate. These markers indicate reduced sensitivity to stress and a deficit in behavioral inhibition. Violence becomes calculated and is used as a means to achieve an external goal: material, status, or control. The act is carried out with affective detachment and prior planning, facilitated by insensitivity to stress. The foundation is represented by chronic HPA hypoactivity and deficits in empathy circuits and consequence processing, specific to psychopathic traits.

3.3. Interaction of the HPA Axis with the Prefrontal Cortex and Implications for Impulse Control. The clinical relevance of the HPA axis derives from its interaction with the prefrontal cortex – PFC, a structure essential for inhibitory control. Early experiences of adversity can disrupt HPA neuroendocrine regulation and can compromise the development and functioning of the PFC. The consequence is a reduction of the temporal interval between the unconscious initiation of the violent impulse and the conscious intervention that could inhibit it.

This mechanism is supported by neuroimaging data. In a 2008 fMRI study, Haynes et al. demonstrated that activity in the frontopolar and parietal cortex allowed prediction of the subject's choice up to 10 seconds before awareness of the decision, with 60% accuracy, significantly above the chance level of 50%. The results support the hypothesis that decision initiation occurs at an unconscious level, while consciousness intervenes subsequently to notify the choice already elaborated. In the context of weakened prefrontal control through neuroendocrine and structural dysfunctions, the window for conscious inhibition becomes insufficient to prevent transition to action.

3.4. Criminological Implications and Prevention Strategies. The neuroendocrine distinction between the two violence subtypes has major relevance for sanction individualization and for recidivism reduction. Reactive violence responds to interventions centered on emotional regulation and anger management. Instrumental violence primarily requires the implementation of situational barriers, environmental control, and limitation of opportunities for manifestation.

From a legal perspective, the offender is criminally liable in both cases if he has capacity for discernment, with the exception of situations involving alienating mental illness. Criminal punishment has limits as a deterrent factor for behavioral disorders.

In a criminological context, the focus shifts from acute reactivity to tonic alterations induced by chronic stress. The Stanford Experiment highlights the role of situational factors as triggers of latent predispositions. Thus, a deficit in fear or empathy can remain latent until the social role structure provides the opportunity for manifestation. Therefore, prevention strategies must include limitation of discretionary power, external supervision, and role rotation, as situational barriers capable of blocking the activation of biological predispositions.

3.5. Theoretical and Applied Implications. The HPA axis, through the regulation of cortisol secretion, functions as a bio-behavioral indicator of violence typology. Dysfunctions of this axis, ontogenetically shaped by early experiences of adversity, represent a fundamental biological link in the causal chain of aggression. When these neuroendocrine disturbances are corroborated with functional and structural deficits at the level of

the prefrontal cortex, self-regulation capacity is severely compromised, and the individual acts impulsively, prior to conscious cognitive processing of consequences.

Therefore, effective interventions must combine two directions: restoration of neuroendocrine balance through reduction of chronic stress and optimization of situational factors that block the conversion of predisposition into violent act. HPA axis alteration thus represents a neuroendocrine decoupling with predictive value for clinical and criminological interventions.

IV. Neurotransmitters and Hormones. 4.1. Serotonin (5-HT). Serotonin exerts an inhibitory effect on impulsive aggression. Low levels of its metabolite, 5-hydroxyindoleacetic acid (5-HIAA), measured in cerebrospinal fluid (CSF), reflect deficient serotonergic activity. The mechanism involved consists of reduced prefrontal control over impulses generated at the limbic level, which "correlates with a history of violent behavior" [7].

4.2. Mesolimbic Dopaminergic System The mesolimbic dopaminergic system mediates reward sensitivity. Sensitization of this system increases the salience of immediate rewards and reduces risk aversion, "facilitating instrumental aggression" [8].

The interaction between systems is fundamental: reduced serotonergic function weakens inhibitory mechanisms while excessive dopaminergic activity amplifies impulsivity. This dual action, reduction of the serotonergic brake and amplification of the dopaminergic accelerator, creates a neurochemical substrate favorable to impulsive aggression under conditions of chronic stress.

4.3. Cortisol. Cortisol sensitizes the mesolimbic dopaminergic system, markedly increasing stimuli associated with immediate reward and reducing risk aversion.

Low cortisol levels signal underactivation of the stress system, which determines active seeking of stimulation in order to reach an optimal level of arousal, thus explaining why sanctions do not produce the anticipatory anxiety necessary to stop the act. This hormonal hyporeactivity causes the individual to remain "cold" in high-risk situations, facilitating the execution of violent acts without remorse or fear of consequences.

4.4. Gamma-aminobutyric Acid (GABA). Gamma-aminobutyric acid, the main inhibitory neurotransmitter of the Central Nervous System, mediates anxiolytic effects through modulation of neuronal excitability. Deficits in GABAergic function, frequently encountered in impulse control disorders, diminish the efficiency of this regulation, facilitating uncontrolled escalation of emotional activation.

Gamma-aminobutyric acid (GABA) controls the threshold for triggering defensive reactions, "GABAergic deficits being associated with uncontrolled outbursts of anger" [9].

The pharmacological perspective is of direct interest to criminology as well, since potentiation of GABAergic transmission through administration of benzodiazepines or mood stabilizers significantly reduces reactive aggression. This neuroendocrine interaction has evident clinical relevance.

Interactions between hormones and neurotransmitters are shaped by early experience through epigenetic mechanisms. Exposure to maltreatment in childhood can induce changes that alter behavioral reactivity to hormonal fluctuations in adulthood.

4.5. Testosterone. Testosterone, often correlated with predisposition toward aggression, is mediated by complex environmental and psychological factors and does not cause violence directly, but "amplifies motivation for dominance and status" [10], its effects being "modulated by cortisol level (dual-hormone hypothesis) and by prefrontal context" [11].

Testosterone functions as an amplifier of motivation for status and dominance, not as a direct determinant of violence. Its behavioral effects are conditioned by cortisol level, by personality traits, and, crucially, by the social context in which the individual acts. Un-

derstanding this complex interaction is essential in order to avoid a unilateral hormonal approach as well as to design interventions that target the social environment, not only biology.

The hormone, therefore, does not prescribe the strategy, but intensifies motivation, leaving the choice of means to the latitude of learned norms.

"Testosterone reduces prefrontal serotonergic tone, diminishing inhibitory control". [12].

Considerations. Violence does not result from the isolated action of a single hormone or neurotransmitter, but from the dynamic interaction between them. Hormones define the motivational context and reactivity thresholds, while neurotransmitters translate behavioral decisions in real time. Understanding this interdependence is essential for a truly integrated etiological approach and for effective interventions at multiple levels.

From an ontogenetic perspective, interactions between hormones and neurotransmitters are shaped by early experience through epigenetic mechanisms.

Exposure to maltreatment during childhood induces hypermethylation of the promoter region of the MAOA gene (monoamine oxidase A), responsible for the catabolism of serotonin, dopamine, and norepinephrine, as well as hypomethylation of the glucocorticoid receptor gene. These epigenetic modifications persist into adulthood and alter behavioral reactivity to hormonal fluctuations. Thus, identical levels of testosterone can generate diametrically opposed phenotypic responses, depending on the individual epigenetic profile of the neurotransmission systems.

From a criminological perspective, understanding violence requires moving beyond unimodal analyses and investigating these interactions, since the effect of a hormone depends on the neurochemical state of the system on which it acts, and vice versa.

Impulsivity and sensation seeking function as proximal psychological mechanisms that translate neurobiological vulnerability (prefrontal hypoactivation, autonomic hyporeactivity) into concrete behavior. They explain why some individuals choose violence not out of necessity, but because, in that moment, it represents the most accessible and most stimulating behavioral option.

Behavioral disorders reflect diffuse dysfunctions of neurotransmission and emotional processing but do not have an identifiable destructive lesional substrate.

V. Immunological Level. Recent literature in medicine and neuroscience shows that immunological imbalances, through chronic neuroinflammation and alteration of the cytokine profile, modulate impulse control circuits and are associated with increased risk of violent behavior.

This state of systemic inflammation directly affects the blood-brain barrier and neuronal communication in prefrontal regions, eroding the individual's "biological brake". Practically, a chemically hyperactivated immune system can keep the brain in a state of permanent defensive alert, in which neutral stimuli are erroneously perceived as threats, triggering disproportionate aggressive reactions.

Research highlights the decisive role of the prefrontal cortex in braking impulses and in moral judgment, as well as the involvement of the amygdala and the limbic system in threat assessment, processing of fear and reactive aggression.

VI. Autonomic Physiological Level. **6.1. Basal Heart Rate**. "Low basal heart rate is a replicable predictor of persistent antisocial behavior" [13], explained by hypoarousal (stimulation seeking) or by fearlessness (insensitivity to punishment).

A low basal heart rate and reduced physiological reactivity do not directly produce violent behavior. They rather represent physiological indicators of a motivational structure oriented toward stimulation seeking and are marked by insensitivity to punishment.

Although their predictive value is limited at the individual level, at the group level it becomes significant and gives us a non-invasive way to observe underlying neurobiological vulnerability.

6.2. Heart Rate Variability (HRV). Heart Rate Variability (HRV) is defined as the physiological oscillation of intervals between two successive heartbeats and constitutes a non-invasive index of autonomic nervous system flexibility, particularly of parasympathetically mediated vagal tone. Unlike average heart rate, which quantifies the general level of autonomic arousal, HRV reflects the organism's capacity for dynamic self-regulation, i.e., the ability to modulate the physiological response in accordance with fluctuating contextual demands.

Within the neurovisceral model, high HRV values indicate efficient prefrontal inhibitory control exerted over subcortical structures, while low HRV values signal autonomic rigidity and an increased predisposition toward emotional dysregulation.

At the general population level, high HRV at rest correlates positively with adaptive emotional regulation, inhibitory control, and optimal social functioning. In contrast, low HRV is associated with deficits in anger management, increased impulsivity, and tendencies toward reactive aggression.

"Low heart rate variability (HRV) reflects autonomic rigidity and deficient prefrontal control, being associated with slow recovery after challenge [14]".

This mechanism presupposes acceptance of a regulation and self-regulation model through neurovisceral integration.

The ventromedial prefrontal cortex exerts tonic inhibitory control over the amygdala, a control that is expressed peripherally through increased heart rate variability. Diminished efficiency of prefrontal control leads to reduced vagal tone (tone of the vagus nerve), decreased HRV, and the establishment of a rigid autonomic pattern, characterized by "all-or-nothing" responses to stressors.

Heart rate variability is not only a physiological parameter, but a window into the individual's self-regulation capacity.

Low HRV does not cause violence, but reflects rigidity of the emotional control system, increasing the probability that aggressive activation, once initiated, will escalate uncontrollably.

From a criminological perspective, monitoring and training HRV could represent a promising target for prevention and intervention, especially because vagal nerve tone can be stimulated through new non-invasive technologies already in use as well as through actions and activities used in daily life (such as pronouncing the alphabet, pronouncing consonants and vowels, and vocalization in general).

6.3. Electrodermal Response. Electrodermal activity (EDA – Electrodermal Activity) represents a physiological indicator of sympathetic nervous system activation, and is frequently used for evaluating emotional response and reactivity to stress.

"Attenuated electrodermal response indicates fear conditioning deficit, characteristic of psychopathy" [15], with a clear dissociation between reactive aggressors (hyperreactivity) and proactive ones (hyporeactivity).

The predictive value of electrodermal activity (EDA) is not absolute, but depends on interaction with environmental factors.

Electrodermal hyporeactivity predicts violent behavior only when it is accompanied by contextual risk factors, such as maltreatment or affiliation with deviant groups. Conversely, in supportive and protective environments, the same physiological profile can be associated with adaptive traits, such as courage and stability in crisis situations.

This plasticity again emphasizes that biological markers do not function as immuta-

ble determinants, but as vulnerability or resilience factors, whose behavioral manifestation is modulated by context.

Electrodermal response provides direct access to fear processing and aversive learning. Hyporeactivity does not cause violence, but eliminates one of the fundamental mechanisms of behavioral inhibition: anticipatory fear of negative consequences.

From a criminological perspective, understanding this mechanism is essential both for differentiating subtypes of aggressors and for designing interventions that compensate for the deficit in learning through punishment with alternative strategies for behavioral modification.

Conclusions and proposals. Knowledge of the individual's profile types is necessary for a deeper understanding of individual differences in reactions to the same risk stimuli, for counseling (by experts in the field) on addressing specialists according to the individual's frequent symptoms, and for correct implementation of prevention based on reactions to *endogenous vs exogenous* stimuli and behavior from the past, present, or in the commission of acts.

Studies highlight that violent criminality results from the complex interaction between biological vulnerability and environmental factors. Integrated understanding of these mechanisms provides the basis for solid risk assessment strategies.

When the individual understands the critical role of accumulated stress, the dynamic configuration of vulnerabilities at the neural, neurochemical, hormonal, and Autonomic Nervous System levels, he will be able to intrinsically generate an increased desire to modulate the reactivity threshold and to make inhibition more efficient. The individual who does not suffer from alienating pathologies has discernment in daily life and, through knowledge of his own general psycho-neuro-physiological state, will be able to anticipate moments of imbalance and will be able to prevent the outcome of acts through their very anticipation.

Effective intervention must be multi-level, targeting both individual risk factors (development of inhibitory control, anger and fear management), and contextual factors (family support programs, reduction of exposure to violence).

Within this model also fits the neuropsychoendocrine and immunophysiological approach of the present work, which details the biological level of the equation, without attributing to it an exclusively causal status, but that of a link in a complex etiological chain.

Biological vulnerabilities and personality traits increase the probability of intense emotional activation but it is the deficit of regulation that transforms this activation into an aggressive act. Development of the organism's regulation skills therefore represents the most accessible and most modifiable objective of preventive intervention.

Proposals. Specialized interventions: Initiation by anti-violence associations, through experts in the field, of targeted programs focused on self-regulation, frustration tolerance, and chronic stress reduction to restore neuroendocrine balance. The usefulness of these interventions would keep under control the risk management of committing illicit acts through violence but above all the probability of not reoffending.

Controlled hormonal evaluation: Possibility of prescription by a physician of hormonal evaluations in the presence of individualized clinical indications, with informed consent from parents/guardians and the minor if they have reached 14 years of age, respecting strict bioethical standards and GDPR.

*School awareness programs*l*: Non-invasive, optional programs for ages 9-16, aimed at emotional self-regulation, carried out with prior consent from parents/guardians.

Use of neuroimaging in justice: Use of neuroimaging techniques for assessing criminal responsibility in cases of violent offenses, exclusively when there is a documented

history of prefrontal brain lesions occurring prior to and temporally correlated with the onset of violent behavior (suspicion of pseudopsychopathy/disinhibitory syndrome).

The proposals will be submitted to the Chamber of Deputies in Rome, Italy, within the Anti-Violence Campaign.

Abstract

The right to privacy has undergone significant evolution in Romania and the Republic of Moldova, amid the political, social and legal transformations of the last decades. In both states, the consolidation of this fundamental right has been influenced both by the internal dynamics of legislative reforms and by the progressive integration into the European legal space. Romania has developed a robust regulatory framework under the impact of accession to the European Union and the jurisprudence of the European Court of Human Rights, which has led to the modernization of legislation on data protection, technological surveillance and procedural guarantees in criminal proceedings. The Republic of Moldova, although in a distinct process of harmonization, has gradually adopted European standards, strengthening data protection institutions and introducing control mechanisms over state interference in private life.

The study follows the regulatory evolution, European influences, relevant jurisprudence and current challenges, such as digitalization, electronic surveillance and data protection in the era of emerging technologies. The conclusions underline the need for continued harmonisation and strengthening of procedural safeguards to ensure an appropriate balance between the public interest and the protection of privacy in both legal systems.

DEZVOLTAREA CADRULUI LEGAL PRIVIND DREPTUL LA VIAȚA PRIVATĂ ÎN ROMÂNIA ȘI REPUBLICA MOLDOVA

Abstract

Dreptul la viața privată a cunoscut o evoluție semnificativă în România și Republica Moldova pe fondul transformărilor politice, sociale și juridice din ultimele decenii. În ambele state, consolidarea acestui drept fundamental a fost influențată atât de dinamica internă a reformelor legislative, cât și de integrarea progresivă în spațiul juridic european. România a dezvoltat un cadru normativ robust sub impactul aderării la Uniunea Europeană și al jurisprudenței Curții Europene a Drepturilor Omului, ceea ce a determinat modernizarea legislației privind protecția datelor, supravegherea tehnologică și garanțiile procedurale în procesul penal. Republica Moldova, deși aflată într-un proces distinct de armonizare, a adoptat treptat standarde europene, consolidând instituțiile de protecție a datelor și introducând mecanisme de control asupra ingerințelor statului în viața privată.

Studiul urmărește evoluția normativă, influențele europene, jurisprudența relevantă și provocările actuale, precum digitalizarea, supravegherea electronică și protecția datelor în era tehnologiilor emergente. Concluziile subliniază necesitatea unei armonizări continue și a întăririi garanțiilor procedurale pentru a asigura

un echilibru adecvat între interesul public și protecția vieții private în ambele sisteme juridice.

Cuvinte-cheie: viața privată, inteligență artificială, legislație, drepturi, protecție, supraveghere digitală, interceptări.

Introduction. The right to privacy represents one of the fundamental guarantees of human dignity and individual freedom, being constantly enshrined in international, European and constitutional instruments. The evolution of this right in Romania and the Republic of Moldova reflects the political, social and legal transformations of the two states, as well as the determining influence of the case law of the European Court of Human Rights (ECtHR). In the context of accelerated digitalization, the expansion of electronic surveillance and the massive processing of personal data, the protection of privacy is becoming a dynamic field, subject to continuous challenges.

Methods and materials applied. The research methods include: *the analytical method* of legislation from the point of view of the right to privacy and the role in its application at the level of the two states, Romania and the Republic of Moldova; *the logical method* analyzed from the point of view of the deduction technique; and last but not least *the empirical method*, by presenting the cases of the ECtHR case law. At the same time, it also includes an analysis of the development of the legal framework regarding the right to privacy in the two states, through a comparative, contextualized and interdisciplinary approach, through the constitutional and legislative dimension, as well as through the impact of European jurisprudence and international standards.

Discussions and results obtained. The development of the Romanian legal framework in the field of privacy protection represents a broad and complex process, influenced both by the transition from a totalitarian regime to democracy and by the gradual integration into the European legal space. The legislative transformations of the last decades reflect the effort of the Romanian state to overcome the authoritarian legacy and to build a system of guarantees compatible with international standards on fundamental rights. In this context, the protection of privacy has become an essential indicator of the consolidation of the rule of law.

The communist regime in Romania (1947-1989) was marked by a systematic surveillance of the population, exercised mainly through the Securitate, the institution responsible for the information control of society. Surveillance of communications, interception of telephone conversations, monitoring of correspondence and collection of information about the private life of citizens were common practices, lacking any form of judicial control or procedural guarantees [1]. In this context, the notion of privacy was practically non-existent, and individual rights were subordinated to the political interests of the state.

This legacy had significant consequences after 1989. On the one hand, Romanian society developed a heightened sensitivity towards any form of surveillance, and on the other hand, state institutions had to reconstruct a completely new regulatory framework, capable of providing real guarantees against abuses. In this sense, the post-communist period represented a moment of profound legal reconstruction, in which the protection of privacy became a central element of democratization.

The adoption of the Romanian Constitution, in 1991, represented a moment of rupture with the totalitarian past, explicitly enshrining for the first time fundamental rights related to privacy: Art. 26 – which guarantees the right to intimate, family and private life; Art. 27 – which enshrines the inviolability of the home; Art. 28 – which protects the secre-

cy of correspondence [2]. These provisions constituted the constitutional foundation of the protection of private life in Romania.

The revision of the Constitution in 2003 consolidated this framework, adapting it to European standards in view of accession to the European Union. In particular, the protection of personal data was strengthened, reflecting European regulatory developments and the need for modern regulation in a constantly changing technological context [3].

The first modern regulatory act in the field of personal data protection was Law No.677/2001, adopted to transpose Directive 95/46/EC. It introduced fundamental principles regarding data processing, the rights of data subjects, the obligations of operators, etc. [4].

The entry into force of Regulation (EU) 2016/679 (GDPR) was a turning point, as it is directly applicable in all Member States. The GDPR introduced innovative concepts such as controller responsibility, data protection by design and, implicitly, the right to portability and the right to be forgotten [5]. Law No.190/2018 completed this framework, establishing implementing rules specific to the national context. Along with the Regulation, a turning point in the application of criminal procedure rules was the entry into force of Directive (EU) 680/2016, which is directly applicable in terms of the protection of individuals with regard to the processing of personal data by competent authorities for the purposes of preventing, detecting, investigating or prosecuting criminal offences or the execution of criminal penalties. In Romania Law No.363/2018, entered into force on January 7, 2019, completing this framework, while also establishing general application rules "at all stages of criminal proceedings and applicable to all authorities involved in the prevention, detection, investigation and prosecution of crimes, as well as in the execution of criminal sanctions" [6, p.10].

Of course, aspects related to the respect for the right to privacy in the application of criminal procedural rules were provided for in the Criminal Procedural Code (CPC), with the regulation of Directive (EU) 680/2016, this protection was strengthened. Interception of communications and technical surveillance are regulated in the CPC, which imposes strict conditions: judicial authorization, thorough motivation, time limitation and subsequent control [7]. However, the case law of the European Court of Human Rights (ECtHR) has repeatedly highlighted deficiencies in the Romanian system, even if these deficiencies could be removed by current regulations. For example, in the case of Rotaru v. Romania (2000), the Court found the lack of adequate guarantees regarding informational surveillance [8], and in the case of Dumitru Popescu v. Romania (2007) problems related to telephone interceptions were identified [9]. These decisions, which are not the only ones, have led to important legislative and institutional reforms.

The expansion of digital technologies, however, required the adoption of specific regulations, prior to the adoption of Regulation (EU) 679/2016 and Directive (EU) 680/2016. Law 506/2004 on the processing of data in the electronic communications sector and Law 365/2002 on electronic commerce and cybersecurity legislation, created the regulatory framework intended to protect users in the online environment [10]. Also, video surveillance, increasingly present in public and private spaces, required clear rules on the proportionality and legality of image processing.

The entry into force of the new Civil Code in 2011 also strengthened the protection of privacy, enshrining in Articles 71-75 rights such as the right to image, dignity, private life and the protection of personal data [11]. Domestic case law was rich at the time, especially in cases concerning the relationship between freedom of the press and the protection of the reputation of public figures. For example, in *Rotaru v. Romania* (2000), the Court high-

lighted the persistence of practices inherited from the communist period [8]. In *Dumitru Popescu v. Romania* (2007), the issues of telephone interception were again brought to the fore [9]. Other cases, such as *Petrina v. Romania*, *Bucur and Toma or Văduva*, addressed the relationship between freedom of the press and the protection of reputation, contributing to clarifying the standards applicable in the Romanian context [12].

The protection of privacy in Romania is still in a continuous process of transformation, influenced by technological dynamics, European legislative developments and the tensions between security, freedom and fundamental rights. If the first two post-communist decades were dominated by the reconstruction of the regulatory framework, the recent period is marked by the need to adapt to new digital realities, the expansion of technological surveillance and the pressures generated by national security.

In this sense, the digitalization of Romanian society has generated significant opportunities, but also major risks for privacy. The expansion of social networks, the massive use of smart devices, the collection of biometric data and the development of artificial intelligence have created an ecosystem in which personal data is processed on a large scale.

In relation to video surveillance and facial recognition, in Romania, in recent years, local authorities and public institutions have implemented extensive video surveillance systems, sometimes integrated with facial recognition technologies. These practices have raised issues regarding the proportionality of the measure, the information of the persons concerned, including the lack of clear guarantees regarding the storage and access to data.

The accelerated expansion of digital technologies, the decrease in equipment costs and the pressures related to public security have led to a massive proliferation of surveillance cameras, both in urban and rural areas. However, this development raises fundamental questions regarding the relationship between the need to prevent crime and the respect for the right to privacy, enshrined in the Constitution and European legislation.

The first video surveillance systems were implemented in Romania in the early 2000s, especially in large cities, as part of urban modernization strategies and increased public safety [13]. Subsequently, video surveillance has rapidly expanded to public institutions, schools, hospitals, means of transport, shopping centres and residential areas. In many localities, video cameras have become a common feature of the urban landscape, being perceived as a necessary tool for crime prevention and traffic management.

However, this expansion has been accompanied by fragmented and in some cases insufficient regulation. Although local authorities have justified the installation of cameras by the need to protect public order, not all projects have been accompanied by data protection impact assessments, as required by European law.

However, video surveillance involves the processing of personal data, as images of identifiable persons are considered personal data. Therefore, any video surveillance system must comply with the principles of the GDPR, such as lawfulness, transparency, data minimisation and storage limitation [5]. Operators are required to demonstrate the necessity and proportionality of the surveillance, as well as to clearly inform data subjects.

Law No.190/2018, which supplements the GDPR in Romania, sets strict conditions for the use of video surveillance, in particular in the context of employee monitoring or the processing of biometric data [14]. It imposes the obligation to carry out an impact assessment (DPIA) when the surveillance may generate high risks for the rights of data subjects.

Law No.333/2003 regulates the use of technical security systems, including video cameras, for the purpose of protecting property and persons [15]. It establishes obliga-

tions regarding the authorisation of the systems, the retention of records and access to data.

Many city halls have adopted decisions on the installation of cameras in public spaces, but these acts must comply with the principles of the GDPR and be accompanied by clear justifications regarding the need for surveillance.

In many cases, cameras are installed in areas where the risks are minimal, which contravenes the principle of proportionality. Generalised surveillance can lead to excessive monitoring of the population, without any real justification [14].

Many systems do not display clear notices about surveillance, which violates the transparency obligation set out in the GDPR [14].

Some institutions retain images longer than necessary, exceeding the recommended 30 day period. This practice contravenes the principle of storage limitation [14].

Video monitoring of employees is only permitted under strict conditions, but in practice abuses occur, such as continuous surveillance or the use of images for disciplinary purposes without justification [14].

However, the authorities justify video surveillance as a necessity to develop privacy, to prevent crime, to intervene quickly in emergencies, etc., but for large-scale video surveillance systems, the GDPR requires a data protection impact assessment (DPIA), which must analyse the risks to the data subjects and the measures to mitigate them [16].

Facial recognition is one of the most intrusive forms of surveillance, as it allows for the automatic identification of individuals and the tracking of their movements. In Romania, the use of facial recognition is still limited, but there are pilot projects in airports and public institutions [17]. The European Union proposes severe restrictions on the use of this technology in public spaces, and Romania will have to comply.

Although video surveillance can contribute to increasing public safety, its development in Romania is conditional on clear regulation, effective institutional oversight and a culture of data protection at the societal level, in order not to create the possibility of excessive surveillance in some areas, risks of institutional abuse, and even a lack of transparency and democratic control.

If we talk about the development of privacy protection in Romania, it cannot be understood in the absence of the European and international context. However, in the last three decades, the evolution of domestic legislation has been strongly influenced by European standards, the case law of the European Court of Human Rights (ECtHR), European Union regulations and global trends in data protection. Art. 8 of the ECHR enshrines the right to respect for private and family life, home and correspondence. In this sense, Romania, as a Member State of the Council of Europe, is obliged to respect these standards, and ECHR rulings have a profound impact on domestic legislation.

As mentioned above, judgments such as *Rotaru v. Romania* [8] and *Dumitru Popescu v. Romania* [9] have highlighted systemic deficiencies in information surveillance and telephone interception. These decisions have required Romania to clarify the procedures for authorizing interceptions, introduce additional guarantees regarding judicial review, regulate access to intelligence files, including strengthening democratic control mechanisms.

The ECtHR has also established a balance between freedom of expression (Art. 10) and the protection of private life (Art. 8). In cases such as *Petrina*, *Bucur and Toma or Văduva*, the Court has clarified the limits of criticism of public figures and sanctioned disproportionate interferences with freedom of the press [12].

In this regard, Romania's accession to the European Union in 2007 was a decisive

moment for the modernization of data protection and privacy legislation.

At present, Romania is at the crossroads of two major global models:

• *The European model* – focused on the protection of fundamental rights; and

• *The American model* – oriented towards self-regulation and economic freedom, which generates tensions in areas such as international data transfers, the use of digital platforms and online surveillance.

In connection with emerging technologies – artificial intelligence, big data, profiling algorithms – complex issues are raised regarding the transparency of automated decisions, massive data collection, lack of user control over their own information [18, pp.111-112]. In this regard, the European Union is preparing a specific legislative framework (AI Act), which will directly influence Romanian legislation. However, artificial intelligence, facial recognition, behavioral analysis and biometric data processing require specific rules to prevent abuse and ensure algorithmic transparency. The adoption of the future European AI Act will impose additional obligations on Romania, including impact assessments on fundamental rights, strict supervision of high-risk systems, prohibition of certain intrusive practices. In this regard, legislative projects in the field must be harmonized with European standards on data protection, for a clear definition of competences, the introduction of additional procedural guarantees, limitation of access to traffic data, etc.

Regarding criminal procedural rules, although European integration has had a positive impact, there are also some challenges, in the sense that the solutions adopted by the courts and which violate the right to privacy, the European requirements in the field are considered to have been superficially applied.

As a development of privacy in Romanian legislation, ANSPDCP participates in the European Data Protection Board (EDPB), contributing to the development of guidelines and interpretations on the application of the GDPR [19], being essential for the standardization of practices at European level.

In the Republic of Moldova, the evolution of this right reflects the profound transformations that the state has undergone since the proclamation of independence in 1991. From a fragmentary legislation, influenced by the Soviet tradition, a modern regulatory framework has gradually emerged, aligned with European and international standards.

This evolution has not been linear. It has been determined by internal factors — legislative reforms, modernization of the Civil Code, development of doctrine — and external factors, in particular the influence of the European Court of Human Rights (ECtHR) and the need for harmonization with the acquis communautaire. Currently, the right to privacy is protected by a combination of constitutional, civil, criminal and administrative norms, complemented by case law and doctrine.

The Republic of Moldova acceded to the Council of Europe in 1995, and the European Convention on Human Rights (ECHR) has become an integral part of the domestic legal order. Article 8 of the ECHR guarantees the right to respect for private and family life, home and correspondence [20, p.109], being directly applicable in the domestic legal order [20], establishing clear limits to state interference, thus imposing the existence of procedural guarantees and, last but not least, obliging the state to ensure a balance between the public interest and individual rights.

The Constitution of the Republic of Moldova takes up these guarantees in Art. 28 enshrining the inviolability of intimate, family and private life [21]. This constitutional provision became the foundation for the subsequent development of domestic legislation and national jurisprudence.

In the first years of independence 1991-2000, the legislation of the Republic of Mol-

dova was still strongly influenced by the Soviet tradition, in which personality rights were poorly developed. The protection of privacy was fragmentary, dispersed in disparate norms in the Criminal Code, the Family Code or the legislation on mass media.

Between 2000 and 2011, the Republic of Moldova began to adopt modern normative acts inspired by European standards, such as the Law on Access to Information (2000), the Law on Protection of Personal Data (2011) and the first regulations on interceptions and technical surveillance.

However, a key moment in the development of the legal framework was the adoption of Law No.133/2018 on the modernization of the Civil Code. Through this reform, Art. 43 was introduced into the Civil Code, which expressly enshrines the category of "personality rights", including the protection of privacy, image, dignity and personal data [22].

Section II of Title II of the Civil Code regulates in detail the respect due to the human being and the rights inherent to it, marking a rapprochement with the German model and modern European standards in the field of personality rights.

The protection of privacy in the Republic of Moldova is closely linked to the legal regime of personal data. Law No.133/2011 on Protection of Personal Data established the general framework for data processing, also creating the National Supervisory Authority (National Center for the Protection of Personal Data).

Although the law does not fully reproduce the GDPR standards, it was influenced by them, and the Republic of Moldova seeks to harmonize its legislation with the European acquis.

The Republic of Moldova has been party to numerous cases regarding the violation of Art. 8 of the ECHR, which has led to legislative and administrative adjustments. The Government Agent Portal lists cases such as *Balmuș v. Republic of Moldova* (2025), *S.M. v. Republic of Moldova* (2025), *Mazur v. Republic of Moldova* (2023) or *Straistă v. Republic of Moldova* (2022), which concerned issues such as illegal interceptions, disclosure of personal data or disproportionate interference by the authorities [23].

These decisions have reinforced the state's obligation to ensure effective procedural safeguards against abuse.

Moldovan courts have increasingly started to apply ECHR standards in cases concerning privacy, particularly in disputes concerning defamation, protection of image, access to personal data or interference by authorities in family life.

In the absence of a rigid definition of the notion of "private life", courts must apply a flexible test, adapted to the circumstances of each case.

The legal literature in the Republic of Moldova has evolved significantly in the last decade. Authors such as Tatiana Tabuncic have analyzed the impact of the modernization of the Civil Code on the protection of privacy, emphasizing the importance of introducing personality rights into civil law [22].

Research conducted within the Institute of Criminal Sciences and Applied Criminology has also highlighted the conceptual difficulties of defining privacy and the need for continuous adaptation of legislation to social and technological developments.

A major contribution is the doctoral thesis of Iulia Butnaru (2022), which analyzes in detail the legal regulation of the inviolability of private, family and intimate life, providing a broad synthesis of the normative and jurisprudential framework [24].

The increasing use of digital technologies, social networks and video surveillance systems raises new issues regarding the protection of privacy. The Republic of Moldova must continue to harmonize its legislation with European standards, in particular with the GDPR.

The case-law of the ECtHR shows that the boundaries between public interest and private life are fluid and must be analyzed contextually [25]. In the Republic of Moldova, the press and public authorities are called upon to respect this balance, avoiding arbitrary interference.

For effective protection of privacy, it is necessary to strengthen the institutional capacity of supervisory authorities, as well as continuous training of judges, prosecutors, police bodies and lawyers.

Conclusions. The evolution of the legal framework on the protection of privacy in Romania reflects a broad process of democratization and Europeanization. From a regime characterized by intrusive surveillance and the absence of legal guarantees, Romania has reached a complex regulatory system, aligned with European standards and adapted to contemporary technological challenges. However, tensions between security, freedom of expression and the protection of privacy remain current, and the consolidation of a legal culture of respect for fundamental rights is a continuously evolving process.

The development of the legal framework in the Republic of Moldova on the right to privacy reflects a complex process of legal modernization, influenced by European standards, technological developments and the consolidation of the rule of law. The introduction of personality rights in the Civil Code, the adaptation of the legislation on personal data and the impact of the ECtHR case-law are essential steps in this evolution. However, contemporary challenges require a continuous adaptation of legislation and judicial practice to ensure real and effective protection of privacy.

PERSONS WHO ESCAPE CRIMINAL LIABILITY

Laurenţiu Gabriel CÎRSTEA,
PhD student,
"Ștefan cel Mare" Academy of the Ministry of Internal Affairs,
Instructor Lecturer, Schengen Multifunctional Training Centre, Buzău,
Romania
ORCID: 0009-0001-2752-7940

Abstract

The depth of the phenomenon of evasion from criminal liability is an essential aspect of the functioning of the criminal justice system. The study starts from the definition of criminal liability as a fundamental institution of criminal law and highlights how it is affected when individuals manage to avoid the application of the law. The principles governing criminal liability, the necessary conditions for its engagement and its role in maintaining social order are presented.

The study analyzes the main forms of evasion, from fleeing the scene of the crime and concealing identity to the use of false documents, leaving the national territory and evading the execution of the sentence, with particular emphasis on new forms of evasion that have emerged in the digital environment, such as online anonymization, encryption of communications and the use of virtual identities.

The paper proposes a comprehensive set of measures to prevent and combat the phenomenon, structured around four main areas: legislative measures (updating regulations, tightening sanctions), institutional measures (inter-institutional cooperation, professional training), technological measures (electronic surveillance, integrated databases, biometric recognition) and international measures (European arrest warrant, extradition treaties). Social and educational measures aimed at increasing public confidence in justice and reducing the tendency to evade are also highlighted.

Keywords: criminal liability, evasion, evasion from criminal prosecution, evasion from the execution of punishment, criminality.

PERSOANELE CARE SE ESCHIVEAZĂ DE RĂSPUNDERE PENALĂ

Abstract

Profunzimea fenomenului eschivării de la răspunderea penală este un aspect esențial al funcționării sistemului de justiție penală. Studiul pornește de la definirea răspunderii penale ca instituție fundamentală a dreptului penal și evidențiază modul în care aceasta este afectată atunci când persoanele reușesc să evite aplicarea legii. Sunt prezentate principiile care guvernează răspunderea penală, condițiile necesare pentru angajarea acesteia și rolul său în menținerea ordinii sociale.

Studiul analizează principalele forme de eschivare, de la fuga de la locul faptei și ascunderea identității până la utilizarea actelor false, părăsirea teritoriului național și sustragerea de la executarea pedepsei, punându-se accent deosebit pe noile forme de eschivare apărute în mediul digital, precum anonimizarea online, criptarea comunicațiilor și utilizarea identităților virtuale.

Lucrarea propune un set amplu de măsuri pentru prevenirea și combaterea fenomenului, structurate pe patru direcții principale: măsuri legislative (actualizarea normelor, înăsprirea sancțiunilor), măsuri instituționale (cooperare interinstituțională, formare profesională), măsuri tehnologice (supraveghere electronică, baze de date integrate, recunoaștere biometrică) și măsuri internaționale (mandatul european de arestare, tratate de extrădare). De asemenea, sunt evidențiate măsuri sociale și educaționale menite să crească încrederea publicului în justiție și să reducă predispoziția la eschivare.

Cuvinte-cheie: răspundere penală, eschivare, sustragere de la urmărirea penală, sustragere de la executarea pedepsei, criminalitate.

Introduction. Criminal liability is one of the most important forms of legal liability, aiming to protect fundamental social values by sanctioning acts that violate the rule of law. However, in practice, not all persons who commit crimes are actually held accountable. The phenomenon of evasion of criminal liability constitutes a major problem for the judicial system, affecting public trust in justice and the efficiency of law enforcement.

Methods and materials applied. This work is based on an interdisciplinary approach, using methods specific to legal, criminological and sociological research. The aim was to analyze the phenomenon of evasion of criminal liability from a complex perspective, integrating both the theoretical and practical dimensions. Among the methods applied, we list: the comparative method, the doctrinal analysis method, the criminological analysis method, the static analysis method, the case study method.

Discussions and obtained results. Criminal liability is the most severe form of legal liability, being engaged when a person commits an act provided for by the criminal law, with the guilt required by it. It is the expression of the state's reaction to behaviors that harm fundamental social values, such as life, bodily integrity, freedom, property or public order [1, p.3-5].

The foundation of criminal liability is twofold: on the one hand, it is based on the need to protect the legal order and essential social interests; on the other hand, it is based on the principle of individual responsibility, according to which each person is responsible for their own actions. In doctrine, criminal liability is viewed as a legal consequence of the crime, being inseparably linked to its existence [2, p.45-47].

In Romanian criminal law, criminal liability establishes the conditions in which it is engaged, its limits and the forms of sanctioning. The state, through the judicial bodies, has the monopoly of the application of criminal liability, which reflects its public nature [3].

Criminal liability operates on the basis of fundamental principles, which ensure the fairness, legality and proportionality of the sanctions applied. These principles are enshrined in both domestic legislation and international human rights instruments.

The principle of legality, expressed by the maxim nullum crimen, nulla poena sine lege, implies that no person can be held criminally liable for an act that is not provided for as an offense by the criminal law in force at the time of its commission [4]. This principle guarantees the predictability and accessibility of the criminal norm, protecting the individual against arbitrariness.

Criminal liability is strictly personal, no one can be held criminally liable for the act of another. This derives from the idea of individual guilt and the need for the criminal sanction to be applied only to the person who committed the act [5, p.112-115].

In order to engage criminal liability, it is necessary for the act to be committed with guilt that is with intention, fault or praeterintent. Guilt represents the perpetrator's psychological attitude towards his act and its consequences [3]. Without guilt, there can be no criminal liability.

The sanction applied must be proportional to the seriousness of the act and the dangerousness of the offender. Proportionality is essential for maintaining fairness and for achieving the preventive and educational purpose of punishment [6].

Modern criminal law rejects inhuman or degrading punishments and promotes the social reintegration of the offender. This principle is enshrined in both the Romanian Constitution and the European Convention on Human Rights [7].

In order for a person to be held criminally liable, certain conditions provided by law must be met cumulatively. These are: the existence of an act provided by criminal law, the unjustified nature of the act, the guilt of the perpetrator, and the imputability of the act.

The first condition is that the act must be typical, that is, it must correspond to the description in the incrimination norm. Typicality is the objective element that delimits the crime from other forms of wrongdoing [3].

Even if an act is provided by criminal law, it does not attract criminal liability if there is a justifiable cause, such as self-defense, a state of necessity or the consent of the injured person in cases permitted by law [3].

The act must be committed with the form of guilt required by law. The lack of guilt excludes criminal liability, even if the act is typical and unjustified [3].

Imputability presupposes the person's capacity to be criminally liable, that is, the existence of discernment at the time of committing the act. Minors under 14 years of age and persons in a state of irresponsibility cannot be held criminally liable [3].

The purpose of criminal liability is twofold: on the one hand, it has a repressive role, sanctioning antisocial behavior; on the other hand, it has a preventive role, discouraging both the offender (special prevention) and society as a whole (general prevention) [8, p.45-47].

In addition, criminal liability aims at the social reintegration of the offender, by applying punishments and educational measures adapted to his needs. Modern criminal law emphasizes re-education and reinsertion, not just punishment.

Criminal liability is an essential instrument for maintaining social order. It guarantees that the fundamental values of society are protected and that their violation entails legal consequences. In the absence of an effective system of criminal liability, the state would lose its authority and citizens' trust in justice would be seriously affected.

Evasion of criminal liability represents the totality of actions or inactions by which a person seeks to prevent being held accountable for a criminal act committed. In doctrine, the term is associated with the idea of avoiding, evading or evading judicial mechanisms, by direct or indirect means.

This conduct can occur at any stage of the criminal process, before the start of the criminal prosecution, during it, at the trial stage or after the delivery of a final judgment. Evasion is not a strictly defined legal concept in the Criminal Code, but a doctrinal and practical concept, used to describe behaviors that prevent the achievement of the act of justice.

In a broad sense, evasion includes both active actions (escape, use of false documents, influencing witnesses) and deliberate inactions (refusal to appear at summonses, concealment of identity). In a narrow sense, the term refers to physical evasion from criminal prosecution or execution of punishment. For example:

1. *Evasion vs. Justified Non-Appearance*: Failure to appear before judicial bodies does not constitute evasion if it is justified by objective reasons, such as illness, inability to travel or other force majeure situations. Evasion implies the clear intention to avoid contact with the authorities [9];

2. *Evasion vs. Right to Silence*: The right to silence is a fundamental guarantee of the criminal process and cannot be confused with evasion. The person under investigation has the right not to give statements, without this being interpreted as a form of evasion from criminal liability [4];

3. *Evasion vs. Obstruction of Justice*: Obstruction of justice is a distinct crime, which involves actions that hinder the conduct of the criminal process, such as influencing witnesses or destroying evidence. Evasion may include such behaviors, but is not limited to them [3];

4. *Evasion vs. Fleeing from the Scene*: Fleeing from the scene of the crime is a par-

ticular form of evasion, but not every escape constitutes evasion. For example, leaving the scene of a road accident is a distinct crime, even if the perpetrator later presents himself to the police [3].

Although the Romanian Criminal Code does not explicitly define evasion, Romanian law contains numerous provisions that punish behaviors associated with it.

The Romanian Criminal Code provides for the possibility of issuing a summons or a warrant for preventive arrest when the person evades criminal prosecution. Evasion may justify more severe preventive measures, such as preventive arrest [9].

Art. 285 of the Romanian Criminal Code [3] criminalizes evasion of sentence, sanctioning the convicted person who hides or leaves the country to avoid imprisonment.

The use of forged documents to avoid identification or detention constitutes a distinct offense, provided under Art. 320-323 of the Romanian Criminal Code.

Art. 338 of the Romanian Criminal Code sanctions leaving the scene of an accident without police permission, considered a form of evasion of criminal liability in the road traffic field.

Refusal to comply with judicial measures (judicial control, obligation not to leave the locality) may lead to the tightening of preventive measures or even their replacement with preventive arrest [9].

The phenomenon of evasion is not specific to Romania, but represents a global problem. The increased mobility of people, the possibility of rapid border crossing and legislative differences between states facilitate the evasion of criminals from criminal liability.

The European Arrest Warrant (EAW) is the main instrument for combating evasion at the European Union level. It allows for the rapid surrender of wanted persons between Member States, eliminating complex extradition procedures [10].

Outside the EU, Romania cooperates with other states through bilateral treaties and through the UN Conventions on transnational crime. Cooperation includes extradition, transfer of proceedings and exchange of information [11].

Although international instruments are effective, there are situations in which states refuse to extradite their own citizens or impose additional conditions. Differences in criminal law, human rights standards and domestic procedures can delay or prevent the surrender of wanted persons.

Modern technology has created new opportunities for evading criminal liability. Criminals can use digital tools to hide their identity, location, or activities.

VPNs allow IP address masking and virtual location in other countries, making it difficult to identify the perpetrators of cybercrimes.

End-to-end encrypted messaging applications make it difficult to intercept communications, even with a court warrant. Although they represent progress for the protection of privacy, they can be used to coordinate criminal activities.

Creating fake accounts, using proxy servers, or generating artificial identities (deepfake) can facilitate evading criminal liability in the online environment.

Although evading criminal liability is a complex phenomenon, located at the intersection of law, psychology, sociology, and technology, technological evolution and global mobility have created new challenges for authorities. In this sense, understanding the concept and its forms are essential for the development of effective prevention and sanctioning policies.

In other words, the phenomenon of evasion of criminal liability manifests itself through a variety of behaviors, which differ depending on the stage of the criminal process, the nature of the crime and the resources available to the person being pursued.

This chapter analyzes the main forms of evasion, both traditional ones and those that emerged in the context of technological evolution.

Fleeing the scene of the crime is one of the most frequent and intuitive forms of evasion. It consists of immediately leaving the place where the crime was committed, in order to avoid identification, detention or ascertainment of the state of affairs by the authorities.

This behavior occurs especially in the case of road traffic offenses, where the perpetrators of accidents leave the scene of the crime to avoid testing for alcohol or psychoactive substances. The Criminal Code specifically punishes leaving the scene of an accident, even if the perpetrator subsequently turns himself in to the police [3].

In other situations, fleeing may occur in the case of violent crimes, thefts or other flagrant acts. Although fleeing in itself is not generally criminalized, it may constitute an aggravating circumstance or may justify the application of more severe preventive measures.

Hiding identity is another subtle but effective form of evasion. This may include refusing to provide real data to the authorities, providing false information regarding name, address or other personal data, using fictitious identities or those of other people [3].

Hiding identity is frequently encountered in the case of economic crimes, illegal migration or organized crime. In some situations, individuals use forged documents to cross borders or to avoid identification during routine checks.

The use of false documents is a complex form of evasion, which involves the use of counterfeit or altered documents to mislead the authorities. The Romanian Criminal Code separately sanctions material forgery, intellectual forgery and the use of forgery [3].

False documents can be used to fraudulently cross borders, obtain official documents (passports, driving licenses), hide criminal records, avoid the execution of sentences or preventive measures.

In the context of globalization, document forgery has become a transnational activity, often carried out by specialized groups. This complicates the identification of persons prosecuted and hinders international cooperation.

Leaving the national territory is one of the most effective forms of evasion, as it involves moving to a state where the Romanian authorities do not have direct jurisdiction. Criminally prosecuted individuals may seek refuge in states that do not have extradition treaties with Romania, that do not extradite their own citizens, where judicial procedures are slow or permissive, and where they may benefit from political or legal protection [10].

In the European Union, this form of evasion has been greatly reduced by the European Arrest Warrant, which allows for the rapid surrender of wanted individuals. However, outside the EU, extradition remains a complex process, subject to strict conditions.

Evasion from serving a sentence is a form of evasion that occurs after a final judgment has been rendered. The convicted person may try to avoid imprisonment by hiding in the country, leaving the national territory, changing identity, using support networks (family, friends, criminal groups).

The Criminal Code explicitly criminalizes this conduct, providing additional penalties for those who evade serving a sentence [3].

In practice, many people with final sentences are put on general or international wanted lists, and their capture requires significant resources from the police and other institutions.

With the development of technology, new ways of evasion have emerged, much more sophisticated than traditional ones. Cybercrime and the use of digital technologies allow criminals to hide their identity, location and activities.

VPNs and TOR networks allow online traffic to be anonymized, IP address hiding and a different location simulation. These tools are used to commit cybercrime, communicate anonymously, and evade digital surveillance.

End-to-end encrypted messaging apps (Signal, WhatsApp, Telegram) make it difficult to intercept communications, even with a court order. Although they are legitimate, they can be used to coordinate criminal activities.

Cryptocurrencies, especially those focused on privacy (Monero, Zcash), allow transactions to be made that are difficult to track. They can be used to finance criminal activities or to hide illegally obtained income.

The forms of evasion from criminal liability are diverse and constantly evolving. If in the past evasion was mainly achieved through physical means (escape, hiding), today technology offers new tools that complicate the work of judicial bodies. Understanding these forms is essential for developing effective prevention and combat strategies.

Evasion from criminal liability is not a random phenomenon, but the result of a complex set of psychological, social, economic and institutional factors. Understanding these causes is essential for the development of effective prevention and control policies. This chapter analyzes the main categories of factors that determine people to avoid criminal liability.

One of the most obvious causes of evasion is the fear of the legal consequences of the act committed. People who have committed serious crimes, such as murder, robbery or drug trafficking, are aware of the severe penalties provided by the law and try to avoid deprivation of liberty at all costs.

Fear is amplified by a multitude of factors, such as criminal records, the risk of recidivism, the perception of prison conditions, social pressure and stigmatization.

Some criminals tend to deny responsibility for the acts committed, considering themselves victims of circumstances or the system. This attitude can lead to avoidance behaviors, such as running away or hiding one's identity.

In the case of crimes committed under the influence of alcohol, drugs or in the context of spontaneous conflicts, perpetrators may act impulsively, fleeing the scene without assessing the consequences. Impulsivity is frequently associated with road traffic offences and acts of violence.

In the case of organised crime, members of groups are often encouraged or forced to evade prosecution in order to protect the organisation. Criminal groups provide shelter, financial resources and false documents, facilitating evasion.

Individuals who fear the reaction of their community or family may try to avoid contact with the authorities. Stigma is particularly strong in small communities, where reputation plays an important role.

Individuals without adequate financial resources may believe that they will not benefit from an effective defence and that the system is against them. This perception may lead to avoidance of legal proceedings.

Individuals from dysfunctional families, with criminal records or negative patterns of behavior, are more likely to adopt avoidance strategies. Lack of family support contributes to the decision to flee or hide.

Economic crimes, such as tax evasion, money laundering or fraud, often involve large sums of money. The perpetrators of these crimes have a strong interest in avoiding criminal liability in order to protect their illegal gains.

Individuals with significant financial resources can hire influential lawyers, purchase false documents, travel quickly to other countries, use advanced technologies for anonymization. These resources increase the chances of successful evasion.

Lengthy criminal proceedings give time to the investigated individuals to evade. Delays can be caused by a multitude of causes such as lack of staff, large volume of files, extended procedural deadlines.

Lack of coordination between the police, prosecutors, courts and other institutions can create loopholes that criminals can exploit. For example, delays in the transmission of warrants or administrative errors can allow people to leave the country.

In some situations, corruption can facilitate evasion by disclosing confidential information, falsifying documents, or even influencing judicial decisions.

Corruption undermines trust in justice and amplifies the phenomenon of evasion. In societies where trust in state institutions is low, people are more likely to avoid contact with authorities. The perception that justice is ineffective or unfair can lead to evasion.

In some communities, certain acts are perceived as "minor" or "acceptable," which reduces the moral pressure on perpetrators and increases the likelihood of evasion. Examples: smuggling, illegal work, petty theft.

Even though the causes of evasion from criminal responsibility are multiple and interconnected, they reflect both individual vulnerabilities and deficiencies in the judicial system and society. Understanding these causes is essential for the development of effective prevention policies that combine legislative, educational and institutional measures.

Evasion of criminal responsibility does not only affect the conduct of an individual case, but also has profound implications for the entire justice system, society and public perception of the authority of the state. The consequences are multiple, interdependent and manifest in both the short and long term.

When individuals manage to evade criminal responsibility, the authority of judicial institutions is affected. The state has a fundamental obligation to ensure the application of the law, and the inability to catch and punish criminals sends a message of weakness.

This perception can lead to a decrease in respect for the law, an increase in the feeling of impunity, and a decrease in citizens' cooperation with the authorities.

Individuals who evade criminal responsibility are often involved in continuous criminal activities. The lack of judicial intervention favors recidivism, because criminals perceive evasion as an effective strategy. Criminals who hide can pose a real danger to the community, especially in the case of violent aggressors, drug traffickers, members of criminal groups, persons involved in sexual crimes.

Evasion facilitates the mobility of criminals and allows the expansion of criminal networks at national and international levels. Individuals who hide can continue to coordinate illegal activities, using digital means or intermediaries.

When citizens notice that criminals are not caught or do not serve their sentences, trust in the justice system decreases. This perception is amplified by the media, which frequently report cases of persons on general or international wanted lists. Lack of trust makes citizens less willing to file complaints, provide statements, collaborate with the police, and participate as witnesses in trials. This phenomenon seriously affects the efficiency of the justice system.

The perception that criminals can get away with it generates a general feeling of insecurity, which affects the quality of life and social cohesion [15].

Evasion can lead to the suspension of trials, postponement of deadlines and prolongation of proceedings. This affects the right to a fair trial, the efficiency of the courts, and judicial costs.

The passage of time affects the quality of evidence – witnesses forget details, physical evidence deteriorates, and digital traces can be erased.

These difficulties can compromise the entire criminal process [9].

Evasion generates significant costs, and the fact that the aggressor is at large can generate fear, anxiety, and post-traumatic stress, especially in the case of violent or sexual crimes.

Victims may feel that the state cannot protect them, which deeply affects the relationship between the citizen and public institutions.

The consequences of evading criminal responsibility are extensive and affect all levels of society. They undermine the authority of the state, compromise public safety, erode trust in justice and generate significant costs. To combat the phenomenon effectively, an integrated approach is needed, combining legislative, institutional, technological and educational measures.

Combating evasion of criminal liability requires a complex, multidisciplinary and coordinated approach. The phenomenon cannot be eliminated by sanctions alone, but by a set of legislative, institutional, technological and social measures.

Criminal legislation must be clear, predictable and adapted to social realities. Periodic updating of the Criminal Code and the Criminal Procedure Code is essential to cover new forms of evasion, especially those in the digital environment.

Art. 285 of the Criminal Code sanctions evasion from the execution of a sentence, but in practice the sentences applied are often reduced. A tightening of sanctions or the introduction of complementary measures (prohibitions, electronic surveillance) could discourage evasion [3].

The legislation could provide for the introduction of more effective preventive measures, such as expanding the use of electronic bracelets, stricter conditions for release under judicial control, and the possibility of digital monitoring of persons suspected of evasion.

Conclusions. Criminal evasion is a complex, constantly evolving phenomenon that requires an integrated and modern approach. Only by combining legislative reforms, institutional strengthening, the use of technology and the involvement of society can the effective application of the law and the protection of the fundamental values of the rule of law be ensured.

The phenomenon of criminal evasion represents one of the most complex challenges of the contemporary justice system. The analysis carried out in this paper highlights the fact that evasion is not a simple act of flight or concealment, but a multifaceted process, influenced by psychological, social, economic, cultural and institutional factors. A deep understanding of this phenomenon is essential for consolidating the authority of the state, for protecting the rule of law and for maintaining public confidence in justice.

Criminal liability, as a fundamental institution of criminal law, loses its effectiveness when individuals manage to evade the application of the law. The principles of legality, proportionality and individual responsibility are seriously affected, and the authority of the state is called into question. Evasion undermines the very idea of justice, as it creates a gap between the legal norm and its effective application.

The forms of evasion are extremely varied and constantly evolving. If in the past traditional methods prevailed – flight, hiding, use of false documents – today technology has opened up new possibilities for avoiding criminal liability. Digital anonymization, encryption of communications, virtual identities and opaque financial transactions represent major challenges for the authorities. Modern crime is increasingly mobile, more sophisticated and harder to detect.

The causes of evasion are deep and interconnected. Fear of consequences, lack of trust in justice, group pressure, institutional deficiencies and legislative vulnerabilities contribute to the perpetuation of the phenomenon. Evasion is not only the result of the

criminal's intention, but also of the weaknesses of the system. Therefore, solutions must be complex and adapted to current realities.

The consequences of evasion are serious and are felt at all levels of society. Public safety is affected, because criminals at large can continue their illegal activities. The judicial system is overburdened, and the economic costs are significant. Citizens' trust in state institutions is declining, and victims of crimes are deprived of moral and material reparation. All this demonstrates that evasion is not only a legal problem, but a social and institutional one.

To effectively combat the phenomenon, an integrated strategy is needed, based on four main pillars:

1. *Legislative reform* – by updating criminal and procedural norms, tightening sanctions for evasion and clearly regulating new forms of crime;

2. *Strengthening institutional capacity* – through inter-institutional cooperation, staff training and reducing the duration of judicial proceedings;

3. *The use of modern technology* – through electronic surveillance, integrated databases, biometric recognition and digital analysis tools.

4. *Education and involvement of society* – through increasing trust in justice, social reintegration programs and community participation in crime prevention.

Finally, evasion of criminal responsibility cannot be completely eliminated, as it is part of the natural dynamics of criminal behavior. However, through coherent, coordinated measures adapted to the current context, the phenomenon can be significantly reduced. An efficient justice system is not one in which there are no crimes, but one in which criminals cannot avoid the consequences of their actions.

Strengthening the state's capacity to prevent and combat evasion is an essential condition for maintaining the rule of law, protecting fundamental social values and guaranteeing a climate of safety for all citizens. Only through an integrated, modern and responsible approach can justice fulfill its role as a guarantor of equity and social stability.

PERSONAL DATA PROTECTION IN THE CONTEXT OF THE EDUCATION DIGITALIZATION

Andreea BURUIANA (RUSU),
PhD Candidate,
"Titu Maiorescu" University of Bucharest,
University Assistant, "Ștefan cel Mare" University of Suceava,
Romania
ORCID: 0009-0000-1535-7270

Abstract

The article examines the issue of personal data protection in the context of the accelerated digitalization of education, with a focus on legislative policies at both the national and European levels. In the digital era, educational organizations act as controllers of complex data and are responsible for handling large volumes of personal information belonging to students, pupils, and teaching staff.

The content of this article addresses the types of data collection, the risks associated with the use of websites or digital platforms, and the legal obligations concerning data security and confidentiality. It outlines the main challenges and trends in best practices, with reference to the GDPR, Law No.190/2018, and the National Education Law.

By emphasizing the implementation of data protection measures and the establishment of responsible institutional structures, the article highlights that fundamental human rights must be respected in the digital educational environment. It also underscores the importance of cooperation among educational institutions, legal authorities, and technology companies to prevent potential risks and errors.

Keywords: data protection, education, GDPR, Law No.190/2018, rights.

PROTECȚIA DATELOR CU CARACTER PERSONAL ÎN CONTEXTUL DIGITALIZĂRII EDUCAȚIEI

Abstract

Articolul examinează subiectul protecției datelor personale în contextul digitalizării accelerate a educației, cu accent pe politicile legislative privind dreptul național și dreptul european. În era digitalizării, organizațiile educaționale sunt gestionarii unor date complexe, responsabile de manipularea unei cantități imense de informații personale ale studenților, elevilor și cadrelor didactice.

Conținutul acestui articol include tipuri de colectare a datelor, riscurile utilizării pe site-uri sau platforme digitale și obligațiile legale privind securitatea și confidențialitatea. În acest articol, sunt descrise principalele provocări și tendințele de bune practici, referindu-se la GDPR, Legea 190/2018 și Legea Educației Naționale.

Prin implementarea măsurilor de protecție și crearea unei instituții responsabile, articolul subliniază că drepturile fundamentale ale omului trebuie respectate în mediul educațional digital. Este subliniată importanța colaborării între instituții, autorități legale și companii de tehnologie pentru a preveni astfel de erori.

Cuvinte-cheie: protecția datelor, educație, GDPR, Legea 190/2018, drepturi.

Introduction. In a world shaped by globalization and the transition toward an information society, data protection is regarded as a fundamental starting point for the rights and freedoms of every individual. The process of digital transformation in education goes

beyond digital platforms and online tools—the transformative nature of this context entails a fundamental restructuring of how students, teachers, institutions, and technology service providers interact with one another.

The constant flow of personal data generated through daily interactions in e-learning environments, educational management systems, and collaborative applications presents both significant opportunities and substantial threats to privacy. This digital environment requires educational institutions to adopt robust measures to protect data in compliance with European and national legal frameworks and the ethical standards governing the educational process. Failure to meet these responsibilities may result in serious reputational and operational damage for schools and universities, thereby necessitating a proactive and responsible approach (Art. 83 of the GDPR and Art. 13 of Law No.190/2018).

The digitalization of education has brought numerous benefits, including improved access to information, enhanced collaboration, and innovation in teaching. At the same time, as the use of increasingly complex and pervasive digital platforms, applications, and databases expands within educational institutions, this transition also raises new concerns regarding the protection of personal data. Therefore, compliance with data protection legislation is essential to ensure that students, pupils, and teachers can effectively exercise and safeguard their rights.

Discussions and results obtained. I. Legislative Framework on the Protection of Personal Data. **1.1. General Data Protection Regulation (GDPR).** Regulation (EU) 2016/679 (GDPR) is the primary legal framework governing the processing of personal data at the European level, establishing principles and obligations to protect the personal data of European Union citizens. Among its key provisions are the fundamental principles governing the lawfulness, fairness, and transparency of processing, as well as purpose limitation, data minimization, and data protection (Art. 5).

Furthermore, the GDPR enshrines an extended set of rights for data subjects, including the right to information, access, rectification, and erasure (the "right to be forgotten") (Arts. 12–23). Data controllers are required to ensure that relevant entities (including educational institutions) implement appropriate security measures, maintain records of processing activities, and provide notifications to supervisory authorities and affected individuals in the event of a data breach (Arts. 24–43, Art. 33).

In Romania, the provisions of the GDPR are supplemented and further specified by Law No. 190/2018, which introduces additional rules concerning the protection of personal data in specific contexts, including the field of education.

1.2. National Legislation. The digitalization of education in Romania emerged as a response to the need to modernize the education system. This process was significantly accelerated by the COVID-19 pandemic, when, in 2020, educational institutions rapidly adopted digital solutions to ensure continuity of instruction. Digitalization has led to a substantial increase in the use of online platforms, educational applications, and digital tools that facilitate interaction between teachers and students.

Institutions in Romania face multiple challenges in protecting personal data. These include insufficient financial and technical resources needed to implement adequate security solutions, as well as resistance to change among teaching staff and administrative personnel. At the same time, low levels of awareness and training among teachers and students regarding data protection contribute to increased exposure to risks.

II. Types of Data Collected in Education. The digitalization of education has generated a large number of new categories of personal information, in addition to traditional

datasets, and the collection and processing of such data impose additional confidentiality requirements. As a result, access logs on e-learning platforms, location data generated by mobile applications, usage preferences, online test results, and written and audio-video communications within school forums and virtual conferences constitute complex information databases. Similarly, data produced through the analysis of students' and teachers' digital behavior also pose risks of accidental or abusive exposure [1, p.6].

Most importantly, transferring such data to third parties, particularly private providers of educational platforms, requires institutions to pay closer attention to legal compliance and to ensure that data transfers are carried out in accordance with applicable regulations, while maintaining continuous oversight of the managed information. In the digital educational environment, the following data are commonly collected: name, surname, personal identification number, contact details, academic results, attendance records, behavior data, biometric data (when advanced technologies are used), and even personal preferences. E-learning platforms often involve data transfers to third-party providers, which further increases privacy risks [1, p.6].

III. Principles of Data Processing in Education. The processing of personal data in the educational environment must strictly comply with a set of fundamental principles designed to protect the rights of data subjects and to ensure a climate of trust in the use of digital technologies.

The first essential principle is the lawfulness of data processing. Any operation involving the collection, storage, or use of personal data must be based on a clear legal ground, as provided by Article 6 of the GDPR. Depending on the context, this legal basis may include the explicit consent of the data subject (for example, for the use of certain educational platforms), the performance of a contract (such as enrollment in studies or access to educational services), compliance with a legal obligation of the institution, or the existence of a legitimate interest that does not override the fundamental rights of pupils, students, or teaching staff.

Another fundamental principle concerns purpose limitation and data minimization. Educational institutions must clearly define the purpose for which personal data are required and collect only the information strictly necessary to achieve that purpose. This helps prevent excessive data collection or the use of data for purposes other than those originally declared, thereby protecting individuals' privacy.

Transparency and full information of data subjects constitute another essential obligation. According to Articles 12 and 13 of the GDPR, pupils, students, parents, and teaching staff must be informed in a clear and accessible manner about the purposes of processing, the retention period, the recipients of the data, and the rights they hold (such as access, rectification, or erasure). Only in this way can a relationship of trust between the institution and data subjects be established [2, pp.43-49].

At the same time, data security must be a permanent priority for any educational institution. The implementation of appropriate technical and organizational measures—from data encryption to clear access and data management policies—aims to prevent unauthorized access, loss, or compromise of personal data. These requirements are set out both in Article 32 of the GDPR and in national legislation (Article 20 of Law No.190/2018).

Thus, the processing of personal data in education cannot be separated from compliance with the principles established by the GDPR: lawfulness, fairness, transparency, purpose limitation, data minimization, accuracy, storage limitation, integrity, and confidentiality. Only by applying these principles can the effective protection of the rights of all actors involved in the digitalized educational process be ensured.

IV. Risks and Challenges of Digitalization. With the expansion of digitalization in education, a range of specific risks related to the protection of personal data emerges, which must be managed responsibly and professionally by all involved institutions.

One of the most significant risks is data breaches and security incidents. These may result from both technical failures in IT infrastructure and from human error, negligence, or insufficient staff training. Such incidents may lead to the exposure, alteration, or even loss of large volumes of personal data, with serious consequences for both organizations and data subjects. Under Article 33 of the GDPR, any personal data breach must be promptly reported to the National Supervisory Authority for Personal Data Processing (ANSPDCP), and in certain cases, affected individuals must also be informed. Transparency and rapid response are essential for mitigating the impact and maintaining trust in educational services [3, p.60].

Another major risk is automated profiling of students and excessive surveillance. The use of algorithms to analyze behavior or academic performance may lead to discrimination, stigmatization, or violations of individuals' privacy, contrary to Article 22 of the GDPR. It is essential that institutions avoid exceeding the limits regarding data collection and use, ensuring that each profiling process complies with ethical and legal principles.

The transfer of data to third parties, particularly to e-learning platforms operated by providers outside the European Union, involves additional risks. Such transfers require the implementation of appropriate safeguards for data protection, in accordance with Articles 44–50 of the GDPR. A lack of effective control over these transfers may result in loss of control over data and exposure to jurisdictions with different levels of protection.

Practical examples from Romania and the European Union show that negligence or insufficient training among educational staff are frequent contributors to security incidents. Among the most common risks are security breaches caused by unauthorized access or data loss, excessive profiling and unjustified storage of sensitive data, lack of control over data transfers to external platforms, and improper use of images or biometric data for non-educational purposes. These issues highlight the need for continuous staff training and the implementation of strict policies on security and transparency in the processing of personal data.

V. Protective Measures and Best Practices. To reduce risks related to the protection of personal data in education and to ensure compliance with European standards, institutions must implement a series of clearly defined protective measures and best practices.

First, adopting clear internal policies and procedures is essential. Each educational institution must develop and implement formal data protection policies, appoint a Data Protection Officer (DPO) in accordance with Article 37 of the GDPR, and provide periodic training for all staff members. Regular training helps reduce human error, increases awareness, and fosters an organizational culture oriented toward protection and responsibility.

In addition, digital projects with a significant impact on privacy require a thorough assessment of the associated risks. The Data Protection Impact Assessment (DPIA), provided for in Article 35 of the GDPR, helps identify and proactively manage potential risks, thereby safeguarding the rights of data subjects from the earliest stages of designing new digital solutions.

Auditing and continuous monitoring of IT systems also represent essential measures. Periodic security audits, access control mechanisms, regular review of access policies, and constant monitoring of activities involving personal data contribute to the early

detection of vulnerabilities and the prevention of security incidents [4, p.32].

Proper information and the obtaining of explicit consent from data subjects remain fundamental requirements for compliant processing. Data subjects must receive clear information regarding how their data are used, and where necessary, their consent must be obtained and documented in accordance with Article 7 of the GDPR and Article 8 of Law No.190/2018.

Finally, cooperation with supervisory authorities is mandatory. Institutions have the duty to promptly notify any security incident to the National Supervisory Authority for Personal Data Processing (ANSPDCP), to cooperate in investigations, and to respond promptly to requests concerning the exercise of data subjects' rights. Compliance with these requirements, together with the use of GDPR-compliant digital platforms, proper information of all participants, and regular security audits, strengthens trust in the digital educational environment and protects the fundamental interests of all stakeholders involved [5, pp.187-188].

Conclusions. The digitalization of education is an irreversible process, significantly impacting how knowledge is generated, transmitted, and protected. This evolution brings undeniable benefits, such as expanded access to educational resources, the stimulation of pedagogical innovation, and the facilitation of international collaboration. At the same time, digitalization entails assuming greater responsibility for protecting the personal data of all participants in the educational process.

Strict compliance with the applicable legal framework (GDPR, Law No.190/2018, and the National Education Law), along with the implementation of effective technical and organizational security measures, is no longer optional but is essential to creating an environment of trust, safety, and mutual respect. Cooperation among educational institutions, competent authorities, and digital service providers must be grounded in transparency, accountability, and a firm commitment to protecting data confidentiality, with the primary aim of ensuring the well-being of pupils, students, teaching staff, and society as a whole [6, p.5].

The protection of personal data in the context of educational digitalization goes beyond a mere legal obligation, representing a moral duty to ensure a safe educational environment. The integration of new technologies must be based on responsibility and respect for the fundamental rights of data subjects.

PREVENTION OF CRIME IN THE DIGITAL ERA: CHALLENGES, MODERN TOOLS AND INSTITUTIONAL COOPERATION

Mihai ȘTEFĂNOAIA,
University Lecturer,
Faculty of Law and Administrative Sciences,
"Ștefan cel Mare" University of Suceava,
Romania
ORCID: 0000-0002-7163-4436

Abstract

The prevention of crime in the digital era represents a major challenge for contemporary legal systems, in the context of the rapid expansion of information technologies and the increasing dependence on the online environment. The development of digital infrastructures has facilitated the emergence of complex forms of crime, such as cyber fraud, identity theft, and cyberattacks, characterized by cross-border mobility and difficulties in identifying perpetrators.

This paper highlights the main challenges associated with preventing these phenomena, including user anonymity, the diversity of jurisdictions, and the rapid evolution of criminal techniques. In this context, prevention becomes essential and requires the use of modern tools such as artificial intelligence, data analysis, and early risk detection mechanisms.

A central element of the preventive approach is institutional cooperation, both at national and international levels. Collaboration between public authorities, the private sector, and international organizations contributes to efficient information exchange and the development of integrated response strategies.

In conclusion, the prevention of digital crime requires a multidimensional approach based on innovation, education, and institutional cooperation, aimed at strengthening security and protecting users.

Keywords: digital crime, prevention, cybersecurity, artificial intelligence, institutional cooperation, cybercrime, data protection.

PREVENIREA CRIMINALITĂȚII ÎN ERA DIGITALĂ: PROVOCĂRI, INSTRUMENTE MODERNE ȘI COOPERARE INSTITUȚIONALĂ

Abstract

Prevenirea criminalității în era digitală constituie o provocare majoră pentru sistemele juridice contemporane, în contextul extinderii accelerate a tehnologiilor informaționale și al creșterii dependenței de mediul online. Dezvoltarea infrastructurilor digitale a facilitat apariția unor forme complexe de criminalitate, precum frauda informatică, furtul de identitate sau atacurile cibernetice, caracterizate prin mobilitate transfrontalieră și dificultăți de identificare a autorilor.

Lucrarea evidențiază principalele dificultăți asociate prevenirii acestor fenomene, inclusiv anonimatul utilizatorilor, diversitatea jurisdicțiilor și ritmul rapid de adaptare a tehnicilor infracționale. În acest context, prevenirea devine esențială și presupune utilizarea unor instrumente moderne, precum inteligența artificială, analiza datelor și mecanismele de detecție timpurie a riscurilor.

Un element central al demersului preventiv îl reprezintă cooperarea instituțională, atât la nivel național, cât și internațional. Colaborarea între autorități publice, sectorul privat și organizațiile internaționale contribuie la schimbul eficient de informații și la dezvoltarea unor strategii integrate de răspuns.

În concluzie, prevenirea criminalității digitale necesită o abordare multidimensională, bazată pe inovație, educație și cooperare, în vederea consolidării securității și protejării utilizatorilor.

Cuvinte-cheie: criminalitate digital, prevenire, securitate cibernetică, inteligență artificială, cooperare instituțională, criminalitate informatică, protecția datelor.

Introduction. The digital era has generated unprecedented opportunities for societal development, facilitating rapid access to information, global communication, and the optimization of economic and administrative processes. At the same time, this profound transformation has created a favorable environment for the emergence of new forms of crime, characterized by complexity, adaptability, and a high capacity for concealment. Offenses such as cyber fraud, cyberattacks, identity theft, and online exploitation have become increasingly common phenomena, difficult to control through traditional means [1].

Digitalization has not only transformed the tools used by offenders but also the structure and dynamics of criminal activity, shifting a significant portion of illicit conduct into the virtual space. In this context, geographical barriers become irrelevant, allowing offenders to operate simultaneously across multiple jurisdictions, which significantly complicates the intervention of authorities [2]. Furthermore, the relative anonymity provided by the online environment, along with the use of advanced technologies such as encryption and decentralized networks, makes the identification and prosecution of perpetrators more difficult [3].

Another relevant aspect is the increasing vulnerability of users, driven by a lack of digital literacy and constant exposure to cyber risks. Phishing attacks, information manipulation, and the misuse of personal data highlight the fact that users often become the weakest link in the digital security chain [4]. At the same time, the development of emerging technologies such as artificial intelligence and the Internet of Things (IoT) creates new challenges, offering both opportunities for prevention and additional tools for criminal activities [5].

In this context, crime prevention can no longer rely solely on reactive approaches but requires a proactive and integrated strategy that combines advanced technological tools with appropriate legal mechanisms and effective public policies. The use of data analysis, artificial intelligence, and predictive systems enables the early identification of risks and intervention before crimes occur [6].

Therefore, this paper aims to analyze the main challenges of crime prevention in the digital era, highlight the role of modern tools, and emphasize the importance of institutional cooperation in developing effective strategies to combat contemporary criminal phenomena.

Discussions and result obtained. I. Challenges of Crime Prevention in the Digital Era (Extended). 1.1. The Transnational Nature of Crime. Digital crime transcends national borders, which complicates jurisdictional enforcement and cooperation between authorities [2]. The lack of legislative harmonization and differences between legal systems hinder rapid and effective interventions, especially in cases involving multiple jurisdictions simultaneously. In many situations, offenders operate from states with more permissive regulations or limited law enforcement capacity, creating so-called “digital safe havens” [2].

Moreover, international judicial cooperation procedures, such as mutual legal assistance or extradition, are often slow compared to the speed at which cybercrimes are committed. This temporal gap reduces the effectiveness of interventions and facilitates the rapid disappearance of digital evidence [6]. In this context, crime prevention requires not only technical tools but also flexible institutional mechanisms and efficient international agreements capable of responding swiftly to cross-border threats.

1.2. Anonymity and the Difficulty of Identifying Offenders. Technologies such as virtual private networks (VPNs), encryption, and dark web infrastructures facilitate the concealment of offenders’ identities, reducing the effectiveness of traditional investigative methods [3]. These tools allow users to mask their location and communicate secure-

ly, significantly complicating the work of law enforcement agencies.

In addition, the use of cryptocurrencies in illegal transactions contributes to increased financial anonymity, making it difficult to trace money flows and identify ultimate beneficiaries [5]. This combination of technological and financial anonymity generates major challenges for judicial systems, which must develop new investigative methods based on digital analysis and inter-institutional cooperation.

Furthermore, the difficulty in identifying offenders also affects the preventive dimension, as the perceived lack of risk of sanction may encourage criminal behavior in the online environment [4].

1.3. Rapid Technological Evolution. The tools used by offenders are constantly evolving, creating a gap between the capabilities of authorities and the sophistication of criminal methods [4]. The emergence of new technologies, such as artificial intelligence, automation, and the Internet of Things (IoT), expands the attack surface and provides new opportunities for illicit activities [5].

For instance, the use of artificial intelligence in generating false content (deepfakes) or automating cyberattacks raises serious challenges for detection and prevention. At the same time, increasingly complex digital infrastructures are becoming more vulnerable to coordinated attacks, with significant implications for national and economic security [6].

This rapid evolution requires continuous adaptation of prevention strategies, including investment in specialist training, the development of advanced detection technologies, and the constant updating of the legal framework. Without an adequate response, the gap between technological advancement and institutional capacity may lead to the escalation of criminal activity in the digital environment.

II. Modern Prevention Tools. 2.1. Artificial Intelligence and Predictive Analytics. The development of artificial intelligence (AI) technologies has opened new perspectives in crime prevention, enabling a shift from a reactive to a proactive approach. Machine learning algorithms can analyze large volumes of data (big data) to identify behavioral patterns, correlations, and risk indicators that would be difficult to detect using traditional methods [5].

Predictive analytics allows the anticipation of potential criminal activities by assessing probabilities based on historical data and suspicious behavior. These tools are used, for example, in detecting financial fraud, identifying cyberattacks, or monitoring suspicious online activities [6].

However, the use of artificial intelligence also raises ethical and legal concerns, such as the risk of algorithmic bias or violations of privacy, which necessitate the development of appropriate regulatory frameworks [7].

2.2. Digital Surveillance and Cybersecurity. Modern digital surveillance systems represent a key pillar in preventing crime in the online environment. These include technologies for monitoring data traffic, intrusion detection and prevention systems (IDS/IPS), and cyber threat intelligence platforms [5].

Furthermore, the implementation of high cybersecurity standards at institutional and organizational levels contributes to reducing vulnerabilities exploited by offenders. Measures such as multi-factor authentication, data encryption, and security audits are essential for preventing unauthorized access [6].

Cybersecurity incident response teams (CERTs) also play a crucial role by coordinating responses to cyberattacks and facilitating rapid information exchange between institutions [5].

2.3. Digital Education and Public Awareness. Crime prevention is not limited to

institutional intervention but also involves empowering users. Digital education plays a fundamental role in reducing individual vulnerabilities by developing the skills necessary to identify risks and adopt safe online behaviors [4].

Awareness campaigns regarding online fraud, data protection, and responsible use of technology contribute to reducing the number of victims of cybercrime. In this sense, prevention becomes a participatory process in which citizens act as active agents of digital security [6].

Moreover, integrating digital education into educational systems and professional training programs represents a long-term investment in reducing risks associated with the online environment [7].

2.4. Public–Private Cooperation and Information Sharing. A key element of modern prevention is cooperation between the public and private sectors. Technology companies control critical infrastructures and large volumes of data, placing them in a strategic position to detect emerging threats [8].

Public–private partnerships facilitate information sharing, the development of technological solutions, and the implementation of effective prevention mechanisms. For example, collaboration between law enforcement agencies and digital service providers enables faster identification of suspicious activities and limits their impact [5].

At the same time, such partnerships must respect data protection principles and fundamental rights in order to prevent abuses and maintain public trust [7].

III. National and International Legal Framework in Preventing Digital Crime. **3.1. National Legal Framework**. At the national level, the prevention and combating of cybercrime are regulated through a set of legal norms that reflect both internal needs and obligations assumed at the European and international levels. In Romania, the main legislative instrument is the Criminal Code, which criminalizes specific acts related to the digital environment, such as illegal access to a computer system, illegal interception of computer data, data interference, and system fraud. These provisions ensure the legal framework necessary for sanctioning illicit behavior in cyberspace.

An important role is also played by Law No.161/2003, which represented an early step in regulating cybercrime, introducing provisions concerning the prevention and combating of offenses committed through information systems [9].

In the field of cybersecurity, Romania has implemented European requirements through Law No.362/2018, which establishes obligations for operators of essential services and digital service providers in order to prevent and manage security incidents [10]. This law contributes to strengthening the resilience of critical infrastructures and to developing a coherent prevention system.

The protection of personal data, essential in preventing digital crime, is ensured through the application of the General Data Protection Regulation (GDPR), complemented by national legislation. This legal framework contributes to limiting unauthorized access to data and reducing the risks associated with the misuse of personal information.

In addition, institutions such as the National Cyber Security Directorate and specialized structures within the Ministry of Internal Affairs play a key role in implementing prevention policies and managing cyber incidents, in cooperation with national and international partners.

3.2. International Legal Framework. At the international level, the prevention of digital crime is supported by the existence of legal instruments designed to facilitate cooperation between states and ensure a minimum level of legislative harmonization. A fundamental document in this regard is the Convention on Cybercrime, also known as the

Budapest Convention, which establishes common standards regarding the criminalization of offenses, investigative procedures, and mechanisms for international cooperation [11].

This convention provides states with a unified framework for action, facilitating the rapid exchange of information and cooperation in the investigation of transnational crimes. Its importance is reinforced by the global nature of cybercrime, which requires coordinated responses at the international level.

In addition, organizations such as the United Nations and Interpol contribute to the development of global prevention policies and to the coordination of efforts aimed at combating digital crime, providing operational and analytical support to Member States.

At the level of the European Union, the legal framework is strengthened through directives and regulations addressing cybersecurity and data protection. Directive (EU) 2016/1148 on the security of network and information systems (NIS Directive) requires Member States to adopt appropriate measures for the prevention and management of cyber risks. Furthermore, the General Data Protection Regulation (GDPR) contributes to crime prevention by strengthening personal data protection and increasing the accountability of economic operators.

Moreover, reports and analyses conducted by European agencies, such as Europol, provide up-to-date insights into the evolution of cyber threats and support the development of effective prevention strategies.

Conclusions. Crime in the digital era represents a complex and dynamic phenomenon, deeply influenced by technological developments, which requires a fundamental rethinking of prevention strategies. The present analysis highlights that traditional methods of combating crime are no longer sufficient in the current context, characterized by transnationality, anonymity, and technological sophistication.

A first essential aspect is the need to adopt a proactive approach, based on risk anticipation and the use of modern tools such as artificial intelligence and predictive analytics. These technologies enable the early identification of threats and intervention before criminal acts produce their effects, thereby increasing the efficiency of prevention systems.

At the same time, the legal framework plays a decisive role in ensuring an adequate response to the challenges of the digital environment. Both national and international regulations, such as the Budapest Convention, provide a solid legal basis for the criminalization and investigation of cyber offenses. However, their effectiveness depends on the continuous updating of legal norms and the harmonization of legislation across states.

Another central element is institutional cooperation, both at the national and international levels. Collaboration between authorities, international organizations, and the private sector is essential for the rapid exchange of information and the development of common prevention strategies. In the absence of such cooperation, the transnational nature of digital crime significantly limits the effectiveness of interventions.

Furthermore, the role of digital education cannot be overlooked. Increasing users' awareness and developing digital competencies contribute to reducing vulnerabilities and preventing a significant number of cyber offenses.

In conclusion, preventing crime in the digital era requires an integrated approach that combines technology, legal frameworks, and institutional cooperation. Only through continuous adaptation and effective collaboration can an adequate level of security in the digital environment be ensured and the risks associated with emerging forms of crime be reduced.

THE JUDICIAL EXPERIMENT AS A FORM OF APPLYING THE EXPERIMENTAL METHOD IN CRIMINAL PROCEEDINGS

Oxana CIUDIN,
PhD Candidate, Moldova State University,
Assistant Lecturer, Faculty of Law and Public Administration,
"Bogdan Petriceicu Hasdeu" University Center,
Technical University of Moldova
ORCID: 0000-0002-5990-478X

Abstract

The judicial experiment constitutes an essential method of investigation within criminal proceedings, distinguished by its specific character deriving from the use of experimental actions aimed at verifying and clarifying existing information, as well as identifying new circumstances of the offense. This form of application of the experimental method enables criminal investigation officers (prosecutors) to examine criminal acts within a controlled framework, to reproduce the conditions under which the investigated event occurred, and to directly observe the manner in which the actions or phenomena associated with the offense unfolded. Within the judicial experiment, the criminal investigation officer (prosecutor) is afforded the opportunity not only to confirm or refute previously formulated investigative versions, but also to obtain new evidence relevant to the resolution of the criminal case.

Through this approach, the judicial experiment emerges as a highly valuable cognitive instrument, contributing to the clarification of the factual circumstances of the case, to the substantiation of investigative conclusions, and to the safeguarding of an objective and rigorous criminal process. Accordingly, the judicial experiment integrates both empirical and theoretical knowledge, representing an indispensable methodological component of the system of criminal investigation, which substantiates the relevance and contemporary significance of the present study.

Keywords: judicial experiment, criminal proceedings, criminal offense, experimental method, criminal investigation measure, verification, clarification, reproduction, reconstruction, circumstances, events, phenomena, evidence, evidentiary material, tactical procedure.

EXPERIMENTUL JUDICIAR: FORMĂ DE UTILIZARE A METODEI EXPERIMENTALE ÎN CADRUL PROCESULUI PENAL

Abstract

Experimentul judiciar reprezintă o metodă esențială de investigare în procesul penal, având caracter specific prin utilizarea acțiunilor experimentale menite să verifice și să clarifice informațiile existente, precum și să identifice noi circumstanțe ale infracțiunii. Această formă de aplicare a metodei experimentale permite ofițerilor de urmărire penală (procurorilor) să cerceteze faptele infracționale într-un cadru controlat, să reproducă condițiile evenimentului investigat și să observe direct modul de desfășurare a acțiunilor sau a fenomenelor asociate infracțiunii. În cadrul experimentului judiciar, ofițerul de urmărire penală (procurorul) are posibilitatea nu doar de a confirma sau infirma versiunile formulate anterior, ci și de a obține probe noi relevante pentru soluționarea cauzei penale.

Prin această abordare, experimentul judiciar se constituie într-un instrument cognitiv de mare valoare, contribuind la claritatea circumstanțelor cauzei, la fundamentarea concluziilor urmăririi penale și la asigurarea unui proces penal obiectiv și riguros. Astfel, experimentul judiciar integrează atât cunoașterea empirică, cât și cea teoretică, fiind o componentă metodologică indispensabilă în sistemul de investigație penală, fapt care determină importanța și actualitatea studiului realizat.

Cuvinte-cheie: experiment judiciar, proces penal, infracțiune, metodă experimentală, acțiune de urmărire penală, verificare, precizare, reproducere, refacere, circumstanțe, evenimente, fenomene, probă, probatoriu, procedeu tactic.

Introduction. The establishment and consolidation of a democratic and rule-of-law state are inseparably linked to the restructuring of criminal investigation bodies and the overall improvement of their activity. Criminal procedural legislation must correspond to European standards and contribute to the recognition and safeguarding of fundamental human rights and freedoms. An essential task of criminal proceedings is to ensure the conduct of a prompt and comprehensive investigation, as well as the proper examination of criminal cases before the courts, the improvement of the procedure for carrying out criminal investigation measures, the configuration of an optimal system thereof, and the enhancement of the efficiency of their application.

The process of crime investigation is conventionally interpreted as a specific cognitive activity — a process of knowledge as a whole, aimed at establishing the truth concerning the existence of facts and the circumstances of the events that have occurred. The process of discovering the truth within criminal proceedings is carried out in the form of procedural proof, the foundation of which is constituted by materialist dialectics, the principles of criminal procedure, the logic of cognition, as well as the methods and techniques of criminalistics.

The process of establishing the truth in a criminal case encompasses both intellectual activity and the concrete actions of the criminal investigation officer, as provided by criminal procedural legislation. Intellectual activity consists in solving certain tasks and clarifying issues that require elucidation [9, p. 42].

According to the opinion of author Stelmach V.Iu., criminal procedural legislation encompasses 15 distinct criminal investigation measures, as well as an even greater number of their subtypes. These measures are positioned equally within the hierarchy of evidentiary tools; however, some are applied systematically, while others are employed only in rare or exceptional situations, requiring thorough preliminary preparation, involving considerable time expenditure, and, by their very nature, allowing the confirmation or refutation of the key investigative version [20, p. 164].

The detection and investigation of criminal offenses, understood as the activity of establishing the veracity of the event that occurred, is carried out through the performance, in the order prescribed by law and in a rational sequence, of criminal investigation measures and special investigative activities, implemented through scientific-technical and tactical procedures, as well as criminalistics methods. Among the effective means of obtaining new evidence, as well as verifying and clarifying already obtained evidentiary material by conducting experimental actions under artificially created conditions, is the judicial experiment as a procedural act.

The necessity of conducting an experiment is determined not by the type of offense committed, but by the concrete circumstances of the criminal case; therefore, it is not possible to identify specific categories of crimes in which this criminal investigation measure must be mandatorily performed [4, p. 819].

The judicial experiment represents one of the criminal investigation measures and is regulated by the provisions of Article 123 of the Criminal Procedure Code of the Republic of Moldova, [15]. Pursuant to the aforementioned legal norm, law enforcement bodies and officials directly responsible for conducting criminal investigations are entitled to perform the judicial experiment for the purpose of verifying or clarifying information that

may be used in the investigation of a criminal offense during the pre-trial phase, and in certain cases — also during the judicial examination stage [3, pp. 240-251].

The judicial experiment comprises a set of actions reflecting the circumstances in which the offense was committed, the environment in which the criminal act occurred, as well as other conditions related to the events produced at the moment of the commission of the offense. This type of criminal investigation measure presupposes a sequence of operations aimed at visualizing and documenting the circumstances associated with the commission of the offense, its contextual environment, and other aspects accompanying the event that took place at the time of the criminal act.

The essence of this investigative measure lies in the performance of special experimental actions. The distinction between the special experimental procedures carried out within the framework of the judicial experiment and experiments conducted under laboratory conditions resides in the fact that, during the investigation of the offense, the procedural action is performed by an officially authorized person endowed with the legal competence to conduct such an action within the criminal case investigation.

The special experimental actions are carried out in a predetermined order with the aim of obtaining information of probative value. As a rule, this criminal investigation measure is performed at a later stage of the criminal investigation, when the criminal investigation officer/prosecutor possesses a certain amount of information necessary for verifying data concerning the persons who committed the offense, the manner of its commission, the mechanism of trace formation, and other information directly related to the offense and its participants. The judicial experiment represents one of the means of verifying information held by the criminal investigation body, possessing evidentiary value [18, pp. 10-12].

The experiment, as a method of evidence verification in criminal cases, is widely used during criminal investigation. The verification of evidence based on the experiment involves experimentally establishing the possibility or impossibility of the existence of a certain fact under specific circumstances determined by the content of the evidence [16, p. 127].

Methodological basis of the research. The preparation of the article involved the use of scientific methods specific to legal and criminalistics research. First, the method of theoretical analysis was applied to examine specialized literature and relevant judicial practice in order to identify the characteristics and particularities of the judicial experiment. Second, the synthesis method was used to integrate theoretical and practical information, highlighting the role and functions of the judicial experiment within criminal proceedings.

Furthermore, comparative methods were employed to correlate different approaches of researchers and practitioners regarding the application of the experimental method and to determine the conceptual and procedural particularities of the judicial experiment. The logical method was used to establish causal relationships between hypotheses, investigative versions, evidence, and conclusions in criminal proceedings, while the systemic method enabled the judicial experiment to be highlighted as an integral component of the overall investigative process.

By combining these methods, the research aimed to ensure scientific rigor, objectivity, and coherence of the analysis, providing a solid foundation for the conclusions formulated regarding the application of the judicial experiment as a cognitive and verification instrument within criminal proceedings.

Discussions and results obtained. The judicial experiment represents an important criminal investigation measure, the essence of which lies in the performance of experimental actions involving the observation of the development of a phenomenon that imi-

tates the circumstances of the investigated offense under specific and controlled conditions, allowing their repetition multiple times [21, p. 183].

According to the opinion of Gheorghiță M., the experiment within criminal investigation proceedings is "...a powerful means of psychological influence on participants, because in most cases its results demonstrate the possibility or impossibility of the existence of certain events and phenomena" [2, p. 673].

In accordance with the interpretation of criminal procedural legislation, the judicial experiment consists in the reproduction of the actions, environment, or other circumstances of a previously occurring event. In this context, Ramazanov Z.*A. argues that the main characteristic of this criminal investigation measure — its experimental nature — is partially absent when comparing the judicial experiment with the closest investigative action, namely the verification of statements at the scene. The essence of the latter also lies in the fact that the previously interviewed person reproduces, at the location of the event, the circumstances of the investigated occurrence, indicates objects, documents, or traces relevant to the criminal case, and demonstrates certain actions [19, p. 106].

It is noteworthy, according to Didenko N.S., the judicial experiment is carried out through the use of the experimental method, whose primary foundation consists of performing experimental actions aimed at determining the authenticity of evidence or refuting it, as well as establishing new circumstances relevant to the criminal case. The admissibility of evidence obtained in this manner is ensured by compliance with the procedural norms and conditions governing the conduct of this investigative measure [22, p. 25].

Proper planning and conduct of criminal investigation measures, including the judicial experiment, largely determine the overall success and effectiveness of criminal investigation. This is primarily due to the fact that the evidentiary basis will be constituted, first and foremost, by accurately and rigorously prepared official records (protocols) of the performed investigative measures, and only subsequently by their results, whether positive or negative. In practice, according to the opinion of Ișcenko D.P. and Fisakov M.Iu., law enforcement representatives do not always fully exploit the potential of the judicial experiment; moreover, during its execution, errors are frequently committed that hinder the effective use of the results obtained in the investigation of criminal acts [17, pp. 88-95].

Researcher Belkin R.S. argues that the theoretical foundation of the judicial experiment is based on the application of two general scientific methods of cognition — the experimental method and the modelling method, while its logical basis is represented by analogy [7, pp.184-185].

The experimental method of cognition is widely used in judicial, investigative, and forensic examination practice, as the performance of experimental actions allows for the verification of the objective possibility of carrying out certain actions and for the perception of specific phenomena or facts. In a general sense, the experiment is understood as one of the principal methods of scientific research, in which the study of phenomena is carried out under deliberately selected or artificially created conditions.

In philosophy, the term "experiment" (from the Latin experimentum — research) denotes an empirical method of cognition of real-world phenomena, carried out under specially reproduced conditions reflecting natural laws, based on a specific scientific theory that establishes the purpose, procedure, and interpretation of experimental results. As a means of correlating theoretical models with real physical processes, the experiment provides empirical meaning to the quantities defining the abstract object of scientific theories, thereby conferring cognitive value upon them.

The term "experiment" is also understood as "...a planned observation, systematic isolation or combination of conditions, for the purpose of studying the phenomena de-

pendent upon them" [14, pp. 191-192].

The essence of the experimental method, according to I. M. Luzghin, consists in the investigation of an object under conditions in which the researcher exerts an active influence upon it by creating artificial circumstances necessary for identifying relevant properties or by modifying the process in a predetermined direction. The content of this method is formed by any experimental actions used to verify the propositions of scientific theory or practical activity [10, p. 159].

Authors Bilenciuk P.D., Lisicenko V.K. and Klimenko N.I., consider that the effective application of the experimental method is conditioned by compliance with several general principles, namely: a) in experiments (experimental actions), the real object or its model (material or imaginary) must be used; b) regarding the investigated object, external conditions that existed at the time of the fact or event subject to verification must be recreated or ensured; c) modification of external conditions is permitted depending on the purpose of the research; d) experimental actions must be repeated several times [8, p. 305].

As an important method within the system of cognitive approaches, the experiment is actively applied in almost all scientific fields and in various spheres of human practical activity [14, p. 576].

The experiment may function both as a general scientific method (constituting a cognitive component of other criminal investigation measures, such as judicial expertise and crime scene examination) and as a judicial experiment, whose cognitive possibilities are primarily limited by the corresponding procedural form. It should also be noted that the judicial experiment represents a specific method of cognition within which previously acquired knowledge can be employed as a criterion for establishing truth. At present, the experiment should be grounded in knowledge derived from psychology, visual psychodiagnostics, physics, mathematics, and other related disciplines.

Considering the experiment as a method of cognition from a dialectical-materialist perspective, the statement of Shtoff V.A. is relevant: "...observation and experiment represent essential elements of experimental action, understood in the dialectical-materialist sense, that is, as a process of interaction in which the object not only exists independently of the subject's consciousness but is also subjected to active influence" [12, p. 54].

Proceeding from the system-activity approach in defining the essence of the judicial experiment, it is considered that this measure encompasses both empirical and theoretical (rational) knowledge.

The judicial experiment represents a means of verifying and clarifying the investigative version formulated during criminal investigation or the hypotheses advanced by the suspect (accused) regarding the manner in which the offense was committed. However, as investigative practice demonstrates, the judicial experiment has a dual character. On the one hand, it may confirm or refute a certain version (for example, the investigative version of the criminal investigation body or the statements of the suspect/accused); on the other hand, it provides the possibility of discovering new information. Thus, the judicial experiment aims not only at verifying or clarifying established facts but also at obtaining new evidence in the criminal case.

The experiment, both in investigative practice and in other areas of criminal procedure, represents a research situation concerning a phenomenon under specially created and controlled conditions that allow active management of the course of the process, namely intervention and modification in accordance with the research objectives, as well as the "reconstruction" of the studied phenomenon by reproducing these conditions. The researcher-experimenter's task consists in isolating the investigated phenomenon from insignificant influences and highlighting the aspect of interest in its natural and authentic

form. The same logic applies to the judicial experiment, since through the conduct of this procedural action it is established whether a certain event or action could have occurred under the given circumstances.

Thus, within criminal proceedings, a specific form of application of the experimental method is the judicial experiment. As a cognitive method, it represents the process of investigating the observed phenomenon (the criminal event), its connections with other phenomena and events, under conditions of artificially modified environment. Since the judicial experiment is, first and foremost, a scientific experiment, it must comply with general scientific categories; therefore, its conduct must employ scientific methods such as analysis and synthesis, possess a cognitive character, and be governed by the principles of scientific research, namely continuity, comprehensiveness, veracity, and objectivity.

The experiment represents an empirical method of studying real-world phenomena, carried out under specially reproduced conditions reflecting natural laws, on the basis of a specific scientific theory that determines its purpose, procedure, and interpretation of results. As a means of correlating theoretical models with real physical processes, the experiment provides empirical significance to the magnitudes and entities defining the abstract object of scientific theories, thereby ensuring their cognitive value.

Contemporary science employs: 1) real experiments, among which are distinguished: a) qualitative experiments, aimed at establishing the existence or non-existence of postulated phenomena; and b) quantitative experiments, aimed at determining the numerical values of the investigated characteristics of objects; 2) mental experiments, conducted for the purpose of creating an idealized, conceptual representation of the object [14, pp.191-192].

The analysis of investigative practice and specialized literature shows that, in many cases, the verification and objective evaluation of the evidence obtained is possible only through the conduct of the judicial experiment [6, p.303; 13, p.101; 11, p.89].

The performance of the experiment enables the representative of the criminal investigation body to verify, by experimental methods, the truthfulness of the information obtained during the investigation of the criminal case, the correctness of hypotheses, investigative versions, and conclusions, as well as to reconstruct the complete picture of the event, taking into account its interrelations, various details, and particularities. The success rate of investigative actions largely depends on how properly the criminal investigation officer (prosecutor) plans the experimental procedures, since the evidentiary basis is constituted by the results of the experiment, recorded in the official protocol (both positive and negative). However, in practice, law enforcement representatives do not always fully exploit the potential of the judicial experiment, and during its execution, errors are frequently committed that hinder the use of the obtained results before the court.

In addition, we note that, according to the opinion of Celysheva O.V., it is correct to classify and systematize all types of judicial experiments into two categories: 1) experiments related to the reproduction of a person's actions; 2) experiments aimed at reproducing (reconstructing) certain events.

On the basis of these categories, the particularities of tactical tasks and the decisions adopted by representatives of criminal investigation bodies in organizing and conducting the judicial experiment are established. Furthermore, Celysheva O.V. states that the results of the judicial experiment are recommended to be determined, according to their content, as positive and negative, which allows for the correct assessment of their significance in establishing circumstances relevant to the criminal case. At the same time, a positive result indicates only hypothetically the existence of circumstances that must be proven within criminal proceedings [21, p.183].

The conclusions of the experiment may lead to the correction of the previously ad-

vanced investigative versions and the formulation of new ones, as well as the performance of criminal investigation actions that were not carried out earlier — such as interrogations, ordering of forensic examinations, etc. [5, p.249]. Thus, as rightly argued by Doraș S., the results of the experiment within criminal investigation proceedings generally have a dual significance: first, they serve as a basis for initiating and conducting other procedural activities aimed at administering the necessary evidence for resolving the case; second, they contribute to the substantiation of the decision regarding the offense and its perpetrator, expressed by the criminal investigation body in the indictment act or in another procedural document drawn up at the end of the investigation [1, p.465].

Conclusions and recommendations. The conduct of the judicial experiment represents an independent decision of the criminal investigation officer (prosecutor), deriving from the necessity to reproduce, through experimental methods, the statements previously made by the interviewed person. The experimental character constitutes the main distinctive feature and significance of the judicial experiment. In certain cases, its results may influence the solution in criminal cases by confirming or refuting the statements of the suspect, accused, injured party, or witnesses.

The judicial experiment allows not only the observation of events and actions under predetermined conditions but also intervention in a given process by transforming and modifying the conditions under which it unfolds. In this regard, the judicial experiment represents a procedural action aimed at collecting new evidence and verifying existing evidence by performing experimental actions oriented toward establishing the possibility of the existence or perception of facts, the commission of acts, the occurrence of consequences, the elucidation of the event mechanism, as well as the process of trace formation relevant to the criminal case, usually carried out under reconstructed or recreated conditions as close as possible to the environment in which the investigated event occurred.

In real investigative practice, during the conduct of the judicial experiment, it is not always possible to fully comprehend the studied phenomenon, or to identify, manage, and modify it in the desired direction. However, the purpose of experimental activity is precisely to achieve the highest possible level of control over the process and, on this basis, to establish the veracity of the criminal event. This represents the methodological ideal of the judicial experiment.

The English proverb “A picture is worth a thousand words” is appropriately integrated into the conceptual framework that highlights the value of the judicial experiment — not for reasons of personal interest, but because any criminal case, or more precisely, the key criminal event forming its core, is composed of a multitude of “images” that the criminal investigation officer (prosecutor) attempts to reconstruct and reconstitute based on statements made by persons with varying levels of sincerity or personal interest.

Within this procedural labyrinth of contradictory information, the use of a specific experimental method characteristic of the judicial experiment appears fully justified, as it allows the criminal act to be investigated “from within”, analyzed in its smallest details, and perceived directly based on factual reality.

DIGITALIZATION OF BUILDING PERMITS AS AN INSTRUMENT FOR PREVENTING CONSTRUCTION-RELATED OFFENSES

Mariana VATAMANITA,
PhD Candidate,
"Constantin Stere" University of European Political and Economic Studies,
Republic of Moldova
ORCID: 0009-0004-2949-4750

Abstract

The digitalization of the building permit issuance process is approached as a strategic tool aimed at preventing crimes in the construction sector, in an environment marked by vulnerabilities such as corruption, abuse of office, document falsification, and unauthorized construction activities. It is based on the idea that traditional administrative mechanisms, often characterized by excessive bureaucracy, lack of transparency, and discretionary decision-making, can create conditions conducive to illicit conduct and erode public trust in institutions. The implementation of electronic platforms, digital registries, and interconnected record-keeping systems contributes to increasing transparency, ensuring decision traceability, and facilitating the verification of procedural steps.

The analysis of the regulatory framework highlights the need to align urban planning legislation with digital governance policies and European standards concerning administrative integrity and accountability. The advantages of integrated information systems are emphasized, including limiting direct contact between applicants and officials, reducing opportunities for corruption, and enhancing control mechanisms. In this context, digitalization transcends its technological dimension, positioning itself as an essential instrument for strengthening legality and preventing criminal phenomena in the construction sector.

Keywords: administrative digitalization, building permits, crime prevention, construction sector, digital governance, institutional integrity, decision-making transparency.

DIGITALIZAREA AUTORIZAȚIILOR DE CONSTRUIRE CA INSTRUMENT DE PREVENIRE A INFRACȚIUNILOR ÎN CONSTRUCȚII

Abstract

Digitalizarea procesului de emitere a autorizațiilor de construire este abordată ca un instrument strategic destinat prevenirii infracțiunilor în sectorul construcțiilor, într-un context caracterizat de vulnerabilități precum corupția, abuzul de serviciu, falsificarea documentelor și realizarea construcțiilor neautorizate. Această abordare pornește de la ideea că mecanismele administrative tradiționale, adesea caracterizate prin birocrație excesivă, lipsă de transparență și decizii discreționare, pot crea condiții favorabile pentru conduite ilicite și pot eroda încrederea publicului în instituțiile statului. Implementarea platformelor electronice, a registrelor digitale și a sistemelor interconectate de evidență contribuie la creșterea transparenței, la asigurarea trasabilității deciziilor și la facilitarea verificării etapelor procedurale.

Analiza cadrului normativ evidențiază necesitatea alinierii legislației în domeniul urbanismului cu politicile de guvernanță digitală și cu standardele europene privind integritatea și responsabilitatea administrativă. Sunt evidențiate avantajele sistemelor informaționale integrate, printre care limitarea contactului direct dintre solicitanți și funcționari, reducerea oportunităților de corupție și consolidarea mecanismelor de control. În acest context, digitalizarea depășește dimensiunea sa strict tehnologică, poziționându-se ca un instrument esențial pentru consolidarea legalității și prevenirea fenomenelor infracționale în sectorul construcțiilor.

Cuvinte-cheie: digitalizare administrative, autorizații de construire, prevenirea infracțiunilor, sectorul construcțiilor, guvernanță digital, integritate instituțională, transparență decizională.

Introduction. The construction sector is widely recognized as one of the areas most exposed to risks of corruption and administrative irregularities, due to the high economic value of projects and the complexity of the permitting processes. Traditional procedures, which rely on physical documentation and direct interaction between applicants and officials, can create opportunities for discretionary decision-making and facilitate illicit behavior.

In this context, the digitalization of building permits emerges as a structural solution to mitigate systemic vulnerabilities and strengthen administrative integrity.

Methods and materials applied. The present study adopts a qualitative and comparative research methodology to explore the transformative impact of digitalization on the building permit process in the Republic of Moldova and its role in preventing construction-related offenses. The methodological framework integrates several complementary approaches to ensure a thorough and multidimensional analysis of the phenomenon.

Firstly, a documentary and regulatory analysis forms the foundation of the research. This involves an in-depth examination of legislative acts, regulatory frameworks, policy documents, and guidelines pertaining to urban planning, construction permitting, and e-governance both within Moldova and in selected European Union (EU) countries. Through this analysis, the study identifies how domestic laws align or diverge from European standards regarding administrative integrity, transparency, and accountability, thereby establishing a legal context for assessing the potential of digital tools to prevent irregularities in construction administration.

Secondly, the research incorporates case study analysis to investigate the practical operation and effectiveness of digital platforms for building permits. Particular attention is given to workflow structures, accessibility for end-users, administrative controls, and auditing mechanisms embedded within these systems. The Moldovan Automated Information System for Managing and Issuing Permits (SIA GEAP) serves as a central case, offering insights into the procedural and operational benefits of digitized permit management. Comparative case studies from EU jurisdictions provide benchmarks for best practices and reveal opportunities for optimizing Moldovan systems.

A third methodological component involves comparative evaluation. By contrasting Moldovan digital permitting practices with European standards, the study identifies systemic gaps, potential risks, and avenues for improvement. This approach facilitates the understanding of how interoperability, harmonization of regulatory frameworks, and alignment with EU digital governance principles can enhance the effectiveness of digitalized permitting systems.

Additionally, the research incorporates expert interviews and secondary data analysis. Interviews with specialists in construction law, urban planning, public administration, and digital governance provide qualitative insights into operational efficiency, regulatory compliance, and practical challenges associated with digital platforms. Secondary data sources including administrative reports, statistical analyses, and performance metrics support the evaluation of workflow efficiency, procedural errors, and the incidence of unauthorized construction activities.

By combining these methods and materials, the research establishes a comprehensive analytical framework capable of evaluating how digitalization transforms administrative processes, enhances transparency, strengthens accountability, and reduces the likelihood of fraud, corruption, or other unlawful activities in the construction sector.

The study demonstrates that the integration of digital platforms into building permit management not only optimizes procedural efficiency but also establishes a preventive governance infrastructure, where traceable workflows, real-time auditing, and database interoperability serve as critical tools for enforcing legal compliance and safeguarding institutional integrity.

In summary, the methodology employed provides a systematic, multi-layered, and comparative approach to understanding the preventive potential of digitalization in the construction permitting process. It combines regulatory scrutiny, practical case examination, comparative benchmarks, expert perspectives, and empirical data analysis to evaluate both the technical and governance aspects of digitalized permit management, highlighting its significance as an instrument for crime prevention, enhanced transparency, and effective public administration in Republic of Moldova's construction sector.

Discussion and results obtained. The process of issuing building permits represents a fundamental pillar of regulatory oversight in the construction sector, serving as a critical mechanism to ensure that all construction activities comply with established legal, safety, and environmental requirements. Essentially, a building permit constitutes formal authorization conferred by a recognized authority, empowering stakeholders to undertake construction, renovation, or modification of structures while simultaneously safeguarding the well-being of building occupants and maintaining the integrity of the urban landscape. Despite its central importance, conventional permitting procedures are frequently characterized by their complexity and procedural rigidity, which often leads to inefficiencies and administrative burdens. The strong interdependence on detailed legal frameworks and governmental protocols renders the permitting process susceptible to errors, lack of transparency, and prolonged delays. These structural and procedural limitations can inadvertently open avenues for noncompliance, regulatory breaches, or illicit interventions within the construction process [5, p.102188; 3, p.1-19].

In recent years, a growing body of scholarly research has been dedicated to improving the efficiency, transparency, and reliability of building permit procedures by leveraging advancements in digital technology. Central to these efforts is the digitalization of construction workflows, which aims to integrate modern tools such as Building Information Modeling (BIM), Geographic Information Systems (GIS), and Industry 4.0 principles into the management and oversight of construction projects [4, p.102137-102153; 2, p.100039]. This technological integration enables authorities and project stakeholders to monitor compliance, optimize processes, and ensure adherence to technical, safety, and regulatory standards in a more streamlined and data-driven manner.

Pioneering studies, such as those conducted by researchers Eastman C., Lee J.M., Jeong Y., Lee J.K. [9, pp.1011-1033], laid the groundwork for what has become known as rule-based model checking, a methodological approach designed to evaluate whether construction models comply with established regulatory codes within a digital workflow. By formalizing rules and embedding them into the analysis of digital construction models, this approach allows for systematic validation of design and planning decisions, offering a higher degree of accuracy and consistency compared with traditional manual review methods.

Subsequent research has expanded the application of automated rule-checking across diverse geographic and regulatory contexts, including case studies in Turkey, the USA state of Florida, South Korea, and several European countries. These investigations consistently demonstrate that digital, model-based verification techniques can significantly enhance the precision of the permit review process, reduce human errors, and

accelerate procedural timelines [14, pp.105115; 15, pp.757-771; 14, pp.143-148; 16, pp.209-233; 18, pp.400-413]. By utilizing digital models as the central reference for compliance assessment, authorities are better equipped to identify inconsistencies, enforce standards uniformly, and minimize the risk of oversight, thereby contributing to safer, more transparent, and more accountable construction permitting practices.

The process of automated model checking in the context of construction compliance typically involves a structured sequence of four essential stages: 1) rule interpretation, which entails understanding and formalizing regulatory requirements so they can be applied systematically; 2) model preparation, involving the conversion of construction or design models into a format suitable for automated analysis; 3) rule execution, during which the prepared model is evaluated against the predefined rules to detect any non-compliance or inconsistencies; and 4) result reporting, which generates a comprehensive output summarizing compliance findings and highlighting areas requiring corrective action [9, pp.1011-1033].

While significant progress has been made in automating the latter three stages model preparation, rule execution, and reporting the initial step of interpreting complex regulatory norms remains a persistent challenge. Converting detailed legal and technical requirements into machine-readable formats that can be seamlessly integrated into automated verification tools often proves difficult due to the complexity, ambiguity, and variability of construction legislation [12, p.105092; 7, pp.651-670]. This step is critical because the accuracy and reliability of the entire automated compliance process fundamentally depend on the correct interpretation of the rules.

Furthermore, research emphasizes that the successful adoption and implementation of BIM-based digital building permits (DBPs) relies not solely on the availability of advanced technological tools but also on the organizational maturity of the public authorities and regulatory institutions responsible for overseeing construction permits. The effectiveness of DBP systems is closely linked to the extent to which these bodies are prepared to adapt their internal administrative workflows, embrace digital practices, and foster a culture of data-driven decision-making within their offices [19, p.45-64]. In other words, even the most sophisticated technical solutions can only achieve their intended outcomes if the organizations utilizing them possess the structural capacity, trained personnel, and procedural readiness to integrate these digital tools into routine permitting operations.

In the context of the Republic of Moldova, the digital transformation of the building permit process has been operationalized through the implementation of the Automated Information System for Managing and Issuing Permits (SIA GEAP). This initiative constitutes a major advancement in the modernization of public service delivery within the construction sector, aiming to enhance procedural transparency, improve administrative efficiency, and provide more accessible services to both citizens and construction professionals. The SIA GEAP platform enables users to request and obtain four critical construction-related permits entirely online: the informational urban planning certificate, the urban planning certificate for design purposes, the building permit itself, and the demolition permit [10].

Through this digital platform, applicants can submit their requests electronically, upload the necessary supporting documents in digital formats, and apply secure electronic signatures via tools such as MPass and EVOSign. In addition, the system allows users to monitor the progress and status of their applications in real time and make the required payments through the online portal, thereby significantly streamlining the workflow.

The adoption of SIA GEAP has substantially reduced the need for in-person interactions between construction applicants and administrative officials. By minimizing face-to-face contacts, the system helps curtail opportunities for discretionary or informal influence that could potentially facilitate irregularities or unethical practices. This reduction in direct interaction, combined with the standardization and digitalization of procedures, strengthens administrative integrity, promotes fairness in decision-making, and acts as a preventive mechanism against potential corruption and procedural abuses within the permit issuance process.

The deployment of digital platforms for managing building permits introduces substantial preventive and regulatory benefits within the construction sector. By implementing standardized procedures across all stages of the permitting process, these platforms create a consistent and uniform framework that ensures each application is treated according to clearly defined rules and requirements. In addition, the automation of verification tasks allows for the systematic review of submitted documentation, reducing the reliance on manual checks and thereby minimizing human error or subjective interpretation that could otherwise compromise compliance.

A critical feature of these digital systems is the establishment of persistent electronic audit trails. Each action performed within the permit management platform from document submission to administrative review is systematically recorded and can be verified at any time. This comprehensive traceability significantly enhances institutional accountability, serving as both a deterrent to attempts at document falsification and a mechanism to prevent unauthorized or illegal construction activities.

Moreover, the integration of disparate databases including land cadastre records, urban planning registries, and construction permits enables real-time cross-referencing of information. This interconnectivity ensures that discrepancies or irregularities in submitted documents can be identified promptly, substantially reducing the likelihood of fraudulent practices. At the same time, it accelerates the verification process, allowing authorities to validate compliance more efficiently and consistently, which ultimately contributes to a safer, more transparent, and more reliable construction regulatory environment.

From the standpoint of public governance, the implementation of the SIA GEAP system is closely aligned with the broader e-governance strategy adopted by the Republic of Moldova, which seeks to harness the potential of information and communication technologies (ICTs) to enhance the efficiency, transparency, and credibility of administrative operations. By centralizing and digitalizing key processes, the initiative not only streamlines service delivery and reduces bureaucratic inefficiencies but also allows public authorities to exercise systematic oversight and monitoring of compliance across all municipal jurisdictions.

The digitalization of permit issuance through SIA GEAP ensures that processes are standardized and accessible, facilitating more equitable and consistent service delivery for both citizens and construction professionals. This centralized approach enables authorities to track each stage of permit processing, ensuring adherence to legal and procedural standards while reducing opportunities for discretionary decision-making or informal influence that could compromise fairness.

Looking forward, the Moldovan government has set a target for full digital adoption across all local administrations by 2027, expanding the system's reach beyond the 33 municipalities currently connected to SIA GEAP. This expansion aims to establish uniformity in service provision nationwide, ensuring that all municipalities operate under the same

digital standards and procedures. Furthermore, these reforms are designed to align with European benchmarks for interoperability, administrative integrity, and the delivery of digital public services, reinforcing Moldova's commitment to international best practices in digital [17, p.108854; 11, p.21].

Through these measures, the SIA GEAP initiative not only modernizes public administration but also strengthens transparency, accountability, and trust in governmental processes, setting a robust foundation for the prevention of irregularities and misconduct in the construction sector.

In a broader perspective, the digital transformation of the building permit system in the Republic of Moldova serves as a clear illustration of how the strategic integration of advanced information and communication technologies (ICTs), coupled with automated compliance verification mechanisms and a centralized digital infrastructure, can function as an effective preventive instrument against illicit activities in the construction sector. By embedding technology-driven solutions into the entire permitting workflow, the system enhances operational efficiency, reduces procedural delays, and ensures that all steps are carried out in a transparent and accountable manner.

This modernization initiative goes beyond mere procedural optimization. By facilitating real-time monitoring, creating persistent digital records, and standardizing permit issuance practices, the digital system substantially mitigates the risk of irregularities, including unauthorized construction, fraudulent documentation, and informal interventions. In addition, the implementation of automated rule-checking and verification reduces human error and discretionary decision-making, thereby limiting avenues for corruption or unethical practices among officials and stakeholders.

Ultimately, the Moldovan experience demonstrates that digitalization in the construction permitting process is not merely a technical upgrade, but a comprehensive governance reform. It strengthens institutional accountability, promotes transparency, and fosters a culture of compliance within the sector. By systematically controlling and recording every phase of permit issuance, digital solutions create a robust safeguard against illegal actions, ensuring that construction activities adhere to legal, safety, and environmental standards while reinforcing public trust in government institutions.

In the modern administrative environment of the Republic of Moldova, the implementation of contemporary digital platforms dedicated to the management and issuance of building permits has become a fundamental tool for promoting greater transparency, accountability, and openness within public sector operations. These sophisticated systems facilitate the public disclosure of extensive information concerning construction permit applications, including all submitted documentation, the current stage of review by the relevant authorities, and the legally defined timelines for decision-making. By offering stakeholders and the general public real-time access to such procedural data, these platforms make it possible to track and verify each step of the permitting process, thereby reinforcing institutional oversight, enhancing the predictability of administrative actions, and cultivating public confidence in governance processes.

The continuous online availability of this information serves several interrelated functions. First, it addresses the traditional lack of visibility in bureaucratic decision-making by providing transparent, accessible, and timely updates, which strengthens trust in the administrative system among citizens, construction professionals, and other stakeholders. Applicants and other interested parties can independently monitor the progress of their submissions, assess compliance with procedural timelines, and receive updates without having to rely on informal inquiries, personal contacts, or subjective assessments

provided by officials. Second, the structured and transparent provision of information reduces uncertainty and constrains the scope for discretionary or arbitrary interventions by administrative personnel, which might otherwise compromise procedural fairness, legal compliance, and the overall integrity of the construction permitting system. By creating a verifiable and systematic flow of information throughout the process, these digital platforms operate as a robust preventive mechanism against potential administrative irregularities, misuse of authority, and corrupt practices that could undermine the legal and operational framework of the sector [1].

Beyond transparency, the integration of electronic systems within the Moldovan construction permitting framework enables the automatic recording of every transaction, interaction, and procedural action associated with a permit application. This persistent logging establishes a robust traceability mechanism, allowing auditors, regulatory authorities, and oversight bodies to reconstruct the sequence of events for any application accurately. Detailed traceability identifies individual responsibilities, reinforces accountability, and provides an institutional safeguard against errors, mismanagement, or arbitrary interventions. In doing so, it strengthens both internal and external control mechanisms and enhances the integrity of public administration in the construction sector.

Moreover, digitalization has facilitated the interconnection of multiple national databases, including land cadastre registries, urban planning records, and construction registries. Such integration allows for real-time cross-checking of information, reducing the risk of accepting fraudulent or incomplete documentation and accelerating compliance verification. Automated verification and synchronized oversight across municipalities further improve the efficiency and reliability of legal and regulatory enforcement. By combining traceable workflows, automated auditing, and database integration, Republic of Moldova's digital permitting systems provide a preventative infrastructure that reduces opportunities for administrative errors, irregularities, and corruption.

An additional advantage of digital platforms is the elimination of dependence on physical document handling, which historically created vulnerabilities to document loss, duplication, or manipulation. Electronic submission, storage, and processing reduce bureaucratic inefficiencies while enabling authorities to monitor and enforce compliance with urban planning regulations more effectively. This digital transformation not only enhances administrative efficiency but also strengthens regulatory oversight, promoting lawful, transparent, and sustainable urban development.

These efforts align with the broader national strategy for digital transformation, aimed at harmonizing Republic of Moldova's public services with European standards of governance, transparency, and accountability. European Union (EU) policies emphasize the modernization of administrative systems, highlighting the role of digitalization in preventing fraud, corruption, and procedural irregularities in public administration. By integrating digital technologies into core governmental processes, Republic of Moldova is enhancing institutional performance, reducing bureaucratic inefficiencies, and ensuring that decisions follow predictable, legally consistent procedures.

The migration of public services to online platforms including cadastral and urban planning services contributes to a more interconnected digital governance ecosystem. Unified platforms, such as national public service portals and mobile applications, provide a single point of access for multiple administrative services. These systems enable authorities to monitor procedures effectively, perform comprehensive compliance checks, and detect irregularities early. Consequently, the digitalization of administrative processes

supports preventive governance, increases transparency, and strengthens accountability in urban planning and construction activities, fostering sustainable and legally compliant development [6].

At the EU level, similar digitalization initiatives have demonstrated that electronic systems improve administrative integrity, operational efficiency, and fraud prevention in construction permitting. Examples include the DigiChecks project, which creates digital frameworks for permit management and regulatory compliance verification, and the CHEK (Change Toolkit for Digital Building Permits) project, which transforms traditional paper-based permitting into standardized, interoperable digital workflows. Both initiatives employ technologies such as Building Information Modeling (BIM), Geographic Information Systems (GIS), and automated compliance checks, enabling authorities to verify adherence to urban planning and construction standards accurately [8].

Digital platforms further reduce opportunities for corruption by minimizing direct interactions between applicants and public officials. Every procedural step is automatically registered, creating an auditable trail for review, monitoring, and enforcement. Electronic registers, traceable workflows, and interoperable databases allow competent authorities and, where legally permitted, civil society organizations to detect irregularities, verify compliance, and ensure accountability. These preventive mechanisms contribute directly to reducing the incidence of illegal or non-compliant construction activities, which may otherwise compromise public safety, environmental protection, and the rule of law.

Conclusions. The digitalization of building permit procedures in the Republic of Moldova represents a comprehensive preventive mechanism designed to curb administrative fraud, corruption, and other criminal activities associated with the construction sector. By integrating advanced technological solutions, procedural transparency, traceable workflows, and alignment with European digital governance standards, Republic of Moldova has developed a system that not only enhances operational efficiency but also strengthens institutional oversight and supports sustainable urban development. While digitalization by itself cannot entirely eliminate risks of misconduct or irregularities, it functions as a fundamental instrument of preventive governance, ensuring that domestic practices are aligned with broader European frameworks emphasizing integrity, accountability, and law-abiding construction management.

Digital platforms for managing construction permits constitute a powerful tool for crime prevention both within Moldova and across European jurisdictions by achieving several key objectives:

a) Increasing transparency – making information on permit applications, procedures, and deadlines accessible to the public;

b) Reducing administrative opacity – ensuring that decision-making processes are visible, standardized, and less prone to informal or discretionary influence;

c) Facilitating oversight and auditing – enabling internal and external control bodies to monitor procedural steps, identify irregularities, and assign responsibilities;

d) Minimizing opportunities for corruption, fraud, or abuse – by automating verification, tracing administrative actions, and integrating multiple databases for cross-checking.

By creating a transparent, traceable, and controllable administrative environment, the digitalization of building permits serves as an effective preventive measure against illicit activities in the construction sector. The Moldovan experience demonstrates significant progress in implementing these mechanisms, yet the enhancement of interoperabil-

ity between databases and harmonization of legal frameworks remains a crucial priority for ensuring long-term effectiveness.

Looking forward, the success of digital reforms in construction governance will depend on the integration of technology with robust legal oversight, institutional accountability, and a culture of public integrity. Digital tools do not replace legal regulations; rather, they reinforce them by providing modern instruments for monitoring, auditing, and preventing illegal conduct. In this way, digitalization supports a proactive approach to compliance, ensuring that construction activities are carried out in accordance with law, technical standards, and ethical administrative practices, both within Moldova and in line with European best practices.

Abstract

South Sudan is the last country globally to declare its independence, on July 9, 2011. Constantly situated within the context of interstate civil wars and interethnic and intertribal conflicts, its legislative progress advances slowly, characteristic of a state at the beginning of its journey, with normative gaps and, often, with violations of fundamental human rights.

Like any state seeking to protect national security against terrorism, organized crime, espionage, and other such threats, South Sudan established, in 2014, the National Security Service (NSS), granting it extensive powers to conduct special investigative activities for the prevention and combating of offenses against the state. Although the NSS Act authorizes the conduct of such special activities, including undercover investigations, the execution of searches, the monitoring of correspondence, and the gathering of information for the protection of the state, the utilization of their outcomes remains constrained by limited coordination with the National Police Service and other judicial authorities. These institutions, in addition to having insufficient professional training, lack bilateral protocols or other instruments of interinstitutional cooperation, which frequently leads to violations of fundamental human rights and of the right to a fair trial.

This research aims to reflect on the convergence between the operational reality regarding the special investigative activities in South Sudan and European jurisprudence on human rights guarantees.

Keywords: special investigative activities, National Security Service, interinstitutional cooperation, human rights, fair trial, national security.

VALORIFICAREA REZULTATELOR ACTIVITĂȚII SPECIALE DE INVESTIGAȚII ÎN SUDANUL DE SUD: O ANALIZĂ ÎNTRE REALITATEA OPERAȚIONALĂ ȘI STANDARDELE EUROPENE ALE DREPTURILOR OMULUI

Abstract

Sudanul de Sud este ultima țară la nivel global care și-a declarat independența, la 9 iulie 2011. Aflat în mod constant în contextul războaielor civile interstatale și al conflictelor interetnice și intertribale, parcursul

[1] The author's practical experience gained during international missions in Africa, including in South Sudan, guided the choice of the topic, without relying on any information that is not already publicly available.

său legislativ avansează lent, caracteristic unui stat aflat la început de drum, cu lacune normative și, de multe ori, cu încălcări ale drepturilor fundamentale ale omului.

Ca orice stat care urmărește protejarea securității naționale împotriva terorismului, a criminalității organizate,spionaj, etc., Sudanul de Sud a înființat, în anul 2014, Serviciul de Securitate Națională (SSN), conferindu-i competențe extinse în desfășurarea activităților speciale de investigații pentru prevenirea și combaterea infracțiunilor împotriva statului. Deși Legea SSN autorizează derularea unor astfel de activități speciale, inclusiv investigații sub acoperire, efectuarea de percheziții, monitorizarea corespondenței și obținerea de informații în vederea protecției statului, valorificarea rezultatelor acestora rămâne constrânsă de coordonarea limitată cu Serviciul Național de Poliție și cu celelalte autorități judiciare. Aceste instituții, pe lângă faptul că dispun de o pregătire profesională insuficientă, nu beneficiază de protocoale bilaterale sau alte instrumente de cooperare interinstituțională, ceea ce conduce frecvent la încălcări ale drepturilor fundamentale ale omului și ale dreptului la un proces echitabil.

Prezenta cercetare își propune să reflecte asupra convergenței dintre realitatea operațională privind activitățile speciale de investigații în Sudanul de Sud și jurisprudența europeană în materie de garanții ale drepturilor omului.

Cuvinte-cheie: activități speciale de investigații, Serviciul de Securitate Națională, cooperare interinstituțională, drepturile omului, proces echitabil, securitate națională.

Introduction. In 2011, after decades of prolonged intrastate conflicts, South Sudan declared its independence on July 9, becoming the newest state on the world map. Born under democratic auspices, this young state aimed to build its own legal system, largely taking over the legislative heritage of the state from which it separated, while also integrating fundamental principles of international law intended to consolidate its democratic profile.

The reality on the ground, however, paints a profoundly different picture. South Sudan faces major challenges regarding internal security and the functioning of the rule of law. The relationship between the central government and the opposition has remained tense, frequently degenerating into violence, killings, kidnappings, and accusations of conspiracy, all of which seriously affect the fundamental values of human rights, as enshrined in international instruments in the field.

On July 14, 2011, shortly after the proclamation of independence, South Sudan became a member of the United Nations, thereby committing to promote national security, equality and international peace, as well as sustainable development. In the same logic, the state included in its Constitution [20] the provisions of the Universal Declaration of Human Rights of 1948 [1], which it formally assumed. In practice, however, this recognition remains largely declaratory, the effective exercise of fundamental rights being strongly affected by political instability and recurrent violence.

Although the state should provide solid guarantees for the respect of fundamental human rights and freedoms, principles that are provided for in the Code of Criminal Procedure, in Article 6 [24], reality shows a constant violation of these rights. There are, sporadically, isolated cases in which convictions have been pronounced for such abuses, but the vast majority of incidents are not investigated, remaining either unresolved or closed without identifying the perpetrators [3, p.2].

Like other states in post-conflict or even intra-conflict situations, South Sudan has established a National Security Service, whose main task is to maintain state security, including through the use of special investigative techniques. Although these activities represent a fundamental tool for preventing and combating threats to national security, the manner in which they are carried out in practice raises numerous questions. Thus, investigations are often conducted within an insufficiently structured legal framework, without a clear purpose to allow the transfer of files to the courts, and not least, with se-

rious human rights violations.

This research aims to analyze how South Sudanese legislation regulates these investigative activities and to assess its degree of compatibility with European standards regarding the respect for human rights guarantees.

Methods and materials applied. In South Sudan, because working procedures are not public or are classified as secret information, there is no clear definition of special investigative measures. These are synthesized, in a simplified manner, in a single word "investigation", as provided for in the Penal Code or in the South Sudanese Police Law. Consequently, the authors of this study have faced considerable difficulties in collecting the data necessary for analyzing the legal framework applicable to these special investigative measures.

The main primary sources that formed the basis of this research are the Criminal Procedure Code, the Criminal Code, the Police Law, the National Security Law, and the Anti-Corruption Law, all in force in South Sudan, corroborated with comparative materials from European legislation in the field of human rights. Secondary sources include studies carried out by authors, expert reports on human rights abuses in South Sudan, press articles, individual research, as well as discussions with relevant persons in the field. The research is therefore largely based on publicly available sources, having no access to internal working procedures or other documents classified as inaccessible to the public.

Discussions and results obtained. I. South Sudanese Legislation on Special Investigative Activities. The concept of special investigative activity is not a legislative novelty that appeared overnight, but rather the result of a long evolutionary process, determined by the emergence of increasingly complex forms of crime with a serious impact on the rule of law. What differentiates special investigative measures from simple criminal research activities is not only their secret nature or technical complexity, but especially the combination of the heightened degree of intrusion into private life and the exceptional procedural capacity they confer upon authorities [4, pp. 74-76]. Precisely for this reason, their use requires rigorous legal guarantees and effective oversight within the framework of a rule of law state [5, vol. 51, issue 2, pp. 394-412].

If we were to attempt a legal definition, we could say that special investigative activity represents "a procedure of a secret and/or public nature, carried out by competent authorities, with or without the use of special technical equipment, for the purpose of gathering information necessary for the prevention and combating of crime, ensuring state security, public order, defending the rights and legitimate interests of individuals, and the discovery and investigation of crimes" [6, Art. 1].

Paradoxically, although South Sudan has a National Police Law (NPL), a National Security Service Law (NSSL), and a Code of Criminal Procedure (CCPSS), we have not succeeded in identifying a clear definition of this concept in its legislation. What we find instead is the general definition of "investigation" [24, Art. 5], understood as the act or process of discovering relevant facts concerning an offense, including all procedures carried out by the police under the authority of the Prosecutor, Judge, or court of law, for the purpose of gathering evidence.

For example, the investigation of corruption offenses in South Sudan follows ordinary procedures, and the possibility of resorting to special investigative measures is strongly limited by existing legal constraints [7, p. 147], which considerably reduces the capacity of institutions to effectively prevent and combat the phenomenon of corruption.

Although the Code of Criminal Procedure of South Sudan constitutes the foundation of inquiries and investigations in the judicial system, investigations may be carried

out by the police either with the consent of the Public Prosecutor or, in his absence, with the approval of the Magistrate. Moreover, the magistrate may take over the inquiry whenever the situation requires it [24, Art. 52]. This flexibility seems, at first glance, beneficial, given the superior legal training of prosecutors and magistrates. However, it raises serious issues regarding the separation of duties between the police and the prosecutor's office concerning the inquiry and criminal prosecution, a fundamental principle of any fair judicial system.

The South Sudanese National Police Law provides, in Article 7, that police officers may carry out investigations or any other criminal procedures in accordance with the CCPSS and may conduct criminal investigations under the authority of the prosecutor, including searches, interrogations, and even operative surveillance activities [22, Art. 8].

On the other hand, the National Security Service enjoys much broader powers [23]. According to Article 13, Chapter 3, it may: "*monitor, investigate, and conduct searches of suspects and places related to crimes or offenses against the state; gather internal and external information regarding national security; undertake investigations to discover any situation, fact, or activity that could jeopardize national security; monitor frequencies, wireless systems, publications, broadcasting stations, and postal services; as well as arrest or detain any person suspected of committing an offense against national security*" [23, Art. 7]. These activities are carried out, for the most part, with the approval of the Director of the service, but may also be ordered at the request of the Minister or even the President, who chairs the National Security Council.

Regarding the arrest or detention of persons, the National Security Service Law provides that any person who attempts to commit, is caught in flagrante delicto, or is suspected of having committed an offense against the state [23, Art. 7] may be arrested by NSS officers without a warrant. This regulation is in total contradiction with Articles 73 and 75 of the CCPSS, which require the issuance of an arrest warrant by the Public Prosecutor or by a magistrate. At the same time, however, Article 76 of the same code allows police officers within the National Police to arrest persons without a warrant in certain situations. This legislative paradox is completely contrary to international standards in the field, which consider that arresting a person without a warrant represents a serious violation of the fundamental right to liberty and security [8; 2, Art. 5], a violation that also entails the non-observance of other related rights: the right to be informed, the right to be brought before a judge, the right to challenge the measure, and the right to a defense lawyer [2, Art. 5 §§ 2, 3, 4; 24, Art. 93 para. 2], as well as the right to inform the family [24, Art. 93 para. 4]. The case law of the European Court of Human Rights has consistently established that the existence of a valid warrant is not sufficient to justify an arrest; all other guarantees provided for in Article 5 must be respected, and their absence constitutes a serious violation of fundamental rights [8; 9].

Regarding the South Sudanese Anti-Corruption Law, although it should provide for the methods and investigative activities related to the Code of Criminal Procedure, there is no explicit mention regarding the use of special investigative measures. In the absence of such provisions, the president of the investigation committee who has reasonable suspicion that a corruption offense has been or is about to be committed may initiate the investigation and decide the concrete manner of its conduct [25, Arts. 24-25]. Regarding intrusive measures against private life and property, these are regulated in the Code of Criminal Procedure, and the lack of similar norms in the Anti-Corruption Law imposes the supplementary application of the Code of Criminal Procedure in carrying out specific activities.

II. Operational Reality. Although South Sudan has a formal legislative framework, the reality faced by the South Sudanese National Police is extremely difficult. Starting in 2011, the United Nations has carried out its mission in this country with the aim of consolidating peace, stability, and development, protecting civilians (considering that the state has no fewer than 64 ethnic tribes), monitoring human rights, and providing humanitarian assistance.

Regarding institutional capacity development, within the UN mission in South Sudan, UNPOL, the police division of the United Nations, operates. Here, experts from the police forces of several states works, participating in this mission based on inter-institutional collaborations between their home country and the UN, based on their professional expertise. Within UNPOL, there is a department dedicated specifically to professional training, and police experts conduct courses with the National Police on a variety of topics, some of the most important of which concern the field of special investigations.

Although the UN mission has been present in South Sudan for approximately 15 years and has provided the National Police with multiple training programs at various levels, the reality is that the latter still does not possess the necessary capacities to carry out its activities in a professional manner. To illustrate this situation, most police posts or stations do not even benefit from basic items such as chairs, desks, or vehicles. Some police stations literally operate under the shade of a tree, in sparsely populated areas or in some isolated villages. Under these conditions, it is certainly understandable that the National Police cannot undertake special investigations to prevent or combat crime.

Unlike the National Police, the National Security Service uses a wide range of operational methods and information-gathering tools to prevent and combat crimes against national security. Although there are no public documents describing in detail these special investigative techniques, the agency in practice resorts to phone tapping, digital surveillance, the use of a network of informants, physical searches, and the conduct of special operations. All these activities specifically target political figures with opinions contrary to the current regime, human rights activists, journalists, and various individuals within civil society [10].

The valorization of these special activities carried out by National Security Service personnel does not, however, have a purely preventive or probative purpose. On the contrary, their real objective is to diminish or eliminate criticism of the government, to prevent the publication of reports on human rights violations in this state, to discourage journalists from making independent publications, and to block any exchange of opinions among opposition members or civil society [11].

Under the legitimate pretext of conducting special investigative activities for national security, the National Security Service monitors and arrests individuals for long periods, without well-founded charges [12, p. 17], with the aim of maintaining constant monitoring to preemptively neutralize potential threats to the government [13]. In reality, through these means, the aim is to identify individuals who have contrary opinions or who wish to change the country's future for the better.

The National Security Service, although it has responsibilities in the field of conducting special activities, the valorization of these does not follow the required course, generating and maintaining a climate of fear through the practices carried out in recent years. The precise purpose of this strategy is to prevent the exposure of a reality marked by public insecurity, corruption, human rights abuses, the censorship of certain publications, and to discourage individuals who might reveal the weaknesses of the judicial or governmental system [12].

III. Comparative Analysis: South Sudanese Legal Framework and European Human Rights Standards on Special Investigative Measures. Although South Sudan does not currently have a clearly defined concept of special investigative measures, nor a coherent legislative framework specifically regulating such activities, this absence does not, of course, mean that the state cannot conduct investigations. Being the newest state to gain independence, in 2011, the regulation of investigations is found primarily in the Code of Criminal Procedure, which constitutes, metaphorically speaking, the "genealogical tree" for carrying out these activities, in close connection with the National Police Law and the National Security Service Law.

However, if we refer to international human rights law, and here we refer in particular to the European Convention on Human Rights, the International Covenant on Civil and Political Rights, as well as the case law of the European Court of Human Rights, we find that the current legislative framework in South Sudan presents numerous normative gaps in this field. While European law has evolved considerably, establishing clear rules regarding judicial control and the protection of individual rights, the South Sudanese system remains anchored in simplistic norms, inherited from the state from which it separated. Thus, although the Code of Criminal Procedure stipulates that police investigations may be carried out under the authority of the prosecutor or a magistrate, regarding the activities carried out by the other institution, namely the National Security Service, we observe that, although these activities are much more extensive and complex, any form of judicial control is completely lacking.

Referring to the investigative activities carried out by the NSS, a profound weakening of the functional relationship between investigation and criminal prosecution is evident, which represents one of the cornerstones of any rule of law state and a fair judicial system. The case law of the European Court of Human Rights clearly shows us that an institution that simultaneously authorizes, conducts, and monitors special investigative measures risks becoming arbitrary, which inevitably leads to a violation of Article 8 of the Convention. An eloquent example in this regard is the case of *Zakharov v. Russia*, in which the Court emphasized that secret surveillance can diminish or even destroy the fundamental values of democracy, precisely under the pretext of defending it, when there are no fundamental guarantees against abuse [14].

At the same time, from the perspective of the European Court of Human Rights and European law, the regulation of special investigative measures can be considered legitimate only if it cumulatively fulfills the four fundamental principles established by Article 8 of the European Convention on Human Rights, namely: legality, necessity, proportionality, and independent judicial control. These principles are mandatory, the European Court consistently establishing that any interference with private life must be provided for by law, pursue a legitimate aim, and be necessary in a democratic society. At the same time, case law has clarified the nature of the offenses that may justify interference with a person's life, the conditions under which interception of communications may be ordered, the duration of these measures, and the applicable oversight mechanisms [15; 16].

Referring to South Sudanese legislation, we find that these principles are not met. A relevant example is the fact that any person suspected of committing an offense against the state may be arrested without a prior warrant, with the theoretical obligation to bring them before a magistrate within 24 hours [23, Art. 54]. However, the practice documented by international human rights organizations demonstrates that this provision is systematically ignored or, in most cases, simply not respected.

Another major deficiency is the absence of a proportionality test. South Sudanese

legislation does not provide any condition regarding proportionality in the application of special investigative measures, contrary to what the Strasbourg Court's case law clearly establishes. The latter emphasizes that any interference with fundamental rights must be proportional to the legitimate aim pursued and must not be extended beyond what is strictly necessary [17, pp. 129-152; 18].

Last but not least, the absence of independent judicial control constitutes a serious violation of European standards. EU Directive 2016/680 on the protection of personal data in the field of judicial cooperation in criminal matters expressly establishes that any surveillance measure must be subject to control carried out by an independent judicial authority [19]. In South Sudan, however, the authorization and cancellation of special investigative measures are carried out by the National Security Service, which is under the direct authority of the President and, implicitly, under the coordination of the director of this institution. There is no direct contact with the judicial authority nor any other form of effective oversight, as imposed by European norms and directives.

Conclusions. Special investigative measures, although not included as a concept in South Sudan's Code of Criminal Procedure or related legislation on investigative activities, remain a delicate subject. The paradox lies in the fact that these measures exist from an applicative perspective, but from a theoretical perspective, they appear only vaguely, not in their complex form. Researchers, specialized publications, and activists in the field of fundamental human rights protection emphasize that, although the purpose of these activities should have been the prevention and combating of serious crimes or the protection of national security, as well as the fundamental rights of the state and citizens, in reality, they follow a different course, totally contrary to the fundamental principles for which they were created.

The abusive use of special investigative measures can violate fundamental human rights, causing public insecurity and public distrust in state security. Specialists in the field emphasize that this concept must be integrated into national legislation in a clear and objective manner. Clarifications are needed regarding the method of use, the circumstances in which they may be applied, as well as the manner of their valorization within an effective judicial framework.

Although Article 6(c) of the National Security Service Law provides, as one of its principles, respect for human rights and fundamental freedoms, and Article 53(g) establishes as an important attribute respect for the dignity of persons and the protection of fundamental human rights, these provisions are violated in reality. Abuses are not investigated or, as we have stated throughout this research, investigations regarding the violation of duties or competences by NSS staff are usually closed, with only extremely rare cases in which the personnel guilty of producing these abuses have been convicted [12, p. 4, p. 27].

Furthermore, if we refer to the valorization of these special investigative measures, which should result in the outcomes of these activities becoming means of evidence used in criminal prosecution, we cannot find a clear definition of means of evidence in any of the legislative acts that are part of the investigative complex. The only source that offers a definition is the Evidence Code [21], a separate act from the Code of Criminal Procedure. It reveals that evidence "*denotes the means by which an alleged matter of fact, the truth of which is submitted for investigation, is proved or disproved, and without prejudice to the foregoing generality, includes statements by accused persons, admissions, and observations by the court in its judicial capacity*" [21, Art. 4]. If we refer to Article 194 of the Code of Criminal Procedure, the admission of evidence in judicial proceedings to establish the

truth in a case must be made without unfair treatment of the accused or witnesses. Evidence is not admitted if it does not tend directly or indirectly to prove or disprove the charge, and it must be administered in the specific circumstances of the case.

In reality, none of the laws provides a clarified chain of custody of evidence. Article 89(2) of the Evidence Code only specifies that evidentiary material must be kept in appropriate places by the person responsible, and improper custody represents either a failure to demonstrate a legitimate origin, or the circumstances prove the nature of a probable origin. These aspects raise the legitimate question of whether there truly a clearly defined chain of custody is, since most evidence that reaches the courts lacks proof of its legitimate origin.

As a final conclusion, this comparative analysis shows us that the South Sudanese system is a legalistic one, but incomplete. It can continue to focus on supplementing legislation regarding the valorization of special investigation results, referring to international human rights and European legislation in the field. Institutions must begin with a legislative reform in the field of special investigations, which would provide judicial guarantees and safeguards against abuses against the private lives of individuals. This must be followed by the development of institutional capacities to carry out these activities in a legal and professional manner.

Proposals and Recommendations. The analysis and research we have conducted show us that South Sudan faces multiple challenges regarding the valorization of special investigative measures. From this perspective, we suggest the following recommendations:

Inclusion of the concept in domestic legislation – It is necessary to include in domestic legislation, especially in the Code of Criminal Procedure and related legislation, the concept of special investigative measures, with a clear definition and exact parameters regarding the applicability of these measures, precisely establishing the manner of ordering them, the period of validity, and effective judicial control.

Adoption of the four fundamental principles – The inclusion of the four fundamental principles, namely legality, necessity, proportionality, and independent judicial control, in all activities related to special investigative measures.

Clarification of institutional responsibilities – Clearly establishing the duties and competences of the National Police and the National Security Service regarding special investigative activity, as well as introducing a unified procedure for obtaining, storing, processing, and disseminating to institutions with responsibilities in the field, emphasizing the chain of custody of evidence obtained from the valorization of these activities.

Strengthening institutional accountability – Developing and strengthening accountability by establishing an institution with clear responsibilities for monitoring and investigating abuses committed by institutions responsible for the applicability of special investigative measures.

Development of operational capacities – Developing the operational capacities of institutions with responsibilities in the field, in order to improve and access specific equipment for carrying out special investigative activities.

Specialized professional training – The United Nations Organization and/or the Ministry of Justice of South Sudan must emphasize the selection of specialists in special investigative measures within the mission in South Sudan, to provide training programs in this field for the National Police, the Security Service, prosecutors and magistrates, as well as designated personnel from institutions with responsibilities in the field, including to support legislative reform.

Allocation of additional resources for monitoring – Ensuring additional capacities, both in terms of human and financial resources, within international organizations such as the UN, NGOs, or other international commissions, to monitor human rights abuses in special investigative activity.

Promotion of institutional transparency – Promoting the transparency of institutions with competences in the field of special investigative activity, after the purpose and means have been achieved, by providing data and information intended for the public and the media, with the aim of improving inter-institutional collaboration and developing public trust in the operative-investigative institutions.

Requesting assistance from international experts – Requesting support from experts within the European Court of Human Rights and the United Nations Organization for support in the legislative reform process.

THE ROLE OF CRIMINAL POLICY IN COMBATING FORCED MARRIAGE: NORMATIVE APPROACHES AND INTERVENTION MECHANISMS

Diana MILEA,
PhD Candidate,
"Constantin Stere" University of European Political and Economic Studies,
Officer, Justice Interaction Directorate, General Police Inspectorate,
Republic of Moldova
ORCID: 0009-0002-9557-5327

Abstract

Criminal policy constitutes one of the principal instruments through which the contemporary state exercises its function of guaranteeing public order and protecting the fundamental rights of individuals. Forced marriage represents a practice through which a person is compelled to enter into or maintain a conjugal relationship against their will, constituting a serious violation of the right to self-determination, human dignity, and physical and psychological integrity.

This article systematically examines the role of criminal policy in combating this phenomenon, analysing both the normative criminalization approaches adopted at the international level and in the Republic of Moldova, and the concrete intervention and victim-protection mechanisms established within the national criminal policy framework. The research demonstrates that the effectiveness of criminal policy in this domain does not reside solely in the existence of criminalization norms, but depends decisively on institutional coherence, the specialization of justice-system practitioners, and the implementation of functional preventive and protective mechanisms.

The article also identifies the major challenges faced by authorities in identifying, investigating, and prosecuting forced-marriage cases, and proposes a set of concrete recommendations for strengthening the normative framework and institutional response capacity in order to effectively protect the rights of vulnerable persons against coercive matrimonial practices.

Keywords: criminal policy, forced marriage, intervention mechanisms, normative approaches, victim protection, gender-based violence.

ROLUL POLITICII PENALE ÎN COMBATEREA CĂSĂTORIEI FORȚATE: ABORDĂRI NORMATIVE ȘI MECANISME DE INTERVENȚIE

Abstract

Politica penală constituie unul dintre principalele instrumente prin care statul contemporan își exercită funcția de garantare a ordinii publice și de protecție a drepturilor fundamentale ale persoanei. Căsătoria forțată reprezintă o practică prin care o persoană este constrânsă să intre sau să mențină o relație conjugală împotriva voinței sale, fapt ce constituie o gravă violare a dreptului la autodeterminare, a demnității umane și a integrității fizice și psihice.

Prezentul articol examinează sistematic rolul politicii penale în combaterea acestui fenomen, analizând abordările normative de incriminare adoptate la nivel internațional și în Republica Moldova, mecanismele concrete de intervenție și de protecție a victimelor, rolul coordonat al instituțiilor statului, precum și provocările structurale care afectează eficiența aplicării politicii penale în practică. Cercetarea demonstrează că eficiența politicii penale în domeniu nu rezidă exclusiv în existența normelor de incriminare, ci depinde în mod determinant de coerența instituțională, de specializarea practicienilor din sistemul de justiție și de implementarea unor mecanisme preventive și de protecție funcționale.

Totodată, sunt identificate provocările majore cu care se confruntă autoritățile în identificarea, inves-

tigarea și urmărirea penală a cazurilor de căsătorie forțată, propunându-se un set de recomandări concrete pentru consolidarea cadrului normativ și a capacității de răspuns instituțional în scopul protejării efective a drepturilor persoanelor vulnerabile.

Cuvinte-cheie: politică penală, căsătorie forțată, mecanisme de intervenție, abordări normative, protecția victimelor, violență de gen.

Introduction. Guaranteeing the fundamental rights of individuals in the sphere of family relations constitutes a persistent challenge for contemporary legal systems, all the more acute given that coercive matrimonial practices continue to affect a significant number of persons globally, regionally, and nationally. Forced marriage stands at the confluence of several legal and social realities: it is simultaneously an expression of gender-based violence, a serious violation of human rights, and an offense demanding an adequate and effective criminal-law response from the state. Its specific character lies in the fact that it occurs frequently in the intimate sphere of the family and community, sheltered by traditional cultural norms or authority relationships, endowing it with a high degree of social and legal invisibility that is difficult to penetrate through classical criminal-law instruments.

The criminal policy of the state understood as the coherent ensemble of principles, strategies, legal norms, and institutional mechanisms through which public authority regulates the prevention, identification, sanctioning, and combating of criminal phenomena holds a central and indispensable role in responding to this challenge. Researcher Zhao Z. [17, p.1] defines criminal policy as a complex governance framework systematically developed and applied by the state to respond to the challenges generated by criminal phenomena, encompassing multiple legislative, institutional, and judicial dimensions. This perspective underscores that criminal policy does not reduce to the simple criminalization norm, but constitutes an integrated system of regulation, application, and permanent evaluation of the state's response to crime.

The role of criminal policy in combating forced marriage does not exhaust itself in the mere formal criminalization of the act in the criminal code, but requires the construction of an integrated framework of clear and precise norms, competent and well-prepared institutions, and functional procedural mechanisms capable of identifying victims, offering them effective protection, and efficiently holding accountable those who have committed the coercive acts. Researcher Bytko I.I. [18, p.145] highlights that the notion of criminal policy, although widely used in legal literature, lacks a universally accepted explicit statutory definition, which may generate inconsistencies in the practical application of criminal-policy measures. Savenok A.L. [19, p.2] complements this by arguing that criminal policy represents the essential component of the state's general anti-crime policy, forming the foundation on which the strategies of related fields are developed, including criminological policy, criminal procedural policy, and penalty execution policy.

The Republic of Moldova has followed a relevant legislative trajectory in this domain in recent years, adopting express criminalization norms for forced marriage and aligning itself with the standards of the Council of Europe Convention on preventing and combating violence against women and domestic violence, hereinafter the Istanbul Convention [4]. The timeliness of the subject is amplified by recent normative developments: legislative amendments extending victim protection to the digital sphere [10], the launch of the first national specialization program for justice professionals [11], and the continuation of domestic-law harmonization with European and international standards. The present study critically evaluates the relationship between the existing normative framework and

its practical effectiveness, identifies principal structural vulnerabilities, and formulates priority directions for strengthening criminal policy in this field.

Methods and materials applied. The research draws on a mixed and multidisciplinary methodology, combining in-depth legal-normative analysis with a criminological perspective and instruments specific to public-policy analysis, aiming at a comprehensive and nuanced picture of the investigated problem. This integrated approach is justified by the complex nature of the subject matter, which intersects substantive criminal law, criminal procedure, criminology, legal sociology, and violence-prevention public policies.

The exegetical method enabled systematic and rigorous interpretation of the relevant legal provisions of the Criminal Code of the Republic of Moldova [2], the Family Code [1], and the Law on Prevention and Combating Domestic Violence [9], ensuring a precise understanding of the content and scope of the analysed norms. The same method was applied to the international legal instruments binding on the Republic of Moldova, in particular the Istanbul Convention [4] and the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) [5].

The comparative method was used to evaluate the degree of convergence between national normative approaches and European standards of criminalization and victim protection, identifying both elements of alignment and persisting legislative gaps. This method also enabled leveraging good practices from other Council of Europe member states documented in EU Agency for Fundamental Rights reports [7]. The systemic method analysed interactions among the components of criminal policy criminalization norm, procedural intervention mechanism, and institutional structure revealing coherences and inconsistencies and identifying points of rupture that reduce overall system effectiveness.

The historico-legal method traced the legislative evolution of forced-marriage criminalization in the Republic of Moldova, situating recent reforms in the broader context of international commitments and European normative pressures. Documentary sources include specialized criminal-law and criminological literature [8; 12; 14; 15; 17], international human-rights compliance reports [13], and relevant public-policy documents [7; 10; 11]. The triangulation of these diverse methodological approaches ensured both the analytical rigour and the practical relevance of the findings.

Discussions and results obtained. An adequate understanding of the role of criminal policy in combating forced marriage requires, as a methodological premise, clarification of the fundamental operational concepts. Researchers Gill A. and Anita S. [8, p.5] argue that the phenomenon must be approached not as a simple private family-law problem, but as a structural form of gender-based violence with clear criminal implications and serious long-lasting social and psychological effects on victims. Forced marriage is defined by the absence of genuine consent from one or both partners consent that, according to international legal standards, must be freely expressed, informed, conscious, and uninfluenced by any form of external pressure. Tew Y. [12, pp.18-21] clarifies that the absence of consent does not necessarily presuppose an explicit verbal refusal, but may also result from a formal acceptance obtained through coercion or deliberate manipulation of the person's life circumstances, such that they no longer have a viable alternative to marriage.

From the perspective of constructing criminal policy, forced marriage raises three distinct categories of normative and institutional challenges. The first concerns criminalization: the criminal norm must define the material element of the offense with sufficient clarity and precision to cover the full diversity of coercive forms from direct physical violence to subtle psychological manipulation and economic control without creating uncertainties in legal classification. The second concerns investigation and proof: forms of psychological or economic coercion leave no visible material traces and are extremely

difficult to prove in proceedings that must respect fair-trial standards. The third concerns victim protection: criminal policy must guarantee the physical and psychological safety of the affected person throughout the entire judicial procedure. The EU Agency for Fundamental Rights report [7] confirms that autonomous criminalization of forced marriage distinct from related offenses offers significant advantages in statistical visibility of the phenomenon and coherence of prosecution practice.

The international legal architecture for preventing and combating forced marriage is structured across several regulatory levels of varying legal force. The Universal Declaration of Human Rights [6] proclaims in Article 16 the right of every person to marry on the basis of free and full consent, enshrining matrimonial freedom as an inalienable fundamental right. The CEDAW Convention [5] constitutes the basic framework instrument obligating state parties to adopt all appropriate measures to eliminate discrimination against women, including coercive matrimonial practices, and to guarantee the equal right to free consent to marriage.

The Istanbul Convention [4] represents the most advanced and comprehensive European instrument in the field, establishing concrete obligations for state parties in the matter of forced-marriage criminalization. Article 37 imposes the obligation to criminalize as a distinct offense the act of forcing a person to marry, including by transferring them to another country for this purpose, and to provide proportionate penalties. The Convention also requires efficient victim-protection mechanisms, accessible specialized assistance services, and systematic professional training programs for all practitioners involved in identifying, investigating, and resolving cases. Through ratification of the Istanbul Convention [4], the Republic of Moldova assumed these obligations and initiated a process of legislative alignment with significant consequences for the internal criminal normative architecture.

The importance of the international normative framework resides not only in the formal legal obligations it generates for states, but also in its function as a reference standard and evaluation instrument for assessing the adequacy of national criminal policies. States that fail to align their domestic legislation with international standards not only risk infringement procedures but also maintain legal systems incapable of offering real protection to affected persons. Comparative analysis reveals that states adopting autonomous criminal offenses dedicated specifically to forced marriage achieved better outcomes in prosecution rates and victim reporting than those relying solely on general coercion or domestic violence provisions.

The Republic of Moldova has followed a progressive legislative trajectory in criminalizing and sanctioning forced marriage, reflecting efforts to honour international commitments assumed through ratification of the Istanbul Convention [4] and other relevant instruments. The Constitution of the Republic of Moldova [3] guarantees at the constitutional level the freedom to marry and the right to free and full consent in forming a family the constitutional foundation underpinning the entire criminal and civil normative architecture in this domain. The Family Code [1] establishes marriage validity conditions, including the requirement for freely expressed consent unaffected by coercion, and fixes the minimum legal matrimonial age, providing the civil basis for criminal sanctioning of violations.

The Criminal Code of the Republic of Moldova [2] has been supplemented with express and distinct criminalization norms for forced marriage, providing differentiated criminal sanctions depending on the circumstances, with special aggravating factors when the victim is a minor or the offense is committed by multiple persons. This autonomous criminalization reflects the Moldovan legislator's deliberate choice to treat forced

marriage as a distinct criminal-policy problem, recognizing the specific gravity of this form of gender-based violence. The Law on Prevention and Combating Domestic Violence [9] complements the substantive criminal framework with procedural intervention and victim-protection mechanisms applicable in situations of matrimonial coercion.

Recent legislative amendments [10] extended victim protection to the digital sphere by criminalizing forms of violence through electronic means acknowledging that intimidation and coercion increasingly occur through technology and extended protection-order durations, strengthening judicial response capacity. A critical assessment reveals that, while formal alignment with Istanbul Convention [4] standards is largely achieved, practical application remains uneven: the absence of standardized early victim-identification procedures, lack of systematic statistical data on real incidence, and insufficient specialization of certain justice professionals constitute persistent obstacles to criminal-policy effectiveness.

The effectiveness of criminal policy in combating forced marriage must be measured primarily by the real capacity of intervention mechanisms to provide effective victim protection. The protection order is the central procedural instrument, enabling immediate removal of the aggressor from the victim's environment and imposing mandatory contact and proximity restrictions. Current legislation [10] permits issuance of a protection order for up to six months, with an emergency provisional order applicable for an initial twenty-day period, ensuring sufficient time for victims to make informed decisions in safety and for authorities to conduct necessary investigations.

The integrated victim-assistance system is structured on the principle of unified access to legal, psychological, and social services provided through inter-sectoral structures coordinated nationally by the National Agency for Prevention and Combating Violence [11]. Specialized centres function as single inter-institutional contact points, significantly reducing the administrative and bureaucratic barriers faced by victims and ensuring a coherent, multidisciplinary, individually-centred approach to each victim's needs. Access to free legal services and specialized psychological counselling is essential to support victims in overcoming the psychological, cultural, and socioeconomic barriers that frequently prevent them from reporting abuses or consistently participating in judicial proceedings.

The Republic of Moldova launched the first national specialization program for justice professionals in violence cases [11], an important step in strengthening institutional capacity. The program targets judges, prosecutors, and criminal-investigation officers and develops competencies for early identification of coercion indicators, sensitive interviewing of vulnerable victims, and coherent application of legal norms. Savenok A.L. [19, p.2] argues that criminal-policy effectiveness is fundamentally conditioned by the professional preparation quality of those who apply it particularly pertinent for offenses involving vulnerable victims and forms of coercion that are difficult to prove.

Beyond direct protection and assistance mechanisms, criminal policy includes preventive instruments aimed at reducing the phenomenon's incidence through information and education. Public awareness campaigns on fundamental matrimonial rights, gender-equality education in schools and communities, and training for social workers in contact with vulnerable groups are internationally recognized as effective long-term prevention tools [7]. Integrating these preventive instruments transforms criminal policy from a simple repressive tool into a complex social risk-management mechanism a transformation that modern criminological scholarship, including the contributions of Yu S. [14] and Wen Y. [15], identifies as essential for sustainable effectiveness.

Effective implementation of criminal policy in the domain of forced marriage requires the coordinated and complementary participation of a broad set of public insti-

tutions with distinct roles. Parliament holds primary responsibility for elaborating and permanently refining the legislative framework, ensuring coherence of criminal criminalizations and continuous alignment with international standards. Recent amendments introducing forced marriage as a distinct criminal offense in the Criminal Code [2] reflect the state's legislative commitment to combating this phenomenon.

The Government, through relevant ministries and the National Agency for Prevention and Combating Violence [11], bears direct responsibility for developing national strategies, allocating necessary resources, and continuously monitoring implementation. Police structures intervene on the front line with explicit obligations to proactively identify risk situations, promptly notify prosecutors, and ensure immediate victim protection. Prosecutors coordinate and supervise criminal investigations, exercising control over investigative-act legality and ensuring public criminal action against suspects. Courts fulfil essential repressive and preventive criminal-policy functions through their judgments, evaluating evidence and applying legally prescribed sanctions. Yu S. [14, p.25] underscores that effective criminal policy against complex criminal phenomena requires not only clear norms but also functional institutional coordination and impact-evaluation mechanisms.

Social-protection authorities, social assistance directorates, and child-protection services complete the institutional picture, identifying vulnerable groups, monitoring risk situations, and providing integrated support services. Structured cooperation with non-governmental organizations significantly amplifies the public system's response capacity, ensuring victim access to assistance even in communities with limited institutional presence. The fragmentation of responsibilities and absence of clear inter-institutional coordination protocols generate, in practice, delays and gaps in intervention with direct and serious consequences for victims' safety a systemic weakness that requires structural solutions rather than merely individual improvements.

The application of criminal policy in the domain of forced marriage faces persistent structural challenges that significantly affect the system's overall effectiveness. The gravest is the systematic under-identification of cases: official statistics certainly reflect only a reduced fraction of actual incidents, since victims frequently in situations of economic and emotional dependence are discouraged from reporting by fear of reprisals, socio-cultural stigmatization, or serious economic consequences [13]. This generates a significant dark figure that undermines the empirical foundation for public policies and limits authorities' capacity to rationally allocate available resources.

A second category of challenges concerns the legal and evidentiary complexity of investigations. Psychological coercion, emotional manipulation, and economic pressure leave no visible material traces and are extremely difficult to reconstruct probatorily, especially when victims come from socio-cultural environments where coercive practices are normalized. Possible overlap with other criminal offenses trafficking in persons, unlawful deprivation of liberty, general coercion can generate uncertainties about optimal legal classification and competent judicial authorities. Wen Y. [15, p.3110] notes that effective crime-prevention mechanism design requires rigorous analysis of the phenomenon's deep structural causes, not merely reaction to identified cases.

Modern trends in criminal policy for combating forced marriage reflect a significant paradigm shift: the transition from predominantly repressive approaches centered on post-facto criminal sanction toward integrated preventive strategies leveraging synergies among legal instruments, social mechanisms, and educational programs. The Republic of Moldova has aligned with this trend through legislative amendments extending protection to the digital sphere [10], strengthening procedural protection durations, and launching the national professional specialization program [11], demonstrating strate-

gic orientation toward more integrated, preventive, and effective criminal policy. These developments reflect growing awareness that criminal-policy effectiveness ultimately depends on capacity to prevent the conditions enabling forced marriage, not merely to sanction it once it has occurred.

Conclusions. The research undertaken permits formulation of relevant conclusions regarding the role of criminal policy in combating forced marriage in the Republic of Moldova. First, criminal policy plays an essential and irreducible role in the state's response to forced marriage, but cannot be effective by itself without the simultaneous existence of functional institutional structures, operational procedural protection mechanisms, and systematic programs for prevention and victim assistance. Formal criminalization, however well drafted normatively, remains insufficient if not accompanied by adequate institutional capacity for case identification, efficient investigation, and real victim protection.

Second, the Republic of Moldova has achieved notable legislative progress through autonomous criminalization in the Criminal Code [2], extension of protection-order durations, broadening of digital protection [10], and launch of the first national practitioner specialization program [11], largely aligning with Istanbul Convention [4] standards. These developments demonstrate the state's genuine commitment to combating the phenomenon and protecting vulnerable persons.

Third, criminal-policy effectiveness cannot be assessed solely through criminalization norms' existence but must be measured by the real impact of intervention mechanisms. Chronic case under-identification, insufficient specialization of certain practitioners, and absence of prevention programs specifically dedicated to the phenomenon remain significant structural vulnerabilities requiring priority attention. Functional inter-institutional cooperation and structured civil-society partnership are determining factors in the protection system's overall effectiveness, and the fragmentation of responsibilities generates delays and gaps with direct consequences for victims' safety.

Recommendations:

1. Development and adoption of a national action plan dedicated exclusively to preventing and combating forced marriage, distinct from the general gender-based violence strategy, with clear objectives, measurable performance indicators, implementation deadlines, and explicitly allocated financial resources.

2. Establishment of a unified, standardized, and mandatory system for collecting and statistically reporting forced-marriage cases across all involved institutions police, prosecution, courts, social services to enable periodic assessment of the phenomenon's real scale and evidence-based intervention adjustment.

3. Continuous expansion and deepening of specialized professional development programs for police officers, prosecutors, judges, and social workers, with emphasis on early identification of atypical matrimonial coercion forms, sensitive interviewing techniques for vulnerable victims, and strengthening efficient inter-institutional coordination.

4. Strengthening and geographic extension of the specialized assistance centre network for forced-marriage victims nationally, including in rural areas and high-risk communities, with an integrated offering of legal, psychological, social, and medical services accessible also to minors and persons in situations of multiple vulnerability.

INTERNATIONAL STANDARDS ON THE RIGHT TO PRIVACY

Daniel CRISTEA,
PhD, Chief Police Commissioner,
Criminal Investigation Office, Buzau County Police Inspectorate, Romania
ORCID: 0000-0002-5786-2619

Abstract

Even though the right to privacy is in a moment of profound transformation, in a world dominated by intrusive technologies, surveillance and massive data flows, this right to privacy has become essential for democracy, freedom and human dignity. International standards are being consolidated, harmonized and constantly adapted to the challenges of the 21st century. Not only through global cooperation, but also through efficient mechanisms and a culture of respect for privacy, the real protection of this fundamental right is ensured.

The study conducted allows understanding the directions, methods and trends, including criminal procedure, from the point of view of historical evolution, of international standards, through international courts, such as the European Court of Human Rights, the Court of Justice of the European Union, the UN Human Rights Committee, regarding the right to privacy, demonstrating that the right to privacy has become a multidimensional fundamental right, which includes all the concepts of privacy: personal autonomy, data protection, dignity, integrity of identity, etc.

Keywords: right to privacy, international standards, concept, development, evolution, dimensions, interferences.

STANDARDE INTERNAȚIONALE PRIVIND DREPTUL LA VIAȚA PRIVATĂ

Abstract

Chiar dacă dreptul la viața privată se află într-un moment de transformare profundă, într-o lume dominată de tehnologii intruzive, supraveghere și fluxuri masive de date, acest drept al vieții private a devenit esențială pentru democrație, libertate și demnitate umană. Standardele internaționale se consolizează, se armonizează și se adaptează permanent pentru provocările secolului XXI. Nu numai prin cooperare globală, dar și prin mecanisme eficiente și o cultură a respectului pentru viața privată se asigură protecția reală a acestui drept fundamental.

Studiul realizat permite înțelegerea direcțiilor, metodelor şi tendințelor, inclusiv procesual-penale, din punct de vedere al evoluției istorice, a standardelor internaționale, prin instanțele internaționale, precum Curtea Europeană a Drepturilor Omului, Curtea de Justiție a Uniunii Europene, Comitetul ONU pentru Drepturile Omului, privind dreptul la viața privată, demonstrând că dreptul la viața privată a devenit un drept fundamental multidimensional, ce include toate conceptele vieții private: autonomia personală, protecția datelor, demnitatea, integritatea identității etc.

Cuvinte-cheie: dreptul la viața privată, standarde internaționale, concept, dezvoltare, evoluție, dimensiuni, ingerințe.

Introduction. The right to privacy is part of and constitutes the cornerstone of the protection of human rights at the international level, a development that is experiencing an increasingly complex evolution both jurisprudentially and doctrinally, being constantly reinterpreted according to the transformations produced. This evolution reflects the profound transformations of Western society and the international legal order. In other

words, from the first forms of protection of privacy in Roman law, the development occurred gradually, being influenced by the factors of change. International courts, such as the European Court of Human Rights (ECHR), the Court of Justice of the European Union (CJEU), the UN Human Rights Committee, interpret this protection of the right to privacy extensively, constituting the way in which states can apply and protect this right to privacy. Louis Henkin synthesized the essence of the right to privacy through the famous formula "the right to be left alone" [1, p. 226], emphasizing its negative dimension, namely the state's obligation not to arbitrarily interfere in the individual sphere. Alan Westin defined privacy from a modern perspective as "the desire of people to freely choose under what circumstances and to what extent they will expose themselves, their attitude and behavior" [2, p. 2], thus anticipating the centrality of personal data protection in the digital age, but the protection of privacy is currently explicitly enshrined in international instruments.

Methods and materials applied. The research methods include: the analytical method of legislation, at the international level, of the right to privacy and the role in its application at the national level; the historical method, from the point of view of evolution; the logical method, from the point of view of the deduction technique, and last but not least the empirical method, by presenting cases from the ECtHR jurisprudence.

Discussions and results obtained. The concept of privacy is today a fundamental right recognized in all modern legal systems, but this idea has not always existed as an autonomous notion. Its evolution is the result of a complex historical process, in which different legal, cultural and philosophical traditions have contributed to the shaping of a protected sphere of the individual. From the first forms of domicile protection in Roman law, to the enshrinement of the right to privacy in Art.8 of the European Convention on Human Rights (ECHR), the path of this concept reflects the profound transformations of Western society.

In Roman law there was no "right to privacy" in the modern sense, but incipient forms of protection of the personal sphere were found. Domus [3, pp. 413-414] – the home – was considered an inviolable space, and unauthorized entry was sanctioned by various legal actions. The interdicts of "vi", between "vis private" – violence between individuals and "vis publica" – violence against public order, [3, pp. 781-782], and the actions for iniuria [3, pp. 524-526] protected not only property, but also the dignity and authority of the pater familias. We observe this protection of the domicile as one of the first manifestations of the idea of private life, even if at that time, the Romans did not explicitly conceptualize the notion of privacy.

In the Judeo-Christian tradition, the family home – the dwelling – acquires a sacred dimension, being perceived as a protected moral space [4, pp. 74-78], and intrusion into family life was perceived as an attack on the moral order [4, pp. 110-115]. This view later influenced European conceptions of privacy.

In the Middle Ages, in the doctrine on the concept of private life, the author G. Duby [5], analyzes in detail the social structure, mentalities and organization of the domestic space, and from these descriptions one can observe the reconstruction and the way in which the medievals understood privacy, the protection of the home and the separation between public and private. Thus, the author emphasized that family life was the core of social stability, and the house was perceived as a closed, ordered and moralized space [5, pp. 1-40], private life at that time was closely linked to social status, privacy being a privilege only of the elite. [5, pp. 10-25].

An essential stage in the evolution of the concept is represented by English common

law. In the 17th century, in the decision of Semayne's Case (1604) the judge Sir Edward Coke formulated the famous principle "The house of every one is to him as his castle", consecrating the idea of the inviolability of the domicile, a man's home is his "castle", offering protection against forced entry, but allowing the intervention of the authorities (sheriffs) under certain conditions of civil enforcement, after summons [6]. This decision established for the first time, in a systematic way, the limits within which the authorities can enter a home and consecrated the idea that the domestic space is protected by law. The protection of private space thus becomes for the first time an explicit legal principle, close to the modern meaning of the right to privacy.

The modern concept of privacy emerged in the context of liberalism and the emphasis on individual autonomy only in the 19th century. The founding moment is considered to be the article by Samuel Warren and Louis Brandeis, The Right to Privacy (1890), which defines privacy as "the right to be let alone" [7, p. 193]. This formulation profoundly influenced American doctrine and later international doctrine.

In continental Europe, the development of the concept was influenced by the idea of human dignity, present in Kantian philosophy and in modern Civil Codes. The French Civil Code introduces the protection of image and reputation, and German jurisprudence develops the Allgemeines Persönlichkeitsrecht – general personality law – which includes the protection of privacy [8].

In the 20th century, the protection of privacy was internationalized. After World War II, the protection of privacy became part of fundamental human rights. The Universal Declaration of Human Rights (1948) and the International Covenant on Civil and Political Rights (1966) enshrine the right to privacy as a universal right [9].

The culmination of the historical evolution of the concept is given by Art.8 ECHR, which guarantees the right to respect for private and family life, the inviolability of the home, the secrecy of correspondence, and the jurisprudence of the European Court of Human Rights (ECHR) has significantly expanded the scope of the notion of privacy, including both personal identity and physical and mental integrity, personal data, sexual orientation, professional life, public image [10].

After the Second World War, the right to privacy is enshrined in fundamental international instruments: Universal Declaration of Human Rights (1948) – Art.12; International Covenant on Civil and Political Rights (1966) – Art.17; European Convention on Human Rights (ECHR) – Art.8; International Covenant on Civil and Political Rights (ICCPR) – Art. 17, thus guaranteeing respect for private life, family life, home and correspondence, establishing both the limits of state interference and positive obligations of protection.

These instruments mark the transition from fragmentary protection to universal recognition of privacy as a fundamental right. However, the way of interpretation differs between the UN system and the European system. Thus:

1. Art.17 ICCPR is supervised by the UN Human Rights Committee, a quasi-judicial body, in which the committee formulates general recommendations and resolves individual communications, but cannot impose sanctions or binding reparation measures [9]. Art.8 ECHR is interpreted by the European Court of Human Rights, a judicial body in its own right, whose judgments are binding on Member States [11]. The Court can award compensation, impose legislative amendments and establish individual measures.

2. The UN Committee seeks to establish universal standards, applicable to all States, regardless of legal traditions or level of development. The interpretation is more general, principle-oriented, in order to accommodate cultural diversity [9]. The European Court interprets the Convention as a "living instrument", adapted to contemporary realities. Its

case law is detailed, casuistic and dynamic, especially in areas such as electronic surveillance, biometric data or gender identity [11].

3. The UN Committee recognizes the obligation of States to adopt legislative and administrative measures to protect privacy, but in a less detailed manner [9].

The European Court has developed a complex doctrine of positive obligations, establishing concrete standards in cases such as:

– Obligation to protect vulnerable persons [12] – ***X and Y v. Netherlands*** (1985);

– Obligation to ensure procedural safeguards against surveillance [13] – ***Rotaru v. Romania*** (2000);

– Obligation to prevent domestic violence [14] – ***Opuz v. Turkey*** (2009);

– Obligation to protect medical data [15] – ***I. v. Finland*** (2008).

4. The UN Committee has issued recommendations on digital surveillance, but the approach remains principled, without detailed technical standards. In contrast, the European Court has developed a rich case law on: mass surveillance (***Zakharov v. Russia***, 2015) [16]; interceptions (***Kruslin v. France***, 1990) [17]; monitoring at work (***Bărbulescu v. Romania***, 2017) [18]; etc.

At the end of the 20th century and the beginning of the 21st century, there was an expansion of privacy protection in the digital age, which was determined by the massive processing of personal data, due to the emergence of digital communication technologies. In this context, the first international instrument on the protection of personal data appeared, Convention 108 (1981), adopted in 1981 by the Council of Europe [19]. Subsequently, the European Union adopted Directive 95/46/EC, and in 2016 the General Data Protection Regulation (GDPR). The ECHR also, through its case law, extends the protection of privacy to areas such as: biometric data (***S. and Marper v. the United Kingdom***, 2008, in which the Court established that the indefinite retention of genetic data of unconvicted persons constitutes a disproportionate interference with private life [20]. This judgment prompted states to rethink their DNA data storage regimes, imposing clear limits on the duration and purpose of processing); electronic surveillance (***Zakharov v. Russia***, 2015 – the Court condemned mass surveillance systems that allow authorities to have uncontrolled access to private communications) [16]; gender identity (***M.K. v. France*** – the Court reiterated that biometric data are extremely sensitive and their storage in police databases must be proportionate and justified) [21]; taking biological samples (***Pretty v. United Kingdom*** – the Court recognized the right to bodily self-determination as part of private life) [22]. The established principle limits the possibility of authorities to impose coercive measures on a person's body, such as the forced taking of biological samples), etc.

The protection of private life, enshrined in Article 8 of the European Convention on Human Rights, is a fundamental element of the rule of law and an essential benchmark in defining the limits of permissible interferences in criminal proceedings. Since criminal investigations inherently involve intrusions into the private sphere of the individual, the European Court of Human Rights (ECHR) has developed a large body of case law aimed at ensuring a balance between the public interest in the repression of crimes and the protection of fundamental rights.

However, personal private life includes identity, bodily integrity, decision-making autonomy and the development of personality. In criminal proceedings, interferences with this sphere are frequent, in particular through the collection of biological samples, forensic medical examinations, and the collection of biometric data or behavioural surveillance.

However, criminal proceedings can profoundly affect family life, in particular

through measures such as preventive arrest, communication bans, supervision of relations between parents and children or the expulsion of convicted persons. For example, in the ECtHR case law, in ***Kroon and Others v. the Netherlands***, the Court extended the notion of family beyond marriage to include stable de facto relationships [23]. This interpretation obliges criminal authorities to assess the impact of measures on all forms of emotional cohabitation. Similarly, in ***Kutzner v. Germany***, the Court established that State interferences in the relationship between parents and children must be justified by an overriding public interest and must respect the principle of proportionality [24]. In another case, ***Beldjoudi v. France***, the Court examined the impact of the expulsion of a defendant on family life, underlining the need for an individual assessment of the circumstances [25]. Preventive measures must be applied with particular care when they affect family relationships, as they may have irreversible consequences for minors.

The home is rigorously protected against arbitrary intrusions, and criminal proceedings are one of the main contexts in which this protection is put to the test. For example, taken from the case law of the ECHR, the case of ***Camenzind v. Switzerland***, in which the Court established that searches must be strictly necessary and comply with procedural guarantees, including the authorisation of the judge [26]. In the case of ***Niemietz v. Germany***, the Court extended the notion of home to professional premises, considering that these too can represent a centre of private life [27]. Also, in the case of ***Buck v. Germany***, the Court emphasised that searches must be limited to the subject matter of the investigation and not turn into generalised search operations [28].

The doctrine emphasizes that the search is one of the most intrusive procedural measures, which is why it must be accompanied by solid guarantees: judicial authorization, clear delimitation of the object, the presence of witnesses and rigorous documentation of the operation [29, pp. 221-224]. In addition, the legal literature highlights the risk that digital searches may become excessively intrusive, given the large volume of information stored on electronic devices [30, pp. 65-70].

The protection of correspondence is one of the most sensitive dimensions of privacy in criminal proceedings, especially in the digital age. For example, in the case of ***Klass and Others v. Germany***, the Court recognized the legitimacy of secret surveillance for the purpose of combating crime, but established that it must be accompanied by adequate guarantees against abuse [31]. In ***Uzun v. Germany***, the Court examined the use of GPS devices in criminal investigations, concluding that electronic monitoring must be proportionate and limited in time [32]. Similarly, in ***Bărbulescu v. Romania***, the Court established that the monitoring of electronic communications must be foreseeable and proportionate, even in a professional context [18].

However, interceptions represent a profound interference with private life, which is why they must be subject to strict judicial review and be used only as a last resort, since there is a risk that modern technologies may allow for mass surveillance incompatible with democratic principles.

The case-law of the ECHR outlines a complex and evolving framework for the protection of privacy in criminal proceedings. The Court does not deny the need for interferences in the context of investigations, but insists on compliance with the principles of legality, necessity and proportionality. In the absence of these guarantees, criminal proceedings risk becoming an instrument of excessive intrusion, incompatible with democratic values.

Therefore, states must constantly adapt their legislation and judicial practice to European standards, ensuring a fair balance between the public interest and the fundamen-

tal rights of the individual.

The right to private life, enshrined in Art.8 ECHR and Art.17 ICCPR, represents one of the most important guarantees of the individual against arbitrary interference by the authorities. Although its protection is extensive in international law, this right is not absolute. Both international instruments and the case law of the European Court of Human Rights (ECHR) provide for the possibility of its restriction under strictly determined conditions. In criminal proceedings, where interferences with private life are frequent and often necessary for the proper conduct of the investigation, the analysis of the limits of this right becomes essential for understanding the balance between individual and collective interests.

This analysis completes the conceptual and evolutionary perspective of the right to private life, providing an integrated vision of the legal framework applicable in the context of criminal procedural measures.

Both Art.17 ICCPR and Art.8 ECHR permits interferences with private life, provided that they are: (a) prescribed by law, (b) necessary in a democratic society, (c) proportionate to the aim pursued, and (d) justified by a legitimate interest. Recognised legitimate interests include national security, public order, the prevention of crime, the protection of health or morals, and the protection of the rights and freedoms of others [33].

These criteria are interpreted strictly, as interferences with private life can profoundly affect the autonomy and dignity of the individual. In criminal proceedings, they apply directly to measures such as wiretapping, searches, electronic surveillance, data retention or the taking of biological samples.

To be legitimate, the interference must be "prescribed by law". The ECtHR has developed a consistent case-law on the quality of the law, establishing that it must be accessible, foreseeable and formulated with sufficient precision to allow the individual to adapt his or her conduct.

In ***Kruslin v. France*** (1990), the Court found that French legislation on telephone interception did not offer sufficient guarantees against abuse, as it did not clearly specify the conditions, duration and control of the measures [17].

This requirement is particularly important in the context of electronic surveillance, where the risk of excessive intrusion is high.

The notion of "necessity" implies the existence of a "pressing social need". In ***Handyside v. the United Kingdom*** (1976), the Court stated that interferences must be justified by "relevant and sufficient" reasons [34].

In matters of private life, the margin of appreciation of States is narrower when the interference affects essential aspects of personal identity, such as bodily integrity or gender identity. In criminal proceedings, necessity is assessed in relation to the seriousness of the offence, the weight of the evidence and the existence of less intrusive alternatives.

The principle of proportionality is the central criterion in assessing the limits of the right to private life. An interference is proportionate if it pursues a legitimate aim, is appropriate for achieving that aim, is necessary in the sense that there are no less intrusive measures available and strikes a fair balance between the public interest and the rights of the individual.

In **S. *and Marper v. the United Kingdom*** (2008), the Court found that the indefinite retention of genetic data of unconvicted persons was disproportionate, as it went beyond what was necessary in a democratic society [20]. This judgment is relevant to the informational dimension of privacy, emphasising that the State cannot collect and store sensitive data without clear limits.

Cases such as ***Klass and Others v. Germany*** [31] and ***Zakharov v. Russia*** [16] have set strict standards for secret surveillance. The Court has thus emphasised that generalised surveillance is incompatible with a democratic society and that any system of interception must be accompanied by robust procedural safeguards.

Searches, data retention and other intrusive measures must be strictly necessary and accompanied by appropriate safeguards. In criminal proceedings, the prevention of crime is one of the most frequently invoked grounds for interference, but the Court insists on the need for effective judicial review.

Likewise, privacy cannot be invoked to justify unlawful conduct, cannot prevent the exercise of the rights of others, and cannot be artificially extended to cover public activities.

These internal limits are essential to maintain the coherence of the system of fundamental rights and to avoid the transformation of the right to privacy into an instrument of obstruction of justice.

The right to privacy, as discussed above, should not be limited to the State's obligation to refrain from arbitrary interference, but also involves a complex set of positive obligations. These must derive from the need to ensure effective protection of privacy in a democratic society, especially in the context of contemporary technological and social developments. In criminal proceedings, where interference with privacy is frequent and unavoidable, the State's positive obligations become essential to guarantee the personal autonomy, dignity and integrity of the parties.

The State's positive obligations in the field of privacy are implicitly enshrined in Art.17 of the ICCPR and Art.8 of the ECHR, and have been extensively developed in the case law of the European Court of Human Rights. The Court has established that the protection of privacy requires States not only to refrain from interference, but also to adopt legislative, administrative and judicial measures to prevent violations by private actors [35]

This approach reflects the modern conception of human rights, according to which the State has an active role in ensuring the effectiveness of rights, not just in limiting its own interferences. In criminal proceedings, this active role translates into the obligation to create a normative and institutional framework that prevents abuses, protects victims and guarantees effective remedies.

States have an obligation to adopt a coherent and effective legislative framework that protects privacy in all its dimensions. This includes regulations on the protection of personal data, rules on electronic interception and surveillance, legislation on domestic violence, guarantees of the inviolability of the home and rules on the protection of image and reputation. For example, in the case of **X *and* Y *v. the Netherlands*** (1985), the Court found a violation of Article 8 of the ECHR because the national legislation did not provide adequate means to protect a vulnerable person against sexual abuse [12]. This judgment is emblematic of the State's obligation to create an effective regulatory framework capable of protecting vulnerable individuals and preventing serious interferences with their private lives.

In criminal proceedings, this obligation is reflected in the need for clear rules on searches, interceptions, access to data, the taking of biological samples and technical surveillance, all of which are measures with a direct impact on private life.

The protection of private life presupposes the existence of effective procedural mechanisms that allow individuals to challenge unjustified interferences, obtain compensation and benefit from rapid and effective remedies.

In criminal proceedings, this obligation is translated into the need for clear mech-

anisms to challenge interceptions, searches or other intrusive measures, as well as the obligation of judicial bodies to rigorously motivate interferences.

Positive obligations also include protection against interferences originating from private individuals or legal entities. This dimension is particularly relevant in the context of the press, companies processing personal data, digital platforms or employers.

In the case of ***Von Hannover v. Germany*** (2004), the Court established that the State has an obligation to protect the private life of public figures against excessive intrusions by the press [36]. This judgment is fundamental for the balance between private life and freedom of expression, including in the context of criminal proceedings where the press can influence the public perception of a person under investigation.

Family life entails enhanced positive obligations in the context of domestic violence. In the case of ***Opuz v. Turkey*** (2009), the Court found that the State has an obligation to adopt preventive and protective measures for victims of domestic violence [14].

This case-law has strengthened the link between private life and the protection of physical and mental integrity, emphasising that the State must actively intervene to prevent abuse, including through criminal law instruments.

The Court has recognised that private life also extends to the professional environment. In ***Bărbulescu v. Romania*** (2017), the Court established that employers must clearly inform employees about the monitoring of professional communications [18]. The state has an obligation to regulate these situations and to ensure a balance between the employer's interests and the employee's rights.

Conclusions. The study highlights the complex, evolving and multidimensional nature of the right to privacy in international law. Far from being a static concept, privacy reflects the profound transformations that have occurred in societies, primarily due to the development of technology, through the relationship between the individual and the state. In this perspective, the right to privacy captures its conceptual foundations and the interpretative dynamics that characterize it. The evolving interpretation, the absence of a rigid definition, the delicate balance between individual and collective interests, as well as the positive obligations of the state, outline the complex legal framework, adapted to the challenges of modern society. Overall, this protection of privacy represents an essential pillar of democracy and the rule of law, its consolidation becoming a priority in the context of such current transformations.

Through a broad, interdisciplinary and deeply structured analysis of the right to privacy in the context of criminal procedure, integrating doctrinal, jurisprudential and comparative perspectives from international, European and national law, the aim was to clarify the conceptual foundations of privacy, identify the limits and obligations of the state in protecting this fundamental right and assess how the mechanisms of criminal procedure can affect or strengthen the protection of privacy.

The interferences of criminal procedure with privacy are inevitable and must be strictly regulated. Intrusive measures, such as interceptions, technical surveillance, computer searches, access to data, etc., profoundly affect the private sphere of the individual. Therefore, the principles of legality, necessity and proportionality constitute essential benchmarks for assessing the legitimacy of these interferences. The ECHR jurisprudence has thus established clear standards regarding the quality of the law, procedural guarantees and the limits of surveillance, standards that must be integrated coherently into national legislation and practice.

In the context of accelerating digitalization and the expansion of emerging technologies, the protection of personal data has become one of the central challenges of global

governance. Regulatory fragmentation, differences in approaches between states and the proliferation of surveillance techniques require a profound rethinking of the international architecture in this area. To respond to these transformations, a series of convergent measures are needed, designed to strengthen both the global legal framework and the capacity of institutions to protect the fundamental rights of individuals.

A crucial first step is to strengthen the universal framework for data protection. In a world where cross-border information flows are continuous and private actors operate on a global scale, the United Nations should take a more active role in developing an international treaty dedicated to data protection. Such an instrument could establish minimum mandatory standards for surveillance, as well as effective monitoring mechanisms capable of ensuring compliance with the principles of necessity, proportionality and transparency.

In parallel, extending the applicability of Convention No.108 globally would contribute to harmonizing international practices. As the only modern and binding legal instrument in the field, the Convention provides a solid framework for the protection of personal data. Promoting the accession of non-European States, strengthening cooperation between national authorities and aligning standards with those provided for by the GDPR could transform the Convention into a central pillar of global data governance.

Another critical area is mass surveillance, which poses major risks to human rights. States must limit surveillance practices to strictly necessary situations, establish independent oversight mechanisms and ensure transparency, including through subsequent notification of data subjects. The prohibition of generalised and indiscriminate data collection is a fundamental condition for maintaining a balance between security and freedom.

In addition, national legislation must be rapidly adapted to new technologies. Artificial intelligence, facial recognition, algorithmic profiling, the use of biometric data and predictive systems generate unprecedented risks. Regulations must include impact assessments, algorithmic audits and strong safeguards against discrimination, to prevent abuse and ensure the ethical use of technologies.

Strengthening the rights of data subjects remains a central element of any data protection system. Facilitating access to data, simplifying rectification and erasure procedures, guaranteeing portability and protecting against automated decisions are measures that strengthen the autonomy of the individual and allow him to exercise control over his own information.

In an interconnected world, international cooperation becomes indispensable. States and international organizations must collaborate in investigating breaches, develop common mechanisms for responding to security incidents and promote digital education. Only through coordinated efforts can a secure and predictable global ecosystem be built.

Last but not least, data protection authorities must be institutionally strengthened, with adequate resources, independence and extended powers. At the same time, promoting a global culture of privacy, through digital education, empowerment and the development of a data ethic, represents the long-term foundation that respects the rights of the individual.

In conclusion, data protection can no longer be seen as a technical or sectoral issue, but as an essential element of contemporary democracy. Only through a global, coherent and human rights-oriented approach can a digital future be built in which innovation and individual freedom coexist harmoniously.

DIGITALIZATION OF THE SUPERVISION OF CONDITIONALLY RELEASED PERSONS: ELECTRONIC MONITORING BETWEEN PROCEDURAL EFFICIENCY AND RESPECT FOR PRIVATE LIFE

Ecaterina BORTA,
PhD Student,
"Ştefan cel Mare" Academy of Ministry of Internal Affairs,
Consultant to the Prosecutor, Hîncești Prosecutor's Office, Ialoveni Office,
Republic of Moldova
ORCID: 0000-0003-2026-863X

Abstract

This paper analyzes the impact of digital technologies on the social reintegration process of persons conditionally released from criminal punishment before the term. In a context marked by the need to streamline recidivism prevention mechanisms, electronic monitoring (GPS bracelets) emerges as a viable technical solution for ensuring public order. The article explores the duality of this instrument: on the one hand, its capacity to enhance judicial control and reduce detention costs, and on the other hand, the interference it exerts on the right to private life of the supervised person.

The methodology used combines the normative analysis of national legislation with European best practices in digital probation. The research results highlight the need to establish a proportional balance between the use of monitoring algorithms and the protection of personal data.

In conclusion, the paper argues that the digitalization of supervision should not replace social assistance, but serve as technical support that facilitates the transition from the penitentiary environment to full freedom, minimizing crime risks.

Keywords: conditional release, electronic monitoring, digitalization, private life, recidivism prevention, probation.

DIGITALIZAREA SUPRAVEGHERII PERSOANELOR LIBERATE CONDIȚIONAT: MONITORIZAREA ELECTRONICĂ ÎNTRE EFICIENȚĂ PROCESUALĂ ȘI RESPECTAREA VIEȚII PRIVATE

Abstract

Prezenta lucrare analizează impactul tehnologiilor digitale asupra procesului de reintegrare socială a persoanelor liberate condiționat de pedeapsa penală înainte de termen. Într-un context marcat de necesitatea eficientizării mecanismelor de prevenire a recidivei, monitorizarea electronică (brățările GPS) apare ca o soluție tehnică viabilă pentru asigurarea ordinii publice. Articolul explorează dualitatea acestui instrument: pe de o parte, capacitatea sa de a spori controlul judiciar și de a reduce costurile detenției, iar pe de altă parte, ingerința pe care o exercită asupra dreptului la viață privată al persoanei supravegheate.

Metodologia utilizată îmbină analiza normativă a legislației naționale cu bunele practici europene în materie de probațiune digitală. Rezultatele cercetării evidențiază necesitatea stabilirii unui echilibru proporțional între utilizarea algoritmilor de monitorizare și protecția datelor cu caracter personal.

În concluzie, lucrarea argumentează că digitalizarea supravegherii nu trebuie să înlocuiască asistența socială, ci să servească drept un suport tehnic ce facilitează tranziția de la mediul penitenciar la libertatea deplină, minimizând riscurile de criminalitate.

Cuvinte-cheie: liberare condiționată, monitorizare electronică, digitalizare, viață privată, prevenirea recidivei, probațiune.

Introduction. In the legal and social landscape of 2026, the prevention and combating of crime have become processes inseparably linked to the exponential evolution of information technologies. In an era of global digitalization, criminal law institutions must transition from traditional methods of control to intelligent mechanisms capable of ensuring a balance between the rigor of punishment and the imperative of social reintegration.

The regulation of the institution of conditional release in the Criminal Code reflects the orientation of modern criminal policy toward the individualization of sentence enforcement and the encouragement of the convicted person's social behavior. This measure does not constitute a mere act of clemency, but rather represents a complex legal mechanism through which the state conditions freedom on compliance with rigorous obligations, thereby justifying the need for an efficient supervision system. In this regard, Article 91 of the Criminal Code establishes the premises under which a convicted person may be conditionally released, where it is determined that the full execution of the sentence is no longer necessary for their correction. The implementation of electronic monitoring emerges as an essential complementary tool, facilitating the verification of compliance with the obligations imposed by the court in accordance with Article 91(4), which allows for the establishment of specific conduct-related measures during the probation period. Thus, the use of digital technology in supervision directly contributes to achieving the purposes of punishment set out in Article 61 of the Criminal Code: the restoration of social equity, the correction and resocialization of the convicted person, as well as the prevention of the commission of new offenses both by the convicted individual and by others. In this context, through the convergence of strict supervision and psychosocial support, the criminal framework facilitates the social reintegration of the individual while ensuring respect for the dignity of the convicted person [1].

The Enforcement Code establishes the legal framework for the implementation of measures ordered by the court, including the obligations of persons under supervision. In this regard, the execution of sentences within the community entails not only the formal compliance with obligations, but also the existence of effective control mechanisms. Electronic monitoring fits within the logic of modernizing the execution of criminal sanctions, offering authorities the possibility to objectively track the behavior of the supervised person. It contributes to strengthening the efficiency of enforcement mechanisms and to reducing reliance on traditional methods of control. In this context, Article 271^1 of the Enforcement Code details the rigorous procedure for implementing electronic monitoring for persons released from criminal punishment, establishing that it is not a punishment in itself, but rather a means of controlling compliance with the obligations and restrictions imposed by the court. The legal text regulates the technical conditions under which monitoring devices may be applied, stipulating the obligation of the individual to maintain the integrity of the equipment and to ensure its proper charging, under the sanction of revocation of conditional release in cases of repeated or intentional violations. At the same time, the Enforcement Code provides procedural safeguards to ensure that the use of electronic surveillance means does not infringe upon human dignity and does not endanger the health of the supervised individual. Therefore, the digitalization of control through this Code provides a solid legal basis for the individualization of sentence enforcement, transforming the supervision process from intermittent checks into continuous and objective monitoring, capable of generating direct evidence in cases of non-compliance with the established itinerary or entry into prohibited areas as determined by a court decision [2].

The Law on Probation No.8/2008 enshrines the central role of the probation service in the process of social reintegration of convicted persons. It regulates both supervision activities and support interventions, highlighting the complex nature of probation. Within this framework, electronic monitoring can be interpreted as a technical tool supporting the work of probation officers, without substituting the social component of the intervention. It enables better case management and a prompt response to potential violations of imposed obligations. In this context, conditional release from criminal punishment before the full term is served no longer represents merely an act of procedural clemency, but rather a strategic instrument of criminal policy, whose effectiveness depends critically on the quality of post-detention supervision. In accordance with the provisions of the Law on Probation No.8/2008, probation activity constitutes a set of supervision, assistance, and counseling measures aimed at preventing the commission of new offenses and facilitating the social reintegration of individuals. Thus, electronic monitoring operates as a complementary control measure, allowing real-time verification of obligations such as not leaving a locality or not frequenting certain places, thereby ensuring a balance between the requirements of public safety and the individual's right to resume their social and professional life. Through this mechanism, the law provides the necessary framework for conditional release to be accompanied by technological rigor, minimizing the margin of error in the process of post-detention supervision [3].

The central issue of the present paper concerns the analysis of how electronic monitoring can be harmonized with the right to respect for private life, as guaranteed by Article 8 of the European Convention on Human Rights. From the perspective of the protection of fundamental rights, the electronic monitoring of conditionally released persons constitutes an interference with the right to respect for private life, as enshrined in Article 8 of the European Convention on Human Rights. This interference derives from the intrusive nature of the technologies used, which involve the continuous collection and processing of data regarding the location and behavior of the supervised individual. According to the case-law of the European Court of Human Rights, the notion of "private life" has a broad scope, encompassing not only the intimate sphere of the individual, but also freedom of movement, personal autonomy, and the protection of personal data. Consequently, any form of technological surveillance must comply with the requirements set out in Article 8 §2, namely that it must be in accordance with the law, pursue a legitimate aim, and be necessary in a democratic society. The application of these criteria entails conducting a rigorous proportionality test, assessing whether the measure is appropriate and indispensable for achieving the intended aim, and whether less intrusive alternatives exist. Therefore, electronic monitoring can be considered compatible with Convention standards only insofar as it is limited in time, individualized according to the person's profile, and accompanied by effective safeguards against abuse, thereby maintaining a fair balance between the general interest and individual rights [4].

At the same time, the absence of a specialized conceptual framework does not allow for a unified approach by the authorities that should be directly involved in the process of social reintegration of detainees, so that the roles of state bodies and NGOs in this process are clearly delineated (as is the case, for example, in Latvia, Estonia, Poland, and other European countries). Undoubtedly, the establishment of the Probation Service represents an important step toward creating such a mechanism. By creating this structure, the state should not absolve itself of its other existing responsibilities in this field, but rather must create the premises and conditions for the development of such a mechanism, in which both public authorities and NGOs have clear and well-defined roles. A major issue hin-

dering the development of this mechanism is the insufficiency of financial resources for the development of the reintegration system, which has never been a priority within the state budget of the Republic of Moldova. Therefore, it can be concluded that this deficiency is unquestionably greater than the expenses required for the implementation of a viable system for the resocialization of detainees. From a financial perspective, it is more reasonable for the state to invest resources in the creation and development of a resocialization mechanism than to bear repeated losses in the absence of such a system [5, p.8].

Thus, the objective of the research is to demonstrate that digitalization should not lead to the dehumanization of the probation process, but rather serve as an advanced technical support that facilitates the transition of the convicted person from a regime of detention to full freedom, while minimizing risks to public order and security.

Through this approach, we aim to examine the current regulatory framework in the Republic of Moldova and to propose avenues for improving the legislation, so that the digitalization of supervision becomes a cornerstone of the national crime prevention strategy, transforming the "problem" of recidivism into a "solution" grounded in intelligent monitoring and continuous social support.

Methods and materials applied. The development of this research was based on the use of a set of scientific methods aimed at ensuring an objective and comprehensive analysis of the process of digitalizing supervision. The methodological approach is multidisciplinary, combining traditional legal analysis with modern technological perspectives specific to electronic monitoring systems.

The main method used is the comparative analysis method, through which models of best practices from other European jurisdictions were examined. This approach made it possible to identify the efficiency standards of Global Positioning System (GPS) technologies and the way in which they are integrated into recidivism reduction policies at the international level.

Secondarily, the logical method and the method of legal interpretation were applied. These served to examine, in a correlated manner, the criminal law provisions and those governing enforcement, with the aim of determining the limits of competence of probation authorities in the use of digital control mechanisms. Through processes of deduction and induction, the study sought to establish a balance between the need for public safety and the necessity of the individual's social reintegration.

From the perspective of the protection of fundamental rights, the research employed the case-law method. Through the analysis of relevant jurisprudence, the criteria of proportionality and necessity of technological interference in the sphere of private life were assessed. This method facilitated an understanding of how limitations of liberty through electronic means must be strictly regulated in order to avoid becoming abusive.

Discussions and results obtained. In a democratic society, the use of location-tracking algorithms and electronic monitoring bracelets must comply with the principles of legality, necessity, and proportionality. The case-law of the European Court of Human Rights has confirmed that the use of surveillance technologies, including GPS, is compatible with the Convention, provided that certain safeguards are respected. In the case of *Uzun v. Germany*, the Court emphasized that the duration and purpose of the measure are essential in assessing proportionality. This judgment provides an important benchmark for the regulation of electronic monitoring, demonstrating that technology can be used legitimately, provided that clear limits and adequate oversight of its application exist. It thus represents a crucial precedent for the digitalization of criminal supervision. The Court held that GPS monitoring constitutes an interference with private life, protect-

ed under Article 8 of the Convention, but stressed that such interference is justified if it serves public safety and the prevention of crime. A key aspect of the Court's analysis was the distinction between traditional (visual) surveillance and technological surveillance. Although the latter is significantly more intrusive due to its capacity for continuous and automated data collection, it is not incompatible with democratic values. The Court validated the monitoring measure because it was limited in time, subject to rigorous judicial control, and applied in a context where there were reasonable grounds to believe in the risk of recidivism or the commission of serious offenses. Therefore, for the probation system of the Republic of Moldova, the findings in *Uzun v. Germany* are clear: electronic monitoring of conditionally released persons must not be an automatic or perpetual measure, but a strictly individualized one, where the necessity of collecting location data is constantly balanced against the individual's right to rebuild their social life without disproportionate state interference [6].

The implementation of electronic monitoring through Global Positioning System (GPS) technologies represents a technological solution that promises "invisible supervision," capable of providing probation authorities with real-time data and deterring criminal behavior. The Council of Europe's recommendations emphasize that electronic monitoring should be used as an alternative to detention, rather than as an additional form of constraint. They underline the necessity of respecting human dignity and fundamental rights. At the same time, the recommendations highlight the importance of individualizing such measures and avoiding the automatic application of surveillance technologies. Monitoring must be tailored to each specific case, depending on the risks involved and the identified needs [7].

Official data confirm the expansion of the use of electronic monitoring in the Republic of Moldova, reflecting a clear orientation toward the modernization of the criminal justice system. The increase in the number of supervised individuals indicates the authorities' confidence in the effectiveness of this mechanism. These developments highlight the need to strengthen the normative and institutional framework in order to ensure the proper and proportionate use of technology. In this context, electronic monitoring emerges as a form of executing criminal measures within the community, allowing authorities to exercise effective control over conditionally released individuals without resorting to their isolation. The system operates through institutional cooperation between courts, police authorities, and the probation service, reflecting its complex and interdisciplinary nature. Another important result of the research lies in identifying the economic and social advantages of electronic monitoring. It reduces the costs of detention and helps maintain the social ties of the convicted person, thereby facilitating their reintegration into the community. In the Republic of Moldova, electronic monitoring is also used as a protective measure in cases of domestic violence, demonstrating its versatility and practical utility [8].

From a normative perspective, the introduction of electronic monitoring in the Republic of Moldova has been justified by the need to prevent violations of obligations imposed on persons under probation and to enhance the level of public safety. The implementation of GPS technology enables the real-time detection of deviations from established restrictions, thereby contributing to the efficiency of judicial control. This development has been driven by the necessity of aligning with European standards and improving the supervision of individuals under probation. The introduction of this system marks an important stage in the reform of sentence enforcement, contributing to the development of technical infrastructure, strengthening institutional capacity, and ensuring

the effective functioning of the mechanism [9].

Public sources reflect society's perception of electronic monitoring, highlighting both its advantages and the concerns related to its use. Public information contributes to increasing transparency and trust in the system. At the same time, media coverage of the implementation of this mechanism emphasizes its social impact and relevance for public policy in the field of justice. The analysis of the institutional framework establishes that electronic monitoring is not applied uniformly to all categories of convicted persons, but rather involves a selection based on criteria such as the severity of the offense and the assessment of criminological risk. This approach confirms the system's orientation toward the individualization of sentence execution, in line with European trends and existing practices in Romania [10].

Romanian doctrine emphasizes that effective probation presupposes a combination of control and social support. Electronic monitoring cannot replace the relationship between the probation officer and the supervised individual. In this regard, technology must be used as an auxiliary tool, supporting human interventions and contributing to the behavioral change of the individual. This demonstrates that mere technological surveillance is not sufficient for reducing recidivism; it must be combined with counseling programs and social reintegration measures. The research also highlights the risk of transforming electronic monitoring into a predominantly repressive instrument in the absence of complementary social support measures. Practical experience shows that the success of probation does not depend exclusively on the intensity of control, but on the system's ability to support behavioral change in the supervised person [11, p.85].

The effectiveness of offender resocialization is intrinsically linked to community involvement, probation being the mechanism that balances supervision with psychosocial assistance in order to reduce the risk of recidivism. A comparative analysis of probation systems reveals distinct approaches, adapted to the legal culture of each state. In England and Wales, the foundations were laid by the *Probation of First Offenders Act* of 1887, an act adopted by the House of Lords, which regulated the conditional release of first-time offenders. This act marked a key step by extending the activity of volunteer missionaries toward the supervision of minors in at-risk situations. However, the turning point was the *Criminal Justice Act* of 1948, which established the operational framework of probation services, a structure that remains relevant today under the authority of the Home Office. Subsequently, the legislation of 1991 introduced a "new philosophy of punishment," transforming the probation service from a simple monitoring agency into a central pillar of criminal justice, a concept largely maintained after the legislative amendments of 1993 and 1994. Similarly, the emergence of probation in the United States of America is inseparably linked to the private initiative of John Augustus. In 1841, he laid the foundations of the modern concept by providing personal guarantees for offenders, successfully supervising and assisting nearly 2,000 individuals over a period of 18 years. The success of this approach led to the formalization of the probation officer profession in Massachusetts in 1878. Currently, the American system is characterized by a unique structural complexity, often described as a "non-system" due to its fragmentation across more than 50,000 institutions operating independently at federal, state, and local levels. Unlike Anglo-Saxon models, the evolution in France is marked by an "original paradox," where probation services must execute a criminal sanction while having as their primary objective social reintegration. Established by the 1957 legislation in the form of Probation and Assistance Committees for Released Persons (CPAL), the system was reformed by the Decree of April 13, 1999. This reform unified the services into a single administrative entity: the Prison Integration and Probation Services, placing particular emphasis on juvenile

justice, coordinated by the Youth Protection Service. In this European context, the recent history of probation in Romania reflects a rapid evolution from a pilot-project phase in 1996 to national expansion following Government Ordinance No. 92/2000. Institutional development led to the establishment of the Probation Directorate within the Ministry of Justice, which manages county-level services attached to tribunals. The Romanian system was built around the need for alternative sanctioning measures aimed at relieving prison overcrowding while simultaneously ensuring social rehabilitation, reducing recidivism risk, and increasing public safety. In conclusion, although implementation mechanisms vary, the common purpose of these systems is to transform sanctioning from a mere punishment into a process of community-assisted social rehabilitation [12, pp.77-80].

Directive (EU) 2016/680 of the European Parliament and of the Council of 27 April 2016 on the protection of individuals with regard to the processing of personal data requires supervisory authorities to implement strict technical and organizational measures to prevent unauthorized access to location data. Given that such data may reveal sensitive information about private life, such as religious beliefs or health status inferred from frequented places, it is imperative that electronic monitoring systems ensure the confidentiality and integrity of information flows, prohibiting any processing that is not strictly necessary for the intended judicial purpose. A fundamental pillar of the protection of the monitored person's rights is the establishment of clear time limits for the storage and automatic deletion of collected data. According to the European regulatory framework, states must provide procedures for periodically reviewing the necessity of retaining data in the system, thereby avoiding the creation of permanent databases containing the movement histories of former prisoners. The absence of such safeguards regarding storage limitation turns technological surveillance into a disproportionate interference, which may negatively affect the resocialization process by maintaining constant psychological pressure on the individual. The legal regime established by Directive (EU) 2016/680 functions as a mechanism ensuring compliance with the standards set by Article 8 of the ECHR, transforming abstract principles of private life into concrete technical and procedural obligations. The Directive clearly stipulates that any processing of location data for the purpose of executing sentences must respect the essence of the right to private life, requiring states to prevent disproportionate surveillance through strict security measures and limited access to collected information. Thus, the compliance of electronic monitoring with European standards depends not only on the effectiveness of judicial control, but also on the system's ability to ensure that the digitalization of supervision does not become a permanent and unjustified interference with a person's home and correspondence, maintaining a fair balance between public safety and human dignity [13].

However, the effectiveness of electronic monitoring does not depend exclusively on legislative rigor, but also on the reliability of the technical infrastructure. An aspect often overlooked in legal discussions, yet essential in practice, is the vulnerability of systems to technical failures or cyberattacks. In the Republic of Moldova, rural areas with weak GSM coverage represent a major challenge for the stability of GPS bracelet connectivity. Signal loss may be incorrectly interpreted by the system as an attempt to escape or tamper with the device, generating serious legal consequences, such as the revocation of conditional release.

Therefore, I argue that criminal enforcement law must also integrate the principle *in dubio pro reo* in the interpretation of technological errors. Any system alert should be verified in light of the possibility of a network malfunction, so that no sanction is applied in the absence of clear evidence of bad faith on the part of the supervised person.

Conclusions. In conclusion, the digitalization of supervision through electronic

monitoring represents an essential pillar in modern crime prevention and control strategies, providing technical support that facilitates the transition from the penitentiary environment to full freedom. The study demonstrates that this instrument is effective only insofar as it complies with the standards of proportionality and necessity set out in Article 8 of the ECHR, avoiding the transformation of supervision into a purely repressive measure. The research findings emphasize that digitalization should not entail the dehumanization of probation, but rather function as an intelligent mechanism that combines technical surveillance with continuous social assistance, thereby maintaining a fair balance between the general interest and individual rights.

From the perspective of the protection of fundamental rights, it is essential that the implementation of electronic monitoring is not perceived as a measure of absolute control, but rather as a strictly regulated interference with the right to respect for private life, in accordance with the requirements of Article 8 of the European Convention on Human Rights. The intrusive nature of GPS technologies, which enable the continuous collection and processing of data regarding an individual's location and behavior, requires that any such measure be prescribed by clear and foreseeable law, pursue a legitimate aim, and be strictly necessary in a democratic society. Compliance with Convention standards requires a rigorous proportionality test, through which courts must ensure a fair balance between the imperative of public safety and personal autonomy, guaranteeing that surveillance is individualized and limited in time in order to avoid affecting the very essence of the right to private life.

For the future, it is necessary to strengthen the national regulatory framework of the Republic of Moldova in order to ensure a fair balance between the imperative of public safety and the protection of personal data of conditionally released persons. In this regard, we propose optimizing the legal framework by supplementing Law No.8/2008 on probation and the Enforcement Code with specific provisions regulating "Digital Probation". A first direction concerns the establishment of a mechanism for individualizing the intensity of GPS monitoring, which would allow for the gradual reduction of supervision as the person demonstrates real progress in social reintegration, thereby avoiding unnecessary stigmatization.

At the same time, it is imperative to introduce clear procedural safeguards that would allow subjects to challenge technical data in cases of system errors, thereby ensuring the right to a fair trial and protection against automated decisions lacking human review. Last but not least, we propose the development of a strict protocol for the management of location data, which would limit the storage period of such data and condition inter-institutional access on the existence of reasonable indications of the commission of a new offense. In essence, electronic monitoring should serve as an advanced technical support tool, transforming post-release supervision into an intelligent risk management process anchored in respect for human dignity and democratic values.

Electronic monitoring should serve as an advanced technical support tool, transforming post-detention supervision into an intelligent risk management process aimed at facilitating the full reintegration of the convicted person into society.

Moreover, the success of this system depends on rigorous institutional cooperation and the continuous adaptation of legislation to the exponential evolution of information technologies, thereby ensuring that the modernization of criminal justice remains anchored in respect for human dignity and democratic values.

In conclusion, the digitalization of supervision of conditionally released persons does not represent merely a simple adaptation to technological progress, but a structural transformation in the way the state manages social reintegration. The analysis carried out

demonstrates that electronic monitoring lies at the fragile intersection between procedural efficiency—manifested through reduced costs of detention and increased rigor of control—and the ethical imperative of respecting private life. Although the GPS bracelet provides unprecedented tools for preventing recidivism and ensuring public safety, it must not become a form of intrusion that undermines human dignity or hinders the psychosocial rehabilitation of the individual.

Therefore, the future of this mechanism in the Republic of Moldova depends on the ability of the legislator and probation authorities to use tracking algorithms not as an end in themselves, but as a technical support subordinated to the fundamental values of human rights, thereby ensuring a fair balance between digital control and respect for human freedom.

MIGRATION, NATIONAL SECURITY AND THE RULE OF LAW: A COMPARATIVE PERSPECTIVE

Adrian BĂNCILĂ,
PhD, Associate Professor,
Faculty of Police,
"Alexandru Ioan Cuza" Police Academy, Bucharest,
Romania
ORCID: 0009-0000-0743-8708

Abstract

The paper examines how the European Union (EU), the United Kingdom of Great Britain and Northern Ireland (UK) and the United States of America (US) balance migration control, increasingly invoked as a national security issue, with respect for the principles of the rule of law. In relation to the theory of securitization, the tendency to treat migration as a threat to security is present in all the mentioned states, with notable differences in terms of legal guarantees depending on the corresponding constitutional structure. Federal or quasi-federal systems, such as the US and the EU, have several internal balance mechanisms, which limit the action of the executive even in situations perceived as security emergencies. In contrast, the unitary system in the UK, especially after Brexit, offers the executive a wider margin of action, with fewer structural barriers to the adoption of restrictive measures. The conclusion of the paper is that constitutional architecture matters directly for the protection of migrants' rights and that security-focused discourse can, over time, erode the foundations of liberal constitutionalism, regardless of the national legal context.

MIGRAȚIA, SECURITATEA NAȚIONALĂ ȘI STATUL DE DREPT: O PERSPECTIVĂ COMPARATĂ

Abstract

Materialul cercetează maniera în care Uniunea Europeană (UE), Regatul Unit al Marii Britanii și Irlandei de Nord (UK) și Statele Unite ale Americii (SUA) echilibrează controlul migrației, invocat tot mai frecvent ca problemă de securitate națională, cu respectarea principiilor statului de drept. Raportat la teoria securitizării, tendința de a trata migrația ca amenințare la adresa securității este prezentă în toate statele menționate, cu diferențe notabile în ce privește garanțiile juridice în funcție de structura constituțională corespunzătoare. Sistemele federale sau cvasi-federale, precum SUA și UE, dispun de mai multe mecanisme interne de echilibru, care limitează acțiunea executivului chiar și în situații percepute drept urgențe de securitate. În schimb, sistemul unitar din UK, mai ales după Brexit, oferă executivului o marjă mai largă de acțiune, cu mai puține bariere structurale în calea adoptării unor măsuri restrictive. Concluzia lucrării este că arhitectura constituțională contează în mod direct pentru protecția drepturilor migranților și că discursul centrat pe securitate poate eroda, în timp, fundamentele constituționalismului liberal, indiferent de contextul juridic național.

***Cuvinte-cheie**: dreptul migrației; securitate națională; stat de drept; teoria securitizării; control judiciar; non-refoulement; putere executivă.*

Introduction. During the nearly 80 years that separate the end of the last world war from the present moment, the phenomenon of international migration has under-

gone a fundamental transformation in public and legal perception. At first (and currently, traditionally), migration was viewed through the lens of humanitarian considerations (the right to international protection) or economic and demographic ones (in the case of legal migration), so that the beginning of the 21st century brought about its strategic repositioning in the sphere of national security. The tone was set by the terrorist attacks of September 11, 2001, followed by the refugee crisis of 2015-2016 and the geopolitical instability generated by the war in Ukraine, events that accelerated a global trend to treat cross-border human mobility not only as an administrative or social issue, but as a potential existential threat to territorial integrity, social cohesion and public order.

The recalibration of the global perception of international migration has profound legal consequences and highlights an increasingly acute tension between two crucial functions of the modern state. We refer, on the one hand, to the state's obligation to protect the security of its citizens, which justifies rigorous border control and the exclusion of elements considered hostile or dangerous, and, on the other hand, to the very essence of the rule of law, which implies the self-limitation of state prerogatives; in other words, any action by the executive branch, no matter how urgent it may be perceived, must be subject to the law, judicial review and international human rights standards, in particular, in relation to the present matter, the requirements of the principle of non-refoulement.

This article aims to analyze how this tension is managed in three distinct but interconnected jurisdictions: the European Union (EU), as a supranational entity sui generis; The United Kingdom of Great Britain and Northern Ireland (UK), in its new post-Brexit state of a unitary system completely independent of EU legislative constraints; and the United States of America (USA), as a classic model of a presidential federal republic. The selection of these three actors is not arbitrary; each represents a distinct constitutional tradition and institutional architecture that decisively influences the degree of permeability of the rule of law to the arguments produced by the security discourse.

The central hypothesis of the research is the following: although the tendency to securitize migration, that is, to construct it discursively and legally as a major threat to security, is a common phenomenon, its impact on the erosion of the guarantees of the rule of law varies systematically depending on the constitutional architecture and the density of institutional veto points. Political systems that disperse power across multiple levels of government (federalism, supranationalism) or that ensure robust judicial independence tend to resist executive pressures to circumvent legal procedures in the name of security urgency. In contrast, unitary systems, with centralized executive power and more flexible or deferential judicial review, are structurally more vulnerable to rapid and deep implementation of restrictive measures that can undermine the foundations of liberal constitutionalism.

To test this hypothesis, the article will first explore the conceptual and methodological framework, defining key terms such as "securitization", "rule of law" and "non-refoulement". Subsequently, the three case studies, the EU, the UK and the USA, will be analyzed in turn, following recent legislative developments, relevant supreme court jurisprudence and institutional balancing mechanisms. Finally, the conclusions will synthesize the comparative lessons and provide a normative assessment of the risks involved in subordinating the rule of law to security imperatives.

Methods and materials applied. The research is based on a qualitative, multidisciplinary methodological approach, combining the tools of dogmatic legal analysis with those of the political theory of international relations.

1. *Comparative method*. The main working tool is synchronic legal comparison. We

selected three jurisdictions that, although sharing a Western legal tradition and formal commitments to fundamental rights, differ significantly in terms of constitutional structure and allocation of powers in the field of migration and security. The comparison grid included the following operational variables: (a) Constitutional architecture: federalism (USA), supranationalism with shared sovereignty (EU), unitary system with parliamentary sovereignty (UK); (b) Standard of judicial review: proportionality (EU/UK) vs. deference/rational basis (USA in immigration matters); (c) Emergency and derogation mechanisms: the possibility for the executive to suspend procedural guarantees in crisis situations.

2. *Securitization Theory (Conceptual Framework).* To understand how migration becomes a security issue, we used the theoretical framework offered by the Copenhagen School, developed by Barry Buzan, Ole Wæver and Jaap de Wilde in the seminal work Security: A New Framework for Analysis [1]. According to this theory, security is not an objective state, but a speech act. A political actor (usually the executive) declares that a certain referent object (state, society, national identity) is existentially threatened by a certain phenomenon (migration) and, therefore, extraordinary measures that deviate from the usual rules and procedures are necessary. The success of securitization depends on the acceptance of this discourse by a relevant audience (parliament, public opinion, courts) [1, pp. 25-27]. Therefore, by appealing to the algorithm presented by the securitization theory, we believe that we can identify the justificatory rhetoric behind the legislative texts and we can, consequently, assess whether the measures adopted are proportional to the real threat or are the result of a political construction. In addition, we used Jef Huysmans' analysis of the "security continuum" in EU policies, which shows how migration has been discursively linked to terrorism and organized crime [2].

3. *The principle of proportionality (Legal assessment tool).* In order to objectively assess whether security measures adopted in the field of migration comply with the rule of law, we have used the classic proportionality test, as developed in European legal doctrine by Robert Alexy [3] and in the case law of the Court of Justice of the European Union (CJEU). This test involves the completion of four cumulative stages: (a) Legitimate aim – does the measure seek to protect a recognised fundamental interest?; (b) Appropriateness – is the measure effectively capable of achieving that aim?; (c) Necessity – are there alternative, less restrictive measures?; (d) Proportionality stricto sensu – is there a fair balance between the benefit obtained for collective security and the harm caused to the fundamental rights of the individual? [3, pp. 66-69].

4. *Materials used.* The analysis is based on an extensive corpus of primary and secondary sources, consisting of: (a) Primary legislation – Treaty on European Union (TEU); Treaty on the Functioning of the European Union (TFEU); EU Pact on Migration and Asylum (Regulations 2024/1348, 2024/1351, 2024/1356); Illegal Migration Act 2023 (UK); Nationality and Borders Act 2022 (UK); Immigration and Nationality Act (USA); (b) Relevant case law – Judgments of the CJEU, the Supreme Court of the United Kingdom and the Supreme Court of the United States; (c) Specialized doctrine – reference works in the field of migration and security law, including contributions by Elspeth Guild [4], Cathryn Costello [5] and Daniel Thym [6].

Discussions and results obtained. The comparative analysis revealed a number of convergences in terms of discursive dynamics, but major structural divergences in terms of the legal transposition of this discourse and the system's capacity to correct the excesses of executive power.

1. The European Union: The fragile balance between harmonisation and securitization. The European Union faces a unique constitutional dilemma, rooted in the very ar-

chitecture of its founding treaties. On the one hand, Article 78 of the Treaty on the Functioning of the European Union (TFEU) mandates the development of a common asylum policy, with the explicit objective of "respecting the principle of non-refoulement". On the other hand, Article 4(2) of the Treaty on European Union (TEU) unequivocally stipulates that "national security remains the sole responsibility of each Member State" [7].

This dichotomy has been constantly explored and exploited by Member States located on the external borders of the Union (notably Greece, Italy, Hungary, Poland) to justify unilateral border closures or pushbacks, invoking precisely the national security safeguard clause. The recent evolution of the European legislative framework, materialized by the adoption of the Pact on Migration and Asylum (2024), reflects an attempt to resolve this blockage, but also a partial surrender to the security logic.

Outcome 1.1: Institutionalizing securitization through the new legislative framework. The new European migration rules, in particular Regulation 2024/1356, mark a major change in attitude. It is telling that the term "screening" was chosen, a word borrowed from medicine that actually means triage or filtration. This terminological choice is not just a matter of dictionary; it shows that Europe has begun to look at migration through a much more technical and restrictive magnifying glass. In practice, the migrant is no longer just a person seeking asylum, but a subject to a rapid "initial assessment", a filtering process designed to quickly separate accepted from rejected persons, even upon entry into the Union [8]. In the same vein, the regulation introduces the concept of the fiction of non-entry: persons subject to screening are considered, from a legal point of view, not to have yet entered the territory of the Member State, even if they are physically in a transit centre located on national territory. This legal fiction has a major practical consequence as it allows Member States to apply accelerated procedures and lower detention standards, arguing that the full guarantees of the right to asylum provided for by the EU acquis apply only after legal "entry" to the territory.

Similarly, Regulation (EU) 2024/1348 introduces a mandatory border procedure for certain categories of applicants, including those considered to be a risk to national security, drastically reducing examination deadlines and available remedies [9]. These legislative provisions demonstrate that the security logic is no longer a temporary exception, but has been organically integrated into common European asylum law. This trend has been criticised in the doctrine as representing a "missed opportunity" to build a truly solidarity-based and rights-based system [10].

Outcome 1.2: The role of the CJEU as guardian of the rule of law. Despite this worrying legislative development, the European Union benefits from a decisive structural advantage compared to the other jurisdictions analysed: the existence of a supranational Supreme Court (CJEU) with the authority to invalidate national administrative and even legislative acts that contravene the Charter of Fundamental Rights.

The case-law of the CJEU has demonstrated remarkable resilience. In the landmark judgment in N.S. and M.E. (Joined Cases C-411/10 and C-493/10), the Court ruled that the presumption of respect for fundamental rights by Member States is a relative one. A Member State cannot transfer an asylum seeker to the State responsible under the Dublin Regulation if there are "serious grounds for believing" that the applicant would be exposed to a real risk of inhuman or degrading treatment in that State [11]. This judgment allowed the suspension of transfers to Greece and Hungary, forcing Member States to adjust their administrative practices. In the same vein, in the case J.N. (C-601/15), the Court ruled that the detention of an asylum seeker on grounds of national security requires

an individual assessment to establish that the person concerned represents a "genuine, present and sufficiently serious threat" to one of the fundamental interests of society [12].

More recently, in the case Commission v. Hungary (C-808/18), the CJEU penalised Budapest for drastically restricting access to the asylum procedure in the so-called "transit zones". The Court rejected Hungary's argument that these measures were justified by the protection of public order and national security, stressing that any restriction on the right to asylum must be proportionate and based on an individual assessment of the conduct of the person concerned, not on generalisations or the generic invocation of a threat [13].

Thus, the veto power represented by the CJEU (activatable either by the Commission or by national courts through the preliminary reference mechanism) acts as a structural brake on the accelerated erosion of the rule of law. The executive of a Member State cannot legislate in a legal vacuum; it is constrained by a supranational court applying a relatively rigorous proportionality test.

2. The United Kingdom: A Laboratory of Accelerated Erosion Post-Brexit. If the EU represents a model of "institutional friction", the United Kingdom, especially after its withdrawal from the Union on 31 January 2020, offers an almost ideal-typical example of accelerated legislative erosion of the rule of law in the field of migration. Leaving the EU removed the jurisdictional constraint of the CJEU and put an end to the direct applicability of the EU Charter of Fundamental Rights. In this new context, based on the traditional principle of parliamentary sovereignty (according to which no court can invalidate a law passed by Parliament), the British executive has embarked on a radical restructuring of the asylum system.

Outcome 2.1: Protection exclusion legislation. Two major pieces of legislation define the new British legal landscape:

a). The Nationality and Borders Act 2022 (NaBA 2022) introduced a differentiated system of protection, dividing refugees into "Group 1" (those who arrive directly from the conflict zone and, crucially – the conditions having to be met cumulatively – present themselves without delay to the British authorities) and "Group 2" (defined negatively, namely all those who are not included in the first category; therefore including those who have transited a safe third country). The latter benefit from a temporary status (30 months compared to 5 years for Group 1), severe restrictions on the right to family reunification (exceptions being allowed only in the case of "insurmountable obstacles") and a difficult access to permanent residence (10 years of residence compared to only 5 years for those in Group 1) [14]. This differentiation, although apparently administrative, sends a clear message of deterrence and penalization of secondary mobility.

b). The legal framework established by the Illegal Migration Act 2023 (IMA 2023) marks a transition from an asylum system based on individual assessment to an automatic exclusion regime. Under Section 2, the Act imposes an unconditional legal obligation (duty to remove) on the Home Secretary to arrange for the removal of any person who entered the UK by irregular means after 20 July 2023. This provision transforms the administrative procedure into a mandatory mechanism, removing the margin of appreciation of the authorities depending on the individual vulnerabilities of the person [15].

The inadmissibility of protection claims is regulated by Section 4, which explicitly prohibits persons falling within the scope of the Act from making asylum claims or invoking human rights as grounds for suspending removal. This procedural barrier is doubled by Section 5, which stipulates that the obligation to remove the person from the territory prevails over any claim for international protection or recognition of the status of a vic-

tim of modern slavery. Thus, the Act cancels the examination of the merits of the claims, making access to the procedures conditional on the method of entry into the country.

In terms of legality control, the IMA 2023 introduces, through Sections 38-50, a series of exclusion clauses from judicial review. These provisions severely limit the courts' power to grant interim measures to suspend expulsion orders pending the resolution of a dispute. According to Section 42, suspension of enforcement is permitted only in exceptional circumstances, where an imminent risk of "serious and irreversible harm" can be demonstrated, setting an extremely high standard of proof that restricts the judicial power's supervisory function over administrative acts [16].

Outcome 2.2: The Rwanda Case – The Judiciary vs. the Legislature. The flagship policy of this new approach is the Rwanda Migration and Economic Development Partnership, which provides for the forcible transfer of certain asylum seekers to Rwanda for the processing of their claims, without the possibility of returning to the United Kingdom.

In R (AAA and Others) v. Secretary of State for the Home Department [2023] UKSC 42, the United Kingdom Supreme Court demonstrated that, despite political pressures, the judiciary can act as a bulwark of the rule of law. The Court carefully considered the evidence on the functioning of the Rwandan asylum system and unanimously concluded that there were "substantial grounds for believing that there is a real risk" of asylum seekers sent to Rwanda being subject to indirect refoulement (return to their country of origin where they would face persecution) [17]. The Court's reasoning was strictly evidentiary and legal, not political.

However, the response of the British executive and legislature to this judicial defeat has been one that defies the very essence of the separation of powers. Instead of adjusting policy to meet the evidentiary standards set by the Court, Parliament has passed the Safety of Rwanda (Asylum and Immigration) Act 2024. This Act imperatively declares, by law, that Rwanda is a safe country and, even more seriously from a rule of law perspective, prohibits the courts from examining evidence that would contradict this legislative fiction [18]. This substitution of judicial finding of fact by legislative fiat strikes us as an impermissible interference with judicial review in the British system, with profound implications for the future of the separation of powers in the British state. We cannot help but notice the striking similarity to the way in which the Italian government acted in the case of the Rome court's decision regarding the operation of the processing centres for applicants for international protection established in the Republic of Albania; it simply decided by legislation in such a way as to render the court's decision ineffective [19]. It is worth noting that since winning the 2024 general election and forming a new government, the Labour Party has cancelled the Rwanda scheme and announced that it will redirect the money allocated to the scheme to fund a new border agency. Only four people went to Rwanda under a separate voluntary removal programme and none under the Rwanda scheme [19]. This does not change the fact that the Rwanda law was not repealed, nor the way in which the UK Parliament acted against one of the pillars of British democracy.

3. United States of America: Judicial Deference as a Systemic Vulnerability. The United States offers a paradoxical case study. On the one hand, the US Constitution establishes a rigid separation of powers and a robust tradition of judicial review. Thus, although not explicitly mentioned in the text of the Constitution, the concept of judicial review has become the cornerstone of American democracy, being a power implicitly derived from the role of the courts and from the supremacy clause of the fundamental law. This authority was historically consolidated by John Marshall's landmark decision in the case of Marbury v. Madison (1803), definitively establishing that the judiciary has the

final say in interpreting legality. Paradoxically, although it is viewed as the "least dangerous" branch of power, since it controls neither the financial resources of the state nor the enforcement force, the judiciary acts as an essential arbiter. It oversees both federal and state actions, using rigorous standards (such as the test against arbitrary decisions) to prevent administrative abuses and to protect individual rights against any excess of executive or legislative powers.

On the other hand, in the specific field of immigration, a jurisprudential doctrine operates that largely nullifies these guarantees: the Plenary Power Doctrine.

Outcome 3.1: The Origin and Persistence of the Plenary Power. This doctrine has its origins in notable 19th century cases such as Chae Chan Ping v. United States (1889), known as The Chinese Exclusion Case. The U.S. Supreme Court ruled that the power to exclude aliens from the national territory is "an incident of sovereignty" that belongs exclusively to the political branches (Congress and the President) and cannot be subject to constitutional judicial review [20]. Although deeply criticized in the doctrine for its racist origins and for its incompatibility with the evolution of fundamental rights, the doctrine of the plenary power has never been completely abandoned by the Supreme Court [21]. It has been expanded to cover not only the admission but also the expulsion of aliens.

Outcome 3.2: Trump v. Hawaii and the Height of Deference. The practical consequences of this doctrine are perfectly illustrated by the 2018 Decision in the case of Trump v. Hawaii [22]. During his first term, President Trump issued an executive order restricting entry into the United States by citizens of eight countries, six of which were predominantly Muslim. The executive order was justified under Section 212(f) of the Immigration and Nationality Act (INA), which grants the President broad authority to suspend the entry of any class of aliens if their entry would be "prejudicial to the interests of the United States" [23]. Despite extensive evidence of President Trump's discriminatory campaign statements (including his promise of a "Muslim Ban"), the Supreme Court, by a 5-4 majority, upheld the ban. The majority opinion applied the most deferential standard of constitutional review, rational basis review, and refused to look beyond the formal text of the executive order, which was religiously neutral. The Court accepted the executive's justification that the ban was necessary for national security, to allow for an assessment of the ability of the countries concerned to provide adequate information for screening travelers. The given case, illustrates a recurring phenomenon in the American legal architecture, namely that the executive's invocation of "national security" tends to act as an almost impenetrable bulwark against substantive judicial review. This de facto immunity is not an accident, but the result of a convergence between the broad statutory powers granted by Congress and a deep constitutional deference on the part of the courts. In practice, when the president or federal agencies justify a measure on the imperative of protecting national security, judges often adopt a self-imposed position of restraint. Such an attitude is based on the premise that the political branches possess the expertise and information necessary to assess external risks, elements that are often missing from the courts' arsenal. As a result, judicial review is often reduced to a mere formal review, leaving the substance of the decisions unsupervised. This legal shadow zone poses serious challenges to the rule of law, as it allows security considerations to prevail over the protection of individual rights, transforming executive discretion into a sphere of action that is almost unencumbered by constitutional scrutiny.

Outcome 3.3: Alternative Use of the Legal Framework – The Case of Title 42. Another major systemic vulnerability identified in the research is the ability of the executive branch to completely circumvent formal asylum law by using legal powers in related ar-

eas. In March 2020, under the pretext of the COVID-19 pandemic, the Trump administration invoked a public health law (Title 42 of the Public Health Service Act) to authorize the summary deportation of migrants encountered at the land border, without allowing them access to the asylum procedure or an individualized assessment of the risk of persecution. In the three years of its implementation, over 2.8 million people were deported under this authority [24]. Although lower courts imposed some limitations, the Supreme Court allowed the policy to remain in place for an extended period [25], demonstrating once again the judiciary's reluctance to counter executive action on border control issues.

Conclusions. The comparative analysis of the interaction between migration, national security and the rule of law in the European Union, the United Kingdom and the United States of America allows for the formulation of clear conclusions that validate the central hypothesis of the research.

1. Securitization – a global phenomenon, but with variable legal impact. First, the research confirms that the tendency to treat migration as a threat to security is a common phenomenon in all three jurisdictions analyzed. The language of "urgency", "crisis" and "border protection" has deeply penetrated the political discourse and the preambles of recent normative acts, from the acts included in the EU Pact on Migration and Asylum of 2024 to the UK Illegal Migration Act of 2023. This security rhetoric has consistently served as a justification for the adoption of measures that restrict classical procedural guarantees and increase the discretionary power of the executive.

2. Constitutional architecture as a determining variable. Secondly, and this is the central result of the study, the way in which this security pressure translates into the effective erosion of the rule of law is dictated by the constitutional architecture and the density of institutional veto points.

The European Union, by its multi-level nature and by the existence of an independent supreme court (CJEU) that applies a rigorous proportionality test, has internal balance mechanisms that limit the action of the executive. Even if new regulations incorporate securitization elements (such as the fiction of non-entry), they are constantly subject to the risk of being censored or restrictively reinterpreted by the European judiciary. This system creates an institutional friction that prevents a rapid and uncontrolled slide towards arbitrariness.

The United Kingdom, especially after Brexit and the liberation from the jurisdiction of the CJEU, represents the opposite case. The unitary system, combined with the principle of parliamentary sovereignty, gives the executive a wide margin of maneuver and few structural barriers. The case of the Rwanda legislation is emblematic: Parliament can simply legislate against a judicial finding of fact, substituting a legal fiction for the evidentiary reality. This represents an advanced form of erosion of the separation of powers in the state.

The United States offers a paradoxical lesson. Although formally the federal system is full of veto points, in practice the Doctrine of Plenary Power and the deferential standard of judicial review (rational basis) nullify these structural advantages. As long as the executive invokes the magic formula of "national security", federal courts are structurally reluctant to intervene, leaving migrants in a veritable "constitutional vacuum" at the border.

3. Implications for the future of the rule of law. The final conclusion of this research is both descriptive and normative. Constitutional architecture matters directly and profoundly for the protection of migrants' fundamental rights. Systems that disperse power and ensure a truly independent judiciary are more resilient to the authoritarian

temptation to sacrifice the rule of law on the altar of security urgency.

In the long term, however, even in systems with a robust architecture, there is a risk that the security-centric discourse will gradually erode the foundations of liberal constitutionalism. The obsessive repetition of the idea that migration is a threat, corroborated with the creation of normalized exceptional legal regimes (such as border transit centers or expedited procedures without full rights), may lead to a cultural and legal paradigm shift. In this scenario, the exception tends to become the rule, and the sacred principle of non-refoulement risks becoming a simple declaration of intent, emptied of content in the face of the bureaucratic machinery of the security state. It is imperative that legal doctrine and the academic community remain vigilant and continue to subject anti-migration measures to the same rigorous test of legality and proportionality that applies to any other form of exercise of state power.

Abstract
The current publication aims to bring back to the public's attention one of the most dramatic pages in recent history, when, according to estimates, approximately 200,000 people lost their lives in the post-war period. An attempt is made to bring to light alarming data and factual situations, likely to demonstrate the trauma that continues to mark entire families, a tragedy that has left deep traces in Moldovan families, transmitted from generation to generation. This dramatic period demonstrates deliberate policies of the Soviet regime, designed to control the population and reduce any form of opposition. At the same time, we tried to cultivate the urge to assume historical truth and preserve collective memory.

Keywords: crime fighting, crimes of communism, cannibalism, deportees, famine, crime investigations, criminal law, prevention, evidence, desecration of corpses, respect for human rights, freedoms and dignity, totalitarian regime, child abduction, repressions, suicide.

FENOMENUL RĂPIRII COPIILOR ÎN TIMPUL FOAMETEI DIN ANII 1946-1947, PROVOCATE ARTIFICIAL DE CĂTRE AUTORITĂȚILE SOVIETICE PE TERITORIUL RSSM

Abstract
Actuala publicație își propune să readucă în atenția publicului una dintre cele mai dramatice pagini din istoria recentă, când, potrivit estimărilor, aproximativ 200.000 de oameni și-au pierdut viața din perioada postbelică. Se încearcă aducerea în lumină a unor date și situații de fapt alarmante, de natură a demonstra trauma care continuă să marcheze familii întregi, tragedie care a lăsat urme adânci în familiile moldovenilor, transmise din generație în generație. Această perioadă dramatică demonstrează politici deliberate ale regimului sovietic, menite să controleze populația și să reducă orice formă de opoziție. Totodată, am încercat să cultivăm îndemnul la asumarea adevărului istoric și la păstrarea memoriei colective.

Cuvinte-cheie: combaterea criminalității, crimele comunismului, canibalism deportați, foametea, investigații infracțiuni, legea penală, prevenire, probe, profanare de cadavre respectarea drepturilor, libertăților și demnității umane, regimul totalitar, răpirea copiilor, represiuni, suicid.

Introduction. Over three decades have elapsed since the dissolution of the Soviet Union, but victims of the repressive communist totalitarian regime are still struggling to assert their rights. The existence of these unresolved cases illustrates the complexity of investigating crimes committed under communism and the broad spectrum of difficulties experienced by those persecuted by the Stalinist regime. Paradoxically, against this backdrop, certain nostalgic groups advance the incoherent idea of rebuilding the Soviet Empire, claiming that they allegedly lived better during that period. These propagandistic messages seek to justify the atrocities suffered by our compatriots and to glorify the criminal regime that held the territory of today's Republic of Moldova under military occupation for decades. Praising the Soviet totalitarian regime represents an insult to Bessarabians who were executed or imprisoned on the basis of politically fabricated charges, deported individuals, people deprived of their assets, and those unlawfully interned in psychiatric hospitals, all for resisting the occupation regime. The genocide reached its culmination in the Soviet-organized artificial famine of 1946–1947, during which hundreds of thousands lost their lives, and the survivors endured severe and unimaginable hardships.

Concerning the intentional aspect of the famine, we highlight that it did not arise only from unfavorable natural circumstances, but also from coordinated actions implemented by the Soviet authorities. The extreme level of degradation to which the population was subjected explains concrete examples of people being compelled to adopt desperate survival strategies. People brought to the limit of starvation were pushed into resorting to banned means of survival. The regime subjected the population to extreme conditions, sometimes leading to instances of cannibalism.

Methods and materials applied. The creation of this publication involved the use of theoretical, normative, and empirical data. Taking into account the specific and complex nature of the investigated topic, the present research was made possible through the application of several scientific research methods specific to criminal investigation theory: the logical method, the historical method, comparative analysis, systemic and statistical analysis, etc.

The purpose of the research. Is based on: an in-depth study of criminal, procedural, and special investigative regulations concerning child abduction during the famine, analyzed from historical, theoretical, and practical perspectives, highlighting trends and ideological specifics in this field; the shortcomings and challenges that appeared in the judicial practice of the Republic of Moldova, alongside proposed solutions, demonstrate that this dramatic period evidenced the Soviet regime's deliberate policies designed to control the population and suppress opposition.

Depending on the intended purpose, we aim to achieve the following objectives: a) research on the legal regulation addressing child abduction during the 1946–1947 famine; b) emphasis on famine as a mechanism of political control used to defeat population resistance and impose Soviet ideological doctrine; c) formulation of theoretical and practical solutions indicating that, in addition to natural factors, there was also a deliberate intent to break the resistance of those who rejected the new ideology of the "new man".

Discussion and results obtained. Reviewing the crimes committed by the Soviet totalitarian regime against our compatriots, the political dissident GH. Ghimpu remarked within a scientific forum: "...By means of force and terror, the representatives of the Russian-communist totalitarian occupation regime imposed a communist ideology on the Romanian population of the Republic of Moldova, introducing a foreign culture, history, and language to the native people of Bessarabia; they enforced collectivization, deported hundreds of thousands of citizens, and eliminated those who held liberal and democratic

ideas that were dominant in Bessarabia at the time of its occupation by the USSR (June 28, 1940 and August 24, 1944)" [1, p.53]. Reconstructing the sequence of events, we observe that after taking power in 1944, the new regime subjected individuals with different political views to political repression. Subsequently, in the 1946–1947 drought period, all food reserves were taken from the native population, leading to an unprecedented famine that cost the lives of over two hundred thousand people. Obviously, the party elite, experts invited from Soviet Russia, activists, and other privileged categories were supplied with food rations. Simultaneously, a large part of the population that did not command the confidence of the Soviet authorities was left to starve to death. Repressive institutions arrested individuals who, at the limits of their endurance, protested and showed their disapproval of the communist regime. They were accused of acting aggressively, engaging in conflicts with Soviet authorities, and breaching public order. Certain impoverished peasants who repeatedly requested food for their children were arrested and sentenced for anti-Soviet propaganda. The Soviet authorities were indifferent to the starving locals and, on the contrary, aimed to strip them entirely of willpower, transforming them into docile, depersonalized subjects of the regime. Nevertheless, torture by means of starvation generates multiple detrimental outcomes. Consequently, crimes typical of famine-related crises started to be recorded, such as violence, abduction, theft, robbery, and banditry.

Meanwhile, as the authorities delayed the distribution of food to the population, living conditions deteriorated significantly, leading to crimes including abduction, homicide, cannibalism, desecration of corpses, and suicide. Unfortunately, some individuals suffering from dystrophy were gradually transformed into predators willing to consume even their own kind. Many children were among those victimized by these criminals, who had already lost their human status. This research paper provides information on the phenomenon of child abduction during the 1946–1947 famine.

The investigation involved the study of works by local scholars who described this historical period, with particular attention to eyewitness testimonies. Declassified archival materials were examined and cross-checked with contemporary press sources and history textbooks published by Soviet authors. On the basis of this analysis, the falsification of historical facts by Soviet authors was established, and new pertinent evidence was identified for the investigation of communist crimes. This article presents excerpts from documents indicating that the Soviet authorities deliberately provoked the famine and did not take measures to eliminate factors that encouraged criminality in such crises, including the abduction of children and adults, who were killed by criminals for consumption of their flesh. Many of the abducted and murdered children were under the age of ten. Some became victims of violent attacks, while others were attracted by deceptive promises of food. Unfortunately, some of the perpetrators were people familiar to the victims, frequently their neighbors. Easily falling victim to criminals were orphaned children, those left by their parents, or those without supervision. During the research, cases were found of adults involving children in criminal activities, using them to lure victims. Simultaneously, it was established that crime trends were influenced by the Soviet authorities' hostile and discriminatory approach toward the native population, who were deliberately subjected to devastating living conditions in an attempt to physically eliminate individuals expressing national dignity. By means of the artificially caused famine and the violent actions of Soviet repressive organs, the communist totalitarian regime managed to depersonalize and demoralize part of the local population, bringing them to a level corelated to primitive tribes. Due to dystrophy and mental illnesses, they committed murders and consumed human flesh in order to survive by all means. The above-mentioned facts reveal that totalitarian regimes, seeking to stay in power, use tactics reminiscent of barbaric

tribes.

Referring to the criminogenic situation in countries under such regimes, Iurie Larii states that: "...nothing separates people as sharply as political disagreements. Political interests are, in most cases, linked to the pursuit of power, a process in which political opponents use extremely harsh methods and means" [2, p.120-128].

As previously indicated, one of the methods repeatedly applied by the Soviet authorities to suppress political opponents involved artificially provoking famine. Thus: "In 1920, the Bolshevik organization, which had only recently adopted the official name of the Communist Party, started establishing the policies that would ultimately regulate every aspect of everyday life". They were subjected to "work mobilization", meaning that they were obliged to work where, when, and as instructed by the government. Industrial enterprises were headed by directors appointed by the government. Across rural areas, Red Army troops forcibly confiscated peasants' grain and animals under the threat of arms. Shortages continued to make themselves felt, and virtually everything was rationed — food, clothes, even books and tobacco... Similar to food shortages, access to fuel was severely limited. In order to survive the freezing winter, city residents tore planks from fences and wooden houses to use as firewood. People cut down trees from urban parks and burned their books and household furniture for fuel... Sometimes, the cities looked deserted, like ghost towns. "The houses seemed to be the ruined crypts of forgotten graveyards", wrote a resident of Saint Petersburg. "The inhabitants moved [through the city] in a manner resembling living corpses [...]. Deprivation slowly consumed them, and death macabrely clasped their hearts in its claws" [3, p.268-269].

Any revolt was violently suppressed on the orders of the Bolshevik leader Vladimir Ilyich Lenin. According to Candace Fleming: "The situation had grown so desperate that, in March 1921, thousands of sailors, formerly the Bolsheviks' most ardent supporters, openly rose up against the communist authorities". Disappointed by the treatment of workers and peasants under Lenin's rule, they went into the streets demanding the freedoms the Soviet regime had stripped away: free elections, freedom of speech, freedom of the press, independent unions, and peasants' freedom to cultivate their land for their own benefit.

Lenin refused to allow anyone to challenge the power of the Soviets. Sending the Red Army against the rebellious sailors, he unleashed a bloody attack that raged for several days. When it was over, thousands of sailors were dead, and several hundred more were subsequently executed.

True to his fierce realism, Lenin saw the sailors' uprising as proof of a society in profound illness... However, Lenin died on 21 January 1924, and Stalin quickly seized control of the government. He promptly initiated a "purge", eliminating all former Bolshevik leaders, regardless of allegiance, by exile, execution, or assassination. At this point, Soviet Russia was entirely controlled by a ruthless leader committed to transforming the country into a world power, without consideration for the loss of freedoms or human life" [3, p.269-270].

The population's standard of living had worsened enormously. People continued to die of hunger, while the Soviet authorities concentrated on identifying so-called "enemies of the people", who were blamed for all irregularities: "from an ideological standpoint, it was deemed unacceptable to regard Stalin's administrative and political failures, or those of the Soviet leadership, as causes of the Soviet economy's numerous problems, which resulted from collectivization and the Five-Year Plans. These issues were attributed to large, non-existent conspiracies. In 1937, for example, the NKVD (People's Commissariat for Internal Affairs) uncovered an "extremely vicious form of sabotage", entirely fictitious, allegedly carried out by "veterinarians, livestock specialists, and laboratory assistants",

who were said to engage in "bacteriological subversion, infecting cattle, horses, flocks of sheep, and pigs with plague, foot-and-mouth disease, anthrax, brucellosis, anemia, and other infectious diseases", resulting, according to the NKVD, in the deaths of hundreds of thousands of animals. The Politburo directed all republics and regions of the USSR to conduct three to six trials each involving imaginary conspirators, with the aim of warning the "broad peasant masses" about supposed but nonexistent sabotage activities" [4, p.708-709].

Local authors who have examined life under Soviet rule write that: "The totalitarian past may have achieved its most diabolical experiments on members of society. Alternatively, those who resisted were exterminated, exiled, or sentenced. To enable the implementation of communist doctrine, society was subjected to processes of stigmatization, division, and the collectivization of both private and personal spheres of life. First, private property, which formed part of individuals' sense of identity, was eliminated, and collective ownership was introduced to serve the interests of the ruling elite. Expropriation was conducted so ferociously that fear of losing private property, including land, turned into a genuine social illness, even affecting children.

Second, an equality of hidden poverty and inequality before the law among citizens. This effectively signified the marginalization of labor as the only criterion of prosperity and its replacement with loyalty and unconditional obedience to doctrinal power. Thus, the brainwashing of the majority of society was achieved and transmitted from one generation to the next, forming a mass mentality. A kind of mentality previously unknown in human societies, defined by the level of alienation of its members, through which the leadership took revenge on those who opposed the established regime" [5. p.207].

Evidently, members of the party and representatives of the Soviet authorities were supplied with food and comfortable housing. It is hardly accidental that the Soviet criminologist N. Struckv refers to Karl Marx when discussing the factors that influence deviant behavior during famine: "Hunger is hunger", wrote K. Marx, "but the hunger that is appeased with boiled meat eaten with a knife and fork differs from the hunger in which meat is consumed raw, with the hands, nails, and teeth" [6, p.17]. This statement by Karl Marx was deliberately misused by the Stalinist regime, which, drawing on its own experience, repeatedly engineered famine. The Bolshevik leaders realized that the shortest path to shaping human behavior and enforcing loyalty to the regime lay in the use of starvation as a weapon of torture.

During the famine of 1946–1947, the Soviet regime subjected the population to extreme conditions, at times resulting in the consumption of animal carcasses and instances of cannibalism. Reflecting on the impact of the artificially created famine brought about by Soviet power, the author V. Tchalikidze notes that in 1922: "In the Volga region, where famine was devastating the area, criminal groups specializing in cannibalism were operating, composed solely of minors" [7, p.175].

The same author highlights that the Soviet leader: "N. Khrushchev confirmed that, during the 1946–1947 famine, cases of cannibalism were reported in the territory of Ukraine" [7, p.176]. It should be noted that N. Khrushchev was part of the Stalinist regime, which is responsible for artificially causing the famine in the Moldavian Soviet Socialist Republic.

Evidently, the Soviet power also enlisted local activists to take agricultural produce from the population, stripping them of the means to survive. Eyewitness Valentin D. Buts, born in 1931 and a native of the village of Ferapontievca, provides the following testimony: "...At that time, illiterate people were in power, but they were devoted to the Communists. We would say it differently: at that time, the Soviet regime needed obedient people who

would listen and carry out orders, but who showed no concern for the people. It is widely known that none of the local residents respected the chairman of the village soviet, as he lacked the ability to work for the people and was only inclined to report villagers to the militia authorities for punishment. Many diligent and responsible people suffered at that time without having done anything wrong" [8, p.82].

Many residents were expropriated by the Soviet authorities on the grounds that their households had prospered during the period of Romanian administration. Describing her own life, a resident of Avdarma village stated: "Evdochia Chiril Tumba, born in 1936, stated the following: "In 1944, the Soviet authorities mobilized my father, Chiril Vasilievici Tumba... My mother remained at home with six children... In the winter of 1947, our family had fallen into a catastrophic situation. My mother could barely manage to feed six children. At the same time, our aunt was living together with us, along with her six children. In 1946, the Soviet authorities arrested her husband and sentenced him to prison simply for being a "kulak" ... Here should be added that the local authorities excluded us from the list for food provision at the "canteen," and as a result our family of 12 children experienced severe hardship during the famine. The Soviet authorities treated our family in this way, on the grounds that we had enjoyed a better life under Romanian administration" [8, p.120-121].

It is well known that the Kremlin leadership in the post-war period initiated an anti-Romanian campaign in the Moldavian Soviet Socialist Republic. According to the author Iurie Larii: "The incitement of national hostilities by many politicians of the former USSR, through political appeals and slogans pushed to absurdity, became a cause of numerous serious crimes, including mass murder, violence, terrorism, and the forcible occupation of foreign territories, and also affected overall criminality, considerably aggravating its situation. Under such conditions, the social life of the population becomes unbearable, and as a consequence, these situations generate not only various criminal and delinquent behaviors, but also mistrust, social tension, fear, and psychological stress among the population" [2, p.122].

Local activists in the Moldavian Soviet Socialist Republic also caused serious problems for the native population, denouncing fellow villagers not out of political beliefs, but in order to receive rewards from the Soviet authorities for their servility. The author Vasile Balan reports on the presence of such individuals during that time in his native village of Cărpești: "The famine of 1946–1947 claimed several times more lives in Cărpești than the war. The attics of the houses and the barns were entirely empty. They were cleared out by the members of the village soviet together with the "agricultural plenipotentiary. When has it ever been seen to collect "supply" during drought? People were deprived of their last piece of bread and their last chance of survival. Were the district and republican authorities not aware of what was happening?

Obviously not. The barns and attics continued to be emptied, which doomed many locals in Cărpești to starvation. The leadership of the union, republic, district, and village, devoted entirely to Bolshevism, likely deliberately organized the famine, believing that starving peasants would join the collective farms. The village soviet is also responsible, particularly the activists S. Bâzu and E. Chiosa, who denounced fellow villagers who attempted to conceal the little they still possessed... Those who refused to deliver the "supply" were beaten, imprisoned by the NKVD, mistreated, tried, and deported as "enemies of the people." ...Hunger and disease left devastation in almost every home. In some households, everyone died. In spring, people consumed reedmace, coltsfoot, knotweed, amaranth, dock, nettles, oak acorns, and grape pomace, or even boiled their own leather footwear. There were no longer any cattle or poultry left in the village. In some cases,

people resorted to eating crows, cats, and dogs. There was also a case of cannibalism..." [9, p.65].

As previously mentioned, children became particularly easy victims of cannibals. Some of those who survived still recall with strong emotion the experiences they endured: "Dmitrii I. Savastin (born 1942) provides the following account: ... The Communist authorities confiscated nearly all of our assets. Due to an acquaintance of my father employed by the village soviet, our family was allowed to retain a cow and a small quantity of grain, which ultimately ensured our survival. I will never forget that during the famine my mother was compelled, perhaps fortunately for our family, to work in the household of a Russian military officer. She spent the whole day cleaning, washing clothes, and performing other household duties for just one loaf of bread. We, the children, waited for her anxiously at home. Every time, she shared the bread only with us children, hardly eating anything herself.

I frequently recall a disturbing incident. In the spring of 1947, my sisters and I went into the fields in search of edible herbs. Suddenly, a man appeared ahead of us and began running toward us with a frightening expression on his face. In fear, we ran away, running beyond our strength to escape him. He was likely one of the cannibals chasing down his prey. At that time, many people found themselves in such a condition. We express gratitude to God for preserving our lives" [8, p.95].

According to Ivan P. Crușca, there is another case involving his elder sister: "My father, Porfirii Ivanovici, was mobilized for work in the city of Perm in 1945. My mother, Parascovia Pavlovna, remained at home with my sister. When the collective farm was formed in our village, my mother, like other villagers, was sent to work in the fields. Under those conditions, she was forced to leave Domnica at home together with her cousin Lena. On each occasion, she instructed them to lock the door and not to open it to anyone. At that time, people said there was a cannibal in our village who was kidnapping children, cut them up, and fed on their flesh. This individual was constantly seeking out houses where children were left alone. On one day in 1947, he came and knocked on the door of our house, where my sisters were. He spoke to them very softly, telling them to open the door because he had brought bread. Cousin Lena, affected by hunger, accepted his words and moved to open the door, while Domnica strongly refused, invoking their mother's warnings. She was compelled to intervene and stop Lena by force. The situation suddenly changed when that human-faced animal began forcing the door of the house. Fortunately for the sisters, a neighbor, an elderly woman named Calina, observed the situation, raised the alarm by shouting, and the offender left. Following that incident, the mother ceased leaving the children at home and instead brought them with her to the fields where she worked" [8, p.61].

In many cases, the children did not manage to escape. The existence of criminals practicing cannibalism has been noted by several authors. Based on the information published by them, certain characteristics of the psychological profile of these inhuman individuals can be identified. Studying the development of events in the village of Mingir, Hîncești district, the author Iacob Lupanciuc writes: "As in many places across the republic, numerous cases of cannibalism were recorded, and Mingir was not spared from this scourge.

... In the village lived two sisters with the surname Condrovschii, and in the same neighborhood lived Maria Sărățanu with her 10-year-old son. During the winter of 1946–1947, after heavy snowfall and with the neighborhood situated on a gentle slope, Maria's child was sledding along the street. At a certain moment, the child disappeared together with the sled. Seeing this, his mother began to search for him in a hurry, but without any success. Following the investigation of several traces and signs, suspicion fell upon

the Condrovschii sisters. Quickly calling on her neighbors, the poor woman, with their help, rushed into the yard of those sisters, where, in a mound of snow by the corner of their house, found the child, but already chopped into pieces to be put in the pot soon. The child's clothes, along with the sled, were found in their house, under a little bed. The Condrovschii sisters were arrested, after which there was no further information about them" [10, p.220-221].

By correlating this information with archival sources, it was found that: "On January 20, 1947, the residents of the village of Mingir, Magurcean Nina Antonovna, born in 1917, and Grunovschi Axenia Antonovna, born in 1925, following a prior agreement, kidnapped the 9-year-old boy Târsină Denis, brought him to their home, where they cut him up and ate the meat. Both of them were arrested" [11].

In the same study, the author Iacob Lupanciuc writes: "Another case of cannibalism, even more extreme, was identified in the case of Andrei Sârbu. At his residence, according to the testimony of several residents of Mingir village, 14 human heads were found. Mihai Bordei, a 14-year-old boy at the time, recalls once encountering this Sârbu, together with Anton Morărașu, carrying a large dog on his back, with its tail dragging along the ground. Stopping in his tracks, this cannibal told the boy to come to his house, saying he would give him food, as he had plenty. Observing with attention and suspicion what he had just witnessed, with that dog on his back and the way he was being sized up, the poor boy ran away and only stopped once he reached home, out of breath" [10, p.221].

Unfortunately, not all children were able to identify the risks associated with exposure to strangers. There were cases when they were taken by women who managed to manipulate them into following them. As a rule, they used the promise of food as a lure. In his work, Iacob Lupanciuc describes a case in which individuals succeeded in saving an abducted child: "Tudor Bordei's wife, Panaghia, later married to Efim Scutelnicu and now over 80 years old, herself testified that her 5-year-old child Sava was abducted by Zinovia Sârbu, the mother of that cannibal. Fortunately, the child was rescued by Trocin Păcală, the husband of Maria Enechescu" [10, p.221].

In one of the strictly secret notes sent to Covali, Secretary of the CC of the CP(b) of the Moldavian Socialist Soviet Republic, by the Deputy Minister of Internal Affairs of the Moldavian Soviet Socialist Republic, Major General Orlov, the following information is included: "The Internal Affairs Department of Bujor district reported that in the village of Mingir, within the same district, the locals Andrei Gavril Sârbu (b. 1920) and his wife Zinaida Ilie Sârbu (b. 1923) are suspected of practicing cannibalism. Human bones and two skulls were uncovered in the basement during searches carried out at their residence. The investigation revealed that toward the end of February, the Sârbu spouses lured an unidentified woman into their home and killed her. The same method was used by both to kill an unknown man on March 10. They used the bodies of the murdered individuals for food... both have been arrested and will be held criminally liable" [11].

Orphans and children abandoned by their families as a result of the famine frequently became the victims. Recalling the events of that period, citizen Cîrlig (Topal) Livia P., born in 1928, stated the following: "Once, in the city of Bender, I witnessed a mother abandon both her children in the marketplace, after which she boarded a train and left. The little boy and girl were taken in by the militia and were probably placed in an orphanage. We cannot bring ourselves to condemn that woman for the act she committed. She undoubtedly realized that at home her children might perish from starvation, while in a children's institution they could survive" [8, p.72].

Due to the large number of children lacking care, Soviet authorities opened a wide network of orphanages. The media of that time published materials in which the situation

of children in these institutions was shown in a favorable light. A relevant example is the article below: "At the children's home in Chițcani village, Bender district, there is a lot of bustles as the rooms in the four new sections are being whitewashed. The boys are setting up tables, chairs, and beds, whereas the girls are sewing the curtains. The orphanage is getting ready to take in another 100 pupils. The director of the institution, Comrade Hodorovskii, assisted by the Komsomol members Turculeț, Filipovici, Baran, and others, is making every effort to ensure comfort and a warm, homelike atmosphere for the newly arrived pupils. Warm clothes, bedding, and hot food three times a day have already been prepared for them" [12, p.3].

In reality, a large number of children in orphanages perished from starvation. The resident of Cioc-Maidan village, citizen Plucci Petr Mihail, born in 1923, testifies that: "an orphanage was opened in the locality. Orphans from the village and surrounding areas were brought together. Each child received 300 grams of bread daily and was provided with three meals a day. Classes were held in the village school building. During the period of famine, two children lost their lives" [8, p.234].

Details concerning the real condition of children in orphanages can be found in archival materials. One of the highly classified notes reports that: "Eight children in terminal condition due to starvation were identified in the children's home in Vorniceni and were hospitalized. It was found that the children's home had not received 80 kg of fats in January, and the children's feeding was carried out in breach of the established norms" [11, page 53].

Frequently, children escaped from these institutions in search of something to eat. Thus: "On 24 March, the Răspopeni District Internal Affairs Division was informed of the disappearance of pupil Maximov from the Oleșcani Children's Home No.1". Following the measures taken, it was established that the resident of the village of Oleșcani, Barbos Elena, born in 1910, previously convicted by the Romanian authorities for theft, and her son Barbos Vasilii Nicolaevici, lured the minor Maximov, born in 1932, into their house, whom they killed by hitting him with an axe. They ate his flesh. During the search of their residence, the garments of pupil Maximov were identified. Both criminals were taken into custody" [11, page 175].

Soviet history manuals glorified the communist regime for the results obtained during 1946–1947. The writers of these materials deliberately avoided reflecting the reality of the horrors endured by the local population during the famine. Information of this kind was reported to the leadership only in strictly secret documents, while the population, even more than five years after the catastrophe, was informed in crude language using Cyrillic letters about the following "achievements" of the Soviet authorities at the time: "It significantly upgraded the material infrastructure of pedagogical establishments, which in turn improved the quality of teacher preparation... In 1946, the 8th Plenum of the Central Committee of the Communist Party (Bolsheviks) of Moldova debated the issue 'Regarding the preparation of the republic's schools for the 1946–1947 academic year,' the first year of the post-war Stalin Five-Year Plan" [13, p.230-231].

It should be noted that the repressive regime used properties taken from the so-called kulaks to establish orphanages and schools. The feeding of pupils and teachers was based on agricultural produce forcibly requisitioned from the population. Soviet propaganda, of course, declared that the local inhabitants were voluntarily supporting the Soviet state: "The population of the republic actively engaged in the construction and repair of schools and classroom facilities, in ensuring fuel supply for schools, and in creating funds for universal education, as well as in setting up boarding schools and hot morning meals" [13, p.231].

Researching archival materials, we find that due to the famine in the region during the reference period, criminal groups specialized in kidnapping children, killing them, consuming and trading human flesh as well as products prepared from human flesh were formed. The leadership of the Moldavian Soviet Socialist Republic was notified of the existence of such groups by the Deputy Minister of Internal Affairs, Major General Orlov, who reported that: "On March 14, 1947, information was received that citizen Borșci Agripina Ivanovna, born in 1912, and her brother Nicu Alexei Ivanovici, born in 1910, who live in the suburb of Chișinău, on Sfânta Vinere Street, in the Schinoasa village soviet, having no means of subsistence, consume human flesh daily and sell such flesh. During the investigations, it was found that Borșci and Nicu kill people and consume their meat, and sell some of it to the population... Both suspects were detained" [11, page 167].

There were criminal groups that, after killing their victims, distributed the human flesh for consumption among the group members: "residents of Vădeni village, Soroca district, including Iavorschii N.F., Iavorschaia A.P., Iavorschii F.F., Gulii M.P., Gulii A.I., and Gulii I.A. On March 26, they killed citizen Andries A.F. and consumed his flesh. On April 3 of this year, they kidnapped and killed a 13-year-old boy, Graur Matvei Feodorovici, whose body was dismembered and divided among the group members to be consumed. All of them were arrested and held criminally liable" [11, page 180]. The same note reports that: "Residents of the village of Vantseva, Soroca district, Renitchii Ivan Vasilievich, born in 1926, and Renitchaia Evdochia Ivanovna, born in 1907, both poor peasants, on April 7 kidnapped and killed a little boy from the same village, Mucomol Grigorii Semenovich, 12 years old, they divided the meat between them and partially consumed it. The two offenders were arrested" [11, page 180].

A case of kidnapping and murder of a minor was discovered even by the meat collection officers. The information note sent to the Moldavian Soviet Socialist Republic leadership states the following: "On March 19 of the current year, the resident of the village of Unguri, Otaci district, Soroca county, Casico Semen Ivanovici, born in 1896, killed an unknown minor aged 16-17, a beggar who entered his house to ask for something to eat. The body was hidden in the attic of the house to later consume it as food. While the offender was cleaning bloodstains in the yard, he was spotted by the meat procurement officials Zabolotnîi and Boico, who came in the exercise of their duties. The offender was arrested" [11, page 175].

It is evident that even during the famine, activists and authorized collectors of food from the population continued their operations. As we mentioned before, we cannot rule out the fact that some criminals also supplied these proxies with human flesh, in order to meet the quotas, set by the Soviet authorities.

Meanwhile, thousands of people were dying from malnutrition-related dystrophy. Mass graves were prepared for the burial of the numerous bodies in the cemeteries of various settlements. Frequently, even people who were still alive were thrown into these pits. Citizen Anghelov Ivan Vladimir, born in 1935, described the ordeals he experienced, stating that in 1946, at the age of 11 and in a critical condition, he was admitted to the hospital in Avdarma: "During that period, my aunt worked in a temporarily established hospital in the village for people affected by dystrophy, located roughly 200–300 meters from the hospital I was in. In a moment of desperation, I made the decision to visit that hospital. It was an old auxiliary building (a barrack) where people severely ill from famine were admitted. When I opened the door, I saw a horrific scene that I still cannot forget to this day. There were people in that place who were on the brink of death, barely able to move and only attempting to whisper something. Most of them were transported from this place to the cemetery. My days were spent here as well... I became unable to move,

yet hearing the conversations near me made me aware that I was still alive. I didn't want to live anymore. One night I heard: "Take him before his aunt gets back!" But fortunately, as if it were God's will, my aunt arrived at that moment, and the grave diggers left me alone. Later I realized that it wouldn't last long... I don't know: "Who made the decision to bury the people who were still alive in a common grave? Obviously, these living beings were thrown into the mass grave by the grave diggers, who received in return their food ration for that day. I would like to see the records kept by those individuals and the doctors who issued death certificates for persons who were still alive" [8, p.107-108].

I. Anghelov further states: "I was not afraid of dying; nevertheless, deep down I wanted to stay as long as possible with my aunt" Several days passed after that incident, but my situation did not improve in any way. Once again, I heard the same voice: "She went home, hurry and take him!" They put me on a ladder serving as a stretcher, laid the body of a girl on me, and carried us out of the room. While the grave diggers were carrying us toward the cemetery, passing by the church, they came across my aunt Maria and informed her that I had died. I still remember her words: "I want to see him for the last time." Approaching the stretcher, she looked at me and, seeing that I had blinked, right away demanded my return to the hospital. Thus, I was saved from death" [8, p.108].

Similar cases took place in other settlements as well. In this regard, author Vasile Balan states that in the village of Cărpești: "Each day, 3–4 people died and were interred in mass graves. Grigore Mocanu, who worked as a gravedigger in those days, shared the following account about that period. The famine of 1946–1947 covered our village in grief and darkness as well. We buried so many people that I can no longer keep count of them... We did not close the grave completely for a few days, until it was filled. But there were cases when even semi-conscious people were thrown into the common grave. I still cannot forget Anica Znacoveanu, a Gypsy woman we found unconscious in the middle of the road. We laid her in the sleigh along with the others, assuming she had died. When we moved to place her in the grave, she suddenly started groaning. Ilie Argint, who at the time led the village soviet and was accompanying us, told us to throw her into the pit too: "She'll die anyway," he said. "So we buried Anica Znacoveanu alive as well. May I be forgiven for this sin", Mr. Grigore concluded, making the sign of the cross [14, p.65-66].

Naturally, this whole ordeal took place under the cover of **Soviet propaganda articles**, which presented a different version of events. As cases of cannibalism were reported in January 1947 across the Moldavian Soviet Socialist Republic, and activists seized the last remaining food from people, Soviet correspondents wrote: "The collective farm had already prepared the seeds and placed them in granaries. The grains are kept in proper storage conditions and protected against rodents. This refers to seeds of wheat, rye, barley, and corn... Every morning, the collective farm employees move out to the planted fields. They use shovels to cut frozen snow into slabs, stacking them to build ridges that will capture the incoming snow. By this method, 120 hectares had already been processed" [15, p.3].

The article "Let's Protect the Orchards" mentions that: "The young viticulture and orchard workers of the Săseni sovkhoz in Bravicea district take care of orchards and grapevines". Young people from the state farm wrap the trees' trunks with bulrushes and prepare stakes for the vines. Efrosinia and Elena Cemortan are carrying out 180–200% of their daily required output" [16, p.3].

In reality, many of the settlements praised by propagandists in the press were recording high numbers of people affected by dystrophy, along with a rise in crimes typical of the famine period. As previously stated, in most cases cannibals would lure **children with false promises that they would provide them with food. Given their young age, the**

children could not comprehend the adults' cruel intentions.

A strictly confidential note signed by Major Lavrentiev in February 1947, head of the Moldavian Soviet Socialist Republic of the MIA secretariat, states that: "On February 9, 1947, the resident of the village of Taraclia, Căinari district, Stepu Leonid Ivanovici, born in 1912, lured the little boy Guranda, born in 1935, into his house, killed him in order to eat his flesh. He was arrested and taken away... on February 15, 1947, in the village of Cimișlia, Bazatic Maria Savovna, born in 1925, and Bazatic Anna Savovna, born in 1920, lured a 7-year-old girl, Bulat, into their house, killed her, and ate her flesh... The Bazatic sisters were placed under arrest" [11, page 78].

The following note states that: "On February 28, 1947, the inhabitants of the village of Sturzovca, Glodeni district, Balti County, the poor peasants Chilar Anna Stepanovna, Gornan Vasilii Ivanovici and Galușca Zinaida Ivanovna, lured into their house a 10-year-old boy, Crețciuc Mihail Danilovich, whom they cut up and ate his flesh... Everyone involved was arrested and charged with criminal offenses" [11, page 127].

Many children were declared missing during that period, with no further information about them. Following the investigation, some of the remains were found, while other children were never discovered. According to archival records, the following information has been preserved: "On June 8, 1947, an 11-year-old girl from Voroneț village in Chiperceni district, Vorgan Zinaida Feodorovna, disappeared from the family orchard. Her parents notified the village soviet and expressed suspicion that the peasant women Botnar D.A. and Caciuc A.A. from the same village had abducted and killed her. Following investigations carried out by employees of the Internal Affairs Department of the Chiperceni district, it was found that the girl was indeed kidnapped and killed, and her flesh was consumed by the criminals. It was also established that previously, a 15-year-old orphan girl, Russu Vera Timofeevna, was kidnapped and killed by them, whose flesh was consumed by the criminals, who were joined by the resident of the same village, Lopatinschaia A.G. All of them were arrested and brought before criminal justice proceedings" [11, page 191].

On April 26, 1947, information was received by the OAI section of Olănești district regarding the disappearance of two underage sisters, Agafia Joltîri (10) and Tatiana Joltîri (15), from the village of Purcari in Olănești district. Following the measures taken, it was found that both were killed and their meat consumed by the residents of the same village, Danilescu Olga Constantinovna and Murzac Olga Constantinovna. The offenders were prosecuted under criminal law" [11, page 192].

It should be reiterated that in certain cases, offenders could abduct a child simply by promising him a piece of bread. Confirmation of this comes from the following archival records: "On January 26, an unknown 11-year-old girl came to the house of Grigorii Nichitovici Sharov (b. 1928), a poor inhabitant of Volontirovca village, and asked for some bread. Sharov and Sharov's sister Lyudmila Nikitovna, born in 1926, killed her, dismembered her body, and ate the flesh. Both were arrested and taken away" [11, page 78].

Further information on the same case is provided in the following document, which states that: "In the village of Volontirovca, Bender County, in the house of citizen Sharov Grigorii Nichitovici, born in 1920, a dismembered body of an 11-year-old girl was found, part of which was consumed as food. The investigation determined that Sharov and Sharov's sister Lyudmila Vasilievna lured an 11-year-old girl who was passing by their house into their home by promising her bread and killed her. The identity of the minor has not been established to date. Sharov G.N. and Sharova L.V. have been arrested" [11, page 14].

Upon examining the case, it is noted that the victim has not been identified. It is also hard to determine how many such cases took place and how many children are currently

still regarded as missing.

The research materials indicate that children under the age of 10 were more easily victimized by criminals. In a number of cases, the children were abducted by individuals they were acquainted with. Frequently, they were neighbors, as a matter of fact. In the following, we will present a few examples of this type: "On January 24, 1947, the inhabitants of the village of Mileștii Mici, Chișinău district, Chihai Constantin Alexandrovici, born in 1927, a middle-class peasant, and Andronachi Nadejda Andreevna, born in 1930, lured their neighbors' daughter Petrașcu Parascovia Pavlovna, born in 1940, into the house of the Andronachi village, whom they cut up, dismembered, and consumed. Chihai and Andronachi were arrested by the authorities" [11, page 14].

The reports submitted by the Ministry of Internal Affairs of the Moldavian Soviet Socialist Republic mentioned that the main factor that generated the crimes of murder with the subsequent dismemberment of the corpse to consume the meat was the fact that most of the perpetrators did not have food and were deprived of help from the Soviet authorities during the famine. In this regard, we are involuntarily reminded of the statements of the American sociologist Edward A. Ross: "Human groups are often the final result of social processes." [17, p.171].

As previously mentioned, some offenders were suffering from a severe form of dystrophy. A case was reported in early April 1947 to the leadership of the MIA of the Moldavian Soviet Socialist Republic, showing that: "The resident of the village of Ialoveni, Chisinau district, Vasilița Evghenia Petrovna, born in 1917, a peasant, on March 10 kidnapped and cut up an 11-year-old girl, her neighbor Boldurat Feodosia Vasilievna, and consumed her flesh. Vasilița has third-degree dystrophy and has been isolated in a barracks" [11, page 174].

Often, those offenders died shortly after due to the ailments they were suffering from. Thus: "The resident of the village of Sarcova, Rezina district, Orhei county, Lesnic Irina Dmitrievna, born in 1897, on March 27 lured a 5-year-old child who was playing in the road, Morcan Feodor, into the yard of her house, whom she killed by strangulation, dismembered the corpse and partially used it for food. During the investigation at the scene, the other body parts of the murdered boy were found in the attic of the house. A few days following her arrest, Lesnic I.D. died as a result of pneumonia" [11, page 180].

Throughout the reference period, some adults involved children in criminal activities, taking advantage of their precarious situation. One of the strictly secret archival materials states to the Moldavian Soviet Socialist Republic leadership that: "On January 12, 1947, in the village of Avdarma, Comrat district, citizen Iazadji Nadejda, born in 1907, from a kulak family, with the participation of her daughter Elena, born in 1930, kidnapped and cut up a 7-year-old girl, Grec A.S., dismembered her body and ate it. Both of them were apprehended" [11, page 77].

The following top secret note states that: "Citizen Iahodji Nadezhda Ivanovna, born in 1907, and her daughter Iahodji Elena Ivanovna cut a 7-year-old girl, Gref Alexandra Sergheevna... Both women were arrested and recognized their guilt. No food supplies were received from the state by the Iahodji family" [11, page 8].

Another case was reported on May 26, 1947 as follows: "The residents of the village of Alexandresti, Râșcanii district, Derevensachaia D.N., her daughter Derevenschaia P.G. and her son Derevenschii E.G. killed their fellow villager Brenic Leonid Pavlovici, aged 6, and consumed his flesh. The perpetrators are being prosecuted under criminal law" [11, page 192]. This is followed by the statement that: "On June 28, 1947, at 10 p.m., Maria Feodorovna Miron, born in 1892, resident of Scoreni village in Strășeni district, through her daughter Feodosia Davîdovna Miron, aged 13, lured into the house the little boy Boris

Gheorghievici Miron, who lived next door. They cut him up and ate his flesh. During the investigation search, authorities discovered bones and clothing identified as belonging to Miron Boris Gheorghievici. Maria Feodorovna Miron and her daughter Feodosia Davîdovna Miron have been arrested" [11, page 197].

As previously noted, the Soviet authorities made no efforts to assist the population in overcoming these difficulties. On a formal level, meetings were organized and widely reported in the Soviet press. On the pages of "Molodiozh Moldavii," a concise report was published from a meeting dedicated to the fight against drought, stating that: "The gathering was attended by scientists, agricultural specialists, kolkhoz members, and peasants. Comrade Kashnikov, Secretary of the CC of the CP(B) of Moldova, addressed the audience from the tribune on "Measures to combat drought and develop water management in Moldova".

Based on the presentation, participants began active discussions. Professors Dorofeef and Kovarsckii of the Chișinău Agricultural Institute gave significant attention to the proposal on selecting drought-resistant agricultural crops. Other speakers highlighted the role of shelterbelts in agriculture. Comrade Golic, representative of the Central Committee of the CP(B) of Moldova, noted that in many districts insufficient attention is paid to irrigation system development and that the use of drought-resistant crops is progressing very slowly. He also spoke about the need to ensure greater snow retention in the fields and to use water from melting snow to achieve a rich harvest. For outstanding performance in the development of water management in Ceadîr-Lunga, the district received the Red Banner of the CC of the CP(B) of Moldova and the Council of Ministers of the Moldavian Soviet Socialist Republic. The meeting participants signed an address to all peasants and collective farmers of the republic, urging them to combat drought and develop water management. With great enthusiasm, the participants signed a greeting addressed to the leader of the people, Comrade Stalin" [18, p.3].

In reality, propagandists together with party leaders sharpened their skills in deception. They published lies in books and newspapers without remorse, while the population was facing a particularly serious situation. To confirm this, we present an excerpt from a top-secret report dispatched in February 1947 to the political leadership of the Moldavian Soviet Socialist Republic on combating dystrophy in Sângera, Chișinău district, stating that: "... For 99 patients with third-degree dystrophy, 25 beds are available in the Sângera hospital and 20 beds in a barrack opened close to the hospital. The facilities are severely overcrowded. Each bed is shared by three to four patients, who remain in their own clothing. There is no bedding or mattresses in either the hospital facility or the barrack. The hospital and the barrack are attended by one doctor, one feldsher, two nurses, nine orderlies, as well as five auxiliary workers. Conditions in both the hospital and the barrack are appalling because there is no firewood for heating. The responsibility is attributed to the chairman of the village soviet, Andrei Afanasievici Cazacu, the secretary Dmitrii Andreevici Brânzâlă, and the hospital doctor, Comrade Voroncihin. The disinfection chamber and bath are functioning poorly and with great difficulty. As a consequence, a large number of patients are infected with pediculosis ... During January and February 1947, 76 deaths were recorded in the locality, including 54 among hospitalized patients. Significant problems are caused by the lack of support from district party secretary Platov and executive chairman Grigorenco to institutions fighting dystrophy.

The situation worsened due to the negligence shown by the chairman of the village soviet and its secretary, who were to have delivered 35 m^3 of firewood from the Bender forestry enterprise already in July. Currently, they are going through people's yards looking for firewood to ensure heating for the hospital and barrack and to support the

food supply point" [11, pages 42-43]. A further note indicates that: "On 10 February 1947, 46,343 people affected by dystrophy were identified in Chișinău county, including 17,775 children... Only 5,342 patients from the total are under hospital treatment" [11, page 59].

From the evidence presented, it is clear that both local and central (Kremlin) authorities viewed with indifference the statistics showing daily deaths of thousands of people. In psychological terms, they did not differ from the Russian criminal Vasili Komaroff, who at the start of the 20th century killed and dismembered more than 33 people for material interest. During the investigation, he declared that: "he does not think humans are more important than caterpillars" [19, p.275].

It is obvious that this same mentality was present among the officials of the communist totalitarian regime reestablished in Bessarabia beginning in the summer of 1944. Some eyewitnesses insist that even the fascists in the war years did not behave in this manner. A resident of the village of Avdarma, Tumba Evdochia, testified that not all German soldiers were bad people: "During the summer of 1944, the German troops were withdrawing. One German soldier received orders to burn down the munitions warehouse in the middle of the village. Before setting the depot on fire, he went to an old woman's house and asked her to notify all the residents of Avdarma to flee the village. The elderly woman pleaded with him not to burn the depot down, but he explained that he would be executed if he disobeyed the order. Due to this German serviceman, many locals saved themselves by evacuating their homes in haste. As a result of the explosion, fragments flew in all directions. Unfortunately, the German soldier did not succeed in fleeing the area and was seized and executed by the Russians" [8, p.119-120].

It should also be emphasized that both Party members and activists targeted locals who claimed they had enjoyed better living conditions under Romanian administration. As a countermeasure, public trials were organized for war criminals, where both Germans and Romanians were brought before the court. Selected excerpts from the records of these proceedings appeared in the press. The Soviet authorities aimed to convince the population that they were living significantly better under Soviet governance. One of the articles published states that a person called "Kuharev", who had been employed as a medical worker during the occupation, said that... A significant number of people died from infectious diseases in the village of Trușeni in July 1944: "Each dwelling sheltered 5–6 families; on visiting these houses, I had to evacuate 4–5 bodies of people who had died from exanthematous typhus... Throughout a 14-day period, more than 1,000 people in Trușeni died because of typhus" [20, p.6].

Obviously, no one disputed the fact that during the military operations there were cases of infection and death among locals due to infectious diseases; however, the situation during the 1946–1947 famine proved to be much more severe. In a report submitted to the Moldavian Soviet Socialist Republic leadership at the end of February 1947 by Lieutenant General Tutușkin, it is noted that: "There was a continuous rise in the number of dystrophy cases in Chișinău County by February 20, 1947... On February 10, there were a total of 46,343 people in the county, and by February 20 the number had reached 48,173... Over the course of 20 February days, 1,398 deaths were recorded..." [11, page 51].

Chișinău County included the locality of Trușeni as well, to which the witness referred during the trial of war criminals. Unfortunately, during the famine artificially caused by the Soviet authorities, cases of cannibalism were also recorded in this village. Children were also among the people who fell victim. One of the briefing notes indicates that: "The residents of the village of Trușeni, Chișinău District, Nicolai Anna, Grebencea Alexandra and Grebencea Maria, on June 20, 1947, cut up the 7-year-old orphan girl Boța Maria and ate her flesh. The criminals were subjected to criminal prosecution" [11, page 194].

This reality was typically masked by articles encouraging people to engage more actively in building socialism, arguing that: "All labor teams in Moldova enthusiastically support the initiative of the workers of Leningrad and undertake to work determinedly to accomplish the set five-year plan within four years" [21, p.1].

It is well known that the Gagauz population suffered greatly during the 1946–1947 famine; however, the press at the time described it differently. This is confirmed by an article published in late December 1947 by Soviet correspondent D. Shchukin, in which it is written that the Gagauz were content with their situation and that, for the "first time," they were able to choose their local authorities via "free elections": "...The lights in the village of Carbalia burned throughout the entire night. The majority of the inhabitants of this village are Gagauz. Throughout the year, these people experienced many significant events. That fall, shortly before sowing the fields, the "Andreev" collective farm was formed. The people joined forces during sowing and succeeded in completing the work very rapidly. Subsequently, the fields became covered in snow, which guaranteed the kolkhoz workers a good yield.

At present, the Gagauz are, for the first time, freely electing their representatives to the local Soviets. Among the candidates are fellow villagers — Gagauz people: Iusumbeli G.V., Caraiami D.S., Dermendji D.V. In the fraternal Soviet family of peoples, all laboring people, regardless of ethnic origin, have equal rights to employment and happiness" [22, p.2].

Publications describing the "happiness" of Soviet peoples continued even as the Gagauz, along with other local residents, were violently loaded into cattle wagons in 1949 and deported to Kazakhstan and Siberia, where countless people died under inhuman and degrading conditions.

It is disappointing that even nowadays some writers misrepresent historical truth in their publications. Soviet and post-Soviet historiography attempted to present the economic difficulties solely as a consequence of natural causes, downplaying the impact of political decisions and repressive policies on the aggravation of the 1946–1947 famine crisis. Thus, a number of Russian authors sought, with extraordinary cynicism, to attribute the responsibility for the 1946–1947 famine in the Moldavian Soviet Socialist Republic to the Romanian authorities.

These historical revisionists state that: "As a result of the drought, a dreadful famine occurred in Moldova during 1946–1947. The Romanians are also held responsible, as during their retreat under the advance of the Soviet army, they took away all the seed supplies. Consequently, there was not enough bread for the people, and they were living at the edge of existence. Food aid was sent from Moscow to support the local population, and public kitchens were organized, although this was still insufficient" [23, p.10-11].

Archival materials that have been declassified demonstrate the contrary. According to reports from the force structures, it becomes clear that: "Starting in the summer of 1944, the Moldavian Soviet Socialist Republic was crossed by trains carrying grain, food products, medicines, timber, and other goods, traveling from Romania to Soviet Russia. During the 1946 famine, the Moldavian Soviet Socialist Republic railway made trains available to the Soviet authorities for transporting bread from Romania to the USSR. In a strictly classified report dated 5 January 1947, sent to the Minister of Internal Affairs, Lieutenant General Tutușkin, by Major Kornienko, head of the special transport section of the Chișinău railways, it was stated that: "...In accordance with a directive from the Ministry of Transport, in December 1946 we were required to supply wagons for the transport of bread from Romania to the USSR, as well as for returning demobilized Soviet Army personnel to the country...". A further note designated as strictly secret contains the main

tasks established for the Special Transport Section of the Railways in Chișinău for 1946: "To ensure the delivery of bread and other freight from Romania in accordance with the schedules set out in interstate accords". These data indicate that a significant share of Romanian grain, beginning in 1944, was transported via the Moldavian Soviet Socialist Republic to Soviet Russia, including during 1946–1947, when hundreds of thousands of Bessarabians starved due to the fact that, in the period of drought, the Soviet authorities confiscated their last food supplies, leaving them without any means of survival. It is misleading to state that Moscow did everything possible to prevent famine in the Moldavian Soviet Socialist Republic, when in fact it had unleashed a full-scale struggle against the Bessarabians to eliminate any attempt at resistance to the occupiers" [23, p.11].

In order to protect the younger generation of his native village from the danger of historical distortion and from the tendency of some nostalgic feelings to revive the Soviet Empire, Vasile Balan finishes the chapter of his book devoted to the famine with the following lines: "I have enumerated all of this so that future generations may know the anguish experienced by the famine-stricken people of Cărpești. It should be made clear that responsibility for all these disasters falls on the Kremlin leadership, the Moldavian Soviet Socialist Republic leadership of that period led by former First Secretary of the C.C. of the C.P.(b) of Moldova N.G. Coval and the Chairman of the Council of Ministers of the Moldavian Soviet Socialist Republic, together with the party and district authorities of Baimaclia, and especially Ilie Argint, former chairman of the Cărpești village council... Innocent victims of the 1946 famine and of the Soviet occupation regime! They deserve at least some kind of cross raised in their honor!!! Everlasting memory to them!!!" [9, p.66].

Conclusions. The 1946–1947 famine in the Moldavian Soviet Socialist Republic was largely intentional and coordinated. It cannot be considered exclusively a natural phenomenon, but must be analyzed in connection with political choices and their long-term effects on human lives. The traumatic experiences endured by the population shaped the attitudes and mindset of future generations, demonstrating that the 1946–1947 famine left enduring marks on society through the emergence of behaviors, survival mechanisms, and resistance patterns that are still reflected in collective memory today.

This message is addressed not only to younger generations, but also to adults who lived under Soviet censorship and restricted access to information. It is widely accepted that the post-Soviet society still faced a shortage of reliable sources documenting the calvary endured by our fellow citizens during the famine of 1946–1947. Officials of the totalitarian communist regime suppressed information indicating that this humanitarian catastrophe had been intentionally engineered in the Moldavian Soviet Socialist Republic and used as a repressive tool against the indigenous population. Evidently, the famine, compounded by the discriminatory restrictions imposed by the Soviet nomenklatura, forced the population to endure severely degrading living conditions. The ongoing crisis among the population caused disturbances in behavior in many local residents, which in turn led to the commission of serious and particularly serious crimes. A number of individuals were detained on charges of cannibalism. Under these circumstances, the authorities did not take steps to prevent this kind of crime, effectively leaving the population on its own, without ensuring safety or safeguarding lives. Simultaneously, no measures were undertaken to prevent the abduction of children, offenses that had escalated during the famine. In this regard, the article serves as a means of restoring historical memory and disseminating information about the genocide attributed to the communist totalitarian regime against the local population through the artificial induction of the 1946–1947 famine in the Moldavian Soviet Socialist Republic, which resulted in the deaths of hundreds of thousands of people, a fact that remains indisputable.

CYBERSECURITY – COMPONENT OF NATIONAL SECURITY

Aurelian-Gabriel BĂDIȚĂ,
PhD, University Lecturer,
Border Police Department,
"Alexandru Ioan Cuza" Police Academy, Bucharest,
Romania
ORCID: 0009-0004-8987-3357

Abstract

This article analyzes cybersecurity as a fundamental pillar of Romania's national security, in the context of recognizing the cyberspace as a strategic operational domain. The article explores the evolution of the concept of the security, from the protection of physical borders to digital sovereignty, grounded in the confidentiality-integrity-availability (CIA) triad. The current strategic and legislative framework is evaluated, with a particular focus on Law No. 58/2023 and the new requirements introduced by the NIS 2 Directive, highlighting the shift towards direct managerial responsibility and the obligation to report incidents within critical timeframes (24/72 hours).

The research is based on a qualitative methodology, including doctrinal analysis, case studies, and legislative assessment, to provide a overview of the security architecture. The paper details the national institutional architecture (DNSC, Cyberint, DCCO, MApN), providind practical examples of intervention and emphasizing the importance of regional cooperation with the Republic of Moldova through Table Top exercises (TTX).

The conclusions highlight the urgent need to transition from purely reactive to proactive management, an essential step in ensuring the resilience of critical infrastructures against contemporary hybrid threats, where the human factor remains a critical component.

Keywords: cybersecurity, critical infrastructures, NIS 2 Directive, digital resilience, hybrid threats, strategic management.

SECURITATEA CIBERNETICĂ – COMPONENTĂ A SECURITĂȚII NAȚIONALE

Abstract

Prezentul articol analizează securitatea cibernetică drept pilon fundamental al securității naționale a României, în contextul recunoașterii spațiului virtual ca domeniu operațional strategic. Articolul explorează evoluția conceptului de securitate, de la protecția frontierelor fizice la suveranitatea digitală, fundamentată pe triada confidențialitate-integritate-disponibilitate (CIA). Este evaluat cadrul strategic și legislativ actual, cu un accent deosebit pe Legea nr. 58/2023 și noile rigori introduse prin Directiva NIS 2, evidențiind trecerea către responsabilitatea managerială directă și obligația notificării incidentelor în termene critice (24/72 ore).

Cercetarea se bazează pe o metodologie calitativă, incluzând analiza doctrinară, studiul de caz și evaluarea legislativă, pentru a oferi o imagine de ansamblu asupra arhitecturii de securitate. Lucrarea detaliază arhitectura instituțională națională (DNSC, Cyberint, DCCO, MApN), oferind exemple practice de intervenție și subliniind importanța cooperării regionale cu Republica Moldova prin exerciții de tip Table Top (TTX).

Concluziile evidențiază necesitatea stringentă a tranziției de la un management pur reactiv la unul proactiv, etapă esențială pentru asigurarea rezilienței infrastructurilor critice în fața amenințărilor hibride contemporane, unde factorul uman rămâne o componentă critică.

Cuvinte-cheie: securitate cibernetică, infrastructuri critice, Directiva NIS 2, reziliență digitală, amenințări hibride, management strategic.

Introduction. Accelerated technological progress in recent decades has redefined the foundations of national security, shifting the focus from the exclusive control of physical borders to the protection of digital sovereignty.

If in past centuries a state's security was intrinsically linked to geographical barriers (mountains, rivers), in the 21st century, the integrity of cyberspace has become a prerequisite for institutional survival.

The official recognition of cyberspace as an operational domain (alongside the air, land, and maritime domains) marks a paradigm shift in defense and public order doctrine [1].

Contrary to traditional domains, cyberspace exhibits three ontological characteristics that contribute to its complexity:

– *Artificial character*, as it is a man-made infrastructure that is constantly expanding and transforming;

– *Asymmetry*, which is represented by the disproportionate ratio between an attacker's limited resources and their ability to cause strategic damage (e.g., paralyzing a state's financial or payment systems);

– *Atemporality and extraterritoriality*, which are represented by attacks that occur at the speed of light, ignoring national borders and traditional legal jurisdictions.

For example, in modern conflict, before the first ground units cross a border, cyberattacks are launched against communications networks and radar systems to "blind" the enemy's defenses.

Cybersecurity is not a product, but a state of normality maintained through technical measures (firewalls, encryption) and organizational measures (access policies, staff training).

The efficacy of advanced technical systems depends on users' level of cybersecurity literacy, as the human factor remains the primary vulnerability exploited through social engineering techniques.

Digital security is much like public health; it only works if there is "consistent hygiene" at all levels. This approach aims to safeguard three fundamental pillars, known by the acronym **CIA** [2, p. 22]:

- ***Confidentiality –*** ensuring that information is accessible only to authorized persons or systems. Example: Protecting the database containing police wiretap warrants against unauthorized access.
- ***Integrity –*** ensuring that data has not been altered or deleted without authorization. Example: Preventing the alteration of records in the Criminal Records Database or in personal identification databases.
- ***Availability –*** ensuring the continuous operation of systems. Example: Keeping the 112 system operational during a DDoS (Distributed Denial of Service) attack so that citizens can call emergency services.

We have seen a transition from "network security" [3] (viewed as a strictly administrative issue for the IT department) to "cyber security" [4]. Today, a cyberattack is no longer simply a technical error, but an act of aggression with major social consequences.

The social and economic impact can be seen in an attack on an electricity network or water distribution system; it can cause chaos and loss of life, being the functional equivalent of a bombing or physical sabotage of a power plant.

Security as the foundation of democracy can be compromised through the manipulation of voter databases or attacks on electronic voting infrastructure, which can pose direct threats to the constitutional order.

One example is the "Backmydata Ransomware" [5] attack on the IT systems of Romanian hospitals (February 11-12, 2024), which was not just a technical issue involving data encryption, but a public order crisis, as it blocked hospital admissions and surgical procedures, compromising the constitutional right to health.

Methods and materials applied. A comprehensive research methodology was employed in the preparation of this publication, drawing on methods specific to legal sciences and security studies.

The scientific approach was grounded in a qualitative analysis of the national and European regulatory framework, with a particular focus on Law No. 58/2023 [6] and the impact of the NIS 2 Directive [7] on Romania's security architecture.

Additionally, the historical method was used to illustrate the evolution of the concept of security from physical borders to cyberspace.

As a practical tool, this paper makes use of the case study method, analyzing real-world incidents (such as the ransomware attack on the healthcare system in February 2024) to illustrate systemic vulnerabilities.

The materials used include strategic documents (Romania's Cybersecurity Strategy 2022–2027 [4]), official reports from relevant institutions (DNSC, Cyberint), and specialized works from national and international doctrine.

Discussions and results obtained. **I. The National Strategic Framework**. Romania is aligning its security policies with Euro-Atlantic standards, with the central pillar of this effort being Romania's Cybersecurity Strategy for 2022-2027 [4].

The fundamental objective of this document is focused on the secure digitization of public services and on increasing the resilience of critical infrastructure.

In this context, the concept of resilience is defined as the ability of systems and institutions to maintain a minimum level of functionality during a cyber incident and to ensure rapid recovery of affected data and services.

The strategy defines a governance model based on multidimensional cooperation between the public, private, and academic sectors, aiming to transition from reactive to proactive management, focused on anticipating and preventing threats.

Key Strategic Directions:

➢ *Ensuring network resilience*: strengthening the security of information systems that support the state's critical functions (healthcare, energy, transportation, and the financial and banking sector);

➢ *Strengthening the regulatory framework*: aligning national legislation with new European regulations, particularly the NIS 2 Directive [7], to ensure a uniform level of protection across the entire Union;

➢ *Public-private partnership*: recognizing the critical role of private operators in managing critical infrastructure and the need for a constant flow of technical information exchange.

The strategic framework is implemented through the *National Cybersecurity System* (SNSC), which is coordinated at the political level by the *Supreme Council for National Defense* (CSAT).

The institutional architecture is supported by:

➢ *The National Cyber Security Directorate* (DNSC), which is a civilian authority responsible for regulation and incident response in the civilian sector;

➢ *The Romanian Intelligence Service* (*National Cyberint Center*), which is responsible for detecting and countering threats to national security;

➢ *The Ministry of Internal Affairs* (*MAI*), which manages the security of its own net-

works and, through specialized police units, combats cybercrime;

➢ *The Ministry of National Defense* (MApN), which ensures the cyber defense of military infrastructure through the *Cyber Defense Command*.

In conclusion, the National Strategic Framework goes beyond the scope of mere administrative regulations, serving as a strategic management tool that enables Romania to fulfill its role as a provider of security at the eastern border of NATO and the European Union.

II. Institutional Architecture. ***2.1. The National Directorate for Cyber Security (DNSC)*** [10] serves as the civil regulatory, supervisory, and oversight authority for the public and private sectors. The DNSC functions as the single point of contact at the national level for incident reporting, providing essential technical and methodological assistance to protect critical civil infrastructure.

For example, at the operational level, in the event of a massive *phishing* campaign targeting users of banking services in Romania, the DNSC issues real-time public alerts and collaborates with internet service providers to block access to malicious domains, while also providing technical assistance to affected banks for the analysis of malicious code.

2.2. The National Cyberint Center [11] part of the SRI is Romania's core cyber intelligence unit. Its primary mission is to identify, prevent, and counter attacks orchestrated by state actors or terrorist groups that target strategic interests and national security in cyberspace.

An operational example in the National Cyberint Center's remit involves identifying any attempt by a cybercrime group sponsored by a third country to infiltrate the IT network of a strategic institution (e.g., the Ministry of Energy). Cyberint detects the attacker's specific digital signatures and alerts the institution before sensitive data is extracted.

2.3. The Directorate for Combating Organized Crime (DCCO) [12] within the Romanian Police serves as the executive arm of the Ministry of Internal Affairs in this area. The DCCO focuses on the judicial aspect of cybersecurity, with responsibility for investigating criminal cases, collecting digital evidence, and holding perpetrators of cybercrimes accountable.

An example of a case handled by the DCCO involves the dismantling of an international cybercrime network that uses the "accident method" via messaging platforms. DCCO officers conduct *digital searches*, seize the servers used to store victims' data, and gather the evidence needed to bring the perpetrators to trial.

2.4. The Cyber Defense Command [13] within the Ministry of National Defense ensures the protection of military IT infrastructure and builds response capabilities (both defensive and offensive) in the context of national defense missions, integrating cyberspace into the military theater of operations.

For example, during a NATO multinational exercise conducted on Romanian territory, the Command ensures the *cyber protection* of the troops' tactical communications, thwarting attempts at jamming or digital interception originating from outside the theater of operations.

The entire framework is strategically coordinated by the Supreme Council for National Defense (CSAT), which ensures coherence among the civilian, military, and intelligence pillars.

An essential dimension of this architecture is international and regional cooperation.

In this context, the strategic partnership between Romania and the Republic of Mol-

dova in the field of cybersecurity serves as a model of best practices.

Through the constant exchange of technical information between the DNSC and its counterparts in the Republic of Moldova (such as the National Agency for Cybersecurity), the aim is to increase collective resilience along the European Union's eastern border, while also facilitating Chisinau's institutional alignment with EU standards.

An example of this could be the organization of joint exercises in which specialists from both countries simulate a response to a hybrid attack targeting natural gas distribution systems on both sides of the Prut River simultaneously, testing communication protocols and the exchange of technical data under pressure.

III. Analysis of Threats to National Security. Contemporary cyber threats are characterized by increased complexity and are classified in specialized doctrine based on the attackers' motives and the impact on society:

➢ *Cyber warfare*: refers to attacks orchestrated or supported by states with the aim of neutralizing the adversary's command and control systems or destroying critical infrastructure (energy, transportation). An example of this is "wiper" attacks (data deletion) used to paralyze government networks in the early stages of conventional armed conflicts.

➢ *Cyber spying*: involves the unlawful extraction of classified data, intellectual property, or strategic economic information to gain a competitive or political advantage. An example of cyber spying is APT (Advanced Persistent Threat) campaigns targeting the servers of foreign ministries or defense industry companies.

➢ *Hybrid threats*: involve the combined use of technical means (cyberattacks) and psychological operations (disinformation on social media) to erode citizens' trust in state institutions and destabilize the constitutional order. For example, hybrid threats can involve attacking the websites of electoral authorities while simultaneously spreading false news about vote rigging.

To these categories are added forms of aggression that have a direct impact on public order and social stability:

➢ *Cybercrime*: financially motivated attacks, ranging from bank fraud to ransomware campaigns that can paralyze the operations of hospitals or city halls. For example, ransomware campaigns that encrypt the data of hospitals or city halls, demanding money in exchange for the decryption key, thereby endangering citizens' lives (see the "Backmydata" case, 2024).

➢ *Cyberterrorism*: the use of cyberspace for recruitment, financing, propaganda, or planning attacks on critical infrastructure with the aim of causing widespread panic. An example of cyberterrorism is attacks on drinking water network control systems to disrupt the water supply to the population.

➢ "*Hacktivism*" [14]: attacks (such as DDoS attacks) carried out by non-state groups under the guise of ideological or political causes. An example of hacktivism is the takedown of government websites by groups protesting against legislative decisions.

Impact on security management:

– Accurately identifying the type of threat—a process known as attribution—is essential for determining the appropriate response.

– If the attack is assessed as spyware or state aggression, the response is coordinated primarily by intelligence agencies and the military.

– If the incident is classified as cybercrime, the primary responsibility for the criminal investigation falls to law enforcement agencies (DCCO/MAI).

However, in the virtual environment, the line between these actors is often blurred,

which requires ongoing interagency collaboration.

IV. New Legislation. Law No. 58/2023 [6] on Romania's cybersecurity and cyber defense is currently the fundamental piece of legislation that shapes the state's digital resilience ecosystem. It not only modernizes legal definitions but also establishes strict obligations for a wide range of entities, from public institutions to operators of essential services.

The legal framework requires public institutions and providers of essential services to report security incidents within a very short timeframe (24–72 hours) [8].

Also, security is no longer just the "IT person's" job; the head of the institution is directly responsible for implementing protective measures.

The main new and stricter provisions introduced by this legal framework (recently supplemented by the mechanisms for transposing the NIS 2 Directive) [7; 8; 9] include:

- *The obligation to report incidents*: critical infrastructure operators and service providers have a legal obligation to report cybersecurity incidents within extremely short timeframes. The process is phased: an early warning within 24 hours of becoming aware of the incident, followed by a full incident report within 72 hours. This speed is vital for the DNSC or Cyberint to be able to limit the spread of an attack at the national level;
- *Responsibility at senior management level*: perhaps the most significant paradigm shift is the shift of responsibility from the technical level (the IT department) to the decision-making level. According to the law, the head of the institution or entity is directly responsible for approving risk management measures and overseeing their implementation. In the event of non-compliance, the law provides for severe administrative penalties, emphasizing that cybersecurity is a component of strategic management, not merely an administrative task;
- *Extended scope of application*: the law and subsequent regulations (such as those from 2025 concerning critical entities) extend protection to new sectors, such as waste management, postal services, and chemical manufacturing, recognizing their interdependence within the digital economy;
- *Security audits*: the requirement for periodic cybersecurity audits, conducted by authorized entities, is introduced to verify the effectiveness of the implemented protective measures.

In conclusion, Law No.58/2023 [6] transforms cybersecurity from a technical and budgetary consideration into a legal compliance requirement that is essential to the stability of the state.

Conclusions and recommendations. The analysis shows that cybersecurity has evolved beyond a simple technical issue to become an integral and indispensable component of national security.

The recognition of cyberspace as an operational domain requires a profound shift in the institutional paradigm.

The implementation of the new legislative framework, particularly the provisions of Law No.58/2023 [6] and the NIS 2 Directive [7], marks significant progress by holding senior management directly accountable and imposing strict deadlines for incident reporting.

However, the technical and legislative framework cannot function effectively in the absence of a robust cybersecurity culture among human resources.

The human factor remains the weak link, a prime target for hybrid threats and social engineering. The findings of this study underscore that the transition from reactive to proactive and preventive management is imperative.

Last but not least, regional cooperation, exemplified by the strategic partnership with the Republic of Moldova, is an essential pillar for ensuring effective collective resilience at the eastern border of the European Union and the Euro-Atlantic area.

To further strengthen our cybersecurity posture, sustained and targeted efforts are required. To this end, ***the following proposals are recommended***:

1. *The continuous development of a cybersecurity culture* through massive investments in education and awareness programs at all levels of society, from the average citizen and the academic community to employees in the public and private sectors, in order to transform the potential "weak link" into an effective "defense wall." These must include regular training courses and social engineering attack simulations;
2. *Consolidating governance and inter-agency coordination* by optimizing information flows and response protocols between the DNSC, Cyberint, the Ministry of Internal Affairs, the Ministry of National Defense, and the Supreme Council for National Defense, ensuring a unified and rapid response to incidents, as well as the efficient allocation of resources;
3. *Stimulating public-private partnerships* by establishing mechanisms to build trust and facilitate the real-time exchange of technical information between public entities and private operators of critical infrastructure, thereby encouraging innovation and rapid adaptation to new threats;
4. *Strategic investments in advanced* technologies and expertise through the allocation of substantial funds for research and development in the field of cybersecurity, the acquisition of state-of-the-art technological solutions, and the recruitment and training of highly qualified specialists;
5. *Expanding and deepening regional and international cooperation* by stepping up joint tabletop exercises (TTX) and the exchange of best practices with strategic partners, in order to ensure a robust collective defense and contribute to regional stability.

By adopting these proactive measures and continuously strengthening digital resilience at all levels, Romania can not only ensure its own security in cyberspace but also actively contribute to global efforts to prevent and combat cybercrime, thereby reaffirming its role as a provider of security.

CRIMINALIZATION OF AIR POLLUTION: THE ROLE OF ARTICLE 230 OF THE CRIMINAL CODE OF THE REPUBLIC OF MOLDOVA IN PREVENTING ENVIRONMENTAL CRIME

Marcel BOȘCANEANU,
PhD, Associate Professor,
Head of the Studies and Quality Management Department,
"Ștefan cel Mare" Academy of Ministry of Internal Affairs,
Republic of Moldova
ORCID: 0000-0002-4776-9349

Abstract

This scientific study analyzes current issues regarding the legal framework for the criminalization of atmospheric air pollution through the lens of Article 230 of the Criminal Code of the Republic of Moldova and its role in preventing environmental crime. Atmospheric air is necessary for human survival and environmental conservation. The scientific community is concerned about the rapid and continuous growth of the population, which uses resources faster, and thus the accumulation of an enormous amount of waste will gradually worsen the quality of atmospheric air. The change in pollutants released into the atmosphere has become more complex throughout human history, as they are released in huge quantities. Sources of air pollution vary greatly - from fuel combustion, household, agricultural or mining activities, to natural disasters, significant industrial accidents or, more recently, the wars in Ukraine and the Middle East.

At the current stage, new techniques are being developed that monitor air composition to ensure air quality control. The population exposed to these harmful compounds is prone to various health problems, including skin, cardiovascular, brain, blood and lung diseases. The substances also contribute to global warming, acid rain and ozone depletion, which in turn lead to water and soil pollution and damage to flora and fauna. During the COVID-19 pandemic, it was observed that the reduction of human activities that cause pollution led to an improvement in the quality of atmospheric air, which shows that long-term solutions can also be found. Among the reasons for such an unfavorable environmental situation are, among others, violations of criminal environmental legislation, which establishes rules for the protection of atmospheric air.

Thus, in the content of the study we will refer more to atmospheric air as the object of the crime under Article 230 of the Criminal Code of the Republic of Moldova, because atmospheric pollution is one of the factors that shape the Earth's climate.

Keywords: atmospheric air pollution, atmospheric air, environmental crime, prevention of environmental crime, Article 230 Criminal Code of the Republic of Moldova.

INCRIMINAREA POLUĂRII AERULUI ATMOSFERIC: ROLUL ARTICOLULUI 230 DIN CODUL PENAL AL REPUBLCII MOLDOVA ÎN PREVENIREA CRIMINALITĂȚII DE MEDIU

Abstract

În prezentul studiu științific se analizează aspecte de actualitate privind cadrul legal al incriminării poluării aerului atmosferic prin prisma articolului 230 din Codul penal al Republicii Moldova și rolul acestuia în prevenirea criminalității de mediu. Aerul atmosferic este necesar pentru supraviețuirea umană și conservarea mediului. Comunitatea științifică este îngrijorată de creșterea rapidă și continuă a populației, care utilizează resursele mai rapid, iar astfel acumularea unei cantități enorme de deșeuri va înrăutăți treptat calitatea aerului atmosferic. Schimbarea poluanților eliberați în atmosferă a devenit mai complexă de-a lungul istoriei omenirii, aceștia fiind eliberați în cantități uriașe. Sursele de poluare a aerului variază foarte mult - de la arde-

rea combustibilului, activitățile casnice, agricole sau miniere, până la dezastre naturale, accidente industriale semnificative sau mai actual războaiele din Ucraina și Orientul mijlociu.

La etapa actuală se dezvoltă noi tehnici care monitorizează compoziția aerului pentru a asigura controlul calității aerului. Populația expusă la acești compuși nocivi este predispusă la diverse probleme de sănătate, inclusiv boli de piele, cardiovasculare, cerebrale, sanguine și pulmonare. Substanțele contribuie, de asemenea, la încălzirea globală, ploile acide și epuizarea stratului de ozon, care la rândul lor duc la poluarea apei și a solului și la daune aduse florei și faunei. În timpul pandemiei de COVID-19, s-a observat că reducerea activităților umane care cauzează poluarea a dus la îmbunătățirea calității aerului atmosferic, ceea ce arată că se pot găsi și soluții pe termen lung. Printre motivele unei astfel de situații de mediu nefavorabile se numără, printre altele, încălcările legislației de mediu cu caracter penal, care stabilește reguli pentru protecția aerului atmosferic.

Astfel, în conținutul studiului ne vom referi mai mult la aerul atmosferic ca obiect al infracțiunii de la articolul 230 din Codul penal al Republcii Moldova, deoarece poluarea atmosferică este unul dintre factorii care modelează clima Pământului.

Cuvintele-cheie: poluarea aerului atmosferic, aer atmosferic, criminalitate de mediu, prevenirea criminalității de mediu, articolul 230 Cod penal al Republicii Moldova.

Introduction. Atmospheric air pollution has a direct impact on public health. A clear correlation has been established between air pollution and respiratory diseases: bronchitis, tracheitis, asthma, pneumonia and lung cancer. Noise pollution has a negative effect on the nervous system, visual and vestibular systems and reduces reflex activity. Atmospheric air pollution also causes significant economic damage. The greatest losses occur in the housing and utilities, agriculture and forestry sectors. A correlation has been found between the cost of repairing urban residential buildings and the concentration of harmful substances in the air.

Air pollution is a global problem and poses a risk to human health and the environment. In the Republic of Moldova, atmospheric air quality is influenced by emissions from three types of polluting sources [9]:

➢ *Stationary fixed sources*, which include electrothermal power plants (CEPs) and boiler houses, operating industrial enterprises;

➢ *Mobile sources*, which include road, rail, air, river transport and agricultural machinery;

➢ *Transboundary transfer of pollutants*. Air pollutants emitted in one country can be transported through the movement of air masses in the atmosphere, contributing to or leading to poor air quality in other areas.

In fact, these circumstances determined the relevance and importance of the problem of legal and criminal protection of atmospheric air, as well as the choice of the topic of this research. One of the reasons for the rare practical application of the provision of criminal law establishing criminal liability for atmospheric air pollution is the imperfection of criminal and environmental legislation.

Criminal liability for air pollution is established by Article 230 of the Criminal Code of the Republic of Moldova (hereinafter – CC RM), which describes the elements of one of the main offenses and two qualified offenses (aggravating circumstances). The lack of clear elements characterizing the elements of the offense provided for in Art. 230 CC RM, distinguishing it from other offenses and misdemeanors, as well as insufficient methodological support for law enforcement officers pose certain difficulties in classifying such acts. Environmental damage, harm to human health and other losses to society caused by these offenses are difficult to assess. More precisely, the imperfection of criminal and environmental legislation also determines the imperfection of law enforcement practices.

The protection of atmospheric air is one of the essential dimensions of contemporary environmental policies, being closely linked to the guarantee of the fundamental

right to a healthy and ecologically balanced environment. In the Republic of Moldova, this protection is achieved including through criminal law, which intervene as a last resort instrument in combating acts with a high degree of social danger. In this context, a central role is played by the provisions of Art. 230 of the Criminal Code of the Republic of Moldova, which criminalizes atmospheric air pollution.

Article 230 of the Criminal Code of the Republic of Moldova falls under the category of crimes against the environment, aiming to protect social relations regarding the quality of atmospheric air, public health and ecological balance. From a doctrinal perspective, the criminalization of this act reflects the evolution of criminal law towards the protection of collective, diffuse values, which go beyond the sphere of individual interests.

The specific content of the violated obligations is established by non-criminal normative acts, such as legislation on environmental protection and air quality. This legislative technique allows the adaptation of the criminal norm to continuously evolving technical standards, but also generates difficulties in implementation, requiring interdisciplinary interpretations.

Methods and materials applied. In order to carry out this study, several methods were used, including: analysis, deduction, comparative, logical-legal, synthesis and systematic. At the same time, the research undertaken is based on studying the national and international legislation in force, existing in the given field.

Discussions and results obtained. Article 37 of the Constitution of the Republic of Moldova provides for the right of every person to an environment that is ecologically safe for life and health, as well as to harmless food products and household items [3].

In accordance with Article 1 of Law No.1515 of 16.06.1993 on Environmental Protection, the relations of man and society with the environment are regulated by the Constitution, this Law and the provisions of other laws and legislative acts that take into account the issues of environmental protection and rational use of natural resources. Accordingly, Art 4 para. (1) of the same Law specifies that: "Natural resources are understood as the soil, subsoil, waters, flora and fauna, located on the territory of the Republic, as well as the air in the space above this territory, constituting the national heritage of the Republic of Moldova".

In order to strengthen institutional capacities for monitoring and assessing air quality in order to identify and implement effective measures to reduce air pollutant emissions to levels that minimize harmful effects on human health and the environment as a whole, there is a special law on air quality at the national level, namely Law No.98 of 14.04.2022 [5]. Article 43 of this law expressly states that failure to comply with the provisions of this law and the normative acts approved under this law shall entail, as the case may be, civil or *criminal liability*, in accordance with the legislation.

Atmospheric air is a vital element of nature, an integral part of the habitat of people, plants and animals. The main useful function of atmospheric air is that it serves as an irreplaceable source of oxygen, necessary for the existence of all life on Earth.

In addition, atmospheric resources also play a significant role in human economic activity. The atmosphere is intensively exploited as a means of transport. Air is an integral component of industrial processes, thermal energy production and other human economic activities. At the same time, the atmosphere acts as a medium for the emission and dispersion of many types of pollutants generated as a result of the operation of various industries.

All the above-mentioned functions of atmospheric air, which it performs in relation to the plant and animal world, to people and society, represent the most important pre-

requisite for the state to ensure its rational use and protection.

The same circumstances predetermine the need for legal regulation of public relations regarding the use of atmospheric air and its protection from pollution and other harmful effects through environmental, civil, administrative, criminal and other branches of law.

The legal definition of atmospheric air is established by Law No.98 of 14.04.2022 on Atmospheric Air Quality [5], which is the main regulatory legal act establishing the legal framework for the protection of atmospheric air. According to Art. 3 of the aforementioned law, atmospheric air is a mixture of gases that make up the lower layer of the Earth's atmosphere (for the purposes of this law – the troposphere).

If we analyze this concept, we can identify several criteria established by law to define atmospheric air:

1) *Environmental criterion*:

a) Atmospheric air is a component of the environment as a whole;

b) It is a natural mixture of atmospheric gases (not created by man under artificial conditions);

2) *Spatial criterion*. That is, only air located outside residential, industrial and other premises will be considered atmospheric air.

It should be noted that both criteria generally characterize atmospheric air as a component of the environment, an element of nature, which appears as a result of natural processes occurring within it and not as a result of economic or other human activity.

If we refer to various aspects of the concept of "environment", we can highlight the most important ones, in particular: the environment is the operational basis for various human activities, the totality of natural elements – that is, those created by nature, but to a greater or lesser extent transformed by people – which constitute the living conditions of people in a certain place and time; it is the entire material world, external to human society, which surrounds society. The environment exists as a whole, taken at different scales and in various combinations, and not just as a totality of individual elements, natural resources and natural objects. It is emphasized that the environment serves as a condition and means of human life, the territory in which it lives, the spatial limit of state power and the location of industrial, agricultural, cultural and other facilities.

From the specialized literature we know that atmospheric air is made up of a mixture of gases that form the gaseous envelope of the Earth (terrestrial atmosphere). The main composition of atmospheric air is: mainly nitrogen (about 78%), oxygen (about 21%), argon (about 0.93%), carbon dioxide (about 0.04%). In addition, atmospheric air contains in small quantities: water vapor (variable: 0–4%), rare gases: neon, helium, krypton, xenon, ozone (important for protection against UV radiation – the ozone layer). Depending on the area, the air may also contain dust and particles (PM10, PM2.5), smoke, polluting gases (SO_2, NO_2 carbon monoxide). This percentage ratio of gases constitutes the atmospheric air that is typical for the soil layer of the atmosphere.

Thus, atmospheric air can be defined as a vital component of the environment, representing a natural mixture of gases outside any room and, in interaction with other components, providing favorable conditions for life on Earth. Atmospheric air pollution or other changes in its natural properties pose a threat to the life and health of humans, animals and plants.

To cement its legal protection, atmospheric air is legally recognized as the object of several crimes, including crimes against the environment, as provided for in Chapter IX of the Criminal Code of the Republic of Moldova, in particular, the crime of atmospheric

air pollution that we are analyzing (Article 230 of the Criminal Code of the Republic of Moldova).

The commission of a crime from an objective point of view, as a rule, is associated with the impact of the perpetrator on the material objects of the external world. The object of a crime can be discussed in cases where the harm caused to the object of the crime is necessarily related to the damage to a material good within the scope of that good. In the case of crimes against the environment, such goods are components of the environment.

The object of a crime plays an important role in both legislative and law enforcement practice when describing the elements and classifications of crimes. Therefore, together with the object of the crime, it is necessary to establish the other elements of its composition.

In this sense, the object of the crime in conjunction with the other elements of the crime composition (the objective side, the subject and the subjective side) constitutes the legal basis for criminal liability. The notion of the object of the crime is not defined in the legislation, but from the content of Article 15 of the Criminal Code of the Republic of Moldova [2] its significance in determining the harmful degree of a crime is clear. The more important the social value and social relationship achieved by the criminal act, the higher the degree of social danger of the respective act. At the same time, the definition of the notion of the object of the crime is found in the legal doctrine. Thus, according to an opinion, to which we subscribe, the object of the crime is represented by "social values and social relationships, which require criminal defense, in whose consolidation and development society is interested and which, through the antisocial behavior of a person, are or may be significantly harmed" [1, p.35]. The social values protected by the criminal law are listed enumeratively in paragraph (1) of Article 2 of the Criminal Code: "the person, his rights and freedoms, property, environment, constitutional order, sovereignty, independence and territorial integrity of the Republic of Moldova, peace and security of mankind, as well as the entire legal order". In this context, we specify that not only social values are protected by the criminal law, but also the social relations related to these values. Regarding the correlation between social relations and social values, S. Brînza rightly argues that "social relations are realities external to social value, they pre-exist social value and serve as a factor for evaluating and attributing the attribute of value to certain entities that correspond to the interests of society" [1, p.31]. In other words, social relations are built and developed around social values with which they are in a relationship of interdependence.

Thus, we can confidently state that the object of a crime in the theory of criminal law must be understood as the things in relation to or in connection with which a crime is committed.

Next, after this brief account of some general notions regarding the object of the crime, we will focus our attention on the actual analysis of the object of the crime provided for in Article 230 of the Criminal Code of the Republic of Moldova. If we refer to the definition of atmospheric air as the object of atmospheric pollution, we must first consider the concept of the subject of a crime.

The problem of defining the subject of an environmental crime is directly related to the issue of understanding the object of an environmental crime. Since the subject and object of the crime are related as part and whole, it is impossible to determine the part of the whole without taking into account the whole. E.N. Jevlakov rightly writes that: "in environmental crimes, the subject of the crime must always be considered in connection

with and alongside the object. An isolated analysis of the subject does not allow clarifying the relationship to which the harm is caused, which leads to errors and confusion in the classification of the crime" [8, p.57].

The social danger posed by environmental crimes stems from the fact that they attack the stability of the environment and the potential of natural resources, as well as everyone's right to a healthy environment, guaranteed by Article 37 of the Constitution of the Republic of Moldova. The degree of social danger of these crimes depends on the social significance of the object of the attack and is determined by the extent of the damage caused by the crime.

The object of a crime is what the crime attacks, that is, what it targets, what it violates, and what it causes or may cause damage to.

The problem of the social value protected by law that is affected or endangered by the crime is one of the most controversial in the theory of criminal law. In the science of criminal law, there are four main approaches to the object of the crime: 1) social relations; 2) social relations and legal norms; 3) social relations and the productive forces of society, that is, people, tools and means of use; 4) the actual object of the crime. In this case, when determining the object of a crime in accordance with the prevailing concept, the starting point is the recognition of social relations as such.

In our opinion, the theory of "object of crime – social relations" seems to be the most accurate. Of course, the problem of defining the object of crime deserves a detailed analysis, but it goes beyond the scope of this work. We will approach the concept of object of crime only in relation to crimes against the environment in general and atmospheric air pollution in particular.

Understanding the object of environmental crimes has long been one of the most controversial issues in the national criminal law literature. Approaches to understanding its resolution have evolved as environmental and criminal legislation have developed and improved.

A broad understanding of the object of environmental crimes was formulated in the works of X. Ulianovschi. According to him, the object of environmental crimes is complex social relations, protected by the norms of criminal law, regarding the rational use of natural resources, the preservation of a qualitative environment for living beings and ensuring the ecological security of the population, an opinion that is similar to our position regarding the generic legal object of environmental crimes. The special legal object of environmental crimes is social relations regarding the protection and rational use of certain types and forms of natural resources and ensuring the ecological security of the population. Each environmental crime has a special legal object [6, p.45].

In our opinion, the generic object of the crime is the normal relationship between people regarding the environment as the basis of the existence and vital functions of human society. These relationships mediate the functioning of the "man-environment" system, including both the use of natural resources and the deliberate impact of man on nature for the purpose of its preservation and improvement. The direct objects of individual crimes are social values determined by the functions of the environment in human life.

Based on the prevailing opinion in the domestic criminal law doctrine regarding the object of the crime as the social relations protected by criminal law, which the offender violates, the object of environmental crimes is recognized as a complex, integral set of concrete social relations. This complex includes social relations regarding the environment as a whole and its individual components, regulated and protected by legal norms, which, by their content, concern the ownership of natural resources, nature manage-

ment, protection of the environment from harmful impacts, as well as the protection of environmental rights and legitimate interests of individuals and citizens.

Contemporary russian literature also supports a different approach to understanding the object of environmental crimes. A.E. Jalinskii emphasizes that the first meaning of this concept reveals it as a fundamental socio-legal value (a legal benefit) protected by criminal law, while the second – as an element of the composition of the crime [7, p.359].

Considering all of the above, in this research, we will understand as the main object of environmental crimes the social relations regarding ensuring environmental safety and ecological order. However, we must take into account the data on the classification of the objects of the crime in relation to the atmospheric air pollution we are studying.

The common object of all crimes provided for by the Criminal Code of the Republic of Moldova, including atmospheric air pollution, is the totality of all social relations protected by criminal law against criminal attacks.

The list of social relations protected by criminal law is provided for in Article 2 of the Criminal Code of the Republic of Moldova [2]. These include the person, his rights and freedoms, property, the environment, the constitutional order, the sovereignty, independence and territorial integrity of the Republic of Moldova, peace and security of mankind, as well as the entire legal order. As we can see, the general object of the crime, formulated in Art. 2 CC RM, among other things, also provides for the protection of the environment as one of the main objectives of criminal law.

The title of the chapter of the Criminal Code of the Republic of Moldova corresponds to the group of social relations that are protected by its norms from the crimes specified therein and characterizes their generic subject matter. Despite the fact that the environment is specifically mentioned in Article 2 of the Criminal Code of the Republic of Moldova, structural environmental crimes are provided for in Chapter IX called "Environmental Crimes".

As we know, in the criminal law literature, a specific object is understood as the object that is targeted by a certain type of crime. As mentioned earlier, public relations regarding environmental safety act as a specific object of all environmental crimes, including atmospheric air pollution, which correlates with the generic object of the crime, both as specific and as general. Environmental safety is an integral part of public safety.

This point is also mentioned in the new National Security Strategy of the Republic of Moldova approved by Government Decision No.391/2023 [4], namely in Article 8 it is mentioned that one of the national security objectives of the Republic of Moldova is the protection of the environment.

Environmental laws and order represent the state of compliance by all persons with all established standards and rules of ecological conduct.

As for the direct object of air pollution, it is represented by social relations related to ensuring environmental safety, protection and rational use of atmospheric air. The main direct object of the investigated crime is, as previously mentioned, public relations related to ensuring environmental safety, protection and rational use of atmospheric air.

The need to identify the additional direct object of qualified compounds to air pollution as additional direct targets of crime is primarily due to the fact that, ultimately, any negative impact on nature, including atmospheric air, can affect human health.

In addition, an optional object of air pollution may be, for example, public relations regarding property protection in case of property damage, animal death, depopulation and/or contamination of flora, fauna, biodiversity, damage to the health of the population.

It should be noted that personal safety, health of the population (safety of life, health and property) is an element of environmental safety and, therefore, is subject to criminal protection under Article 230 of the Criminal Code of the Republic of Moldova, not in itself, but only in conjunction with public relations to ensure environmental safety, protection and rational use of atmospheric air.

Therefore, a part of public safety is environmental safety, which represents the state of protection of two interconnected components: human life and health from threats to the environment and the natural environment from the negative impact of human activity. Thus, social relations aimed at ensuring the safety of human life, health and property are objects of air pollution only in the context of their protection from the negative impact of the atmosphere, which, in turn, has been subjected to pollution and other negative changes as a result of exceeding the permissible emissions limits and/or maximum permissible concentrations, as a result of the emission or discharge into the atmosphere of pollutants or violation of operating rules or as a result of non-use of equipment, apparatus, purification and control installations for emissions into the atmosphere, if there was a danger of causing damage to the environment or health of the population.

That is, the existence of the danger of causing damage to the environment or the health of the population, socially dangerous consequences in the form of damage in particularly large proportions, the death of a person due to imprudence, etc., are conditioned by the deterioration of the environment, atmospheric air pollution.

On the other hand, causing material damage in large or especially large proportions or harm to the health of the population as a result of, or during, economic or other activities that do not pollute the atmosphere does not constitute a crime against the environment and constitutes a general crime against human life and health, property and public health. In this case, the personal safety of a person is an independent object of protection of criminal law under other chapters of the Special Part of the Criminal Code of the Republic of Moldova.

This provision has an important practical significance, as it allows us to distinguish atmospheric air pollution from other crimes provided for by other chapters of the Criminal Code of the Republic of Moldova.

In our opinion, environmental crimes target components of the environment and natural objects. Ecologically harmful anthropogenic objects should not be considered as the object of environmental crimes, since their existence may, in fact, be a means of introducing negative changes in the environment or its components. For example, emissions of harmful substances pollute the air or dumping of waste into water bodies harms a water body.

The object of the crime provided for in Article 230 of the Criminal Code of the Republic of Moldova is a vital component of the environment, an integral part of the habitat of people, plants and animals, such as atmospheric air. The object of the violation of the crimes includes the atmosphere, atmospheric air and its natural properties, taken together. We believe that the existence of such notions is primarily due to the fact that the current environmental legislation does not make a clear distinction between concepts such as “atmosphere” and “atmospheric air”. Thus, the concepts of “atmosphere” and “atmospheric air” in their natural scientific interpretation are linked as a whole and a part.

Indeed, based on a literal interpretation of Art. 230 of the Criminal Code of the Republic of Moldova, it must be concluded that the object of the crime is precisely the atmospheric air, since the atmosphere is not mentioned in the criminal law. In addition, causing damage to the atmospheric air does not exclude damage to the atmosphere as a

whole.

A broad understanding of the object of environmental crimes was formulated in the works of X. Ulianovschi. According to him, the generic legal object of the crime of air pollution is the social relations protected by criminal law regarding the rational use of natural resources, the protection of a healthy environment for people and other living beings, ensuring ecological discipline and the security of the population. The special legal object of the crime is the group of homogeneous social relations related to the protection of natural resources. The secondary special legal object of this crime is the social relations related to the health and bodily integrity of people and the national economy [6, p.84].

At the same time, it is absolutely clear that there is a need for clarification and harmonization of the terms used in modern natural sciences, criminal law and environmental legislation.

In this regard, it is necessary to clarify that in this article, the term "atmospheric air pollution" will be used in the meaning given to it by the Criminal Code of the Republic of Moldova, for the purpose of designating the title and content of Article 230.

It should also be noted that the concept of "air pollution" reflects the most widespread type of negative human impact on this component of the environment and the most frequent socially dangerous consequence of the acts specified in para. (1) of Art. 230 of the Criminal Code of the Republic of Moldova, a fact confirmed by the analysis of judicial practice. Therefore, we believe that the title of Art. 230 of the Criminal Code of the Republic of Moldova — "Atmospheric Air Pollution" — fully reflects the content of this article of the current criminal law.

Atmospheric air, like any other natural gas, has certain natural properties. Clarification of the list of natural properties of air has not only scientific, but also criminal-legal significance for the classification of a crime, since their pollution is specified in the provisions of Art. 230 of the Criminal Code as one of the socially dangerous consequences of the committed act.

The significance of the object of atmospheric air pollution that we have examined lies in the fact that they allow us to understand the social and legal nature of this offense, its impact on other components of the environment and natural objects, and serve as a criterion for distinguishing this offense from other offenses provided for in Chapter IX and other chapters of the Criminal Code of the Republic of Moldova, and therefore play an important role in the classification of offenses.

For example, air pollution may occur during the commission of other crimes, such as Failure to fulfill or improper fulfillment of duties to comply with legislation on environmental protection (Article 223^1 of the Criminal Code), Violation of the rules for the management of chemical substances and products, waste, including hazardous and radioactive waste (Article 224 of the Criminal Code).

Therefore, when distinguishing between these types of crimes, it is necessary to consider the question of what specific object the perpetrator attacks or what object is directly harmed as a result of the socially dangerous act. Thus, when committing intentional crimes against life and health, the main direct object of the crime will be social relations that ensure the safety of human life and health, rather than social relations that ensure environmental safety, protection and rational use of atmospheric air.

Regarding the object of the crime, a distinction must be made between air pollution and acts of terrorism, sabotage and ecocide, the direct objects of which are, respectively, social relations aimed at ensuring public safety, economic security and the country's defense capacity, as well as safe environmental conditions for the existence of humanity.

It should be noted that, while the object of the crime is the main criterion for distinguishing between the elements of the crimes provided for in different chapters of the Criminal Code of the Republic of Moldova, determining the object of the crime – the component of the environment or the natural object that the perpetrator violates – is the simplest criterion for distinguishing between the elements of environmental crimes.

In particular, by means of the object of the crime, a distinction can be made between the crime of atmospheric air pollution Art. 230 and the other crimes in the same chapter, such as those provided for in Art. 223 – Violation of environmental safety requirements; Art. 223[1] – Failure to fulfill or improper fulfillment of duties to comply with legislation on environmental protection; Art. 224 – Violation of the rules for the management of chemical substances and products, waste, including hazardous and radioactive waste; Art. 227 – Soil pollution; Art. 229 – Water pollution.

The main objective of the analysis of criminal law sources establishing criminal liability for violations of public relations in the field of environmental protection was a comprehensive study and critical understanding of the development of norms on criminal liability for atmospheric air pollution.

Conclusion. The preventive function of the criminal norm is essential in the field of environmental protection. Article 230 of the Criminal Code of the Republic of Moldova contributes to the prevention of environmental crime through several mechanisms. First, through the deterrent effect, the criminal norm imposes on economic agents the obligation to comply with environmental standards, under penalty of severe penalties. Second, the norm has an educational and symbolic role, affirming the importance of protecting atmospheric air as a fundamental social value. This dimension is particularly relevant in the context of increasing environmental awareness. Third, Article 230 CC stimulates voluntary compliance, causing economic operators to invest in non-polluting technologies and emission control systems.

However, there are also some shortcomings in the criminalization of this illegality. One obstacle is the evidentiary difficulties, in particular: establishing the level of pollution in the existence of the danger of causing damage to the environment or the health of the population; identifying the exact source, etc. Also, the character of the blank norm implies a strong dependence on extra-criminal, environmental-specific regulations, which can generate legal uncertainty.

But one thing is encouraging, that contemporary doctrine is taking shape on the tendency to strengthen the preventive role of environmental criminal law by: expanding the incriminations of danger; reducing the threshold of criminal intervention; strengthening the liability of legal entities; harmonizing with European standards in environmental protection. All of this has also been achieved in the criminal legal framework on the crime of atmospheric air pollution from Article 230 of the Criminal Code of the Republic of Moldova.

Thus, in order to increase the efficiency of environmental crime prevention, it was necessary to reconfigure criminalization in the sense of capitalizing on the model of dangerous crimes, which would allow for the sanctioning of polluting behavior before serious consequences occur.

The dependence of Article 230 on extra-criminal regulations allows for adaptation to the evolution of technical standards, but creates difficulties in interpretation and application. In practice, this determines an increase in the role of expertise and a relative unpredictability of the criminal norm.

Therefore, Article 230 of the Criminal Code of the Republic of Moldova represents an

essential legal instrument in combating air pollution in the Republic of Moldova. Although its effectiveness is limited by certain normative and practical constraints, its preventive role cannot be ignored, contributing to discouraging polluting behaviors and strengthening environmental protection.

The criminalization provided for in Art. 230 CC confirm the tendency of modern criminal law to protect collective values, such as the environment, independently of the existence of direct individual harm. Thus, atmospheric air is elevated to the rank of a distinct legal object, which reflects the conceptual evolution of criminal law towards the field of diffuse interests.

Since the main sources of pollution are industrial activities, the effectiveness of Article 230 CC directly depends on the effective application of criminal liability of legal persons. This constitutes an essential tool for the prevention of large-scale environmental crime.

The evolution of national norms is influenced by European standards, which promote a firmer approach to environmental crime. In this context, Article 230 is susceptible to modernization, in order to align it with contemporary requirements regarding the prevention and sanctioning of pollution.

In the future, making this criminalization more efficient requires an integrated approach, combining criminal instruments with administrative, environmental and economic ones, in order to ensure a high level of protection of atmospheric air.

Article 230 of the Criminal Code of the Republic of Moldova constitutes an important pillar of the criminal protection of atmospheric air in the Republic of Moldova, but its preventive efficiency is conditioned by overcoming the current limits of the regulation. A reform oriented towards criminalization of danger, normative clarity and systemic integration would allow transforming this norm into a genuine instrument for combating environmental crime.

CRIME SCENE INVESTIGATION IN THE DIGITAL ERA: THE CONTRIBUTION OF 3D SCANNING TECHNOLOGY

Lucia-Narcisa DUMITRAȘCU,
Police Inspector,
Faculty of Police,
"Alexandru Ioan Cuza" Police Academy, Bucharest,
Romania
ORCID: 0009-0004-0214-1920

Abstract

This article examines the use of 3D scanning technologies in crime scene investigation, highlighting their role in the modernization of forensic methods and techniques. Three-dimensional scanning enables rapid and accurate documentation of the crime scene, allowing for digital reconstruction and subsequent analysis without the need for further physical intervention. Due to its non-invasive nature, this technique contributes to the preservation of the scene and reduces the risk of losing relevant details.

The paper focuses on the main advantages of this technology, such as high accuracy, efficiency in data collection, and the facilitation of collaboration among specialists, while also addressing practical limitations, including associated costs, the large volume of generated data, and the need for adequate professional training. The experiences of other countries are also considered, providing a basis for identifying directions for optimization and national-level adaptation.

Furthermore, the importance of standardizing usage procedures and integrating these technologies into existing working methodologies is emphasized. Thus, 3D scanning emerges as a valuable tool in forensic practice, with the potential to enhance the efficiency of the entire investigative process, provided that it is properly integrated into existing procedures and supported by appropriate technical and human resources.

Keywords: 3D scanning, photogrammetry, LiDAR, crime scene, traces.

INVESTIGAREA LOCULUI FAPTEI ÎN ERA DIGITALĂ: APORTUL TEHNOLOGIEI DE SCANARE 3D

Abstract

Prezentul articol abordează utilizarea tehnologiilor de scanare 3D în cercetarea la fața locului, evidențiind rolul acestora în contextul modernizării metodelor și tehnicilor criminalistice. Scanarea tridimensională permite o documentare rapidă și precisă a locului faptei, oferind posibilitatea reconstituirii digitale și analizării ulterioare fără intervenții suplimentare. Prin caracterul său non-invaziv, această tehnică contribuie la conservarea locului faptei și reduce riscul pierderii unor detalii relevante.

Lucrarea se concentrează asupra principalelor avantaje ale utilizării acestei tehnici, precum acuratețea ridicată, eficiența în colectarea datelor și facilitarea colaborării între specialiști, dar și asupra limitărilor întâlnite în practică, inclusiv costurile asociate, volumul mare de date generate și necesitatea formării profesionale adecvate. Sunt luate în vedere experiențele altor țări ce permit conturarea unor direcții de optimizare și adaptare la nivel național.

De asemenea, este subliniată importanța standardizării procedurilor de utilizare și integrării acestor tehnologii în cadrul metodologiilor de lucru. Astfel, scanarea 3D devine un instrument util în activitatea criminalistică, cu potențial de eficientizare a întregului proces de investigare, în măsura în care este integrată corespunzător în procedurile existente și susținută de resurse tehnice și umane adecvate.

Cuvinte-cheie: scanare 3D, fotogrammetrie, LiDAR, locul faptei, urme.

Introduction. In the context of transformations driven by digitalization, forensic sciences are undergoing significant evolution, characterized by the integration of advanced technologies into specific investigative activities. Crime scene investigation, as a fundamental stage of the criminal process, is subject to these changes, requiring the adaptation of traditional methods to new demands regarding accuracy, speed, and objectivity in documentation.

Within this framework, 3D scanning technologies emerge as modern tools for documenting the crime scene, enabling the creation of detailed and accurate digital representations of reality. Compared to classical methods, these technologies allow for comprehensive, non-invasive documentation, as well as the possibility of subsequent reanalysis of the scene without compromising the integrity of the evidence.

The present approach aims to highlight the role of 3D scanning technology in crime scene investigation by analyzing its advantages, limitations, and prospects for integration into contemporary forensic practice.

Methods and materials applied. This paper is based on a qualitative approach, grounded in the analysis of specialized literature and the comparative examination of relevant studies in the field of 3D scanning technologies applied to crime scene investigation. Recent scientific sources, indexed articles, and reference works in forensic science and digital technologies were used in order to highlight the main directions of development and practical applicability of these methods.

From a methodological perspective, the research was conducted through a descriptive and comparative analysis of the main technologies used for three-dimensional documentation of the crime scene, with a focus on their operating principles, advantages, and limitations. At the same time, relevant case studies and examples of best practices were integrated, illustrating the practical use of these technologies in the activity of judicial authorities.

Discussions and results obtained. I. Introductory Aspects of Crime Scene Investigation. Crime scene investigation represents the activity that marks the beginning of the criminal investigation and leads to the complete, direct, and immediate understanding of the location where the act under investigation occurred [1, p.357].

This preliminary activity, which ensures the direct perception by the judicial authority of the place where the offense was committed [2, p.236], primarily aims at the discovery of traces and the identification of relevant elements necessary for establishing the perpetrator, clarifying the circumstances of the offense, and identifying material evidence, as well as obtaining accurate and reliable data through the direct examination of the crime scene regarding the modus operandi and the offender's identity [1, p.358].

Thus, beyond direct knowledge, the purpose of crime scene investigation is to document and collect material traces created during the commission of the offense, in order to identify victims and perpetrators, as well as to locate and interview eyewitnesses or other individuals who possess relevant information about the act [4, p.160].

With regard to the manner in which this activity is carried out, ensuring the presence of the judicial authority at the crime scene represents "one of the most effective procedural measures" [4, p.9], as it is an activity through which the very purpose of the criminal process is achieved, leading to the establishment of judicial truth.

Crime scene investigation must be conducted as soon as possible after the occurrence of the offense. Its prompt nature prevents the degradation or disappearance of traces and contributes to the identification of witnesses [2, p.239], while also reducing the time advantage available to the perpetrator [4, p.16]. Although these aspects are primarily

tactical in nature, the timely exploitation of traces, as close as possible to the moment of the offense, constitutes one of the most significant advantages of this operational character.

Judicial practice has also recorded situations in which the investigation is delayed, such as when the offense is discovered after a certain period of time or when the location where the main acts of the offense took place was not initially known. Specialized literature highlights such situations and recommends that all inherent changes be taken into account and, where traces can still be identified, that they be interpreted with caution, considering all possible alterations [5, p.509].

Moreover, it is essential that the crime scene be examined with attention to all relevant aspects and every detail [1, p.364], as the establishment of the truth regarding both the circumstances of the case and the identity of the perpetrator directly depends on it [6, p.184]. A higher level of attention and a greater number of recorded details contribute to ensuring the establishment of judicial truth, understood as truth grounded in evidence and means of proof, where material evidence provides substantive support.

In addition to its initial, immediate, and mandatory character, crime scene investigation is an activity that, as a rule, is not repeated, and its working procedures and manner of execution confer upon it an organized character [7, p.11-12]. It should be noted that crime scene investigation is not strictly limited in time, and the resumption of certain phases should not be confused with repetition in the sense of re-performing the static and dynamic phases, which would effectively constitute a new investigation of the same scene.

At the same time, given the complexity of this activity, it is essential that each member of the investigative team has clearly defined roles and responsibilities, ensuring that the evidentiary procedure achieves its intended purpose.

II. 3D Scanning – Concepts and General Aspects. Starting from the detection technology used, namely the mechanism by which areas and objects in the real environment are captured and converted into digital representations, the main methods of crime scene scanning highlighted in the specialized literature [8, p.56-85] are laser scanning, photogrammetry, and RGB-D scanning.

While photogrammetry captures fine details more effectively by generating denser point clouds, laser scanning provides a more comprehensive understanding of the overall geometry of the crime scene [9, p.22-33], with lower associated error rates [10].

Following several comparative studies between photogrammetry and laser scanning, it has been concluded that the optimal approach consists in the combined use of both technologies for crime scene processing [10]. This view is supported by multiple specialists. One study [9, p.22-33; 8, p.56-85] proposes, for high-quality indoor crime scene documentation, the combination of the FARO Focus3D X 330 with the portable FARO Freestyle, while for large outdoor environments it recommends the use of aerial photogrammetry alongside terrestrial laser scanning with the FARO Focus S70.

Supporting the same perspective is the proposal to combine terrestrial laser scanning with close-range photogrammetry in order to obtain high-precision 3D data during crime scene reconstruction, by overcoming limitations such as device positioning, shadows, object distance, and laser beam angles that may prevent the creation of a complete model [11].

A laser scanner is a device specifically designed for scanning the surrounding environment, operating by emitting laser beams and calculating distance based on the reflected signal. A widely used laser-based sensor in crime scene investigation is the LiDAR

system, which currently exists in three main forms: terrestrial, aerial, and mobile [12].

LiDAR technology is based on the emission of laser pulses and the measurement of the time required for these pulses to reach an object and return to the sensor. In this process, the system emits short-duration laser beams, typically in the infrared spectrum, which propagate through the environment at the speed of light. When these pulses encounter an object, part of their energy is reflected back toward the receiver.

The reflected signal is detected by the sensor, which records both the return time and its characteristics. Based on the propagation time and the known speed of light, the system calculates the distance between the sensor and the targeted object. By repeating this process for a large number of laser pulses, a three-dimensional representation of the analyzed environment is generated [13, p.164-172].

The scanning of space using this method is materialized through the processing, within dedicated software, of a 3D model in the form of a point cloud [12]. These 3D models allow not only the visualization of the crime scene, but also various analytical activities, such as determining shape, size, and distances between objects, observing objects in detail from multiple angles and distances, reconstructing damaged objects, performing situational modeling by establishing cause–effect relationships, and conducting reverse modeling for comparative analysis [9].

The use of LiDAR systems ensures extensive coverage, having the capability to capture data from large areas, which allows measurements over longer distances. In addition, due to improved signal processing algorithms and higher-resolution detectors, accuracy and precision are enhanced in long-range measurements. As a result, LiDAR systems are capable of capturing fine details with high fidelity [13, p.164-172].

When compared to photogrammetry, LiDAR proves to be effective even in low-light conditions, whereas photogrammetry performance is significantly affected by insufficient lighting. Moreover, crime scene documentation using LiDAR technology is faster, while photogrammetry requires the capture of multiple images and more complex subsequent processing [10].

III. Advantages and Limitations of 3D Crime Scene Scanning. The accurate and comprehensive documentation of the crime scene represents an essential condition for the effective conduct of the criminal process, as it ensures the preservation and proper use of evidence in establishing judicial truth. Traditionally, the technical methods of documentation identified in the specialized literature [1, p.366] include forensic photography, sketches, and audio-video recordings. Combined with direct measurements, these conventional methods present certain limitations in terms of execution time and the possibility of subsequent reanalysis of the crime scene.

In this context, the development of three-dimensional scanning technologies has led to a profound transformation in forensic documentation, enabling the creation of digital representations that faithfully reproduce reality.

3D scanning technologies allow for the generation of detailed digital models of the physical environment, which can subsequently be analyzed independently of direct access to the crime scene. This feature is particularly important, as it enables judicial authorities to revisit the crime scene virtually, perform additional measurements, and test investigative hypotheses without compromising the integrity of the evidence.

Furthermore, in recent years, modern technologies have gained increasing importance in the reconstruction of road traffic accidents, contributing to the accurate determination of event dynamics and the interaction between vehicles and victims [14].

3.1. Crime Scene Processing Time is Significantly Reduced. As previously high-

lighted, a key aspect of crime scene intervention is its operational character. In practice, investigators are often required to act under difficult conditions, under time pressure, and in potentially hazardous environments. In such situations, 3D scanning technologies provide a significant advantage by enabling rapid scene capture and reducing direct interaction with traces. Thus, the use of LiDAR scanners can lead to the acquisition of three-dimensional models within a very short time frame, sometimes in a matter of minutes [15, p.32-39].

Compared to traditional methods, where the documentation of an extensive crime scene may take several hours and require the involvement of multiple specialists, 3D scanning significantly reduces intervention time. This aspect has important implications both from an operational standpoint and in terms of evidence preservation.

With regard to the event referred to in the American press as the "Halloween shooting spree," a case study presented by FARO Technologies [16] illustrates how the Colorado Springs Police Department handled a case in which a male individual randomly shot people while walking down the street and was subsequently shot during an exchange of gunfire with police officers. The crime scene in this case was complex, involving both the location where a police officer was shot and two additional locations where three civilians were fatally wounded.

To document the entire crime scene, investigators used the FARO Focus laser scanner. Based on the scans performed at the scene, investigators were able to determine the sequence of events and reconstruct the crime scene.

Investigators from Colorado Springs reported that, prior to the use of the FARO Focus laser scanner, the processing procedure involved photographing the scene as it appeared upon arrival, identifying and marking each piece of evidence, re-photographing the scene with evidence markers in place, and subsequently taking at least two measurements for each trace in order to create a 2D diagram. The disadvantages of this traditional approach included the lengthy processing time, the difficulty of producing an accurate sketch, and the risk of omitting relevant details.

When using the 3D scanning technique, investigators followed these steps: identifying each piece of evidence, re-photographing the scene, and performing five scans in different areas of the location (each scan lasting approximately 11 and a half minutes). The result was that, in less than one hour, the entire intersection where the incident occurred, along with all 55 pieces of evidence, was fully documented.

Upon returning to the office, investigators used the FARO SCENE software to register the scans and generate a dimensionally accurate 3D model. Furthermore, based on this model, an animation was created to accurately represent witness statements and the spatial positioning of the evidence found at the scene. Additionally, by analyzing projectile defects scanned in vehicles and nearby buildings, investigators were able to determine approximate trajectories for several of the shots fired by both the suspect and the officers.

3.2. Reduces exposure to risk during crime scene investigation. Given the technological capabilities available to modern forensic science, crime scene documentation can no longer be limited to traditional methods, particularly in situations involving increased risk for the investigative team. Such contexts require the use of advanced tools that ensure both the accuracy of data capture and the protection of judicial authorities. The ability of 3D scanning technology to generate detailed digital reconstructions and to enable remote documentation represents an effective solution to these challenges, facilitating both evidence preservation and the possibility of conducting subsequent analyses under safe conditions. In this sense, 3D scanning optimizes the documentation process

and fundamentally transforms the approach to crime scene investigation, allowing for the complete recording of spatial configurations within a short time frame and without direct physical presence in high-risk areas.

An illustrative example is the case of the building explosion in Poznań, where a residential block partially collapsed following a detonation, causing significant structural damage, multiple fatalities, and numerous injuries, thus creating an extremely hazardous environment for intervention teams. In this situation, the Polish Police used 3D scanning to rapidly document the aftermath, with the scanner mounted on the arm of a fire truck in order to capture data remotely from the unstable structure. This approach reduced the risk for investigators while ensuring comprehensive documentation of the crime scene [15, p.32-39].

In the context of 3D scanning usage, it has been noted [15] that the internal procedures of the Polish Police include provisions that significantly simplify the process of conducting crime scene investigations.

3D scanning technology has also been employed to support investigators in Ukraine in documenting crime scenes associated with offenses committed during the ongoing conflict with the Russian Federation. These activities were facilitated through the establishment of a Joint Investigation Team (JIT). Using 3D scanners provided by the Polish Police, multiple crime scenes across different regions of Ukraine were documented. The cited source [15, p.32-39] highlights that 3D scanners proved particularly useful in documenting the aftermath of missile attacks, capturing scattered fragments, structural damage, and essential spatial relationships necessary for reconstructing events, with a high level of accuracy.

Beyond the ability to collect information without direct physical contact, the use of this technology significantly reduces the time investigators spend in high-risk environments, thereby minimizing exposure to danger. Ukrainian prosecutors and police officers have emphasized the reliability and efficiency of the technology, noting its capacity to function effectively under extreme conditions and to enable the safe collection of evidence even in locations characterized by extensive debris and severe structural destruction.

The use of 3D scanning in the documentation of war crimes allows for the recording of hard-to-access areas and large surfaces in a rapid and highly precise manner, from multiple angles. Additionally, it provides the benefit of obtaining accurate coordinates for each captured point, which is particularly useful for subsequent reconstructions. For instance, in the case of a missile attack, where fragments are dispersed over a wide area, these elements must be reassembled into a coherent whole in order to determine the type of missile used, its technical characteristics, trajectory, and other relevant circumstances for the investigation [9, p.22-33].

3.3. The Possibility of Virtually Revisiting the Crime Scene. As previously shown, the data obtained through 3D scanning are processed using dedicated software and materialized in the form of a virtual model. This provides the possibility of revisiting the scene at a later stage for additional analyses whenever necessary [15]. As a rule, crime scene investigation has an irreproducible character, governed by the principle that inherent changes caused by the intervention of judicial authorities, environmental factors, or the passage of time make it impossible to recreate the original conditions. From this perspective, 3D scanning becomes a tool for the digital preservation of reality, enabling the virtual storage of the initial state of the crime scene in a format that allows for subsequent measurements and examinations without requiring physical presence at the scene.

Moreover, the possibility of revisiting the crime scene enables the identification and exploitation of traces or details that were not initially considered relevant [12]. As the investigation progresses and new information emerges, certain elements that initially appeared insignificant may acquire essential evidentiary value. In such situations, 3D scanning allows for a retrospective reassessment of the crime scene, in light of newly formulated hypotheses.

As previously discussed, traditional documentation methods inevitably involve a certain degree of subjective selection. In contrast, 3D scanning enables comprehensive and non-discriminatory recording, reducing the risk of omitting relevant elements and reinforcing the objective character of crime scene investigation.

Last but not least, the possibility of virtually revisiting the crime scene as it was initially documented facilitates activities such as forensic examinations, reconstructions, and the presentation of evidence in court, providing a visual support that complements traditional methods.

3.4. Unfavorable Environmental Conditions May Affect Scanning Quality. LiDAR technology is vulnerable to environmental factors and weather conditions that can significantly influence the performance of scanning systems. Phenomena such as rain, fog, or the presence of dust particles in the atmosphere may cause the scattering or absorption of laser pulses, leading to a reduction in both the operational range and the accuracy of measurements. In such situations, LiDAR systems may encounter difficulties in correctly detecting objects and in generating reliable datasets.

To mitigate these limitations, various technical solutions have been developed and implemented, including the use of adaptive algorithms, the integration of multi-wavelength systems, and the application of signal polarization-based methods. Additionally, calibration procedures and compensation mechanisms are employed to correct atmospheric influences and improve measurement accuracy [13, p.164-172].

Although, compared to photogrammetry, LiDAR-based systems are less dependent on ambient lighting conditions and are capable of functioning effectively even in the absence of natural light, their performance may still be affected by the optical properties of the investigated surfaces. For instance, scanning extremely dark or highly reflective surfaces may result in reduced data quality and accuracy, or even in the loss of relevant information [10].

3.5. High Costs. Despite the benefits highlighted in the specialized literature, one of the main obstacles to the widespread adoption of 3D scanning technologies in the forensic field is the high cost of equipment and associated infrastructure. Acquiring a high-performance scanning system involves a considerable financial effort, which often exceeds the budgetary capacities of law enforcement institutions [12], frequently faced with limited resources and multiple operational priorities. Although these technologies offer clear advantages in terms of accuracy and efficiency in crime scene documentation, the initial investment remains a major restrictive factor. Some sources [12] estimate the cost of a terrestrial LiDAR scanner within a range of approximately 20,000 USD to 70,000 USD, while portable scanners are estimated between 5,000 USD and 18,000 USD. Another source [10] suggests that a reliable unit with medium accuracy and a scanning range of approximately 70 meters may cost around 30,000 EUR.

Even though there are cost differences between various types of equipment, this aspect does not eliminate financial barriers. While portable scanners are generally more affordable than complex terrestrial systems, their acquisition still requires significant financial resources, which are difficult to sustain for many operational units.

As previously mentioned, in order to fully exploit their potential, the data collected through 3D scanning must be processed using specialized software. Therefore, beyond the cost of the hardware itself, substantial investments are also required for dedicated software, personnel training, equipment maintenance, and technological updates. These components contribute to increasing the total cost of ownership, making the implementation of 3D scanning a financially complex endeavor.

IV. Results obtained. The obtained results highlight that the integration of 3D scanning technologies into crime scene investigation must be assessed not only from the perspective of their technical advantages, but also in terms of the methodological implications they generate. Although these systems enable detailed documentation and a faithful representation of spatial configurations, they do not eliminate the interpretative dimension of forensic activity. The evidentiary value of the data remains dependent on the manner in which it is captured, processed, and analyzed.

While 3D scanning reduces the subjective selection inherent in traditional methods, the technical decisions involved in its use may still influence the final outcome. Factors such as scan positioning, resolution settings, data filtering, and post-processing choices can shape the resulting model and, implicitly, the conclusions drawn from it.

Moreover, the operational efficiency provided by these technologies must be correlated with the resources required for their implementation. The reduction in on-site intervention time is counterbalanced by the complexity of subsequent processing stages and the need for specialized software applications. This, in turn, requires advanced technical competencies and additional investments, which may limit accessibility and widespread adoption.

Consequently, the results support the view that 3D scanning represents a valuable tool in forensic investigation; however, its effectiveness is contingent upon the manner in which it is integrated into existing forensic methods and techniques. It does not replace the role of the crime scene investigation team, but rather complements and enhances it within a technologically advanced investigative framework.

Conclusions. Following the conducted analysis, it can be concluded that 3D scanning technologies represent a relevant instrument in the process of modernizing crime scene investigation, contributing to increased precision and to the efficiency of documentation activities. These technologies enable detailed and durable recording of the entire crime scene, facilitating both subsequent analysis and the effective use of traces within the criminal process.

However, the effectiveness of these technologies is conditioned by several factors, including the availability of technical and financial resources, the level of professional training of specialists, and the existence of standardized procedures for their use. In the absence of these elements, there is a risk that the full potential of the technology may not be properly exploited.

Consequently, the integration of 3D scanning into forensic practice should be carried out in a balanced manner, as a complementary tool to traditional methods, aimed at ensuring a comprehensive, objective, and reliable evidentiary framework.

FORMS OF REGULATING DIGITAL ASSETS IN THE CONTEXT OF ENSURING THE SECURITY OF THE DIGITAL ENVIRONMENT OF THE REPUBLIC OF MOLDOVA[1]

Mircea GLADCHI,
PhD, University Lecturer,
"Ștefan cel Mare" Academy of the Ministry of Internal Affairs,
Republic of Moldova
ORCID: 0000-0002-7815-083X

Abstract

The regulation of digital assets in the Republic of Moldova constitutes a strategic pillar for national security, grounded in the harmonization of domestic legislation with international requirements. The current legal framework transforms intangible assets into legally protected entities, a process guided by Directive (UE) 2022/2555 (NIS 2) and the Budapest Convention, which establish global standards for combating cybercrime. This security architecture is consolidated through Law No.48/2023 on Cybersecurity that imposes rigorous control and resilience mechanisms over critical infrastructures and digital services.

The integration of digital assets into the civil circuit is supported by the provisions of the Civil Code of the Republic of Moldova regarding incorporeal assets, while information integrity is guaranteed by Law No.133/2011 on the Protection of Personal Data. Through the Digital Transformation Strategy 2023-2030, the state establishes a supervisory regime aimed at preventing hybrid attacks and protecting informational sovereignty. Thus, the forms of regulation are not merely administrative norms, but genuine defensive shields that ensure a resilient digital environment, capable of supporting innovation without compromising user safety or state stability in the face of contemporary cyber challenges.

Keywords: digital asset, digital content, proprietary right, intellectual property, digital resale.

FORMELE DE REGLEMENTARE A BUNURILOR DIGITALE ÎN CONTEXTUL ASIGURĂRII SECURITĂȚI MEDIULUI DIGITAL AL REPUBLICII MOLDOVA

Abstract

Reglementarea bunurilor digitale în Republica Moldova constituie un pilon strategic pentru securitatea națională, fiind fundamentată pe armonizarea legislației interne cu rigorile internaționale. Cadrul juridic actual transformă activele intangibile în entități protejate legal, proces ghidat de Directiva (UE) 2022/2555 (NIS 2) și Convenția de la Budapesta, care stabilesc standarde globale pentru combaterea criminalității informatice. Această arhitectură de securitate este consolidată prin Legea nr. 48/2023 privind securitatea cibernetică, ce impune mecanisme riguroase de control și reziliență asupra infrastructurilor critice și a serviciilor digitale.

Integrarea bunurilor digitale în circuitul civil este susținută de prevederile Codului Civil al Republicii Moldova privind bunurile incorporale, în timp ce integritatea informațiilor este garantată prin Legea nr. 133/2011 privind protecția datelor cu caracter personal. Prin Strategia de Transformare Digitală 2023-2030, statul instituie un regim de supraveghere ce vizează prevenirea atacurilor hibride și protejarea suveranității informaționale. Astfel, formele de reglementare nu sunt simple norme administrative, ci veritabile scuturi de apărare care asigură un mediu digital rezilient, capabil să susțină inovația fără a compromite siguranța utilizatorilor sau stabilitatea statului în fața provocărilor cibernetice contemporane.

Cuvinte-cheie: bun digital, conținut digital, drept patrimonial, proprietate intelectuală, revânzare digitală.

[1] This publication was produced within the research subprogram "National Security of the Republic of Moldova in the Context of Accession to the European Union: Legal, Political, and Sociological Approaches," code: 01.05.01.

Introduction. In an era of global interconnectivity and reliance on data flows, the Republic of Moldova has embarked on an ambitious path of digital transformation, a process that has required a profound re-evaluation of traditional legal concepts in light of emerging cyber risks. The Reform of the Civil Code of March 1, 2019, marked a turning point by introducing the notions of "digital content" and "digital asset" through Articles 477 and 478. This legislative evolution represents more than a mere administrative necessity; it has become a fundamental condition for guaranteeing national sovereignty and security within a virtual ecosystem increasingly vulnerable to hybrid attacks.

The central issue lies in the transformation of intangible assets into legally protected entities, turning the "digital asset" from a simple line of code into an object of law that requires active security mechanisms. In the context of digital environment security, the regulation of these assets acts as a shield protecting data integrity and critical infrastructure. A secure digital environment cannot be limited to technical solutions alone; it requires a legal foundation that clearly defines responsibilities regarding digital possession and access control, thereby preventing cyber espionage and digital identity theft.

From this perspective, digital security is not merely a technical attribute, but an obligatory premise for the validity of any digital asset. Without a regulatory framework ensuring the resilience of these "quasi-things," users and state institutions remain exposed to risks that can paralyze the functioning of electronic government services and erode citizens' trust in the virtual space. Thus, the present article analyzes how current forms of regulation manage to balance the need for the free circulation of goods with the imperative of maintaining a secure and sovereign digital environment for the Republic of Moldova.

Methods and materials applied. The methodology applied in this research is based on a multidisciplinary approach, combining doctrinal legal analysis with the comparative method to highlight the convergence between national legislation and international security standards. The core of the analysis is the regulatory framework of the Republic of Moldova, specifically examining the amendments introduced by the 2019 Civil Code Reform, particularly Articles 455, 477, and 478, which define the legal regime of "digital assets" and "digital content". To understand the protective dimension of these assets, the study integrates the provisions of Law No.48/2023 on Cybersecurity and Law No.133/2011 on the Protection of Personal Data, as these are essential for ensuring the resilience of the digital environment.

At a comparative level, the materials applied include external sources of inspiration, such as the American RUFADA model (Revised Uniform Fiduciary Access to Digital Assets Act), which served as a benchmark for regulating access to digital assets in cases of incapacity or death. Furthermore, European strategic documents are analyzed, such as Directive (EU) 2022/2555 (NIS 2) and the Budapest Convention on Cybercrime, which outline the coordinates for digital asset security at a regional level. The practical dimension of the research is supported by the analysis of European case law, with a central focus on the French case regarding the Steam platform, which provides a perspective on the recognition of digital assets as objects of property subject to free circulation.

Discussions and results obtained. The alignment of the regulatory framework regarding digital assets with the rigors of Law No.48/2023 on Cybersecurity [1] represents a fundamental shift from a static view based on property rights to a dynamic one focused on the resilience of the Republic of Moldova's information infrastructure. While the Civil Code provides, through Articles 477 and 478, the patrimonial foundation of digital assets, Law No.48/2023 establishes the defense mechanisms that transform these assets into

secure and audited entities.

This alignment is primarily visible through Art. 3 of Law No.48/2023, which extends the understanding of a digital asset beyond mere content, integrating it into the concept of "network and information system security". Consequently, the integrity and availability of digital assets are no longer just the private interests of the holder but have become national security objectives. In this regard, Art. 7 imposes rigorous cyber risk management obligations on entities managing such assets, requiring technical and organizational measures proportionate to the identified risk. This means that the regulation of digital assets is no longer limited to defining possession but imposes an active protection regime intended to prevent data compromise.

A vital pillar of this alignment is Art. 12, which introduces the cybersecurity audit. For the Republic of Moldova, this implies that digital assets with major social or economic impact can no longer exist in a verification vacuum; they must undergo periodic evaluations to confirm that the "legal garment" provided by civil legislation is reinforced by a resistant "technical armor". Furthermore, according to Art. 13, the use of European and international certification standards becomes an indirect form of regulating the quality and safety of digital assets, ensuring that their circulation in the virtual environment does not create systemic vulnerabilities.

The reporting and cooperation dimension provided for in Art. 15 completes this picture by establishing an obligation to notify significant incidents. This provision correlates directly with the need to protect digital assets against destruction or unauthorized access, transforming security from a technological option into a shared legal responsibility. Through this legislative synergy, the digital asset in the Republic of Moldova ceases to be a mere legal abstraction and becomes a secured asset, capable of supporting the country's digital transformation in a sovereign and resilient manner against hybrid challenges.

The modernization of the regulatory framework of the Republic of Moldova, materialized by the entry into force of the Civil Code Reform on March 1, 2019 [2], marked a turning point in aligning national legislation with the demands of contemporary technological reality. The central pillar of this transformation is the introduction of Article 477, through which the legislator formally recognizes the categories of "digital content" and "digital asset". This legislative innovation is not merely a terminological update but requires a profound re-evaluation of the legal ontology of the notion of "asset". Although Article 455 remains the fundamental reference, preserving the classic definition of an asset as an entity comprising things and proprietary rights, the insertion of the digital dimension forces an inquiry into the nature of these assets: are we witnessing an extension of traditional categories, a special rule with a derogatory character, or the birth of an autonomous legal institution that borrows civilist language to regulate unprecedented immaterial phenomena?

The dilemma is amplified by the accelerated pace of information innovations, which places classic legal qualifications—historically built on tangible objects—in direct conflict with fluid and dematerialized realities. A striking example is the legal status of cryptocurrencies, assets that fluctuate between divergent interpretations depending on the adopted reference system, generating uncertainties not only in legal qualification but also in accounting and tax records, both nationally and internationally. In this context, national legislation seems to propose a hybrid regime, attempting to anchor digital content within a framework of legal certainty by establishing strict criteria for existence.

According to the requirements of Article 477, a "digital asset" is the result of an asymmetric symbiosis between two cumulative elements: the existence of digital content

or an electronic account and, obligatorily, the person's subjective right over them. This legal construction moves away from the disjunctive definition in Article 435 (which distinguishes between a thing or a right), imposing the condition that digital content must always be supported by a subjective right to be qualified as an asset. However, the text of the law leaves room for interpretation regarding the nature of this right—whether it must be strictly proprietary, such as a claim right, or can be non-proprietary, such as access to personal data. This distinction is essential, as using the term "asset" for non-proprietary rights contravenes the civilist tradition that associates an asset with an evaluable economic value.

Furthermore, a careful analysis reveals the need for a clear demarcation between digital assets and intellectual property objects. While copyright manifests over the creation itself, the holder of a digital asset exercises a specific form of control called "digital possession". This does not involve physical appropriation but rather technical control over the digital object.

The pragmatic purpose of these regulations is closely linked to Article 478, inspired by the American RUFADA model (Revised Uniform Fiduciary Access to Digital Assets Act) [3]. RUFADA represents a benchmark American legislative model that served as a source of inspiration for modernizing the Civil Code of the Republic of Moldova. The essence of RUFADA lies in resolving a modern legal conflict between the protection of electronic data privacy and the need for heirs or legal representatives to manage the digital estate of a deceased or incapacitated person.

The analysis of this regulatory framework reveals a strict hierarchical structure regarding consent and access to digital assets. RUFADA establishes that user instructions expressed through online tools provided by platforms (such as "legacy contact" settings) take absolute priority over any other document. In their absence, the will expressed in a testament or other legal acts becomes decisive, and only as a last resort do the service provider's standard terms and conditions apply. This hierarchy was designed to provide fiduciaries—whether executors, administrators, or guardians—the legal authority to manage digital assets, such as online bank accounts, cryptocurrencies, or documents stored in the cloud, without violating federal computer fraud laws.

In the context of our discussion, RUFADA brings an essential clarification to the distinction between the "catalogue of electronic communications" (metadata, such as sender and date) and the "content of communications" (the text of the messages). While access to the catalogue is more easily permitted to the fiduciary to identify assets, access to the actual content requires explicit user consent, thus protecting post-mortem privacy. This approach demonstrates that, in the vision of RUFADA, a digital asset is not treated as a simple material object that can be physically taken, but as an extension of the right to privacy that requires a specialized access regime.

Although the American model has a limited scope, focused on third-party access to digital assets in case of death or incapacity, Moldovan legislation uses this foundation to propose a "non-competitive" approach to traditional classifications. Thus, a clear distinction is made: if digital content is provided on a material medium (such as a CD), it remains subject to the rules of corporeal assets according to Article 455 para. (2). In contrast, pure digital assets tend to naturally fall into the category of incorporeal assets.

Looking ahead, an express classification of assets into corporeal and incorporeal, with the explicit integration of digital assets into the latter category, could eliminate current ambiguities. By recognizing the proprietary or sentimental value of digital content, civil law can provide a coherent legal regime where the existence of the content itself

justifies the status of an incorporeal asset, thereby facilitating the secure integration of these assets into modern civil relations.

This perspective suggests that the legislator's primary intention through the amendments to the Civil Code was to extract digital objects from a normative vacuum and provide them with a formal "legal garment", placing them under the protective umbrella of assets and patrimony. Their official recognition is not just a stage of nomenclature but a deliberate attempt to grant them legal guarantees through fundamental institutions, including property rights. However, this legislative ambition faces an insurmountable dogmatic barrier: the immaterial nature of these assets makes it impossible to manifest the attribute of possession in its classic, material sense, which legally excludes their qualification as objects of traditional property.

This discrepancy between the desire for protection and the technical reality of the assets can generate more practical difficulties than legal solutions. Although the legislator accepts the existence of these "quasi-things" through Articles 477 and 478, it fails to base them on detailed and specific regulation, as is the case with intellectual property, where special norms precisely define limits and defense mechanisms. In the absence of special legislation detailing the digital regime, the legal space remains vulnerable to dangerous precedents [4].

The major risk lies in the forced attempt by judicial practice to transfer statutes and rules specific to established institutions onto entities that cannot organically assimilate them. Such an approach risks damaging the purity of theoretical concepts and compromising the full applicability of the respective institutions. Essentially, digital assets remain "quasi-things"—entities that, while having value and utility, lack the constitutive elements of a "thing" in its physical sense, thus requiring a dedicated legal architecture that does not force counterproductive analogies with classic property rights.

The analysis of the legal regime of digital assets in the Republic of Moldova reveals an ambitious attempt by the legislator to provide these virtual entities with a "legal garment" under the cover of traditional asset and patrimony institutions. Through the formal recognition of these assets, the aim was to confer specific forms of protection, sometimes even attempting to relate them to property rights. However, this approach faces a major conceptual barrier, as digital assets cannot be objects of property rights in the classic sense due to the impossibility of manifesting physical possession. This situation risks generating more problems than solutions, as the acceptance of these "quasi-things" in the Civil Code is not mirrored by detailed regulation, as seen in intellectual property. While intellectual creations benefit from special laws defining their limits, digital assets remain in a zone of normative ambiguity that can create dangerous precedents. The main risk lies in the forced attempt to assign them incompatible legal statutes, which damages fundamental theoretical concepts and creates major difficulties in the full applicability of legal institutions for these entities that lack the necessary elements to be considered "things".

This fragility of the civil framework is partially remedied by the process of alignment with Law No.48/2023 on Cybersecurity and by harmonization with the European NIS 2 Directive, which transforms the digital asset from a simple patrimonial unit into an asset requiring active resilience. Thus, the protection of the digital asset migrates from the sphere of physical possession to that of risk management and security auditing, providing practical substance to the concept of technical control.

In conclusion, the regulation of digital assets in the Republic of Moldova is in a state of hybrid transition, where their recognition as autonomous incorporeal assets is the only way to avoid confusion with intellectual or classic property. It is imperative that legisla-

tion evolves toward a dedicated structure that recognizes the specificity of these "quasi-things" and ensures their integrity through a synergy between private law and strict cybersecurity standards, thereby guaranteeing real protection of the digital estate in an increasingly interconnected society. We are witnessing the shaping of a digital patrimony attributed to both natural and legal persons under private law, including those under public law.

The harmonization of Moldovan legislation with Directive (EU) 2022/2555 (NIS 2) [5] represents a qualitative leap from defensive security to a proactive resilience strategy, redefining digital assets not just as objects of private patrimony but as critical resources for state stability. By means of Law No.48/2023, the Republic of Moldova transposes the core pillars of NIS 2, imposing a supervisory and risk management regime that directly targets the integrity, availability, and confidentiality of digital assets. Directive (EU) 2022/2555 represents the new European standard of excellence in cybersecurity, designed to replace the old regulatory framework with a much more rigorous strategy adapted to modern hybrid threats. The transposition of NIS 2 through Law No.48/2023 marks the transition from symbolic legal protection to mandatory technical protection, imposing a common high level of security across the Union and, by extension, in partner states in the process of alignment.

The essence of this directive lies in the massive expansion of its scope, eliminating ambiguities by classifying entities into two critical categories: essential (such as those in energy, transport, health, or digital infrastructure) and important (such as postal services, waste management, or chemical manufacturing). This classification is crucial because digital assets managed by these entities cease to be simple elements of private patrimony and become components of critical infrastructure, whose integrity is vital for the functioning of society. The NIS 2 Directive imposes strict risk management measures on these organizations, including risk analysis policies, supply chain security, the use of cryptography, and business continuity plans in case of crisis.

Another fundamental pillar of the directive is the significant incident reporting mechanism, which obliges entities to notify competent authorities within a maximum of 24 hours of detecting a serious threat. This forced transparency ensures a rapid response at the national and European levels, preventing the propagation of cyberattacks. Additionally, NIS 2 introduces the personal responsibility of the entities' management bodies, meaning that an organization's management can be held liable for non-compliance with cybersecurity obligations.

A primary dimension of this harmonization lies in the expansion of the scope and the rigorous classification of entities managing digital assets. In the spirit of NIS 2, national legislation distinguishes between essential and important entities, a classification that transforms the legal regime of digital assets according to their systemic impact. If a digital asset, regulated under civil law by Art. 477 Civil Code, is part of the infrastructure of an essential entity (e.g., energy, health, digital infrastructure), it is subject to much more severe security requirements. This approach eliminates legal fragmentation and ensures that critical digital assets are protected uniformly, regardless of their public or private nature.

In terms of risk management, harmonization with NIS 2 introduces the obligation to secure the entire supply chain. This means that the regulation of digital assets no longer stops at the final holder but extends to digital service providers. According to the European norms adopted nationally, entities are obliged to assess the vulnerabilities of every digital asset purchased or used. The result is the transformation of the digital asset from an isolated entity into an interconnected element, whose legal validity is conditioned by

technical compliance and "security by design".

Furthermore, the incident reporting mechanism, a central pillar of the NIS 2 Directive, redefines the protection of digital assets in the event of security breaches. The obligation to notify significant incidents to the Cybersecurity Agency (ASC) within strict deadlines (24/72 hours) ensures that any attack on a digital asset is monitored at the state level. This forced transparency protects not only the individual asset but also prevents a domino effect across the entire digital ecosystem of the Republic of Moldova.

Conclusions. The evolution of the legal regime of digital assets in the Republic of Moldova represents a complex process of transition, marked by the effort to reconcile classic concepts of civil law with the technological realities of the 21st century. This normative architecture, initiated by the Civil Code Reform of March 1, 2019, attempted to provide a "legal garment" to immaterial entities that, until recently, existed in a legislative vacuum. Through Articles 477 and 478, the legislator extracted digital content and electronic accounts from the zone of uncertainty, placing them under the umbrella of patrimony and assets; however, this integration has generated a series of doctrinal and practical challenges that require a multidimensional analysis.

The core of this regulation lies in defining the digital asset as an obligatory symbiosis between immaterial content and an associated subjective right. This legal construction departs from the traditional vision of Article 455, imposing a cumulative condition that, while offering symbolic clarity, leaves unresolved ambiguities regarding the nature of the right—whether proprietary or non-proprietary. Furthermore, digital assets are identified as "quasi-things", entities that possess utility and value but lack the materiality necessary to be objects of property rights in the classic sense. The impossibility of manifesting the attribute of physical possession creates a conflict with the institution of property, risking the deterioration of fundamental theoretical concepts if one attempts to force analogies between technical control (codes, access keys) and the actual possession of a corporeal thing.

This civilist basis, although essential, has proven insufficient in the absence of detailed regulations similar to those in the field of intellectual property. The lack of special laws detailing the protection mechanisms for these "quasi-things" creates a risk of dangerous precedents in practice, where digital assets might be assigned statuses incompatible with their fluid nature. However, this protective void is partially compensated by the new dimension of digital security. Alignment with Law No.48/2023 on Cybersecurity and harmonization with the European NIS 2 Directive mark the transition from a static protection of property rights to an active resilience strategy. The digital asset ceases to be merely a unit of private patrimony and becomes a strategic asset whose existence is conditioned by information system security, risk management, and periodic auditing.

In conclusion, the legal regime of digital assets in the Republic of Moldova is currently in a hybrid paradigm, where civil law provides the foundation for patrimonial recognition, and cybersecurity legislation provides the practical defense mechanisms. To ensure full and coherent applicability, a doctrinal re-evaluation is imperative to definitively anchor these assets in the category of incorporeal assets, detaching them from the constraints of classic property. The future of this regulatory framework depends on the ability to develop a dedicated legal architecture that does not force the adaptation of digital assets to old institutions but creates new forms of protection based on secure technical control and shared responsibility. Only through a synergy between the rigor of the Civil Code and the dynamism of cybersecurity standards can the Republic of Moldova guarantee a sovereign digital environment capable of protecting the economic and sentimental value of its

citizens' virtual assets in the face of global challenges.

Abstract

The institution of criminal sanctioning of minors is today one of the most sensitive areas of criminal law, considering, on the one hand, the need for an effective state response to the criminal act committed and, on the other hand, the obligation to treat the minor as a developing person who needs protection, care and social reintegration when he or she comes into contact with the justice system.

The issue of criminal liability and criminal sanctioning of minors remains highly topical, as demonstrated by the new requirements of juvenile justice and by the increased attention that the international community gives to the consolidation of criminal policies in relation to juvenile offenders. In this scientific paper we highlight several models of criminal response to juvenile crime: the repressive model, the protectionist model, the restorative model and the mixed model. Each of these models has its own particularities, which we describe through the prism of international regulations and relevant doctrinal interpretations. At the same time, we emphasize the advantages and vulnerabilities of each model, as well as the specific features of the mixed model within the criminal law of the Republic of Moldova.

Keywords: minor, model of criminal sanctioning, sanction, criminal penalty, coercive educational measures, resocialization.

MODELE DE SANCȚIONARE PENALĂ A PERSOANELOR MINORE

Abstract

Instituția sancționării penale a persoanelor minore reprezintă astăzi una dintre cele mai sensibile zone ale dreptului penal, având în vedere, pe de o parte, necesitatea unei reacții eficiente a statului față de fapta infracțională săvârșită, iar pe de altă parte, obligația de a trata minorul ca persoană aflată în dezvoltare, care are nevoie de protecție, grijă și reintegrare socială atunci când acesta nimerește în contact cu sistemul de justiție.

Problematica răspunderii și sancționării penale a minorilor rămâne una destul de actuală, fapt demonstrat de noile exigențe ale justiției juvenile, dar și de atenția sporită pe care comunitatea internațională o oferă consolidării politicilor penale în raport cu minorii delincvenți. În această lucrare științifică evidențiem câteva modele de reacție penală la criminalitatea minorilor: modelul represiv, modelul protecționist, modelul restaurativ și modelul mixt. Fiecare dintre aceste modele are propriile sale particularități, pe care le descriem prin prisma reglementărilor internaționale și a interpretărilor doctrinare relevante. Totodată, scoatem în evidență avantajele și vulnerabilitățile fiecărui model, dar și accentuăm trăsăturile specifice ale modelului mixt în cadrul dreptului penal al Republicii Moldova.

Cuvinte-cheie: minor, model de sancționare penală, sancțiune, pedeapsă penală, măsuri de constrângere cu caracter educativ, resocializare.

Introduction. In the case of minors, the coercive function of the criminal sanction can no longer be understood in its traditional meaning, specific to criminal law applicable to adults, namely as a predominant expression of state coercion exercised for the purpose

of repressing criminal conduct. Within juvenile justice, coercion must be adapted to the particularities of age, the level of intellectual and psychological development, as well as to the increased possibility of shaping the minor's behavior. Thus, in relation to a minor, the coercive function must be subordinated to a formative purpose, avoiding the transformation of the sanction into a mere instrument of intimidation or social exclusion.

Methods and materials applied. For the purpose of preparing this scientific investigation, we used several research methods, including the historical method, the comparative method, the systematic method, logical-rational analysis and others. At the same time, the paper focuses on the analysis of national and international regulations concerning the subject addressed, as well as relevant scientific works from our country and from other states.

Discussions and results obtained. When analyzing international documents on the criminal liability of minors, we observe that, at international level, the criminal response to minors who have committed offences must be adapted to their specific needs, their age and the objective of their social reintegration. Article 40 of the Convention on the Rights of the Child expressly enshrines the obligation of States Parties to recognize "the right of every child alleged as, accused of, or recognized as having infringed the penal law to be treated in a manner consistent with the promotion of the child's sense of dignity and worth, which reinforces the child's respect for the human rights and fundamental freedoms of others and which takes into account the child's age and the desirability of promoting the child's reintegration and the child's assuming a constructive role in society" [1]. It is precisely for these reasons that a profound rethinking of the concept of criminal sanction applicable to minors is required.

Below we shall analyze several approaches to the term criminal sanction, which, in general, includes penalties and coercive measures. Some authors describe the term "sanction" as a consequence of criminal liability. For example, as Romanian professor C. Bulai argues, "the offence as an act prohibited by criminal law cannot be conceived without the inevitable consequence that is criminal liability, and this, in turn, would be devoid of object without the criminal sanction, without punishment. Conversely, punishment cannot be conceived without the existence of criminal liability, and the latter can have no legal basis other than the offence" [2, p.312]. Other authors, defining criminal sanctions, show that they "are measures of coercion and re-education, provided by criminal law (penalties, educational measures and security measures), applied to persons who have committed acts incriminated by it, for the purpose of preventing the commission of such new acts through the re-education of offenders" [3, p.77].

Usually, the consequence of committing an offence implies the application of a penalty, but it cannot be said that this is the only criminal consequence, especially in the case of minors. This idea is also supported by doctrinal interpretations which show that "educational measures may also be applied to minors or, together with the penalty or educational measure, or even in their absence, security measures may be ordered or criminal liability may be replaced by liability that entails the application of an administrative sanction" [4, p.221]. Therefore, we reiterate that criminal penalties alone, as measures of state coercion applied to persons who have committed offences, cannot fully and independently guarantee effective criminal-law protection, especially in the case of minors. Thus, in the theory of criminal law, the role of security measures is increasingly emphasized. As the author F. Antolisei also states, "the fight against offences could not be effective if criminal-law sanctions were limited only to penalties; often the acts provided by criminal law reveal certain human or social realities which, if not counteracted, may determine the

commission of other acts provided by criminal law. These realities, considered 'states of danger', are distinct from the social danger presented by acts provided by criminal law and cannot be counteracted by penalties, because they arise from realities that are not susceptible to being influenced by penalties: the removal of these states of danger could be achieved only through preventive measures – security measures" [5, p.714].

The need to establish a mixed system of criminal sanctioning, in the sense of regulating penalties and security measures, is also highlighted by A. Posdarie, according to whom the system of criminal-law reaction is no longer "a system of single, exclusivist reaction (either only penalties – the classical school, or only preventive measures – the positivist school), but a unitary system in the sense of merging penalties with security measures into a unitary instrument for combating the phenomenon of criminality" [6, p.15].

Considering the age-related particularities and the specific development of minors, it is imperative that they benefit from a sanctioning regime distinct from that of adults. Thus, we agree with the opinions of legal scholars who argue that "criminal law and the criminal statute cannot view from the same angle these activities (offences) committed by minors and treat them as those committed by adults. This is required both from the point of view of the degree of social danger of the acts and with regard to the means of legal coercion necessary for sanctioning offenders" [7, p.217]. We also agree with other opinions invoked by the same authors, according to which "when related to the age and living conditions of minors in general, the acts committed by them naturally present a less serious degree of social danger than those committed by adults. This objective finding empirically leads to the conclusion that the problem of juvenile offenders could be solved through a corresponding mitigation of criminal coercive measures in the case of acts committed by minors" [7, p.217].

Further, referring specifically to the models of criminal sanctioning of minors, we note that the study of legislation and doctrine allows us to identify several models that may conventionally be classified as follows:

- The repressive or retributive model;
- The protectionist or welfare model;
- The restorative model; and
- The mixed or integrative model.

These models represent the expression of distinct conceptions regarding the specificity of the criminal liability of minors, the purposes of the state's response to criminal acts committed by minors, and the reciprocal link between the act and the personality of the perpetrator. At the same time, these models often coexist within the same legal system and are not applied in isolation; however, one of them tends to become dominant and is placed at the basis of criminal policy regarding minors. The standards of the United Nations and of the Council of Europe support mixed models of criminal sanctioning of minors, the emphasis being placed on the educational and restorative purpose of the sanction, while detention is applied only in exceptional situations and for the minimum necessary period, as a measure of last resort.

In describing the specific features of each model, we note that the repressive model, also called in doctrine the retributive model, is based on the idea that the criminal sanction must represent, first and foremost, a proportional response of the state to the seriousness of the act committed. Thus, this model focuses on the offence, on its degree of dangerousness and on the need to reaffirm the authority and imperative nature of the criminal norm. Within this system of social reaction, the minor is treated primarily as the

author of a violation of the legal order, and his or her age-related particularities are relevant mainly for mitigating the sanctioning regime, but not for fundamentally changing the nature of the criminal response. At the same time, this model is specific to systems in which juvenile justice is closely aligned with the justice applicable to adults. In these systems, differences in legal regime often consist only in the reduction of penalty limits or in the existence of special procedures, without the purpose of the sanction truly moving away from the classical essence of punishment.

In some research, this model is also called the authoritarian or traditional model and is described in contrast to the liberal model, meaning that within the authoritarian model "juvenile offenders who are criminally liable are subject to criminal sanctions, whereas the liberal model indicates that the criminal regime will not be applied in this case, and minors will be subject only to measures of another nature" [8, p.107].

The apparent advantage of the repressive model lies in the clarity and firmness of the legal response, as well as in the emphasis placed on individual responsibility. Nevertheless, its limits are significant. It does not sufficiently value the realities of the minor's psychological development or his or her increased vulnerability to family, social and peer-group influences. In addition, the early application of severe sanctions may intensify stigmatization and compromise the very objective of preventing recidivism. Contemporary juvenile justice standards have moved beyond this paradigm, as they promote the idea that a child in conflict with criminal law must be treated in a manner compatible with his or her dignity, age and the objective of social reintegration, considering that his or her physical and psychological development justifies diminished culpability and, consequently, differentiated legal treatment. The same reasoning can be derived from the European Rules for juvenile offenders subject to sanctions or measures, which provide that "the imposition and implementation of sanctions or measures shall be based on the best interests of the juvenile offenders, limited by the gravity of the offences committed (principle of proportionality), and take account of their age, physical and mental well-being, development, capacities and personal circumstances (principle of individualization), as ascertained when necessary by psychological, psychiatric or social inquiry reports" [9].

General Comment No.24 (2019) of the UN Committee on the Rights of the Child also emphasizes that "the physical and psychological development of children differs from that of adults. Such differences constitute the basis for the recognition of a lower degree of culpability and for the establishment of a separate system with a differentiated and individualized approach. It has been demonstrated that exposure to the criminal justice system causes harm to children, limiting their chances of becoming responsible adults" [10]. At the same time, the document recommends that States develop extrajudicial measures and make use of alternatives to detention, which contradicts the foundations of an exclusively punitive paradigm. Consequently, although the repressive model has not completely disappeared from comparative law, it can no longer legitimately constitute the main axis of the criminal sanctioning of minors.

The second model – the protectionist or welfare model – unlike the repressive model, is based on the idea that the minor who has committed an offence must be approached by taking into account his or her psychosocial development particularities and the environmental conditions that favored the criminal behavior. Therefore, this model focuses not exclusively on the act committed, but on the minor's personality, family environment and social groups, as well as on his or her prospects for resocialization. The protectionist model is based on the idea that juvenile delinquency cannot be effectively addressed only through criminal coercive means, considering that it often represents the expression of

deficiencies in socialization, harmful family environments, economic vulnerability or a lack of educational or emotional support. Thus, the state's response must be primarily focused on education and assistance. Moreover, intervention measures regarding the minor must constitute instruments of formation, supervision, counseling, psychological support, school and vocational guidance, and must not be strictly limited to the application of sanctioning means.

Such a model may also be derived from the analysis of international standards, since the Beijing Rules proclaim as a principle the obligation of Member States, in accordance with their general interests, "to promote the well-being of the juvenile and his or her family" [11]. At the same time, the system of administration of juvenile justice must be designed so as to respond to the different needs of minors and protect their fundamental rights. The Riyadh Guidelines also emphasize the welfare of the minor, the broad use of preventive measures and the avoidance, as far as possible, of the minor's interaction with the justice system. According to the document, "a child-centered orientation should be pursued. Young persons should have an active role and partnership within society and should not be considered mere objects of socialization or control" [12]. At the same time, it is necessary to understand that "labeling a young person as 'deviant', 'delinquent' or 'pre-delinquent' often contributes to the development of a consistent pattern of undesirable behavior by young persons" [12].

Some research shows that the protectionist model is based on a positivist approach, in the sense that "the juvenile's unlawful behavior is the product of social or environmental factors for which he or she cannot be individually responsible. Consequently, the main purpose of the youth justice system is to provide offenders with appropriate support or treatment, rather than to punish them. Moreover, young people who are vulnerable or in difficulty are considered to need protection against the potentially harmful and corrupting influences of the adult world, including the adult criminal justice system. As a result, the main emphasis is placed on the needs and best interests of the child, rather than on the acts he or she may have committed" [13, p.3].

As a characteristic of the protectionist approach, we also highlight the broad involvement of various experts in the social sciences, such as social workers, psychologists, psychiatrists and specialists trained in pedagogy, either as decision-makers in their own right or, more frequently, as advisers and authors of reports intended to support judges. Another characteristic invoked by James Dignan in his studies is that "decision-makers are granted broad discretion when establishing and ensuring the best interests of the child. This often involves recourse to custody (or, at least, compulsory removal from the family environment), both for diagnostic purposes and to remove the child from a harmful environment. There is also an obvious preference for judicial decisions and measures that are flexible, individualized and open-ended or indeterminate in duration. Such measures, in turn, have the effect of conferring upon the practitioners responsible for their implementation a broad discretionary power over the life of the young person" [13, p.4]. However, we consider that the protectionist model is not an ideal one, since an excessively protective approach may lead to the diminished importance of procedural guarantees and to the justification of overly broad interference in the minor's life under the pretext of his or her "good". Therefore, the application of this model must be accompanied by strict respect for the principle of legality, proportionality and effective judicial control. At the same time, the best interests of the child cannot serve as an argument for arbitrariness; it must be integrated into a clear and predictable legal framework.

Another model – the restorative model – constitutes one of the most important

innovations of contemporary criminal policy and has particular relevance in the field of minors. This model distances itself both from strictly repressive logic and from exclusively protectionist logic, placing at the basis of the legal response the idea of repairing harm and reconstructing the social relationships harmed or endangered by the commission of the offence. Within this model, the minor is not only the recipient of a sanction or educational intervention, but an active participant in the process of assuming responsibility and remedying the consequences of the act.

From the analysis of various doctrinal interpretations, we identify several basic principles on which the restorative model is based, namely that society's response to criminal acts committed by minors should not be limited to punishment, but should primarily pursue the repair of harm, the assumption of responsibility by the minor, the involvement of the victim and the social reintegration of the child. At the same time, some research shows that "restorative justice offers a very different way of understanding and responding to crime. Instead of considering the state as the primary victim of criminal acts and placing the victim, offender and community in passive roles, restorative justice recognizes that crime is directed against concrete persons. It is based on the belief that those most affected by the offence must have the opportunity to be actively involved in resolving the conflict. Repairing harm and restoring losses, providing the offender with the opportunity to assume direct responsibility for his or her actions, and supporting the victim in overcoming vulnerability and reaching a certain degree of emotional closure stand in clear contrast to the values and practices of the traditional criminal justice system, centered on past criminal conduct and on the application of increasingly higher levels of punishment" [14, p.255].

Regarding the essence of restorative justice within the criminal response to juvenile crime, L. Walgrave states that it "does not consist exclusively in a certain procedural technique, but in the purpose of restoration: the legal response is legitimate insofar as it is primarily oriented toward repairing the harm caused by the offence. This position is important for juvenile justice, because it allows the restorative model to be understood not merely as criminal mediation, but as a genuine philosophy of criminal response applicable to minors, centered on responsibility, reparation and reintegration, not on mere punitive suffering" [15, pp.1-2]. J. Dignan also highlights several characteristics of this model, according to which "in terms of criminal justice policies and procedures, the restorative justice model — like the minimum intervention model — favors diverting a large number, if not the majority, of offenders away from prosecution, as well as strategies aimed at decarceration, since custodial interventions often make it very difficult to achieve restorative outcomes. It is not surprising that the emphasis placed on meeting victims' needs, while promoting offender accountability and welfare, as well as strengthening the active role of victims, offenders and communities, has led to the search for new institutional and procedural mechanisms that are more appropriate and more culturally sensitive" [13, p.10].

Referring to restorative justice practices, A. Bolocan-Holban argues that in the field of justice they may be used in order "to reduce the burden on the criminal justice system, to divert certain cases from judicial proceedings and to establish alternatives to detention, where the law allows and provides ways of resocializing the offender through non-custodial sanctions" [16, p.120]. The author, analyzing criminal policy in the context of the criminal legislation of the Republic of Moldova, emphasized that "one aspect oriented toward restorative justice concerns alternatives to detention. National legislation provides for a series of measures that focus on the person of the perpetrator, offering him

or her legal facilities and the possibility of eventual resocialization" [16, p.120]. At the same time, several principles governing restorative justice were highlighted, including responsibility, reparation, rehabilitation and reintegration.

We further emphasize that among the objectives promoted by international documents on the criminal liability of minors is also "the promotion of key strategies for reducing the particularly harmful effects of contact with the criminal justice system, taking into account increased knowledge regarding the development of minors, in particular the more frequent application of measures to avoid the involvement of minors in formal judicial procedures" [10]. Moreover, General Comment No.24 (2019) on Children's Rights in the child justice system defines the term restorative justice itself, meaning "restorative justice: any process in which the victim, the offender and/or any other individual or member of the community affected by an offence participate together and actively in resolving the matters arising from the offence, often with the help of a fair and impartial third party" [10].

At the international level, during the Twelfth United Nations Congress held in Salvador, Brazil, the importance of valuing the restorative model within juvenile justice was reiterated. Thus, paragraph 51 of the Salvador Declaration emphasizes "the need to reinforce alternatives to imprisonment, which may include community service, restorative justice, electronic monitoring, as well as the need to support rehabilitation and reintegration programmes, including those aimed at correcting criminal conduct, together with educational and vocational programmes for convicted persons" [17].

Although the restorative model has a number of advantages, it should not be idealized. Its effective application depends on the existence of specialized services, trained counselors, a clear procedural framework and the genuine consent of the participants. Moreover, not every act and not every case allows for an adequate restorative intervention. Therefore, restorative justice must be viewed as an essential, but not exclusive, instrument in the architecture of the criminal sanctioning of minors.

The mixed or integrative model is currently the model that dominates most European systems and the normative architecture promoted by international organizations. It starts from the idea that the minor must be held accountable for the act committed, but this liability cannot be materialized through the simple transposition, in attenuated form, of the sanctioning regime applicable to adults. On the contrary, the criminal response must combine elements of legal accountability, protection, education, reintegration and, where appropriate, restoration. Therefore, it presupposes a combination of elements of the educational (protectionist) model and of the repressive model, to which components of minimum intervention or restorative approaches may be added in practice. James Dignan, in a comparative analysis of juvenile justice systems, explicitly emphasizes that the typologies he identified in the work Juvenile Justice Systems: A Comparative Analysis are not "ideal types" and that "real juvenile justice systems do not correspond exclusively to a single model, most of them being influenced by several approaches simultaneously" [13, p.2].

In national legal doctrine, the idea of a mixed model of criminal sanctioning of minors is supported by the recognition of a legal regime in which criminal penalties coexist with educational measures, without excluding criminal liability itself. As already highlighted, some doctrinal studies identify two major models of approach regarding the criminal liability of minors: the liberal model and the authoritarian model. Referring to the authoritarian model, M. Spatari and N. Danelciuc-Colodrovschi identify several modalities of it:

"1. A minor whose age is close to majority may be considered an adult and, conse-

quently, may be subject to penalties provided for adults (the authors consider this incorrect, because a minor cannot be sanctioned to the same extent as an adult);

2. Only penalties are applied to minors, but their duration is reduced compared with those applied to adults;

3. Penalties and/or educational measures (security measures) are applied to minors, that is, a mixed sanctioning regime is involved" [18, p. 76].

Furthermore, the same authors, analyzing the provisions of the criminal laws of various states, identified that "the state of minority has an influence on criminal liability. In this regard, most states provide that a minor under the age of 14 benefits from the absolute and irrebuttable presumption that he or she lacks discernment and, consequently, criminal liability cannot be engaged" [18, p.76]. It is also reiterated that, according to the criminal law of the Republic of Moldova, the age limits of criminal liability are 16 and 14 years, emphasizing that "among the categories of penalties provided in Article 62 of the Criminal Code of the Republic of Moldova for natural persons, the fine, unpaid community work and imprisonment are applicable to minors" [18, p.76], and that minors released from criminal liability or criminal punishment are subject to coercive educational measures provided by law.

Discussing the particularities of criminal punishment applied to minors, D. Popescu maintains that, in the field of minors, the sanction cannot be conceived exclusively in the logic of repression, but must be individualized according to age-related particularities and the corrective-educational purpose. The author shows that punishment "must be adapted so as to take into account the influence of the punishment applied on the correction and re-education of the guilty person, as well as the living conditions of his or her family" [19, p.472]. He also emphasizes that, in the case of the minor, sanctions must take into consideration not only the act, but also the person in formation, showing that "the minority of the person who committed the offence must produce special essential effects in the individualization of criminal liability and punishment" [19, p.472]. It is also necessary to consider that "age is an individual characteristic of the juvenile offender which indicates the level of his or her bio-psycho-social development" [19, p. 472].

Other legal scholars who have addressed the issue of using legal-criminal coercive means against minors also support the need to establish a sanctioning system distinct for minors. For example, I. Casandra argues that "the need to launch and continue efforts to reduce the degree of liability and sanctioning of acts committed by minors is not denied, but in no way under the aspect of reducing the degree of social danger of the offence committed by them. All these reasons indicate the need to differentiate the sanctioning regime of juvenile offenders from that provided and intended for adult offenders" [8, p.106]. At the same time, we agree with the same authors that "not only differentiated sanctioning treatment is necessary, but also the individualization of criminal liability based on the age of the active subject of the offence. This latter aspect may be promoted for each offence individually or for certain categories of offences, depending on how they are classified in criminal law" [8, p.106].

From the corroboration of various doctrinal opinions, we may conclude that the mixed model is understood as a formula of balance between the requirements of criminal liability and the need for differentiated treatment of the minor. In other words, the minor remains a subject of criminal liability, but the legal response to his or her act is structured by combining penalties with educational measures and through a pronounced individualization oriented toward correction, re-education and social reintegration. This orientation is also confirmed by the observation that the list of educational measures provided

by law is exhaustive, the court being unable to apply measures other than those expressly provided by law.

From the analysis of the provisions of the Criminal Code of the Republic of Moldova, we conclude that it provides for a mixed sanctioning regime in relation to minors, establishing the possibility of applying either a criminal penalty or security measures (coercive educational measures), under the conditions provided by law. Also, when applying the criminal penalty, the penalty applicable to adults is taken as a basis, from which certain individualizations are made in relation to minors. In the context of the Republic of Moldova, the analysis of the models of criminal sanctioning of minors is particularly important, because domestic law must be interpreted and applied in accordance with the international treaties to which the state is a party. From this perspective, the national framework should not be read in a strictly punitive logic, even when criminal law establishes the minor's liability for certain acts. On the contrary, the institutions of criminal and criminal procedural law relating to minors must be subordinated to a special conception, centered on individualization, psychosocial assessment, educational measures and reintegration.

Conclusions. For the law of the Republic of Moldova, the most appropriate model is, in our opinion, the mixed model with an educational-restorative dominant. This option is justified both by binding international standards and by criminological realities. The minor should not be automatically exempted from liability, but neither should he or she be treated as an adult subject only to an attenuated sanctioning regime. Rather, the minor must be subject to a differentiated legal response, in which the assessment of personality, family environment and capacity for change has a decisive role in choosing the applicable measure.

In this way, the criminal sanctioning of the minor becomes a means of genuine special prevention, and not merely a formal expression of criminal coercion. In addition, full compatibility of the law of the Republic of Moldova with the modern requirements of juvenile justice presupposes not only the existence of adequate norms, but also the functioning of institutions capable of giving them real content. The role of probation services, pre-sentence psychosocial assessment reports, counseling programmes and restorative mechanisms becomes essential for transforming the sanction into a genuine instrument of reintegration. In the absence of these mechanisms, even a well-oriented normative framework risks being applied in a formalistic manner, close in fact to the repressive logic that international standards seek to limit.

Abstract

Crime, its determinants, the management of combating crime, the control of consequences and the prevention of criminal behavior, both at the individual and social levels, constitute the object of study of criminology. In this context, a special place is reserved for criminological management, which can only be conceived in the context of social control of the determinants of crime. Or, namely, the specificity of the causes and conditions of crime, shapes criminological management, to ensure public order and security.

Both the activity of public authorities and civil society contribute directly or tangentially to the annihilation of the determinants of crime. This is due to the fact that both the causes and conditions of criminal behavior are different, but can be conventionally grouped into individual and general.

The specificity of crime in the Republic of Moldova is determined by a multitude of factors, among which the following can be mentioned at the macro level – the war in Ukraine, migration from the war, the crisis in the Middle East and others. The latter generate changes in managerial methods and public policies, including in the field of criminological management, capable of providing adequate solutions to security threats and attacks on public order.

In this paper, is proposed a conceptual analysis of the determinants of crime, as well as a description of their specifics at the current time in the Republic of Moldova.

Keywords: prevention, determinants, causes, conditions, level of crime.

UNELE ASPECTE ALE DETERMINANTELOR CRIMINALITĂȚII ÎN REPUBLICA MOLDOVA

Abstract

Criminalitatea, determinantelor sale, managementul combaterii criminalității, controlul consecințelor și prevenirea comportamentului infracțional, atât la nivel individual cât și social, constituie obiectul de studiu al criminologiei. În acest context, un loc aparte este rezervat managementului criminologic, care nu poate fi conceput, decît în contextul controlului social al determinantelor criminalității. Ori, anume specificul cauzelor și condițiilor criminalității, modelează managementul criminologic, pentru asigurarea ordinii și securității publice.

Atît, activitatea autorităților publice, cît și a societății civile contribuie direct sau tangențial la anihila-

rea determinantelor criminalității. Această se datorează faptului că atît cauzele, cît și condițiile comportamentului infracțional sunt diferite, dar pot fi convențional grupate în individuale și generale.

Specificul cimnalității din Republica Moldova este determinant de o mulțime de factori, printre care se pot menționa la nivel matro - războiul din Ucraina, migrația din calea războiului, criza din Orientul Mihlociu și altele. Ultimele, generează modificarea metodelor manageriale și politicilor publice inclusiv în domeniul managementului criminologic, apt să ofere soluții adecvate pericolelor securității și atentatelor la ordinea publică.

Propunem analiza conceptuală a determinantelor criminalității, precum și descrierea specificului acestora la momentul actual din Republica Moldova.

Cuvinte-cheie: prevenirea, determinantele, cauzele, condițiile, nivelul criminalității.

Introduction. The mass-media space of the Republic of Moldova is full of reports about the conflict in the Middle East, the war in Ukraine, crimes of various kinds and their consequences, including for the Republic of Moldova. The discourses widely present reports about serious and particularly serious crimes, including murder, rape, domestic violence, fraud, smuggling and road accidents with serious consequences. The context in which, an objective assessment of the crime situation requires substantiation not only on the basis of media discourses, but also a systematic analysis of official statistics.

Official statistics from the Republic of Moldova confirm the annual registration of approximately twenty thousand crimes. According to the Ministry of Internal Affairs, 26,300 crimes were registered in 2020, which corresponds to a rate of 100 crimes per 10,000 inhabitants [1]. In 2021, this figure increased to 27,200 crimes (an increase of 3.1% from the previous year) [2].

The number of people convicted by the courts of first instance in 2022 was 8,400 (an average of about 23 people per day), a decrease of 27.1% compared to 2021. The main types of punishments were: imprisonment, unpaid community service and conditional suspension. In the same year (2022), 6,079 people were detained in penitentiary institutions, of whom 17.1% were in pretrial detention and 82.9% were serving a final sentence. Women constituted 5.4% of the prison population.

Crime mapping indicates that most crimes are committed in urban areas (60.8%), with approximately every third crime being recorded in Chisinau municipality. Significant crime rates are also recorded in Balti municipality (5.8%), as well as in Cahul (2.9%), Orhei (2.8%) and Ialoveni (2.5%). A direct connection and interdependence is identified between the level of urbanization, population density and criminal activity. However, lower crime rates in other regions may be partly due to both low population levels and a higher crime latency rate.

The juvenile crime rate in 2022 constituted 2.6% (705 cases) of the total number of recorded crimes, the vast majority of which were committed by men [3].

In 2023, the total number of registered crimes decreased to 24,000 (-10.4% compared to the previous year). The crime rate was 96 crimes per 10,000 inhabitants. The proportion of men among criminals was 90.9%, and women – 9.1%. The number of convicted persons increased to 9,100 (+8.2% compared to 2022) [4].

In 2024, 24,600 crimes were registered (an increase of 2.5% compared to the previous year). The crime rate was 102 crimes per 10,000 inhabitants. Property crimes (35.4%) and transport crimes (16.9%) dominated the crime structure. The number of convicted persons reached 10,900 (an increase of 19.6% compared to 2023) [5].

In 2025, the number of crimes decreased by 23,100 (a 6.0% decrease compared to the previous year). The crime rate was 97 crimes per 10,000 inhabitants. Meanwhile, the number of convicted persons continued to increase, reaching 11,800 (+8.4%). The structure of crime remained relatively stable: property crimes accounted for 35.1% and trans-

port crimes accounted for 17.0% [6].

According to data in January 2026, were recorded 1,761 crimes, which is 0.46% more than in the same period of the previous year [7].

The analysis of the dynamics of registered crimes for the period 2020-2025 reveals a moderate downward trend in the overall crime rate. While in 2020, 26,300 crimes were registered, in 2021 this figure already constitutes 27,200 (an increase of 3.1%). A gradual decrease in crime has been observed starting with 2022: 26,800 (2022); 24,000 (2023); 24,600 (2024); and 23,100 (2025). Thus, a long-term decrease in crime is observed, despite certain fluctuations.

A similar trend is also evident in the crime rate per 10,000 inhabitants: from 100 in 2020 to 97 in 2025, with intermediate fluctuations (103 in 2022; 96 in 2023; and 102 in 2024). Statistical data confirm a gradual stabilization of the crime situation, although it is premature to speak of a sustainable improvement due to the continued volatility of the indicators.

Structural analysis of crime revealed a persistent predominance of property crimes (approximately 35% annually), indicating that a significant part of criminal activity is influenced by economic relations. Transport crimes also account for a significant share (approximately 16-17%), reflecting systemic problems in road safety and law enforcement.

The gender structure of crime remains practically constant: the vast majority of crimes are committed by men (approx. 90%). This is consistent with global criminological patterns and indicates the need for gender-focused prevention programs. However, there has been a slight increase in the proportion of women among female offenders (from 7.9% in 2022 to 9.1% in 2023), which may indicate gradual changes in women's social roles and their involvement in criminal activity.

The increase in the number of people convicted by the courts of first instance deserves special attention: from 8,400 in 2022 to 11,800 in 2025. This trend is manifested against the background of a general decrease in the number of registered crimes, which can be interpreted as follows. On the one hand, this may indicate an increased efficiency of magistrates and the entire judicial system, which leads to an increase in the number of cases detected and resolved. On the other hand, it cannot be ruled out that criminal policy has become harsher, and the proportion of criminal cases closed or resolved with the application of alternatives to sentencing is decreasing.

Studying the statistical data of the penitentiary system in the Republic of Moldova indicates a slight decrease in the total population in prison (from 6,079 people in 2022 to 5,690 people in 2023), which confirms the trend of humanization of penal policy and an increase in alternative punishments to detention. The share of men among prisoners (approximately 95%) confirms the gender asymmetry in crime.

It should be noted that official statistics do not fully reflect the real crime rate. Latent crime plays a significant role, resulting from both the inability to detect and the tendency to hide some crimes from statistical data. This factor must be taken into account when interpreting statistical data and in the trends of public crime prevention policies.

The criminogenic situation in the Republic of Moldova is characterized by a combination of relative stabilization of quantitative indicators and persistent structural problems that require a comprehensive and interdisciplinary approach. An effective criminal policy against crime must take into account not only law enforcement, but also the determinants of crime.

The answer to the eternal question "... for what reasons does crime exist and what factors influence it?", is offered by thinkers and scholars, depending on the level of devel-

opment of society at the specific stage of its evaluation.

The problem of the causality of crime is one of the central ones in criminology.

Thomas More, a thinker from the early 16th century, argued that the main causes of crime lay in the existence of a wealthy class and the so-called nobility, surrounded by numerous servants and living in comfort alongside the poverty of the masses. "Until the wealthy class disappears", more said, "crime will not disappear", and he painted a picture of a non-existent state, where gold and silver are priceless, where a life of ordinary work is led, where there are no lazy people, and where crime is a rare exception [8, p. 105].

In criminology, causality is the basis for explaining everything related to the existence and transformation of crime; it represents the inherent content of determination, that is, the causal definition of crime. Interest in such a causal definition can be found in the philosophical works of ancient thinkers: Plato, Aristotle, Democritus, Diogenes and others. Later, within the framework of criminological theories of crime and criminals, schools of thought emerged that explore the causes of crime: for example, the Italian school (C. Lombroso, E. Ferri, R. Garofalo) and others. However, the first relatively complete concepts about the causes of crime appeared in the second half of the 19th century and are associated with the birth of criminology as a science [9, p. 115].

Currently, the causes of crime should be recognized as a combination of objective and subjective circumstances, rooted in existing real social relations and giving rise to crime as a natural social consequence of it [10, p. 20].

Criminology, which studies social phenomena, cannot be limited to examining the causes of individual criminal behavior. Its goal is to identify the causes of crime as a whole, in order to consistently reduce and eliminate it [11, p. 70].

To explore this issue in more detail, it is necessary to make some clarifications. First of all, causality is an objectively existing connection, a relationship between two or more phenomena, in which one (the cause) gives rise to the others (the effects). Causality is not a figment of our imagination, but a truly existing pattern of nature and society [12, p. 123].

The determinants of crime constitute the set of causes and conditions of crime, representing a system of negative social phenomena that affect the prevailing social relations, phenomena and processes. Moreover, these causes and conditions are not a random, mechanical set of determinants of crime, but rather a criminogenic system, which represents the unity and integrity of interacting subsystems and elements, which are interconnected and arranged in a specific hierarchy and level of subordination.

The system of determinants in criminology uses several types of relationships, but the main ones are cause-effect relationships, conditioning relationships or state relationships and functional relationships. As a type of objective, legal relationship, causality possesses such characteristics as: universality, irreversibility and spatial and temporal continuity. Causes and conditions are united by the generic concept of "criminogenic determinants". The identification of these determinants is arbitrary; they exist in close interconnection.

A cause is a phenomenon whose presence provokes, determines, changes, produces, or implies another phenomenon, called an effect. It ensures a specific course of an event, necessary for the occurrence of a certain effect.

Conditions are phenomena that cannot, in themselves, produce a consequence, but by accompanying and influencing the causes, ensure a certain development necessary for the emergence of the consequence. Without conditions, without their interaction with the cause, the latter will either not appear or will not act. In the exclusive presence of conditions, the possibility of a consequence does not become a reality [13, p. 19]. A condi-

tion is something that, in itself, does not generate crime or criminality, but influences the processes of generating it and participates in determining the crime [14, p. 38].

Spatial connection expresses the distribution of crime and its causes depending on the administrative-territorial division of the space in which the studied phenomenon exists. As V.D. Malkov rightly noted, "spatial connection expresses the distribution of crime within a territory, the prevalence of various types of crime depending on social, economic, geographical, demographic, ethnographic and other differences in individual regions of the country" [15, p. 59].

Thus, the determinants of crime lie in the multiplicity of interconnections and interactive phenomena of social reality that underlie its existence. Unfortunately, it is already becoming clear that crime will exist as long as humanity exists.

The study of crime requires a classification of causes and conditions. Classification is, in essence, a scientific analysis of the connections and dependencies between similar factors that influence crime. The main task is to select, from a wide variety of causal relationships within crime, those that have common points [16, p. 20].

Criminogenic conditions can be divided into the following groups: conditions that favor the commission of crimes (the so-called situational conditions) and conditions that shape criminogenic motivation. These conditions, of course, interact at the informational level. A situational condition, for example, is the lack of security in an enterprise, which contributes to the development of a selfish and irresponsible attitude towards the safety of manufactured products. Conditions that shape criminogenic motivation are those environmental phenomena that contribute to the emergence of motives for criminal behavior. These include accompanying conditions – those that form the general background of events and phenomena, the circumstances of place and time; necessary conditions – without which an event could not occur; and sufficient conditions – the combination of all necessary conditions.

The determinants of crime can be divided into the following categories: conditions that favor the commission of crimes (the so-called situational conditions) and conditions that shape the criminogenic motivation. These conditions, of course, interact at the informational level. A situational condition, for example, is the lack of security in an enterprise, which contributes to the development of a selfish and irresponsible attitude towards the safety of manufactured products. The conditions that shape the criminogenic motivation are those environmental phenomena that contribute to the emergence of motives for criminal behavior. These include accompanying conditions – those that form the general background of events and phenomena, the circumstances of place and time; necessary conditions – without which an event could not occur; and sufficient conditions – the combination of all necessary conditions. In terms of the mechanism underlying the crime, situational conditions can be neutral, facilitating or hindering the commission of crimes. Situational criminogenic conditions are more specific during the criminal investigation and trial and are easier to measure. The psychological conditions that shape the personality and its motivation are more distant from the crime itself and are much less susceptible to clear preventive intervention. However, identifying and responding to both conditions is essential. Depending on the specific situation, the same circumstance can act as both a cause and a precondition for the crime. For example, poor security at a facility storing valuables can be both a prerequisite for a persistent criminal group to target the facility and a prerequisite for the development of corresponding motivation among the facility's employees [17, p. 49].

N.S. Artemiev emphasizes that the conditions of crime can be divided into:

✓ Accompanying: form the general context of events and phenomena, the circumstances of place and time;

✓ Necessary: without such conditions, the event might not have occurred;

✓ Sufficient: the set of necessary conditions [18, p. 90].

Criminological literature usually classifies the causes and conditions of crime according to the following criteria: mechanism of action, level of functioning, content, nature of production, proximity to the event, sources, etc. Thus, based on the criterion of their mechanism of action, the negative social processes that determine crime are divided into causes, conditions and criminogenic factors. According to their level of operation, criminogenic factors are classified into causes and conditions: of crime in general (general causes); of types (categories, groups) of crimes; and of specific crimes.

These three main levels of the causes of crime are interdependent. The process of interconnection starts both from the first (more general) level to the last (specific) level, and vice versa – from the causes and conditions of a particular crime to the unique characteristics and features of types and groups of crimes, to the general characteristics of the causal complex of crime as a whole.

Depending on their content, criminogenic determinants are subdivided into socio-economic, political, socio-psychological, ideological, educational, legal, organizational and managerial, etc. The immediate causes of crime and offenses are phenomena of a socio-psychological nature, namely a criminogenically deformed social and individual psychology, which contradicts the generally accepted principles of international, constitutional and criminal law.

According to the criterion of their origin, the determining factors of crime are usually divided into objective, objective-subjective and subjective. The first two categories, at this stage of history, are independent of human will and, therefore, cannot be eliminated immediately. They can only be neutralized, blocked, reduced, and their development and criminogenic impact can be prevented. Objective determining factors include, for example, the gap between consciousness and reality, between individual consciousness and social consciousness, and so on. Most determining factors, however, are of an objective-subjective nature, with either the objective or the subjective prevailing.

Based on their origin, the determinants of crime are usually divided into objective, objective-subjective and subjective. The first two categories, at this stage of history, are independent of human will and, therefore, cannot be eliminated immediately. They can only be neutralized, blocked, reduced, and their development and criminogenic impact can be prevented. Objective determinants include, for example, the gap between consciousness and reality, between individual consciousness and social consciousness, and so on. Most determinants, however, are of an objective-subjective nature, with either the objective or the subjective prevailing.

Depending on their proximity to the criminal event or to a specific set of them, the causes and conditions are divided into immediate and remote, direct and indirect.

The causes and conditions of crime are also differentiated by source, into internal and external. The internal determinants of crime are linked to the internal contradictions of our society, while the external determinants are connected with those of an international nature [18, p. 4].

The conditions and causes of crime, types of crimes and specific crimes are not identical. They are interconnected. If there were no causes that generate crime as a social phenomenon, then there would be no causes for specific crimes.

According to the author I. Ciobanu, the causes and conditions of recidivism, as one

of the most dangerous types of crimes in the Republic of Moldova, are the following:

✓ Circumstances preceding the first conviction that persist after serving the sentence:

1) Return to a negative, vicious environment (mainly, to a dysfunctional family);

2) Reestablishment of old ties with people leading a parasitic lifestyle;

3) Establishment of contacts with convicts in places of detention (and their influence after serving the sentence);

✓ Deficiencies in law enforcement: low crime detection rates;

✓ Low effectiveness of punishments for repeat offenders; Numerous violations of the law regarding a comprehensive, complete and objective investigation of the circumstances of the crime;

✓ Corruption and favoritism;

✓ Difficulties in social reintegration after serving a prison sentence: loss of previous positive social ties;

✓ Emergence of antisocial ties (with repeat offenders in penitentiary institutions);

✓ Mental disorders caused by prolonged imprisonment; Formation of stereotypes and ideals of criminal behavior based on the traditions and customs of the underworld;

✓ Deficiencies in the process of studying and re-education of convicts in places of detention;

✓ Unsatisfactory organization of educational and professional training of convicts, etc. [19, p. 298].

M. Bârgău identifies the following determinants of violent crimes:

✓ Negative influence of the microenvironment;

✓ Abuse of alcohol/soft drugs;

✓ Hostile interpersonal relationships;

✓ Conflict situations between the offender and the victim;

✓ Deficiencies in solving violent crimes;

✓ Increase in the number of people with criminal records, unemployed people and minors who do not attend school;

✓ Increase in the number of offenders sentenced with suspended sentences and released on parole;

✓ Increase in the number of people declared mentally incompetent for committing socially dangerous acts against the life and health of people;

✓ Insufficient monitoring of convicts in places of detention;

✓ Deficiencies in the prevention of violent crimes, etc. [20, p. 270].

According to G. Mateuț, the general causes of crime have their roots in the precarious economic state of society, the lack of culture among people, frequent consumption of alcoholic beverages, unemployment, deficiencies in socio-political organization, the malfunctioning of the criminal justice system, the system of lenient punishments, heredity, the environment, etc. [21, p. 11].

According to the activity report of the Prosecutor General's Office of the Republic of Moldova, regarding crime indicators for the years 2024-2025, it was established that the dynamics of crime was determined by a series of reasons and conditions, the main ones being:

– The low standard of living of certain categories of people, the lack of permanent sources of income, including for their maintenance and that of their family members, the insufficient level of salaries, the high level of unemployment, the state of social crisis, the massive migration of the population within the country and abroad – circumstances that

particularly determined the share of crimes against property [22];

– Disintegration of the family environment of children who, in the absence of means of subsistence and adequate supervision, resort, in particular, to committing thefts and petty thefts;

– Low levels of civic awareness, lack of legal culture and trust in law enforcement agencies and their representatives, as well as an irresponsible attitude of certain categories of citizens towards criminal and administrative liability;

– Inefficiency of the state system in this area and in its efforts to combat crime, re-educate and reintegrate into society convicted and imprisoned persons, combined with the partial inefficiency of the state's punitive policy, which in many cases is based on the use of non-imprisonment penalties;

– Continuation of criminal activity by persons against whom criminal prosecution has been terminated due to reconciliation of the parties, as well as recidivism of persons who have served prison sentences [23].

Therefore, we share the idea that crime prevention represents a complex multi-level system of public administration bodies, which exerts an anti-criminogenic influence on social objects, in order to prevent violations of legal and criminal norms and neutralize their determining factors, constituted by the subjects, objects and measures of prevention activity [24].

Regardless of the specific type of crime or the specific genre of crimes, it can be stated with certainty that the development of modern crime is facilitated by a variety of causes and conditions. The context in which, among the main determining factors of current crime in the Republic of Moldova are:

a) The spiritual crisis of society, the manifestation of which is the growth of alcoholism and drug addiction among the population, the decline of traditional moral values. An eloquent example in this regard could serve the following case from judicial practice: "R.N., *unemployed, was found guilty and convicted of the offense under Article 145 of the Criminal Code of the Republic of Moldova, paragraph (2), letter e/1), j). Thus, on January 15, 2025, at around 2:00, R.N. was with his son in the common home, where, following the consumption of alcoholic beverages, a conflict broke out between them, during which the latter hit his father in the face. Finally, R.N., in a state of alcoholic intoxication, acting out of revenge and with the intention of killing, waited for his son, also in a state of advanced alcoholic intoxication, to lie down on the bed to avoid resistance, ensuring that he fell asleep, after which he hit him several times in the head with a blade and the tip of a hammer, causing bodily injuries, as a result of which his son died*" [25]. Another similar example from judicial practice: "G.A., *unemployed, being registered with the narcologist as a drug addict, with a previous criminal conviction, was found guilty of committing a crime provided for in paragraph (1) of Article 171 of the Criminal Code of the Republic of Moldova. Thus, G.A., on 02.11.2024, while he was in the house of citizen T.G. between 17:00 and 18:00, in a state of intoxication, foreseeing the harmful consequences of his actions, consciously wanting and recognizing the occurrence of these consequences, used psychological coercion and physical force, manifested by a blow to the face with a palm, to satisfy his sexual desire and, at the same time, taking advantage of the incapacity of the victim L.N. to defend himself, he had sexual intercourse with the latter in the form of vaginal and anal penetration against her will, thus satisfying her sexual desire*" [26];

b) Sharp exacerbation of social contradictions in a period of political, ideological, economic and legal reforms;

c) Comprehensive systemic crisis of society, including a crisis of power, economy,

social sphere, ideology and law, the most significant manifestation of which from a criminological point of view is the significant increase in inequality between rich and poor;

d) Unemployment and poverty, according to data from the National Bureau of Statistics of the Republic of Moldova, the number of unemployed in the III quarter of 2023 was approximately 39.2 thousand people, which is approximately 16.9 thousand more than in the III quarter of 2022 (22.3 thousand people) [27];

e) Legal nihilism, which has spread to all layers of our society and is expressed in ignoring both the rules of conduct in society and safety at work and in transport, as well as the norms of criminal law, and in the loss of trust in law enforcement agencies and corrupt government structures;

f) A widespread feeling of insecurity among the general population regarding security (personal, financial, property) and future prospects for themselves and their loved ones;

g) Lack of confidence in the ability and desire of those in power to manage and reform the state in the interests of the population;

h) High levels of anxiety, irritation, conflict and aggression in society;

i) Loss of ethical principles that allow an objective assessment of the acceptability and inadmissibility of certain actions in solving life problems;

j) Consumerism, i.e. the continuous growth and change of needs, has a negative impact on the mentality and psyche of a person, narrowing thoughts and desires towards the acquisition of instant gratification and material goods by any means necessary. Consumer sentiments become dominant in society, determining deviant behavior;

k) The corrupting influence of mass media and communications, etc.

Conclusions. The examined statistical data, the analysis of quantitative and qualitative indicators of crime in the Republic of Moldova over the last five years, allows us to formulate the following conclusions:

1. A moderately downward trend in crime rates is recorded, with persistent short-term fluctuations;

2. Crime is dominated by property crimes, which indicates its socio-economic orientation;

3. The role of law enforcement institutions and judicial courts is increasing;

4. Crime has pronounced gender and urban specificities;

6. The high level of latent crime remains a significant limitation in studying the real level of crime.

SPECIAL INVESTIGATIVE MEASURES IN THE INVESTIGATION OF OFFENCES COMMITTED BY ORGANISED CRIMINAL GROUPS

Ion BOTNARI,
PhD Candidate,
"Ștefan cel Mare" Academy of the Ministry of Internal Affairs,
Director, Information Technology Service of the Ministry of Internal Affairs,
Republic of Moldova
ORCID: 0000-0002-4262-9777

Abstract

This article examines the role and applicability of special investigative measures in the investigation of crimes committed by organised criminal groups in the Republic of Moldova. The study analyses the legal grounds for authorisation, proportionality conditions and judicial oversight provided under the Criminal Procedure Code, as well as the evidentiary efficiency of the main categories of special investigative measures: interception of communications, video and GPS surveillance, undercover investigators, and controlled delivery. The study is grounded in the empirical analysis of over one thousand judicial decisions from the Republic of Moldova (2015-2025) and the activity reports of the Prosecutor's Office for Combating Organised Crime and Special Cases for the period 2020-2024, corroborated with Europol and UNODC international standards.

The findings demonstrate that interception of communications remains the instrument with the highest evidentiary impact (9 out of 10 cases), although its effectiveness is contingent upon operational cooperation with authorities in other states. The study further establishes that the use of special investigative measures in organised criminal group cases in the Republic of Moldova is characterised by a predominantly reactive approach, and that their systematic, proactive integration within a unified investigative strategy constitutes a methodological necessity. The article proposes a methodological model for the integrated utilisation of special investigative measures across the stages of criminal proceedings in organised criminal group cases.

Keywords: special investigative measures, organised criminal groups, interception of communications, undercover investigator, controlled delivery, criminal proceedings, proportionality.

MĂSURILE SPECIALE DE INVESTIGAȚIE ÎN CADRUL CERCETĂRII INFRACȚIUNILOR COMISE DE GRUPURI CRIMINALE ORGANIZATE

Abstract

Articolul examinează rolul și aplicabilitatea măsurilor speciale de investigație în cercetarea infracțiunilor comise de grupuri criminale organizate în Republica Moldova. Sunt analizate temeiurile legale de autorizare, condițiile de proporționalitate și controlul judiciar prevăzute de Codul de procedură penală, precum și eficiența probatorie a principalelor categorii de MSI: interceptarea comunicațiilor, supravegherea video și GPS, investigatorul sub acoperire și livrarea supravegheată. Studiul se bazează pe analiza empirică a peste o mie de hotărâri judecătorești din Republica Moldova (2015-2025) și a rapoartelor de activitate ale Procuraturii pentru Combaterea Criminalității Organizate și Cauze Speciale pentru perioada 2020-2024, coroborate cu standarde internaționale Europol și UNODC.

Rezultatele demonstrează că interceptarea comunicațiilor rămâne instrumentul cu cel mai ridicat impact probator (9 din 10 cauze), dar eficiența sa este condiționată de cooperarea operativă cu autoritățile din alte state. Se constată că utilizarea măsurilor speciale de investigație în cauzele grupurilor criminale organizate din Republica Moldova se caracterizează printr-o abordare preponderent reactivă, iar integrarea lor sistematică, proactivă, în cadrul unei strategii investigative unitare constituie o necesitate de ordin metodologic. Articolul propune un model metodic de valorificare integrată a măsurilor speciale de investigație pe etapele urmăririi penale în cauzele grupurilor criminale organizate.

Cuvinte-cheie: măsuri speciale de investigație, grupuri criminale organizate, interceptarea comunicațiilor, investigator sub acoperire, livrare supravegheată, urmărire penală, proporționalitate.

Introduction. Organised criminal groups represent one of the most serious threats to public order and national security in the Republic of Moldova. Unlike individual offenders, organised criminal groups operate through hierarchical structures or well-defined networks, employ encrypted communications, resort to the intimidation and corruption of witnesses and public officials, and rapidly adapt to counter-measures deployed by the authorities. These characteristics necessitate the use of investigative instruments of a special nature, capable of penetrating the opaque structure of the group [1].

According to the activity reports of the Prosecutor's Office for Combating Organised Crime and Special Cases, 657 offences committed by organised criminal groups were recorded between 2014 and 2021, with an upward trend from 87 cases in 2014 to 142 cases in 2021 [2]. According to EU-SOCTA 2025, 65% of criminal groups active at the European level use encrypted communication infrastructures, and 80% subcontract specialised components of their activity within the crime-as-a-service model [3].

Special investigative measures represent, in this context, the primary procedural instruments through which criminal investigation bodies can document the internal activity of organised criminal groups, identify their leaders and command structures, and build a solid evidentiary chain to support the prosecution in court. Nevertheless, their application raises complex issues of legality, proportionality, and evidentiary efficiency that require a rigorous methodological approach [4].

The present study aims to: 1) examine the legal framework of special investigative measures from the perspective of the specific requirements of organised criminal group cases; 2) empirically assess the efficiency of the various categories of special investigative measures in Moldovan judicial practice; 3) identify methodological shortcomings in the current application of special investigative measures; and 4) propose a methodological model for the integrated utilisation of special investigative measures in organised criminal group cases.

Methods and materials applied. The study employs a mixed methodological approach based on the triangulation of sources and methods.

Normative analysis covered the Criminal Procedure Code of the Republic of Moldova, in particular Chapter IV on special investigative measures (Articles 132^1–132^5); the Criminal Code of the Republic of Moldova – Article 284 on criminal organisations; Law No.50/2012 on the Prevention and Combating of Organised Crime; and ECtHR standards on Covert Surveillance (*Roman Zakharov v. Russia* and *Big Brother Watch v. the United Kingdom*) [5; 6; 7; 8].

Empirical jurisprudential analysis encompassed over one thousand final judicial decisions delivered in cases concerning organised criminal groups (2015-2025), available on the instante.justice.md portal [9], with extraction of data on the type of special investigative measures used, the volume of evidence obtained, and their weight in grounding convictions.

Institutional documentary analysis covered the annual activity reports of the Prosecutor's Office for Combating Organised Crime and Special Cases 2020-2024 [10].

Comparative doctrinal analysis corroborated national forensic science doctrine [11; 12] with Europol [3; 13] and UNODC [14] international standards.

Discussion and results obtained. I. Legal Framework of Special Investigative Measures in Organised Criminal Group Cases. The Criminal Procedure Code of the Republic of Moldova regulates special investigative measures in Chapter IV, Articles 132^1–132^5, establishing a catalogue of 15 measures, strict conditions for judicial authorisation, maximum durations, and the regime for utilising the results obtained [5].

The principal special investigative measures relevant to organised criminal group cases are: a) interception and recording of communications; b) surveillance by photography, video recording, or audio recording; c) tracking through electronic positioning systems (GPS); d) undercover investigators; and e) controlled delivery [5].

Authorisation of special investigative measures is subject to mandatory judicial oversight, except in urgent cases where the prosecutor may order provisional application, subject to subsequent confirmation by the investigating judge within 24 hours [5, p.214].

ECtHR case law has established that any special investigative measure must cumulatively satisfy the conditions of: (i) lawfulness — the existence of a clear and foreseeable legal basis; (ii) legitimate aim; and (iii) necessity and proportionality in a democratic society [8]. Failure to comply with these conditions results in the exclusion of the evidence obtained, with direct consequences for the robustness of the evidentiary chain in organised criminal group cases.

The specificity of organised criminal group cases with respect to special investigative measures lies in the longer duration of surveillance required (organised criminal structures operate over extended periods), the large number of persons simultaneously targeted, and the need to correlate special investigative measures with other investigative activities — searches, interviews, financial investigations — in order to document both the predicate offence and the organisational structure of the group, which is a constituent element of the offence under Article 284 of the Criminal Code [6, Art. 284].

II. Efficiency of Special Investigative Measures in Moldovan Judicial Practice: Empirical Data. Analysis of over one thousand judicial decisions [9] and of the Prosecutor's Office for Combating Organised Crime and Special Cases activity reports for 2020-2024 [10] reveals a differentiated picture of the efficiency of special investigative measures in organised criminal group cases in the Republic of Moldova.

Interception of communications proved to be the method with the highest evidentiary impact: present in 9 out of 10 organised criminal group cases concluded with a conviction, providing both direct evidence of criminal activity (discussions about the commission of offences, coordination of operations) and essential data on the hierarchical structure of the group. Leading scholars in the field emphasise that interception of communications is the "method with the highest evidentiary yield in the investigation of complex criminal structures" [11, p.312]. Analysis of data obtained through interception enables identification of the central nodes of organised criminal groups and their structural vulnerabilities, through the social network analysis (SNA) method [16, p.87].

Notwithstanding this, practitioners interviewed in the course of the research signalled a challenge specific to the Moldovan context: members of organised criminal groups frequently use SIM cards registered in Ukraine, Romania, or other states, which entails requesting mutual legal assistance — a procedure that takes on average 2–3 months, during which time the group changes its communication methods [10].

Video and GPS surveillance was employed in 7 out of 10 cases, demonstrating effectiveness in documenting meetings between members of organised criminal groups, confirming cross-border movements, and establishing the locations of criminal property storage. Its use is, however, limited by the cost of equipment and the need for specialised personnel, resources insufficient relative to the number of cases being investigated [10].

Undercover investigators were deployed in 4 out of 10 cases, with significant results in drug trafficking and human trafficking cases, where infiltration into the group's structure enabled documentation of the internal mechanisms of recruitment, financing, and distribution of roles. The procedural risks are, however, considerable: any overstepping

of the authorised limits may result in the exclusion of evidence and the criminal liability of the investigator [11, p.287].

Controlled delivery represented the central instrument in cases of cross-border trafficking in drugs and counterfeit goods, enabling identification of all links in the distribution chain. The case study concerning the cocaine trafficking network through rice containers (2018-2019) illustrates the maximum effectiveness of this special investigative measure in coordination between Moldova, Belgium, and Suriname, resulting in the seizure of 2,200 kg of cocaine and the arrest of 20 persons [13].

III. Methodological Shortcomings in the Application of Special Investigative Measures in Organised Criminal Group Cases. Empirical analysis identifies three systemic shortcomings in the utilisation of special investigative measures in investigative practice in the Republic of Moldova.

The first is the predominantly reactive nature of the application of special investigative measures. In over 60% of the cases analysed, special investigative measures were ordered after members of the organised criminal group had been identified through traditional methods (flagrante delicto, denunciation), and not as a proactive instrument for mapping the group's structure [9]. Modern forensic doctrine recommends integrating special investigative measures from the initial stages of the investigation, prior to the formal identification of suspects, precisely in order to document the organisational structure — an essential evidentiary element in cases under Article 284 of the Criminal Code of the Republic of Moldova [12, p.156] — since proof of criminal liability for leading a criminal organisation requires demonstrating the specific attributions of the leader within the group [18, p. 145].

The second shortcoming consists in the insufficient exploitation of the correlation between special investigative measures and financial investigation. In organised criminal group cases with an economic dimension (money laundering, tax evasion, fraud), proactive financial investigation — tracing financial flows, identifying assets, blockchain analysis — should be conducted in parallel with special investigative measures, not sequentially after them. Empirical data shows that in cases with proactive financial investigation, the asset recovery rate increases from 23% to 67% [10].

The third shortcoming concerns international cooperation for the authorisation of special investigative measures. The average response time to mutual legal assistance requests in the area of interceptions is 6-14 months [10], during which interval the criminal group reorganises its communications. The EMPACT 2026-2029 framework provides for rapid operational cooperation mechanisms under which authorisation of cross-border interceptions should be achieved within 48-72 hours [15].

IV. Methodological Model for the Integrated Utilisation of Special Investigative Measures in Organised Criminal Group Cases. Based on the empirical findings and specialist doctrine, we propose a four-stage methodological model for the integrated utilisation of special investigative measures in organised criminal group cases:

Stage I — Preliminary Profiling and Selection of Special Investigative Measures (pre-criminal investigation phase). On the basis of available operational intelligence, the criminal investigation officer draws up an initial profile of the organised criminal group and selects the combination of special investigative measures suited to the group's structure and activity, requesting prior judicial authorisation. The result of this stage is an integrated investigative plan correlating special investigative measures with financial investigation and the necessary international cooperation mechanisms [12, p. 143].

Stage II — Mapping the Structure of the Organised Criminal Group through Special

Investigative Measures (active stage). Interception of communications and GPS surveillance provide the data necessary for constructing a structural map of the organised criminal group: identification of the leader, hierarchical levels, key members, and communication routes. Research demonstrates that organised criminal groups function as adaptive networks in which weak ties facilitate transnational expansion and reduce detectability [17, p.271]. This map constitutes the foundation of the main investigative version and of the search plan [11, p.298].

Stage III — Documentation of the Predicate Offence and Organisational Structure. Undercover investigators and controlled delivery are activated to document the commission of the predicate offences (drug trafficking, human trafficking, money laundering), concurrently with establishing the constituent elements of the organised criminal group: stability, organisation, common purpose, and distribution of roles [6, Art. 284].

Stage IV — Evidentiary Utilisation and Preservation of the Evidentiary Chain. The results of the special investigative measures are integrated into the criminal case file in strict compliance with admissibility conditions: transcription of recordings, authentication of materials, exclusion of evidence obtained by overstepping authorised limits. The criminal profile of the leader, developed on the basis of cumulative data from the special investigative measures, underpins the legal characterisation of each participant's role and the interview strategy [14, p. 87].

Conclusions. The study demonstrates that special investigative measures represent the central and often indispensable investigative instrument in the investigation of offences committed by organised criminal groups, owing to their capacity to penetrate the opaque structure of the group and to provide evidence regarding both the predicate offence and the constituent elements of the criminal organisation.

Empirical analysis has shown that interception of communications remains the special investigative measure with the highest evidentiary impact in Moldovan practice (9 out of 10 cases), followed by video and GPS surveillance (7 out of 10) and undercover investigators (4 out of 10) [19, p.358]. The effectiveness of these methods is, however, contingent upon three critical factors: 1) their proactive integration from the initial stages of the investigation; 2) their correlation with financial investigation; and 3) rapid international cooperation mechanisms for the authorisation of cross-border interceptions.

The proposed four-stage methodological model — preliminary profiling, structural mapping, documentation of the predicate offence, and evidentiary utilisation — provides a practical algorithm for the integrated utilisation of special investigative measures, tailored to the specific features of organised criminal group cases in the Republic of Moldova and compatible with European procedural standards.

Implementation of this model requires the creation of a rapid cooperation mechanism with Ukraine and Romania for the authorisation of interceptions; specialised training of criminal investigation officers in techniques for correlating special investigative measures with financial investigation; and equipping law enforcement institutions with software tools for the analysis of communication networks and digital financial flows.

THE ROLE OF JUDICIAL REVIEW IN STRENGTHENING INSTITUTIONAL INTEGRITY AND PREVENTING CORRUPTION AMONG PUBLIC OFFICIALS

Galina BOUBATRÎN,
Judicial Assistant, Chişinău Court,
Republic of Moldova
ORCID: 0009-0003-3685-2221

Abstract

This paper analyzes the importance of judicial review exercised by administrative courts as a fundamental pillar in strengthening institutional integrity and preventing corruption among public officials. In a state governed by the rule of law, the legality of an administrative act is not merely a formal requirement, but an essential mechanism for protection against the abuse of power and favoritism.

Drawing on practical experience within the judicial system, the author investigates how the annulment of administrative acts issued in violation of the conflict of interest or incompatibility regimes contributes to deterring illicit behavior. The study emphasizes institutional integrity models, examining the correlation between the rigor of legality oversight and the decrease of the corruption index in the public sector. It addresses the difficulties encountered in the evidentiary process and the importance of providing thoroughly reasoned judicial decisions to serve as preventive precedents.

Finally, the paper proposes solutions for streamlining the dialogue between administrative authorities and the courts, highlighting the need for an integrated theoretical and practical approach. The research findings underscore that rigorous judicial review does not only sanction misconduct but also fosters a culture of accountability and decision-making transparency among public officials, in full compliance with international standards of good governance.

Keywords: institutional integrity, corruption, public officials, administrative litigation, judicial review, prevention.

ROLUL CONTROLULUI JUDICIAR ÎN CONSOLIDAREA INTEGRITĂȚII INSTITUȚIONALE ȘI PREVENIREA CORUPȚIEI ÎN RÂNDUL AGENȚILOR PUBLICI

Abstract

Prezenta lucrare analizează importanța controlului judiciar exercitat de instanțele de contencios administrativ ca pilon fundamental în consolidarea integrității instituționale și prevenirea corupției în rândul agenților publici. Într-un stat de drept, legalitatea actului administrativ nu reprezintă doar o cerință formală, ci un mecanism esențial de protecție împotriva abuzului de putere și a favoritismului.

Autorul cercetează, prin prisma experienței practice din cadrul sistemului judiciar, modul în care anularea actelor administrative emise cu încălcarea regimului conflictelor de interese sau al incompatibilităților contribuie la descurajarea comportamentelor ilicite. Studiul pune accent pe modelele de integritate instituțională, examinând corelația dintre strictețea controlului de legalitate și scăderea indicelui de corupție în sectorul public. Sunt abordate dificultățile întâmpinate în procesul de probațiune și importanța motivării temeinice a hotărârilor judecătorești pentru a servi drept precedent preventiv.

În final, lucrarea propune soluții pentru eficientizarea dialogului dintre autoritățile administrative și instanțe, subliniind necesitatea unei abordări integrate teoretico-aplicative. Rezultatele cercetării evidențiază faptul că un control judiciar riguros nu doar sancționează abaterile, ci educă corpul agenților publici în spiritul responsabilității și al transparenței decizionale, în deplină concordanță cu standardele internaționale de bună guvernare.

Cuvinte-cheie: integritate instituțională, corupție, agent public, contencios administrativ, control judiciar, prevenire.

Introduction. In the contemporary legal landscape of the Republic of Moldova, strengthening institutional integrity has become a priority objective, closely linked to the process of justice reform and to aspirations for European integration. Integrity among public officials is not merely an ethical obligation, but a *sine qua non* condition for the effective functioning of state administration. In this context, judicial review exercised by administrative courts emerges as a balancing mechanism, aimed at protecting the public interest against the discretionary exercise of power.

The core of public integrity in the Republic of Moldova is grounded in the constitutional pillars that define the rule of law and the relationship between authority and the citizen, thereby conferring legitimacy upon judicial review as a mechanism for preventing corruption. This legal framework derives from the proclamation of the Republic of Moldova as a state governed by the rule of law, in which justice and human dignity are supreme values, and is supported by the principle of the separation and cooperation of powers, which establishes the system of checks and balances necessary to prevent the abuse of power. The supremacy of the Constitution imposes absolute rigor in the decision-making process, as no legal act that contravenes the Supreme Law has legal force, while the guarantee of free access to justice provides every individual with the right to an effective remedy against harmful administrative acts. In this context, the control of legality is complemented by the observance of the principle of proportionality, ensuring that any restriction of rights is strictly prescribed by law and necessary in a democratic society, without affecting the very essence of the right itself. Therefore, the convergence of these constitutional norms transforms judicial review into an essential safeguard against corruption, ensuring that the activity of public authorities remains transparent, predictable, and strictly confined to the general interest [1].

The adoption of the Administrative Code of the Republic of Moldova represents a turning point in the modernization of relations between the citizen and the state, establishing in Article 21 the principle of legality as the foundation of the rule of law. According to this provision, public authorities and competent courts must act in accordance with the law and other normative acts, and the exercise of legal powers must not be contrary to the purpose for which they were established. At the same time, public authorities and competent courts may not restrict the exercise of individuals' rights and freedoms except in cases and under conditions expressly provided by law. Under this principle, within a legal system striving to meet European standards of good governance, the administrative act is no longer viewed merely as a manifestation of unilateral will, but as a legal product that must strictly comply with these requirements. Thus, legality as defined by Article 21 becomes an essential premise for preventing any form of arbitrariness, providing the necessary framework for a predictable and transparent public administration. Moreover, the interpretation of the principle of legality obliges the administrative judge to examine whether the exercise of legal powers has not been diverted toward a purpose other than that intended by the legislator—an aspect that is crucial in identifying subtle forms of corruption. This procedural rigor ensures that no limitation of individual rights occurs outside the cases expressly established by law, thereby protecting honest public officials from potential hierarchical reprisals disguised as administrative measures. Ultimately, the consistent application of this principle strengthens confidence in the administration of justice, demonstrating that within the architecture of the rule of law, legality is not a bureaucratic barrier, but the ultimate guarantee of a public administration characterized by integrity in the face of illegitimate influences [2].

However, the effectiveness of judicial review in matters of integrity does not depend

solely on the letter of the law, but also on the magistrate's ability to decipher the subtle mechanisms through which the public interest is diverted in favor of undue benefits. A fundamental pillar in the architecture of institutional integrity, as defined by the current normative framework, is the cultivation of a spirit of absolute intolerance toward integrity incidents within public entities. According to Article 19 of the Integrity Law No.82 of 25 May 2017, the responsibility for ensuring the credibility of the public mandate lies both with leaders and public officials, who are obliged to refuse any involvement in acts of corruption or improper influence. This dimension of integrity requires the heads of entities to set a personal example in upholding the public interest and to ensure the disciplinary sanctioning of all violations, thereby creating an institutional environment in which legality prevails over any abuse. Consequently, judicial review becomes the instrument through which it is verified whether internal mechanisms for sanctioning and reporting to anti-corruption authorities have been properly activated, ensuring that integrity incidents do not remain unpunished.

Complementing these requirements, Article 20 of the same Law ensures transparency in the decision-making process as an essential condition for responsible governance in relation to citizens. The Law obliges public entities to establish mechanisms of cooperation and partnership with civil society, ensuring the continuous provision of information to the public regarding activity programs and draft decisions. Transparency is not merely an administrative formality, but a preventive tool, as the publication of annual reports and the consultation of stakeholders enable active social oversight of the exercise of power. From the perspective of judicial review, failure to comply with these obligations of information and citizen participation may lead to disciplinary sanctions for the responsible public officials, with the court ensuring that the decision-making process remains a transparent and reasoned act of will [3].

In conclusion, the introduction highlights the need for a constant and integrated dialogue between administrative authorities and the courts. A coherent theoretical and applied approach is essential to ensure that international standards of good governance are effectively implemented at the national level. Through this study, we aim to provide practical solutions for enhancing the effectiveness of judicial review, as a fundamental pillar in preventing corruption and safeguarding democratic values.

Methods and materials applied. The substantiation of this research required the adoption of a multidisciplinary methodology, designed to correlate the theoretical rigor of administrative norms with the practical realities of the judicial system in the Republic of Moldova. In order to ensure a relevant analysis anchored in current legal realities, the scientific approach was structured through the use of the following research methods. The historical method was applied, being essential for analyzing the evolution of the legislative framework governing administrative litigation. This facilitated an understanding of the transition process from the former Law No.793/2000 to the current Administrative Code, allowing for the highlighting of progress achieved in strengthening integrity mechanisms and adapting them to new social and institutional challenges.

Subsequently, through the logical and analytical method, a systematic interpretation of the provisions of the Administrative Code and the Integrity Law No.82/2017 was carried out. This method made it possible to identify the intrinsic correlations between the specific obligations of public officials, regulated by Articles 19 and 20 of Law No.82/2017, and the judicial review powers of the courts, with a view to ensuring the internal coherence of the legal norms underpinning the rule of law.

Last but not least, the research was strengthened through the method of analyz-

ing international case law. This approach served to relate national practice to the jurisprudential standards established by the European Court of Human Rights (ECtHR). The analysis focused in particular on the applicability of the principle of good administration and the right to a fair trial, providing solid arguments for interpreting judicial review as an indispensable instrument for the protection of European democratic values within the national administrative system.

Discussions and results obtained. From the earliest times to the present day, administration has performed the same functions of organizing the execution of laws and ensuring their concrete implementation. After the establishment of the constitutional regime and the principle of the separation of powers, the functions of administration merged with those of the executive power.

Analyzing the principle of the separation of powers, professor Gheorghe Alexianu stated that the state has distinct functions; the nation delegates these functions to different holders who are independent from one another; each of these functions constitutes a power; and the state can function properly only when these functions (powers) are separated, with different bodies and distinct holders. According to this conception, the legislative body alone may enact general rules, or, in any case, rules of law; the executive authority alone may adopt particular measures of governance and administration; and the judiciary, in turn, alone may apply the law in disputes that arise. The author concludes, however, that this conception was reached over time through a long process of development and intense debate, particularly of interest for the constitutional organization of the United States and for the French Revolution [4, p.8].

Beyond the constitutional foundations, integrity within the administrative system derives from the standards of conduct established by Law No.25 of 22.02.2008. Article 2 of this law provides that, in the exercise of public office, the civil servant is obliged to be guided by the fundamental principles of legality, impartiality, independence, professionalism, and loyalty. This requires strict compliance with the Constitution and international treaties, as well as the integrity protection mechanism through the obligation to report any pressure involving unlawful actions or conduct contrary to ethical standards. Moreover, the exercise of duties in an impartial, non-discriminatory, and equitable manner ensures that public decisions are not taken by giving preference to certain persons or groups on the basis of race, nationality, ethnic origin, language, religion, sex, opinion, political affiliation, property, or social origin, thereby ensuring conduct grounded in respect, diligence, fairness, and courtesy toward the citizen. Thus, judicial review intervenes as a guarantor of these standards, verifying whether deviations from these principles have vitiated the administrative act and undermined public trust in state institutions [5].

In the architecture of the rule of law, judicial review exercised by administrative courts goes beyond a mere formal verification, becoming a pillar of institutional integrity. National doctrine, through the contributions of researcher M. Orlov, emphasizes that the administrative act must always be subordinated to the provisions of the law, since its issuance and application are based on the organization of the execution of legal norms. This hierarchical subordination justifies the existence of multiple control mechanisms aimed at ensuring the legality of public authorities' actions. Thus, administrative litigation is not merely a legal procedure, but an essential instrument for the protection of human rights, being regarded as a "banner of democracy" and a dogma of the rule of law, necessary to protect the citizen against potential abuses. Moreover, the importance of the rule-of-law doctrine, as supported in legal scholarship, lies in the fact that no authority can be exempt from control, with the administrative court being the only body capable of restoring the

balance between state interest and individual freedom. This judicial oversight transforms administrative litigation into a defensive barrier against institutional favoritism, offering the citizen not only a procedural remedy but also effective protection of their dignity in relation to executive power. Consequently, the validation of integrity through judicial decisions confirms that justice remains the only authority capable of transforming the theoretical principle of legality into an incontestable administrative reality [6, pp.11-15].

The international foundation of integrity standards is enshrined in the United Nations Convention against Corruption (UNCAC). The Republic of Moldova acceded to this Convention through Law No.158-XVI of 6 July 2007 (O.G. No.103-106/20.07.2007), and it entered into force on 20 July 2007. UNCAC establishes a universal framework for preventing the abuse of power. In particular, Article 8 of the Convention emphasizes the crucial role of judicial integrity and provides that, in order to combat corruption, each State Party shall, in accordance with the fundamental principles of its legal system, promote integrity, honesty, and responsibility among public officials. At the same time, Article 10 stipulates that, taking into account the need to combat corruption, each State Party shall, in accordance with the fundamental principles of its domestic law, take appropriate measures to enhance the transparency of its public administration, including, where appropriate, its organization, functioning, and decision-making processes. This requires states to promote integrity, honesty, and accountability among public officials through codes of conduct and control mechanisms. From this perspective, judicial review exercised by administrative courts is not merely an internal prerogative, but an instrument for implementing international commitments, ensuring that any administrative decision remains aligned with the principles of good governance and decision-making transparency promoted at the global level [7].

Another fundamental reference point in shaping administrative ethics standards is Recommendation No. R (2000) 10 of the Committee of Ministers to Member States on Codes of Conduct for Public Officials. This international instrument establishes that public officials have the duty to act, in all circumstances, with integrity, impartiality, and loyalty, emphasizing that the exercise of discretionary power must be transparent and subject to control. From the perspective of judicial review, this Recommendation provides administrative courts with objective criteria for assessing the good faith of public officials. Thus, the judge is not limited to a purely technical analysis of the administrative act, but also examines whether the official's conduct has respected the spirit of public service, ensuring that personal interest has not prevailed over the public interest, in full accordance with European principles of good administration. Accordingly, the rigorous application of Recommendation No. R (2000) 10 by the courts of the Republic of Moldova directly contribute to the prevention of corruption, transforming abstract principles of ethics into concrete legal obligations, the non-compliance with which leads to the annulment of the act and the establishment of liability of the public official [8].

This standard of protection has been codified and expanded at the level of the European Union through Directive 2019/1937 of the European Parliament and of the Council on the protection of persons who report breaches of Union law. The Directive establishes the obligation of Member States to put in place secure reporting mechanisms and, crucial for judicial activity, prohibits any form of retaliation against whistleblowers. In the context of the Republic of Moldova, the transposition of the spirit of this Directive through the mechanisms of Law No.82/2017 provides administrative courts with an additional normative basis. Thus, judicial review no longer concerns only the formal legality of a sanction, but must also verify whether the administrative act does not, in reality, consti-

tute an institutional "reprisal" against the person who disclosed acts of corruption, thereby ensuring genuine protection of the integrity environment [9].

In the case *Vilho Eskelinen and Others v. Finland*, the European Court of Human Rights established the right of public officials to full judicial review, emphasizing that they are custodians of public trust. From the perspective of institutional integrity, this case is crucial, as it establishes that no administrative decision concerning the conduct of a civil servant may be exempt from judicial scrutiny. Thus, judicial review becomes the guarantor that integrity standards are applied objectively, eliminating the possibility that allegations of corruption or disciplinary sanctions may be used as instruments of political pressure or administrative arbitrariness. The *Vilho Eskelinen* judgment marked a paradigm shift in European case-law, establishing the presumption of applicability of Article 6 of the Convention to disputes involving public officials, except in cases where the State can demonstrate that access to justice would prejudice vital national interests. In the context of the fight against corruption, this standard obliges administrative courts to exercise full jurisdictional control, which entails not only a formal review of the external legality of the sanctioning act, but also a thorough examination of the factual basis of the allegations made against the public official [10].

For the Republic of Moldova, the case *Guja v. Moldova (2008)* has functioned as a fundamental judicial reasoning through which the European Court of Human Rights marked a paradigm shift in the relationship between public authority and subordinate, transforming the concept of "institutional loyalty" from an obligation of silence into a responsibility toward the public interest. In this case, the Court held that the reporting of irregularities within public institutions by employees constitutes a legitimate exercise of freedom of expression, especially where the information concerns acts of corruption or political pressure on the administration of justice. The Court established six essential criteria for determining the protection of a "whistleblower": the existence of a public interest in the disclosed information, verification of the authenticity of the information, the good faith of the author, the absence of effective alternative reporting channels, the damage caused to the institution, and the severity of the imposed sanction. Through this reasoning, the ECtHR enshrined the principle that an official's loyalty is not blind allegiance to the hierarchical superior, but rather loyalty to the state and to the citizen, imposing on national courts the obligation to exercise substantive judicial review capable of annulling any administrative retaliation disguised as disciplinary sanctions [11].

The case *Guja v. Moldova* represented the premise for the adoption of Law No.132/2016 on the National Integrity Authority, providing the necessary impetus for the transition from a symbolic control system to an institutionalized and independent one. This judgment of the European Court highlighted that, in the absence of an autonomous authority responsible for managing conflicts of interest and the assets of public officials, integrity mechanisms remain subject to political or hierarchical discretion. Thus, Law No.132/2016 transposes the legal necessity identified by the ECtHR into a rigorous normative framework, where the findings issued by integrity inspectors are subject to full judicial review. In this way, the court becomes the guarantor that the integrity verification process is not used as an instrument of pressure, but as an objective mechanism of the public system, in accordance with the standards established in the Strasbourg case-law. From this perspective, the law not only established an autonomous authority (ANI), but also redefined the role of judicial control, transforming the court into the ultimate guarantor of the balance between the rigor of integrity checks and the protection of the official's rights against any abuse of power [12].

Conclusions. The synthesis of the present research demonstrates that the fight against corruption finds its culmination and validation in the courtroom. Judicial review should not be perceived as a barrier to executive activity, but rather as an "integrity filter" necessary for the democratic "health" of the state. Corruption in the public system is not merely a simple deviation from ethical norms; it constitutes a systemic threat that undermines the very foundations of the rule of law and erodes citizens' trust in democratic institutions. The consequences of this phenomenon are multidimensional: economically, corruption leads to an inequitable distribution of public resources and discourages investment, while socially it deepens inequalities and compromises the quality of essential public services. Moreover, within the administrative framework, the presence of corrupt acts vitiates the decision-making process, replacing the public interest with group or personal interests, which results in a degradation of professionalism and the establishment of a culture of impunity. Thus, corruption becomes a major obstacle to sustainable development, transforming state authority into an instrument of illicit enrichment and destroying social cohesion through the perception that the law is not applied equally to all.

As a result of the analysis, it was found that the evolution of case-law has succeeded in redefining the loyalty of public officials: the primary duty of a civil servant is toward truth and the citizen. The legal framework established by Law No.132/2016 and Law No.82/2017 provides a solid structure; however, it remains vulnerable in the absence of rigorous judicial oversight capable of preventing the use of integrity checks as instruments of pressure.

The role of the administrative court goes beyond a mere review of compliance, becoming a guarantor of the balance between state authority and the rights of the citizen. In disputes concerning integrity, the administrative judge is the one who examines whether an administrative act was issued in the spirit of the law or whether it conceals an excess of power. Through the power to annul flawed decisions, the court not only restores the legal order but also eliminates the "administrative toxicity" that allows the perpetuation of corrupt acts.

The effectiveness of the anti-corruption fight is directly proportional to the depth of judicial review. The administrative court does not limit itself to examining formal elements, but exercises full jurisdictional control, assessing the proportionality and appropriateness of the measures imposed by authorities such as the National Integrity Authority (ANI). This mechanism ensures that no public official is sanctioned arbitrarily, while also guaranteeing that no serious breach of integrity norms remains unpunished due to minor procedural defects.

An essential aspect of judicial activity in this field is the creation of precedents that discourage unlawful behavior. Decisions of administrative courts draw clear boundaries between the legitimate exercise of powers and the abuse of authority. Through the rigorous reasoning of these solutions, the judge provides a code of conduct for the entire administrative apparatus, transforming each case into a lesson in public ethics and decision-making responsibility.

Moreover, the administrative court functions as a shield for whistleblowers, giving substantive effect to the legal protection guaranteed by national and international legislation. The judge is the one who must identify the causal link between an act of reporting corruption and a potential administrative retaliation disguised as a disciplinary sanction. Thus, by protecting the honest public official, the court strengthens the very structure of institutional integrity and resilience.

Judicial practice shows that the mere annulment of an act is not always sufficient to

eradicate systemic corruption phenomena, as a deeper analysis is required of how administrative authorities apply the principles of good administration. The challenges related to the administration of evidence in complex cases of favoritism or conflicts of interest require a refined filtering of the judicial examination methodology, so that the court's judgment becomes a genuine preventive precedent.

In conclusion, the role of judicial review in strengthening institutional integrity and preventing corruption among public officials goes beyond the technical function of legality control, asserting itself as a pillar of resilience of the rule of law in the Republic of Moldova. The administrative court not only sanctions individual breaches but also acts as an architect of public morality, transforming international standards into binding legal realities. In an administrative system undergoing continuous reform, the independence and rigor of the judge represent the ultimate guarantee that public power remains subordinated to the law, thereby ensuring an irreversible transition toward transparent, honest governance oriented exclusively toward serving the citizen.

GEOPOLITICAL TRANSFORMATIONS IN THE 21ST CENTURY: THE ROLE OF GREAT POWERS AND POLITICAL LEADERS

Ionuț-Robert CIOBĂNICĂ,
Police Officer,
"Alexandru Ioan Cuza" Police Academy, Bucharest,
Romania
ORCID: 0009-0003-7025-3150

Abstract

This study analyzes the geopolitical transformations of the 21st century, with a focus on the role of great powers and political leaders in shaping contemporary international relations. In a context marked by intensifying strategic rivalries, persistent regional conflicts and global economic vulnerabilities, the international system is undergoing a period of transition towards a multipolar order.

The paper highlights the impact of major factors such as the wars in Ukraine and the Middle East, tensions in the Asia-Pacific region, competition for strategic resources and technological supremacy, as well as the fragility of global supply chains. At the same time, the effects of economic instability, climate change, migration and the accelerated development of artificial intelligence on international security and stability are analyzed.

A central element of the study is the analysis of the personality and leadership style of the main global actors, highlighting how their decisions influence the dynamics of the international system. The paper also examines current trends in the domestic and foreign policies of the great powers, as well as the relations between them, characterized by a fragile balance between competition and cooperation.

The study concludes that the evolution of the international order depends crucially on the ability of the great powers to manage these tensions and prevent the escalation of conflicts, in an increasingly complex and interdependent global context.

Keywords: multipolar order, international relations, great powers, political leadership, strategic competition, international security, regional conflicts.

GEOPOLITICAL TRANSFORMATIONS IN THE XXI CENTURY: THE ROLE OF GREAT POWERS AND POLITICAL LEADERS

Abstract

Prezentul studiu analizează transformările geopolitice ale secolului XXI, cu accent asupra rolului marilor puteri și al liderilor politici în configurarea relațiilor internaționale contemporane. Într-un context marcat de intensificarea rivalităților strategice, conflicte regionale persistente și vulnerabilități economice globale, sistemul internațional traversează o perioadă de tranziție către o ordine multipolară.

Lucrarea evidențiază impactul unor factori majori precum războaiele din Ucraina și Orientul Apropiat, tensiunile din regiunea Asia-Pacific, competiția pentru resurse strategice și supremația tehnologică, precum și fragilitatea lanțurilor globale de aprovizionare. În același timp, sunt analizate efectele instabilității economice, ale schimbărilor climatice, ale migrației și ale dezvoltării accelerate a inteligenței artificiale asupra securității și stabilității internaționale.

Un element central al studiului îl constituie analiza personalității și stilului de leadership al principalilor actori globali, evidențiind modul în care deciziile acestora influențează dinamica sistemului internațional. De asemenea, lucrarea examinează tendințele actuale din politica internă și externă a marilor puteri, precum și relațiile dintre acestea, caracterizate printr-un echilibru fragil între competiție și cooperare.

Studiul concluzionează că evoluția ordinii internaționale depinde în mod esențial de capacitatea marilor puteri de a gestiona aceste tensiuni și de a preveni escaladarea conflictelor, într-un context global tot mai complex și interdependent.

Cuvinte-cheie: ordine multipolară, relații internaționale, marile puteri, leadership politic, competiție strategică, securitate internațională, conflicte regionale.

Introduction. **I. Current Political Situation**. The beginning of 2026 highlights a significant intensification of the dynamics of international relations, characterized by an increasing number of events that are difficult to anticipate and manage.

The current instability is mainly generated by the persistence and escalation of major armed conflicts, such as the war in Ukraine, the Israel–Hamas conflict and the multiple civil wars in states such as Syria, Yemen or Sudan. These are amplified by economic vulnerabilities, internal political tensions and global challenges such as climate change and migration, high public debts [1]: USA 125% GDP, China 96% GDP, Japan 230% GDP, India 81% GDP, UK 103%, France 114% GDP, Italy 138% GDP, Germany 62% GDP; political instability in many states, climate crises (episodes of extreme heat, torrential rains, severe storms, prolonged drought, destruction of ecosystems: Amazonian Forest, Arctic Zone, Marine Ecosystems), massive migration (Europe being the most affected by the flight of the population from war-torn areas: Ukraine, Gaza, Iran, South Asian workers in search of jobs) or uncertainty surrounding the use of artificial intelligence.

Compared to previous periods, the global scene is marked by an acceleration of crises and an increase in their complexity.

II. Political Leaders: Factors of Instability in International Relations. Today's international political scene is defined by instability, high-stakes elections in 2026, and geopolitical tensions amplified by conflicts, economics, and climate change. Violent strikes and protests in Western Europe supported by Russia and the United States, at least declaratively and sometimes even financially, are helping to fuel the rise of far-right parties with anti-immigration, anti-Ukraine agendas that advocate distancing nation states from the European Union.

The outstanding personality of 2025 was the President of the United States, Donald Trump, one of the most active political figures worldwide. The inauguration of the second term as president of the country in January 2025, after a highly polarizing and internationally publicized campaign. In 2025, he stood out with tough policies on immigration and trade relations, to unconventional positions on the international stage — which generated *debate and reactions worldwide*, bringing him a central role in global political news.

Donald Trump is one of the most influential and controversial figures in contemporary international politics, frequently associated with right-wing populism and political nationalism. His leadership style differs from American political traditions in that it is direct, confrontational, and geared toward the emotional mobilization of the electorate. Coming from a business background, his political rise occurred outside a classic institutional path, which has significantly influenced the way he approaches both domestic politics and international relations. This perspective is reflected in a pragmatic and transactional vision of foreign policy.

From an ideological perspective, Donald Trump promotes the "America First" doctrine, which involves prioritizing the national interests of the United States in economic, political and strategic terms. This orientation translates into a critical attitude towards globalization, multilateral agreements and international institutions, in favor of state sovereignty and bilateral relations. His vision reflects a realist conception of international relations, focused on power relations and immediate benefits. Trump starts from a *transactional understanding of international relations*, influenced by his background as a businessman. He sees foreign policy as a series of negotiations between sovereign actors, in which each state must obtain a clear and immediate advantage. From this perspective, multilateral agreements are problematic because they involve complex compromises and diffuse benefits, while bilateral relations allow for direct pressure and results that are

easier to claim politically. Trump has also been consistently critical of globalization, which he sees as responsible for the loss of industrial jobs, the offshoring of production, and the decline of the American working class. Protectionist policies, withdrawal from certain trade agreements, and renegotiation of others have been presented as means to *regain economic control* and protect American economic interests.

Another important factor is *the distrust of international institutions* (UN, NATO, WHO, etc.), perceived by Trump as inefficient, costly and unfair to the US. He has frequently argued that the United States contributes disproportionately much, without receiving equivalent benefits, which runs counter to his idea of equity and strict national interest. Donald Trump has insisted on increasing the defense spending of NATO member states primarily for financial reasons. He argued that the United States bears a disproportionately large share of the costs of collective defense, while many European countries were not respecting the assumed objective of allocating a minimum of 2% of GDP to defense (Wales Summit Declaration adopted by the heads of state and government participating in the North Atlantic Council meeting in Wales, 4-5 September 2014). From this perspective, Trump considered the situation to be unfair to American taxpayers.

Another important reason was domestic politics. The "America First" message was central to his speech, and criticism of allies who "don't pay enough" resonated with his electorate. His insistence on reducing foreign financial burdens and holding allies accountable reinforced his image as a leader who defends the economic interests of the United States.

Last but not least, this orientation also had an *electoral and symbolic role*. The sovereignist, anti-elitist, and anti-globalist discourse resonated strongly with a significant portion of the American electorate, who felt marginalized by traditional establishment policies. By rejecting the internationalist consensus, Trump positioned himself as an "outside the system" leader, willing to defy existing norms.

Donald Trump's relationship with the electorate is based on the mobilization of social segments dissatisfied with the political establishment, especially the working class and conservative voters. The intensive use of mass media and social networks has allowed him to build a direct connection with his supporters, but has also contributed to the deepening of political and social polarization in the United States.

In terms of public policies, Trump supports measures to reduce taxes, strictly control immigration and protect domestic production. In foreign policy, he adopts a pragmatic and confrontational approach, characterized by economic pressure, tough negotiation and reassessment of traditional alliances. Overall, Donald Trump is a highly influential and controversial political figure, whose impact on the American political system and on the contemporary international order is significant.

Another prominent actor on the international stage is Vladimir Putin. He came to power through – a combination of a favorable political context, support from the security structures, and a transition orchestrated by his predecessor, Boris Yeltsin. The decisive moment was his appointment as primeminister in 1999 and then Yeltsin's sudden resignation, which transformed Putin into acting president. Putin worked in the KGB, then the FSB, where he became director in 1998. This position gave him visibility and the trust of the security elites. Putin consolidated his power in Russia through a gradual process, combining control of state institutions, reshaping the political system, and reducing the space for opposition. The essence of his strategy was to centralize authority and eliminate any alternative centers of influence.

Putin aims to restore Russia to superpower status. In his view, Russia cannot be-

come a major global player again without a strong, disciplined command center capable of rapidly mobilizing national resources. Therefore, the first step of his strategy was to rebuild a hypercentralized state, in which political decision-making is concentrated around the president, and institutions are subordinated to a "vertical of power" that eliminates regional autonomy and limits internal opposition.

This recentralization has allowed the Kremlin to control the economic elite, reduce the influence of independent oligarchs, and create a loyal administrative apparatus. By consolidating control over the media, the judiciary, and the security services, Putin has gradually eliminated any alternative source of power. In his political logic, a fragmented or pluralistic state cannot compete with the world's great powers, and internal stability is an essential condition for Russia's geopolitical ambitions.

Putin has built an external project aimed at restoring the influence lost after the collapse of the USSR. Russia is presented as an alternative pole of power to the West, capable of challenging the international order dominated by the US and the EU. Military interventions in Georgia, Syria and Ukraine, the modernization of the army and the use of energy resources as a geopolitical tool are expressions of this strategy. In parallel, the Kremlin promotes a *multipolar world*, in which Russia claims its role as a regional arbiter and indispensable global actor [2].

Putin's desire for Russia to become a superpower again rests on two complementary directions: total internal control and aggressive external projection. State centralization is not just a method of governance, but the foundation of a geopolitical project that seeks to reposition Russia at the center of major global decisions.

Putin can be characterized as an authoritarian leader who has consolidated power in his hands, reducing the influence of the opposition and controlling the media to promote a narrative favorable to his policies. His pragmatic approach to foreign policy, known as *realpolitik*, promotes a political *messianism* that focuses on Russia's national interests, and the use of military force reflects his willingness to achieve his goals by any means. In the Russian economy, Putin favors a model in which the state plays a central role, which has led to a dependence on natural resources and the perpetuation of corruption. His regime also places a strong emphasis on internal security, using security agencies to suppress dissent, while relations with the West have been strained, especially after the crisis in Ukraine and the sanctions imposed on Russia, with Putin presenting himself as a defender of the country against external aggression.

If Putin is known for his influence on Russia's foreign policy and for his role in redefining the country's position on the geopolitical stage, Xi Jinping is the central figure of the political leadership in the People's Republic of China and one of the main actors in the current global transformations. Thus, moving on from the analysis of Putin's leadership, it is important to also analyze how Xi Jinping leads China and contributes to increasing its influence worldwide.

Xi promotes a "Chinese path to modernization" that emphasizes political control, not liberalization unlike **Deng Xiaoping 's, even** making symbolic efforts to downplay Deng's historical importance in order to strengthen the legitimacy of the Xi era.

Xi Jinping's vision of domestic and international politics is presented coherently in his speeches and in the official doctrine called "Xi Jinping Thought on Socialism with Chinese Characteristics for a New Era" [3]. This doctrine has become the ideological core of the Chinese state and defines China's strategic direction today.

Domestically, Xi Jinping is relying on the consolidation the power of the Chinese Communist Party (CCP) as the absolute ruling force of the state. Analyses show that Xi

has reversed the gradual liberalization trend of the Deng Xiaoping era and reintroduced a much stronger role for ideology in public life and administration. Under this model, the party is present in all institutions – from private companies to universities – and loyalty to the CCP becomes an essential criterion for the promotion of officials.

Another central element is economic and technological modernization, with a focus on self-sufficiency in strategic areas such as semiconductors, artificial intelligence, and defense. Recent sources point out that Xi is promoting a strategy of "technological autonomy" to reduce dependence on the West and transform China into a technological superpower by 2035. On the social front, Xi emphasizes stability and security, which translates into extensive control over civil society, the media, and the internet. Highly visible anti-corruption campaigns have served to discipline the state apparatus, but also to eliminate political rivals. At the same time, Xi promotes traditional Chinese values as the moral foundation of society, in a combination of cultural nationalism and modern socialism.

Internationally, Xi Jinping aims to transform China into a central global actor, capable of shaping the international order. Analyses show that Xi does not seek direct confrontation, but a gradual reconfiguration of the global system in favor of Chinese interests, through economic diplomacy, multilateral initiatives and technological expansion.

In the context of US-China strategic competition, the China-Russia partnership is reciprocal: for China, Russia is indispensable as a source of natural resources and military technology; for Russia, China is the only viable partner capable of providing financial assistance in conflict and diplomatic support in the UN Security Council. This mutual dependence transforms the alliance into a geopolitical necessity for both actors, consolidating economic, military and diplomatic cooperation into a pragmatic and long-term strategic partnership.

China-Russia Boundless Partnership [4] is a comprehensive strategic alliance that encompasses economic (bilateral trade, long-term energy contracts), military and technological cooperation, as well as diplomatic alignment in international organizations. Forced by Western sanctions and a shared desire to counterbalance US influence, the partnership reflects complementarities between Russia's natural resources and China's technological capabilities and capital. Although officially presented as "boundless", the relationship has real limits imposed by international sanctions, strategic differences and an asymmetrical dependence, with Russia being more vulnerable than China. In essence, it is a pragmatic and adaptable cooperation based on shared geopolitical and economic interests, rather than a formal military alliance like NATO.

Xi does not necessarily aim to replace the US as the sole hegemon, but to create a multipolar world in which China is one of the central poles.

Another major pillar is the Belt and Road Initiative (BRI) [5], through which China is expanding its economic and strategic influence across Asia, Africa, the Middle East, and Europe. One of the main goals of the initiative is *to facilitate international trade*. By building ports, railways, highways, and energy pipelines, China aims to create faster and more efficient trade routes. These projects can reduce transportation costs and facilitate Chinese exports to global markets, while strengthening economic ties between participating states. At the same time, the initiative aims *to expand China's geopolitical influence*. By financing and developing infrastructure in numerous countries, China is strengthening its diplomatic relations and increasing its role in the economic development of other regions. This can lead to increased political and strategic influence for Beijing in the international system [6].

Another important goal is *to develop China's inland regions*, especially those in the west of the country, which are less developed than the coastal areas. By connecting these regions to international trade networks, the Chinese government is trying to stimulate investment, production, and job creation.

In parallel, Xi is promoting a more assertive foreign policy in the Asia-Pacific region, including in the South China Sea and in the relationship with Taiwan, where Beijing insists on "reunification" as a fundamental national goal.

In its relationship with the United States, Xi pursues a strategy of controlled competition, in which China seeks to avoid military conflict but consolidate its position in areas such as technology, trade, and diplomatic influence. Recent sources emphasize that technological tensions with the US are a central element of Xi's foreign strategy, which sees technological competition as a struggle for the future of the world order.

The European Union differs from the US, Russia and China primarily in its institutional nature and the way it exercises power: the EU is not a sovereign state, but a union of states that coordinate their policies through cooperation and consensus mechanisms, which makes the decision-making process more complex and slower, but more balanced. In contrast, the US, Russia and China are highly centralized states, capable of quickly adopting strategic decisions and implementing them in a unified manner. Internationally, the EU relies mainly on "soft power", i.e. economic influence, regulations, diplomacy and the promotion of democratic values, such as the rule of law and human rights, generally avoiding the use of military force. In contrast, the US combines economic power with an extensive global military capacity, Russia frequently uses instruments of force and aggressive geopolitical strategy to assert its influence, and China combines economic and technological expansion with a gradual increase in military power. Thus, the essential difference lies in the fact that the EU acts more as a "normative actor" and cooperative in the international system, while the other great powers operate as classic state actors, oriented towards competition and direct consolidation of power.

While the European Union focuses internally on strengthening the single market, social cohesion and the security of its citizens, these priorities cannot be separated from the external geopolitical challenges it faces. Thus, on the international stage, the EU must defend its economic and security interests through strategic trade relations, active diplomacy and a strong geopolitical stance, demonstrating that internal stability and external influence are complementary and interdependent.

The internal policy of the European Union is based on the idea of progressive integration between the Member States, with the aim of creating a common, stable and competitive economic and legal area. The Single Market is the core of this project: a framework in which goods, services, capital and people circulate freely, without internal barriers. To maintain the functionality of this area, the EU sets common standards in areas such as consumer protection, the environment, energy or competition, thus ensuring equal conditions for all economic actors. In parallel, cohesion policy aims to reduce development differences between regions, through massive investments in infrastructure, innovation and social development, so that the benefits of integration are distributed as evenly as possible.

Another essential pillar of internal policy is the protection of the rule of law, democracy and fundamental rights. The European Union considers these values to be fundamental to its functioning, which is why it constantly monitors their respect in all Member States. Mechanisms such as the annual rule of law assessments, the Article 7 procedures [7] or budgetary conditionality are tools through which the EU seeks to prevent demo-

cratic slippage and maintain the coherence of the Union's values. In addition, many internal policies such as those on migration, agriculture, energy or the environment have significant external effects, reflecting the interdependence between internal action and the EU's global role.

The European Union's foreign policy is built around the objective of promoting peace, stability and international cooperation. Through the Common Foreign and Security Policy, the EU seeks to act as a coherent global actor, capable of responding to international crises and contributing to maintaining a rules-based world order. The Union presents itself as a "normative actor", i.e. a promoter of democracy, human rights and multilateralism, using diplomacy, dialogue and cooperation as its main instruments of influence. The European External Action Service coordinates the EU's diplomatic relations, managing delegations around the world and representing the Union in international negotiations.

The principles of the European Union's foreign policy are based on the promotion of democratic values, based on respect for human rights, the rule of law and the principles of international law. An essential principle is multilateralism, through which the EU supports collaboration between states and the role of international organisations in managing global issues. The EU also promotes international peace and security, preferring diplomatic solutions and conflict prevention to the use of force. Another important principle is solidarity and cooperation, both among Member States and in relations with other countries, in particular through support for development and humanitarian aid. At the same time, the EU's foreign policy aims to protect economic and trade interests, but within a regulated and fair framework, and supports the promotion of democracy and European values globally.

Economically, the EU is one of the world's largest trading powers, and its common commercial policy allows it to negotiate free trade agreements with many countries and regions. In recent years, the Union has taken a more assertive approach to defending its economic interests, adapting to increased global competition. In the area of security and defence, the EU is gradually developing common capabilities through initiatives such as PESCO and the European Defence Fund, deploying civilian and military missions in conflict zones to contribute to stability. Migration policy is an area where the internal and external dimensions overlap: the EU works with third countries to manage migration flows, while seeking to harmonise internal rules on asylum and border protection.

III. Relationships between Global Actors. Relations between major global actors are characterized by a complex combination of strategic competition and selective cooperation, taking place in an increasingly unstable international context. The transition to a multipolar order determines a constant reconfiguration of power relations, in which states pursue their interests both through collaboration and confrontation. In this framework, economic interdependence coexists with geopolitical rivalry, which makes international relations difficult to predict and manage. This dynamic reflects the profound transformations of the contemporary global system.

The relationship between the United States and China is the central axis of global competition. The two powers are engaged in a complex rivalry that combines economic interdependence with strategic confrontation, particularly in areas such as technology, trade, and geopolitical influence. While they avoid direct conflict, tensions are evident in regions such as the Asia-Pacific and in the dispute for technological supremacy, as each seeks to consolidate its position in the world order. The relationship is currently the most important and tense bilateral relationship in the international system. The two powers

are engaged in a broad strategic competition that covers areas such as technology, trade, regional security, and global influence. The United States seeks to limit China's rise and protect the liberal international order it shaped after World War II, while China seeks to expand its economic and military power and consolidate its status as a superpower. Their rivalry affects global supply chains, regional alliances, and stability in sensitive areas such as Taiwan and the South China Sea. This relationship is considered the main driver of current geopolitical transformations.

Relations between the United States and Russia are deeply strained, particularly in the wake of the conflict in Ukraine. The United States, along with its Western allies, have imposed severe economic sanctions and provided political and military support to Ukraine, while Russia perceives these actions as a direct threat to its security. This confrontation reflects a broader geopolitical rivalry between the West and Russia, characterized by distrust and strategic competition.

The relationship between China and Russia has strengthened in recent years, becoming a strategic partnership based on shared interests, especially in opposition to the global influence of the United States. The two countries cooperate in economic, energy and diplomatic fields, supporting the idea of a multipolar world. However, this relationship is more pragmatic than one of formal alliance, and there are also imbalances, especially in favor of China.

The European Union maintains complex relations with these actors [8]. In relation to the US, the EU is a strategic ally, sharing common values and cooperating in areas such as security and the economy. At the same time, the EU is trying to develop strategic autonomy. Relations with Russia are tense and dominated by sanctions and political divergences, while the relationship with China is a mixed one: important economic cooperation, but also competition and concerns about security and political influence [9].

Overall, the current international system is characterized by a combination of rivalry and interdependence, in which great powers collaborate where they have common interests, but constantly clash for global influence and supremacy.

Conclusions. The analysis presented highlights the fact that the current international system is marked by a profound transition towards a multipolar order, in which competition between great powers and the influence of political leaders contribute to an unstable global environment.

In this context, in the sense defined by Henry Kissinger in his work *World Order*, the main challenge of the 21st century consists in building a stable international order, accepted by the great powers, in the face of major differences in values, interests and political models [10].

Analyzing international relations as simplistically and cynically as possible, we can anticipate a future on two axes. The world is not so clearly divided into two "parallel fronts", but rather functions as a complex network of interdependent relationships.

The US-China axis is indeed the main line of global competition, as it involves two superpowers competing for global economic, technological and geopolitical supremacy. In contrast, the EU–Russia relationship is more of a regional one, focused on European security, energy and influence in the Eastern neighbourhood, without the same capacity to structure the entire global system.

Based on these trends, it is possible that in the future we will witness the intensification of competition between the United States and China, especially in the field of technology and geopolitical influence, with the risk of major crises in sensitive regions such as Taiwan or the South China Sea. Also, the conflict between Russia and the West could

continue or even escalate, generating new security tensions in Europe and reinforcing the division of geopolitical blocs. At the same time, the partnership between China and Russia could become more solid, helping to shape a counterbalance to Western influence.

The future relationship between the United States and China can evolve in several directions, but it will most likely remain defined by an unstable balance between competition and cooperation. A first scenario is that of the *intensification of strategic rivalry*, in which the two powers will consolidate their separate economic and technological blocs, accelerating the process of "decoupling" in areas such as semiconductors, artificial intelligence and supply chains. In this context, the world could become increasingly fragmented, with states forced to choose between competing spheres of influence.

A second scenario is that of *controlled competition*, in which the US and China recognize each other's great power status and try to avoid direct conflict while keeping the rivalry within manageable limits. In this case, cooperation would continue in key global areas, such as climate change, financial stability, or arms non-proliferation, even if geopolitical and technological tensions persist.

The riskiest scenario is that of an *escalation of tensions*, especially in sensitive areas such as Taiwan or the South China Sea, where a military incident or diplomatic crisis could escalate into an open conflict with major global implications. Such a scenario would seriously affect the world economy, international security and political stability of many regions.

The rivalry between the United States and China can also be interpreted through the lens of the "Thucydides Trap" concept, formulated by Graham Allison. He argues that, throughout history, the rise of an emerging power and the reaction of a dominant power frequently lead to conflict. In this context, the competition between the United States and China reflects a similar structural dynamic, in which the risk of escalation derives not only from specific policy decisions, but also from systemic pressures of the global redistribution of power [12].

The European Union will face major challenges, having to strengthen its strategic autonomy, manage internal pressures generated by migration, economic instability and the rise of populist currents, but also to redefine its role on the global stage. At the same time, technological developments, especially in the field of artificial intelligence, as well as cyber threats and disinformation will become increasingly important factors in international relations, influencing both the security of states and the stability of societies.

The future relationship between the European Union and Russia is likely to remain marked by tension and distrust, at least in the medium term, in the context of deep political, strategic and value divergences. The most realistic scenario is to maintain a cold relationship, characterized by economic sanctions, limited dialogue and minimal cooperation only in strictly necessary areas, such as regional security or the management of global crises. In this context, the European Union will continue to strengthen its energy and strategic autonomy, reducing its dependence on Russia, while the latter will increasingly orient its foreign and economic policy towards Asia. Another possible scenario, but dependent on the evolution of the current conflicts and possible internal political changes, could involve a gradual resumption of dialogue and a partial normalization of relations. However, this would involve major compromises and rebuilding trust, a difficult and long-term process. In a more pessimistic scenario, tensions could escalate, leading to new security crises in Eastern Europe or to an even greater consolidation of rival geopolitical blocs.

Overall, the EU–Russia relationship will continue to reflect a confrontation between two different models of political organization and visions of the international order, which

makes the prospect of stable and extensive cooperation limited in the near future.

In broad terms, the future of the international order will depend on the ability of great powers to manage these tensions and avoid turning rivalries into open conflicts. In the absence of effective mechanisms for global cooperation, there is a risk that the current instability will intensify, leading to the emergence of regional or even global crises, which underlines the need for a balance between competition and cooperation in managing the challenges of the 21st century.

THE INSTITUTIONAL DYNAMICS OF THE NATIONAL BANK OF MOLDOVA IN THE CONTEXT OF EUROPEAN INTEGRATION

Ludmila GUȘTIUC,
PhD, University Lecturer,
Public Law Department,
"Ștefan cel Mare" Academy of the Ministry of Internal Affairs,
Republic of Moldova
ORCID – 0000-0002-8516-4949

Abstract
The institutional dynamics of the National Bank of Moldova (NBM) reflect its evolution from a traditional monetary authority to a modern institution, aligned with European standards. Created in the political context, following the achievement of state independence, the National Bank of Moldova occupies the main role in the country's economy. Throughout the evolution of the Moldovan banking system, for over 30 years, the NBM has demonstrated countless times that it represents a fundamental institution of society. The National Bank of Moldova has established itself as a symbol of national sovereignty. The National Bank of Moldova, being a pillar of state independence, now exercises complex powers of central authority over the national banking sector.
Keywords: central bank, National Bank of Moldova, national banking system, European Integration of the Republic of Moldova.

DINAMICA INSTITUȚIONALĂ A BĂNCII NAȚIONALE A MOLDOVEI ÎN CONTEXTUL INTEGRĂRII EUROPENE

Abstract
Dinamica instituțională a Băncii Naționale a Moldovei reflectă evoluția acesteia de la o autoritate monetară tradițională către o instituție modernă, aliniată standardelor europene. Creată în contextul politic, în urma obținerii independenței statale, Banca Națională a Moldovei ocupă rolul principal în economia țării. De-a lungul evoluției sistemului bancar moldovenesc, timp de peste 30 de ani, Banca Națională a Moldovei a demonstrat de nenumărate ori că reprezintă o instituție fundamentală a societății. Banca Națională a Moldovei s-a constituit ca simbol al suveranității naționale. Banca Națională a Moldovei, fiind un pilon al independenței statale, exercită acum atribuții complexe de autoritate centrală asupra sectorului bancar național.
Cuvinte-cheie: bancă centrală, Banca Națională a Moldovei, sistem bancar național, integrarea europeană a Republicii Moldova.

Introduction. In what follows, we will conduct scientific research on the aspects of the evolution of the National Bank of Moldova in the context of European integration. Until the accession of the Republic of Moldova to the European Union, the National Bank of Moldova has an important role in terms of its institutional dynamics. Respectively, the National Bank of Moldova:

- Ensures the economic stability of the country and aligns the national banking legislation with the norms of the European Union and good European practices;
- Participates in various legislative and functional reforms of the state;
- Is involved in the mechanisms for coordinating our country's accession to the

European Union and participates in negotiations with it.

Methods and materials applied. The scientific work was carried out using a set of research methods, including: *the documentary analysis method*: used to study the banking legislation of the Republic of Moldova and the European Union and review the specialized literature on the activity of the National Central Bank and European integration; *the comparative analysis method*: used to compare the legislation of the European Union and the legislation of the Republic of Moldova; and *the logical analysis method*: used to delimit the key concepts regarding the banking system. The use of these research methods contributes to facilitating the formulation of scientific conclusions.

Discussions and results obtained. The central bank is of vital importance in ensuring the stability of the value of the national currency. "In general terms, a central bank acts as an institution, on behalf of the state, to establish and coordinate the monetary and credit policy of the economy" [10, p.44]. We would like to clarify that a central bank has specific functions, the central bank does not exercise the functions of a commercial bank, and therefore, the central bank cannot compete with other banks in the national banking system. The central bank "as the state's bank of issue, an expression of the state's independence obtained over time, has acquired several functions and powers in the context of a bank of banks, specific to such an institution" [24, p.93].

Referring to the legal status of the central bank, from a comparative perspective, the French author Pierre Tifine argues that: "resulting from all the legislative provisions, the Central Bank of France is a "sui generis" public person and the function of centralizing information or banking files of enterprises constitutes a public administrative service mission that does not maintain any category of operations subject to civil and commercial legislation by virtue of Article 21 of the Law of 4 August 1993" [26]. "It is thus considered that the Bank of France, which, before France's entry into the Economic and Monetary Union, was recognized as a public institution with an administrative character, placed directly under the tutelage of the Prime Minister, starting with 1997 could no longer be qualified in the same way, since it is no longer considered to be under the tutelage of any French administrative authority, becoming a "sui generis" legal person" [8, p.120].

In Romania, Law No.34/1991 on the statute of the National Bank of Romania provided that "The National Bank of Romania is a state body and has legal personality" [15]. It was not until 2004 that Law No.312/2004 on the Statute of the National Bank of Romania referred to the National Bank of Romania as "an independent public institution" [16]. "It was emphasized, therefore, that the registration of the bank in the 2004 law as an independent public institution is intended to exclude any approximation of the central bank to the notion of a state body" [8, p.120].

In the Republic of Moldova, according to the legal provisions, more precisely of Law No.548 of 21.07.1995 on the National Bank of Moldova, "The National Bank is an autonomous public legal entity" [17]. Analyzing the legislation of several states regarding the activity of the central bank, we find that the Romanian legislator was the most skillful in clearly rendering the legal status of the central bank.

In the view of professors S.J. Bytheway and M. Metzler, "today, the actions of the central bank continue to develop the economy, perhaps even more than they did a century ago" [4, p.18]. The Romanian author L.C. Ionescu also highlights the role of the central bank, stating that: "the central bank has a special role in maintaining the stability of the national currency and public confidence in banks" [12, p.71].

In accordance with Article 1 of the Law on the National Bank of Moldova, entitled "The Legal Status of the National Bank of Moldova", "The National Bank of Moldova (equiv-

alent name – the National Bank) is the Central Bank of the Republic of Moldova" [17]. Accordingly, it follows that "the fundamental objective of the National Bank of Moldova is to ensure and maintain price stability" [14]. And by achieving this goal, the National Bank of Moldova should gain the trust of citizens. "Without prejudice to its fundamental objective, the National Bank promotes and maintains a financial system based on market principles and supports the general economic policy of the state" [1, p.28]. Accordingly, to achieve its fundamental objective, the National Bank of Moldova has the competence provided for in Art.3 of the Law on the National Bank of Moldova: "a) concluding contracts and issuing obligations; b) acquiring and disposing of movable and immovable property for the purpose of exercising its powers; c) filing actions in court and participating in the trial as a subject".

"In its activity, the National Bank of Moldova is not a closed institution, but is permanently in collaborative relations with the public, the Government and the Parliament. It should be noted that these relations do not in any way affect the autonomy of the National Bank of Moldova, stipulated in Article 1 of the Law on the National Bank of Moldova" [10, p.145]. When we talk about the relationship of the National Bank of Moldova with the public, we mean informing the public about the evolution of the financial market, various statistical data, information on the granting of loans, etc. This information is placed on the website www.bnm.md, which is the official page of the National Bank of Moldova.

Referring to the relations of the National Bank of Moldova with the Government, we note that: "The National Bank cooperates with the Government in achieving its objectives and undertakes the necessary actions to achieve such cooperation. The National Bank provides the economic and financial bodies of the Government, at their request, with information on monetary and financial issues" [17]. And in the situation where the National Bank requests information on monetary and financial issues, the economic and financial bodies of the Government are obliged to present them. Also, regarding the cooperation of the National Bank with the Government, "The Governor of the National Bank may attend and speak at the meetings of the Government, the address being recorded in the minutes and may present in writing opinions on the issues addressed following participation in the meetings" [17].

Regarding the relations of the National Bank of Moldova with the Parliament, the Moldovan legislator establishes that "The National Bank is an autonomous public legal entity and is accountable to the Parliament" [17]. Also, at the request of the Parliament, the National Bank is obliged to approve draft laws that target the areas of activity of the central bank. The policy of the National Bank is explained to the Parliament by the Governor of the National Bank, members of the Supervisory Council or members of the Executive Committee.

The relations between the Parliament of the Republic of Moldova and the National Bank of Moldova do not represent relations of subordination. The great scholar in the field of administrative law, A. Iorgovan, argues that: "administrative subordination, in an organic sense, implies: a) the right to organize the lower authority; b) the right to transmit mandatory instructions to it; c) the right to general supervision of the activity; d) the right to appoint leaders; e) the right to hold accountable by applying administrative-disciplinary sanctions; f) the right to control the activity with the possibility of annulling the acts" [13, p.80]. In this sense, in the case of the relationship established between the Parliament and the central bank, it is of a coordinating nature.

The cooperation between the Parliament of the Republic of Moldova and the National Bank of Moldova is based on the presentation of periodic reports and hearings. The

National Bank of Moldova is obliged to submit periodic reports to the Parliament on the state of the economy and monetary policy. At the same time, the National Bank of Moldova is called for hearings in order to provide additional information to parliamentarians.

Depending on the form of ownership, there are three types of central banks:

• Public banks, in which the capital belongs to the state;

• Joint-stock companies, in which the capital belongs to banks; and

• A symbiosis between the two types named above, in which the capital belongs to both the state and banks. According to this classification, the National Bank of Moldova belongs to the first category, namely, it is a public bank, the capital belongs to the state.

"Based on the attributions of the NBM, the specialized literature attributes to it several qualities, namely:

• Public authority;

• State bank;

• Bank of banks;

• Currency regulation center" [1, p.30].

By carefully analyzing the organizational chart, we find that the National Bank of Moldova, as an autonomous administrative authority, is made up of departments, directions, services and other subdivisions.

With reference to the banking sector, on August 28, 2015, the Official Gazette of the Republic of Moldova published Law No.147 of 30.07.2015 amending and supplementing certain legislative acts.

According to the legal provisions of the Law on the National Bank of Moldova as amended, "The National Bank and the members of its management bodies are independent in the exercise of the powers established by this Law and may not request or accept instructions from public authorities or any other authority. Public authorities, as well as any other authorities, shall not attempt to influence the members of the management bodies of the National Bank of Moldova in the exercise of their powers" [17].

Composition of the management bodies, the manner of appointment and dismissal of their members. According to Article 22 of the Law on the National Bank of Moldova, the management of the bank is ensured by:

– "The Supervisory Council, which is the body responsible for organizing an effective system of independent public supervision of the activity of the National Bank;

– The Executive Committee, which ensures the independent implementation of its basic attributions" [17].

At the proposal of the President of the Parliament, the Parliament of the Republic of Moldova appoints the Governor of the National Bank. Subsequently, at the proposal of the Governor of the National Bank, the Parliament appoints the First Deputy Governor and the Deputy Governors.

Candidates for the position of member of the Supervisory Board and the Executive Board must be citizens of the Republic of Moldova, have higher education, have an impeccable reputation, and have no records of a negative result of the professional integrity test in their professional integrity record in the last 5 years. "In the case of a candidate for the position of member of the Supervisory Board, he/she has at least 10 years of work experience in the financial, legal or audit field or in a scientific or academic position in these fields or, in the case of a candidate for the position of member of the Executive Board, he/she has at least 10 years of work experience in the financial or monetary field" [17]. The Parliament of the Republic of Moldova has the right to dismiss a member of the Supervisory Board or the Executive Board. The Chairman of the Supervisory Board is

dismissed upon the proposal of the President of the Parliament, by a vote of 2/3 of the number of elected deputies. The dismissal of the other members of the Supervisory Board and the Executive Committee shall be made upon the proposal of the Supervisory Board, submitted following the Governor's request, with the vote of the majority of the elected deputies. The decision to dismiss a member of the Supervisory Board or a member of the Executive Committee may be appealed to the Chisinau Court of Appeal within 15 days of its publication in the Official Gazette of the Republic of Moldova.

"It should be noted that, on the date of entry into force of this reform, the members of the Board of Directors of the National Bank of Moldova became ex officio members of the Executive Committee of the National Bank of Moldova, according to the mandates of Governor, First Deputy Governor and Deputy Governor held until their expiration. The members of the Board of Directors of the National Bank of Moldova, according to the mandates of Governor and First Deputy Governor, became the President and, respectively, Vice-President of the Supervisory Board until the expiration of their mandates" [11, p.124].

Within the meaning of the Law on the National Bank of Moldova, the Governor is responsible for formulating initiatives in the field of monetary and foreign exchange policy to be submitted to the Executive Committee and for their execution [17]. The Governor is also the one who heads the National Bank of Moldova. The Governor represents the national central bank in relations with any natural or legal person. Other rights of the Governor of the National Bank of Moldova provided for by the legislation in force are: issuing orders and provisions binding on employees of the domestic central bank, verifying their execution, signing agreements and other acts concluded by it.

With reference to the powers of the local central bank, "The National Bank of Moldova develops and implements monetary and foreign exchange policy within the framework of the state's single economic policy, arising from the need to create favorable conditions for achieving the proposed goals" [21, p.267]. According to Article 17 of the Law on the National Bank of Moldova, "The National Bank of Moldova establishes the requirements for banks to maintain mandatory reserves against deposits and other similar liabilities, specified for this purpose. These reserves are maintained by holding cash on hand or in correspondent accounts of banks or in special accounts of banks with the National Bank [17].

Another competence of the central bank is to grant loans to banks. Thus, according to Article 18 of the Law on the National Bank of Moldova, "The National Bank may grant loans to banks under the conditions periodically established by the National Bank and secured by: a) securities issued by the Government; b) securities issued by the National Bank; e) deposits and other accounts with the National Bank or with a bank accepted by the National Bank, representing any type of assets that the National Bank may purchase, sell or negotiate; f) other eligible financial assets established by the National Bank" [17].

With regard to foreign exchange operations, "The National Bank has the right: a) to buy, sell and negotiate gold coins, gold bars and other precious metals; b) to buy, sell and negotiate foreign currency, using the assets indicated in Article 53 paragraph (1); c) to buy and sell treasury bills and other securities issued or guaranteed by foreign governments and international public financial institutions; d) to establish the rate at which it will buy, sell and carry out the operations mentioned in letters a)–c)" [17].

For the purposes of Article 107 paragraph (2) of the Constitution of the Republic of Moldova, the National Bank of Moldova has the legal nature of an administrative authority. Thus, "For the purpose of leading, coordinating and exercising control in the field of economic organization and in other fields that do not fall directly within the competence

of the ministries, other administrative authorities shall be established, in accordance with the law" [5].

For comparison, in Romanian specialized literature, since 1996, professor A. Iorgovan included the National Bank of Romania among the autonomous central authorities [13, p.525]. Also, in 2004, professor L. Bercea qualified the National Bank of Romania as an autonomous administrative authority [2, p.83]. "In the same sense, other authors showed, in 2008, that the legal definition of the NBR as an "independent public institution" could lead to an erroneous conclusion in the sense of removing it from the ranks of public administration authorities, although such a definition was necessary to emphasize the lack of dependence on the political factor" [22, p.125]. It was thus specified that "the interpretation in the sense of a sui generis status of the bank, of a public institution outside administrative control cannot be admitted" [24, p.304]. Therefore, in general, the authors of administrative law include the National Bank of Romania among the autonomous administrative authorities [27, p.309].

In the Republic of Moldova, there are two categories of autonomous central authorities:

– Those created by the Constitution of the Republic of Moldova;

– Those that are not mentioned in the Constitution of the Republic of Moldova.

"In their creation, the basic role usually falls to the Parliament, which is why these authorities are subject to special parliamentary control" [19, p.388].

Since no article or paragraph in the Constitution of the Republic of Moldova was dedicated to the National Central Bank of Moldova, we consider that the National Bank of Moldova belongs to the second category of autonomous administrative authorities.

Professor A. Dumitrescu-Pasecinic argues that: "the solution to the problem of the legal nature of the bank should not be sought in the qualification given by the law..., but in its independent position and prerogatives of public power. French legal literature expressed a similar idea when it showed that the Law of January 3, 1973 qualified the Bank of France as an "institution", a term without legal significance" [8, p.122]. According to the Law of August 4, 1993 "the Bank of France remained "an institution whose capital belongs to the State" (article 6) so that the law did not define the legal nature of the "Banque de France institution" [3, p.157]. Regarding the independence of the National Bank of Moldova, this topic is developed in detail in the following paragraph.

The author A. Dumitrescu-Pasecinic considers that the central bank is a public authority, emphasizing that "if the central bank is a public authority and enjoys independence, the question arises of its classification in the categories of public authorities provided for in the Constitution..." [8, p.124].

In his valuable work, I. Silberstein argues that the central bank "is not a body of public administration and is not even included among the state bodies..." [24, p.305-306]. We do not share the same opinion with Professor I. Silberstein, since "the statement that the central bank is not a body of public administration seems to confuse the sphere of public administration with the sphere of government administration" [8, p.124]. In this context, if we refer to the independence of the National Bank of Moldova, this principle determines that the National Bank should not be part of institutions that are subordinate to the Government.

In the context of the above, the question arises "what kind of authority is the National Bank of Moldova on the national stage"? In our opinion, since 1991, the National Bank of Moldova, as a legal entity, was and is a state body. We believe that the notion of "state body" does not necessarily mean subordination to the Government. Institutional

independence refers to the idea that "the monetary authority is an independent body, it is not part of the government administration" [25, p.162]. However, the fact that the National Bank of Moldova is not part of the institutions subordinate to the government does not mean that it is not part of the public administration. Accordingly, we conclude that the National Bank of Moldova is an independent administrative authority.

On September 1, 2015 at the European Central Bank Conference, professor M. Selmayr, being the Chief of Staff of the Presidential Commission, is of the opinion that central banks occupy a separate power in the state [23]. We certainly state that the central bank cannot be part of the judicial, legislative or executive power, because the central bank, like the executive, serves the people by exercising a specialized obligation – ensuring financial stability in the state for the good of the citizen.

"Autonomous administrative authorities... are included in the sphere of executive power, exercising an executive activity, having as its object the organization of the application and concrete application of laws, as well as ensuring the proper functioning of the services established within them" [7, p.326]. These institutions are not part of the executive.

Unlike the Constitutional Court or the People's Advocate, which have the role of supporting citizens, the National Bank of Moldova does not play the role of guarantor. "As professor A. Iorgovan also shows, since the political power is only one, and the functioning of the state mechanism in which it is organized, since the interwar period has exceeded the rigid framework of the trinity of powers, the trinity of powers would have become a brake on the regulation of border institutions such as the People's Advocate or the Constitutional Court which, strictly speaking, do not fall within the sphere of any of the classical powers" [8, p.134].

We believe that the National Bank of Moldova, as an autonomous administrative authority, exercises an activity similar to the executive branch, but is in no way a component part of any power in the state.

A few years ago we were present in the midst of major events. We bear in mind that on June 23, 2022, the Council of Europe gave the green light to the Republic of Moldova, granting it the long-awaited and coveted status of candidate country for accession to the European Union. With reference to the banking sector, the significance of the event had several variables. We believe that the immediate advantages were best articulated by Mr. Janis Mazeiks, former Head of the European Union Delegation to the Republic of Moldova. Among other things, he stated that: "The European Union is committed to supporting structural reforms that bring impactful benefits to the Republic of Moldova, its citizens and business communities. The country's financial sector was significantly affected by the banking fraud of 2014. This was caused by an insufficiently strong legal and governance framework of the sector, high-level corruption and personal interests...." [20].

In this context, the mission of the banking system of the Republic of Moldova, among many others, is to adapt to new realities, study the legislation and practice of the European Union in the banking field and transpose into the legislation of the Republic of Moldova everything that the European Union has produced in the banking dimension. All this will bring institutional efficiency and advantages, ultimately, to the citizen and legal entities.

As a result, in recent years the following directives and regulations of the European Union have been transposed into the legislative segment of the banking regulation of the Republic of Moldova:

1. Directive 2001/24/EC of the European Parliament and of the Council of 4 April 2001 on the reorganisation and winding-up of credit institutions. This Directive regu-

lates issues concerning the competition of laws between Member States of the European Union when credit institutions close (wind up) subsidiaries in countries other than the country of origin of the parent company [6, p.487].

2. Directive 2002/87/EC of the European Parliament and of the Council of 16 December 2002 on the supplementary supervision of credit institutions, insurance undertakings and investment firms in a financial conglomerate. According to the provisions of the Directive, "the promotion of the regulatory act contributed to ensuring financial stability and the protection of depositors, policyholders and investors. Supplementary supervision was exercised by a coordinating authority designated from among the authorities competent for sectoral supervision, on the basis of the criteria established by the Directive" [9, p.124]. However, although this directive has been transposed into national banking legislation, the European Parliament and the Council of the European Union adopted in 2023 Directive 2023/2864 amending certain directives as regards the establishment and operation of the European single access point, the purpose of which is to provide for a possibility of improving public access to financial and non-financial information by creating a European single access point. Therefore, in accordance with point 13 of Directive 2023/2864, Directive 2002/87/EC of the European Parliament and of the Council of 16 December 2002 on the supplementary supervision of credit institutions, insurance undertakings and investment firms in a financial conglomerate is to be amended.

3. Directive 2015/849 of the European Parliament and of the Council of 20 May 2015 on the prevention of the use of the financial system for the purposes of money laundering or terrorist financing, amending Regulation (EU) No.648/2012 of the European Parliament and of the Council and repealing Directive 2005/60/EC of the European Parliament and of the Council and Commission Directive 2006/70/EC, known as the Anti-Money Laundering Directive IV, is one of the most important pieces of legislation in terms of combating money laundering and terrorist financing within the European Union. The essence of Directive 2015/849 is to establish a common regulatory and supervisory framework in the European Union for combating money laundering and terrorist financing with the aim of promoting the integrity and stability of the European financial system.

4. Directive 2009/110/EC of the European Parliament and of the Council of 16 September 2009 on the taking up, pursuit and prudential supervision of the business of electronic money institutions is a directive that regulates the activity of electronic money institutions and associated payment services within the European single market. Through Directive 2009/110/EC, the European Union aims to promote competition in the payment services sector, while ensuring the protection of users' funds and the stability of financial markets.

5. Directive 2007/64/EC of the European Parliament and of the Council of 13 November 2007 on payment services in the internal market is known as the Payment Services Directive. Directive 2007/64/EC is an important piece of legislation governing the provision and use of payment services in the European single market. The role of this directive is to create a common regulatory and supervisory framework for payment services in order to promote innovation and protect consumers.

6. Directive 98/26/EC of the European Parliament and of the Council of 19 May 1998 on settlement finality in payment and securities settlement systems is one of the first European directives to regulate the field of payments in the European single market. The importance of this directive is demonstrated by the establishment of common rules for transfers of funds between financial institutions.

7. Directive 2013/36/EC of the European Parliament and of the Council of 26 June

2013 on access to the activity of credit institutions and the prudential supervision of credit institutions and investment firms, amending Directive 2002/87/EC and repealing Directives 2006/48/EC and 2006/49/EC and Regulation No.575/2013 of the European Parliament and of the Council of 26 June 2013 on prudential requirements for credit institutions and investment firms and amending Regulation (EU) No.648/2012 is part of the European Union legislative framework for the regulation and supervision of the banking and financial sector. This directive is an important part of the reforms following the 2008-2009 financial and economic crisis and aims to strengthen financial stability by setting sound capital requirements for credit institutions and financial institutions.

8. Regulation (EU) No.575/2013 of the European Parliament and of the Council of 26 June 2013 on prudential requirements for credit institutions and investment firms and amending Regulation (EU) No.648/2012 is known as the Capital Requirements Regulation. Regulation (EU) No.575/2013 is part of the European Union legislative framework governing the banking and financial sector. This regulation is intended to ensure consistency and uniformity in terms of capital requirements for credit institutions in the European Union.

9. Directive 2014/59/EU of the European Parliament and of the Council of 15 May 2014 establishing a framework for the recovery and resolution of credit institutions and investment firms and amending Council Directive 82/891/EEC and Directives 2001/24/EC, 2004/47/EC, 2004/25/EC, 2005/56/EC, 2007/36/EC, 2011/35/EU, 2012/30/EU and 2013/36/EU of the European Parliament and of the Council and Regulations (EU) No.1093/2010 and (EU) No.648/2012 of the European Parliament and of the Council was adopted in the wake of the financial crisis to establish a common framework for action for the recovery and resolution of credit institutions in financial difficulties. It aims to ensure financial stability and protect taxpayers against systemic risks in the banking and financial sector.

In the current conditions of the Republic of Moldova, a special contribution to the country is the Manual on Harmonization of Legislation as a Key Element for the Success of the Process of Integration of the Republic of Moldova into the European Union [18]. Article 449 of the Association Agreement between the Republic of Moldova and the European Union provides for the dynamics of harmonization of the legislation of the Republic of Moldova with the Community acquis. The authors of the above-mentioned manual argue that: "This dynamic nature of the process of implementing the Association Agreement between the Republic of Moldova and the European Union stems from the dynamic nature of the EU acquis. The European Union acquis is constantly evolving, sometimes at a slow pace, sometimes with large leaps, which bring significant changes, which means that the acquis is constantly subject to amendments or repeals in accordance with the new needs of the European Union Member States, experiences and/or technological progress" [18].

Conclusions. In conclusion of the arguments mentioned above and starting from the objectives that we set out to achieve by elucidating this scientific study, we come up with a masterful statement. The institutional dynamics of the National Bank of Moldova have been elucidated, including by showing the evolution of the Europeanization-harmonization of national banking legal relations, starting from the Association Agreement between the Republic of Moldova and the European Union and reaching the Pre-Accession Plan of the Republic of Moldova to the European Union 2024-2027.

Between these two time frames, the banking system of the Republic of Moldova has experienced development, ascension, harmonization and efficiency, even if the process was somewhat overshadowed by the occurrence of banking fraud. We appreciate the re-

forms and modernization felt by individuals (both individuals and legal entities) and share the nation's optimism that the causes and conditions that could lead to new banking fraud have been eliminated, if political actors become characters lacking integrity and greedy for illicit enrichment.

CONTRAVENTION LIABILITY OF LEGAL PERSONS IN THE FIELD OF ROAD TRAFFIC: ISSUES OF QUALIFICATION AND APPLICATION

Doinița ȚÎMBALARU,
PhD Candidate, University Assistant,
Department of Private Law,
"Ștefan cel Mare" Academy of the Ministry of Internal Affairs,
Republic of Moldova
ORCID ID 0009-0002-7359-0171

Abstract

This study examines the contravention liability of legal persons in the field of road traffic from the perspective of the qualification and application issues generated by the current normative framework of the Republic of Moldova. Starting from the analysis of the general conditions established by Article 17 of the Contravention Code No. 218/2008, the research identifies the main categories of subjects susceptible to road traffic contravention liability: road transport operators, legal-person vehicle owners, and fleet managers, examining for each category the most frequent contentious situations and specific difficulties of legal qualification.

The study reveals a significant gap between the high frequency of legal persons' involvement in road traffic contravention relationships and the inadequacy of the normative framework governing the engagement, individualization, and enforcement of their liability – a gap that generates non-uniform case law with negative effects on the principles of equality before the law and predictability of the sanctioning system.

Keywords: contravention liability, legal person, road traffic, legal qualification.

RĂSPUNDEREA CONTRAVENȚIONALĂ A PERSOANELOR JURIDICE ÎN DOMENIUL CIRCULAȚIEI RUTIERE: PROBLEME DE CALIFICARE ȘI APLICARE

Abstract

Prezentul studiu examinează răspunderea contravențională a persoanelor juridice în domeniul circulației rutiere din perspectiva problemelor de calificare și aplicare generate de cadrul normativ actual al Republicii Moldova. Pornind de la analiza condițiilor generale instituite de art. 17 din Codul contravențional nr. 218/2008, cercetarea identifică principalele categorii de subiecți susceptibili de răspundere contravențională rutieră: operatori de transport rutier, proprietari de vehicule persoane juridice și administratori de parcuri auto, examinând pentru fiecare categorie situațiile litigioase frecvente și dificultățile specifice de calificare juridică.

Studiul relevă existența unui decalaj semnificativ între frecvența ridicată a implicării persoanelor juridice în raporturi contravenționale rutiere și insuficiența cadrului normativ care guvernează angajarea, individualizarea și executarea răspunderii acestora, decalaj care generează o jurisprudență neunitară cu efecte negative asupra principiilor egalității în fața legii și predictibilității sistemului sancționator.

Cuvinte-cheie: răspundere contravențională, persoană juridică, circulație rutieră, calificare juridică.

Introduction. The contravention liability of legal persons represents one of the most controversial and least systematized institutions of Moldovan contravention law, situated at the intersection of administrative law, commercial law, and contravention procedural law. Whereas in the field of criminal liability of legal persons, doctrine and case law have

accumulated, in recent years, a relatively consistent analytical corpus, their contravention liability has remained, in the domestic legal landscape, an insufficiently explored subject, despite the high frequency with which legal persons are involved in contravention proceedings and the legal complexity generated by their status as sanctionable subjects [11, pp. 145-162].

The field of road traffic amplifies this complexity in a specific manner. Unlike a natural person — the vehicle driver, who commits a road traffic offence directly and identifiably — the legal person intervenes in the road contravention relationship in a variety of distinct legal roles: as owner of the vehicle with which the contravention was committed, as a transport operator organizing and managing road transport activity, as employer of the vehicle driver, or as possessor of the vehicle under a legal title distinct from ownership [6, pp. 4-6]. Each of these roles generates a distinct legal configuration of contravention liability, with different conditions for engagement, forms of culpability, and applicable sanctions, the regulation of which in the Contravention Code of the Republic of Moldova is far from complete and coherent.

The issue of qualifying and applying the contravention liability of legal persons in the field of road traffic is therefore not merely academic. It produces direct and immediate practical consequences: enforcement officers applying sanctions in the absence of a clear normative basis; courts issuing divergent rulings in similar cases; legal persons sanctioned under conditions of legal uncertainty; and ultimately, an erosion of the legitimacy and predictability of the contravention system in the field of road traffic. Remedying these dysfunctions requires, as a first step, a systematic and critical analysis of the applicable normative framework, existing case law, and solutions adopted in comparable legal systems — an endeavour that the present study undertakes.

Methods and materials applied. Investigating the issues of qualification and application of the contravention liability of legal persons in the field of road traffic required the use of a set of legal research methods and techniques, selected in accordance with the mixed — normative, jurisprudential, and doctrinal — nature of the subject matter.

The dogmatic method formed the foundation of the research, materialised in the systematic analysis of the provisions of the Contravention Code of the Republic of Moldova No.218/2008, particularly Article 17, which regulates the general conditions of contravention liability of legal persons — read in conjunction with the special norms applicable in road traffic matters and with the provisions concerning the individualization and enforcement of contravention sanctions.

The interpretation of these texts was carried out through grammatical, systematic, and teleological techniques, with the aim of identifying normative gaps and interpretative tensions generated by their application to concrete legal situations.

The logical method was employed through the construction of deductive reasoning — from the general principles of contravention liability to the specific configurations of legal-person liability — and inductive reasoning, proceeding from concrete jurisprudential situations toward general conclusions regarding the coherence of the applicable normative framework.

The jurisprudential method complemented the normative analysis through an examination of judgments issued by courts of the Republic of Moldova in cases concerning the contravention liability of legal persons in the field of road traffic, with emphasis on the qualification and sanction-individualization problems most frequently encountered in practice.

The comparative method was applied by benchmarking Moldovan normative solu-

tions against regulations in Romania and France — states with relevant experience in the contravention liability of legal persons in the field of road transport.

The materials used include primary national and international normative sources, specialist doctrine from Moldovan and comparative contravention and administrative law, relevant national case law, as well as studies and institutional reports on the practice of applying contravention liability to road transport operators.

Discussions and results obtained. The recognition of the legal person as a distinct subject of contravention liability represents a relatively recent development in Moldovan law, enshrined through the adoption of the Contravention Code No.218/2008, which thereby transcended the traditional conception — inherited from the Soviet era — according to which contravention liability could be engaged exclusively against natural persons. This evolution reflected the acknowledgement that numerous contravention offences are committed not by individuals acting in their own name, but within and in the interest of collective entities — commercial companies, autonomous administrations, public institutions, associations — against which the exclusive sanctioning of the natural person involved proved insufficient both from the perspective of the proportionality principle and from that of the preventive function of contravention liability.

The general normative basis for the contravention liability of legal persons in Moldovan law is Article 17 of the Contravention Code, which establishes the cumulative conditions in the presence of which a legal person may be held liable for a contravention. According to this provision, a legal person — with the exception of public authorities — is liable for a contravention if one of the following alternative conditions is met: the act was committed in the interest of the legal person by a natural person vested with managerial functions, acting independently or as part of an organ of the legal person; the act was admitted or authorized by the organ or person responsible for the management or control of the legal person; or the act was committed as a result of the lack of supervision or control by the organ or person responsible for the management or control of the legal person [3].

An analysis of these conditions reveals that the Moldovan legislator has adopted, in the field of contravention liability of legal persons, a model of indirect or derivative liability, in which the engagement of the collective entity's liability is conditioned upon the existence of an act committed by an identifiable natural person — the person with managerial or supervisory functions, acting in the interest of or within the legal person. This model differs from the direct liability model adopted in some European legal systems, where the legal person is liable for its own act, independently of the identification and sanctioning of the natural person involved. The choice of the indirect model by the Moldovan legislator has significant practical consequences: in the absence of identification of the natural person who committed the act in the interest of the legal person, or in the absence of proof that the act was admitted or authorized by the governing body, the contravention liability of the legal person cannot be validly engaged — generating considerable practical difficulties in the field of road traffic, as will be discussed in the following sections.

A second essential characteristic of the general normative framework is the exclusion of public authorities from the category of subjects of contravention liability. Article 17 of the Contravention Code expressly provides that legal persons governed by public law — central and local public authorities, public institutions funded from the state budget — cannot be subjects of contravention liability. This exclusion, justified in doctrine by the functional immunity of public authorities and the inadequacy of contravention sanctions

in relation to public-law entities, nevertheless creates a significant normative gap in the context of road traffic: publicly-owned vehicles — belonging to state institutions, local authorities, or autonomous administrations — may be involved in road contraventions without the owner entity being subject to contravention liability as a legal person, leaving liability exclusively with the vehicle driver as a natural person [4, pp. 25-28].

Contravention sanctions applicable to legal persons are regulated by Articles 32 et seq. of the Contravention Code and include: the fine and the deprivation of the right to carry out a certain activity, the latter of which may be applied as a supplementary sanction [3]. The contravention fine applicable to legal persons is established in conventional units, with significantly higher upper limits than those applicable to natural persons, reflecting the greater economic capacity of collective entities and the need for the sanction to have a genuinely dissuasive effect on them [10, pp. 89-102]. The deprivation of the right to carry out a certain activity represents, in the context of road traffic, the most severe sanction applicable to legal persons — transport operators or commercial companies engaged in transport activities — as it may lead to the suspension or withdrawal of the transport authorization, with major economic consequences for the sanctioned entity.

A distinct and insufficiently regulated aspect of the general normative framework concerns the relationship between the contravention liability of the legal person and that of the natural person involved in committing the same act. The Contravention Code does not contain an express and general provision regulating the possibility of cumulating the two forms of liability — that of the legal person and that of the natural person holding managerial or supervisory functions — leaving this matter to the specific normative framework of each category of contraventions and, ultimately, to the interpretative discretion of the courts. This gap generates non-uniform judicial practice regarding the possibility of simultaneously sanctioning the legal person and the natural person for the same contravention, with direct consequences for the predictability and fairness of the sanctioning system.

The legal qualification of a road contravention committed in the context of a legal person's activity represents, in Moldovan administrative and judicial practice, one of the most frequent sources of procedural error and jurisprudential divergence. The difficulty of qualification does not reside, in the majority of cases, in identifying the contravention rule infringed — which is generally clear and foreseeable — but in determining the subject of contravention liability: the natural person (the vehicle driver), the legal person (owner, possessor, or transport operator), or both, under a cumulative regime. This difficulty is amplified by the specific nature of road traffic contraventions, which are committed, by their very nature, by a natural person (the vehicle driver), but which may be generated, facilitated, or even imposed by organizational decisions of the legal person in whose interest or within whose framework the driver acts.

The first alternative condition provided by Article 17 of the Contravention Code for engaging the contravention liability of a legal person — the commission of the act in the interest of the legal person by a natural person vested with managerial functions — raises, in the context of road traffic, an interpretive issue with direct practical consequences: what is meant by committing a road traffic contravention "in the interest of the legal person"?

In a strict and restrictive interpretation, this condition could be understood as requiring the existence of a direct and identifiable benefit to the legal person resulting from the commission of the road contravention. Thus, exceeding the legal speed limit by the driver of a vehicle belonging to a transport company could be qualified as committed in

the interest of the legal person if such excess was imposed or stimulated by the company's internal policy — for instance, by setting delivery deadlines impossible to meet under normal traffic conditions — but not if it represents an exclusively personal initiative of the driver, independent of any decision or organizational policy of the employer.

In a broader interpretation more favourable to procedural efficiency, the commission of the act in the interest of the legal person could be presumed whenever the vehicle driver acts in the exercise of his or her professional duties, regardless of whether the contravention was or was not imposed or stimulated by the employer's internal policy. This interpretation, closer to the model of vicarious liability in civil law, has the advantage of simplifying the burden of proof, but raises issues from the perspective of the culpability principle governing contravention liability, which requires that a sanction be applied exclusively to the person against whom a form of culpability — intent or negligence — can be established in relation to the act committed [11, pp. 178-185].

The Contravention Code does not explicitly resolve this interpretive dilemma, leaving courts with the task of determining, on a case-by-case basis, whether the vehicle driver's act was committed in the interest of the legal person within the meaning of Article 17. The absence of clear normative criteria in this regard generates non-uniform case law, in which different courts reach divergent conclusions in cases with similar factual circumstances, thereby undermining the principle of equality before the law and the predictability of the sanctioning system.

The second alternative condition provided by Article 17 — the admission or authorization of the act by the organ or person responsible for the management or control of the legal person — is, in the context of road traffic, even more difficult to prove in practice. This condition presupposes the existence of a volitional act by the governing body of the legal person — a decision, instruction, or directive — by which the contravention was expressly or implicitly authorized or admitted. Applied to road contraventions, this condition could be satisfied, for example, where the transport company issued internal instructions requiring drivers to adhere to transport schedules incompatible with compliance with traffic rules, or where the governing body tacitly accepted the employees' contravention practices without taking corrective measures.

The evidentiary difficulty is evident: the enforcement officer drawing up the contravention report does not ordinarily have access to the internal documents of the legal person — transport schedules, internal instructions, minutes of governing body meetings — that could prove the admission or authorization of the act. This evidentiary limitation renders the second alternative condition of Article 17 practically inapplicable at the detection stage in road traffic matters; the liability of the legal person can be engaged on this basis only during judicial proceedings, where the court may order additional evidence to be produced.

The third alternative condition — the commission of the act as a result of the lack of supervision or control by the organ or person responsible for the management or control of the legal person — is theoretically the most accessible from the perspective of engaging contravention liability of legal persons in road traffic matters, as it implies a form of organizational negligence, independent of the existence of an explicit volitional act of the governing body. Under this hypothesis, the legal person is liable not because it ordered or authorized the act, but because it failed to establish the supervision and control mechanisms necessary to prevent its commission by its employees or agents.

Applied in the field of road traffic, this condition could ground the contravention liability of transport operators who have not established adequate systems for monitor-

ing the behaviour of employed drivers — tachographs, GPS systems, periodic compliance checks — of legal-person vehicle owners who have not internally regulated the conditions of use of vehicles in their own fleet, or of transport companies that have not verified that their employees hold valid driving licences corresponding to the category of vehicles driven.

Even this condition, however, is not free from qualification difficulties. The standard of diligence required of a legal person in supervising and controlling the activity of vehicle drivers is not normatively defined, leaving courts with broad discretion in determining whether the lack of supervision attributed to the legal person reaches the threshold required for engaging contravention liability. This discretionary margin, in the absence of clear normative criteria, contributes to the non-uniformity of judicial practice and to the unpredictability of outcomes in similar cases [10, pp. 198-204].

A distinct qualification issue of particular doctrinal significance concerns the form of culpability with which a legal person commits a road contravention. The Contravention Code regulates the forms of culpability — intent and negligence — exclusively by reference to natural persons, without containing explicit provisions regarding how these forms translate to collective entities. Legal doctrine has proposed, in this regard, two distinct approaches: the identification theory, according to which the culpability of the legal person is identified with the culpability of its governing bodies, and the organizational negligence theory, according to which the culpability of the legal person is its own, distinct from the culpability of the natural persons involved, consisting in structural deficiencies of its internal organization, supervision, and control system [5, pp. 198-210]. In the context of road traffic, the organizational negligence theory appears better suited to practical reality, as it allows the engagement of a legal person's contravention liability independently of establishing the individual culpability of a specific natural person, based on the finding that the organizational deficiencies of the collective entity created conditions favourable to the commission of the contravention.

The diversity of legal roles in which a legal person may intervene in road contravention relationships necessitates a differentiated analysis of the main categories of subjects susceptible to contravention liability in this field. Moldovan judicial practice and comparative experience reveal that the most frequent and complex contentious situations from the perspective of legal qualification are concentrated around three main categories of legal persons: road transport operators, legal-person vehicle owners that do not engage in professional transport activity, and fleet managers. Each of these categories presents specific particularities regarding the conditions for engaging contravention liability, applicable sanctions, and practical difficulties in proving the constituent elements of liability.

Road transport operators — commercial companies authorized to carry out public or private road transport of passengers or goods — represent the category of legal persons most frequently involved in contravention proceedings in the field of road traffic and, at the same time, the category in respect of which the applicable normative framework is most developed, though still far from complete and coherent.

The specific nature of transport operators' activities generates a distinctive type of contravention risk: road contraventions committed systematically in the context of carrying out transport activity, by a large number of employed drivers under the coordination and supervision of the legal person. This systemic nature of contravention risk means that the operator's liability cannot be reduced to the sum of the individual liabilities of employed drivers, but requires a separate assessment of the organizational negligence of the collective entity — the manner in which it organized its operations, the supervision

and control systems it established, and the preventive measures it adopted to reduce contravention risk [2, pp. 17-19].

The most frequent contentious situations in judicial practice regarding transport operators concern, first, contraventions related to drivers' working time and rest periods. Non-compliance with driving time and rest requirements prescribed by applicable national and European regulations — in particular Regulation (EC) No.561/2006 for international transport — generates contraventions attributable both to the vehicle driver and to the transport operator who imposed or tolerated non-compliance with these rules. The legal qualification of such acts raises the distinct issue of delineating the natural person's liability (the driver who exceeded the permitted driving time) from the legal person's liability (the operator who organized transport activity under conditions incompatible with compliance with working time rules). The Contravention Code does not contain explicit provisions regulating this delineation, leaving courts to make it on a case-by-case basis in light of the evidence produced [2, pp. 15-17].

A second frequent category of contentious situations concerns contraventions related to the technical condition of vehicles. Operating vehicles with technical defects in the braking system, steering mechanism, or lighting and signalling devices — acts sanctioned under Article 228 of the Contravention Code — may be attributed both to the vehicle driver, who agreed to drive a vehicle with visible technical defects, and to the transport operator, who failed to ensure that periodic technical inspections were carried out and that the vehicle was maintained in proper working condition. Engaging the transport operator's liability for this category of contraventions requires proof that the technical defects identified pre-existed the vehicle's departure and that the operator failed to remedy them, with or without the driver's knowledge — proof that is, in practice, difficult to obtain and largely dependent on the vehicle's technical documentation (maintenance records, technical inspection reports) to which enforcement officers have no direct access at the time of detecting the contravention.

A third frequent and legally complex contentious situation concerns the overloading of freight vehicles. Exceeding the maximum authorized total weight or the maximum axle load — contraventions provided for in specific road transport regulations — involves, by its very nature, an organizational decision of the transport operator or cargo sender, not merely an individual act of the vehicle driver. Nevertheless, in Moldovan contravention practice, sanctions are applied predominantly to the vehicle driver as an identifiable natural person at the time of detection, without the transport operator's liability being systematically investigated and engaged. This non-uniform administrative practice reflects both the instrumental limitations of enforcement officers in investigating legal-person liability at the scene of detection and the absence of clear procedures for referring the matter to competent authorities to engage the operator's liability in cases where the contravention evidently involves an organizational decision on the part of the operator.

A distinct and, from the perspective of legal qualification, less regulated category consists of legal persons that own vehicles in their assets without engaging in professional transport activity — commercial companies with production or trade profiles using vehicles for supply, delivery, or personnel transport activities; educational institutions; non-governmental organizations; and others. For these legal persons, vehicles are driven by employees who are not professional drivers and over whom the legal-person owner exercises less formalized control than in the case of professional road transport.

The most frequent contentious situation in this category concerns contraventions committed by employees during business trips. The vehicle driver — the legal person's

employee — commits a road contravention while on a trip undertaken in the exercise of professional duties, using a vehicle belonging to the employer. The legal qualification of this situation raises the question of whether the act was committed in the interest of the legal person within the meaning of Article 17 of the Contravention Code and, consequently, whether the legal person's contravention liability may be engaged in parallel with the driver's liability.

The answer to this question is not uniform in Moldovan judicial practice. Some courts have held that the mere fact that the journey was undertaken for business purposes is sufficient to conclude that the act was committed in the interest of the legal person, thereby engaging the latter's liability. Other courts have adopted a more restrictive position, requiring proof that the legal person directly benefited from the contravention or that it contributed to creating conditions favourable to its commission. This jurisprudential divergence, generated by the absence of clear normative criteria, directly affects the predictability of the contravention system and the equal treatment of legal persons in similar legal situations.

A distinct and increasingly frequent contentious situation in recent practice concerns the use of legal-person vehicles for personal purposes by employees or managers outside working hours and without the employer's explicit consent. In such cases, the legal qualification of the legal person's liability is even more challenging: the vehicle belongs to the legal person but is used outside its activity, without the knowledge or approval of its governing bodies. Engaging the legal person's contravention liability in this scenario would presuppose proof that the lack of supervision and control allowed the unauthorized use of the vehicle — a considerable evidentiary burden that, in practice, generally results in the exclusive sanctioning of the vehicle driver as a natural person.

A third category of subjects, less discussed in Moldovan doctrine but relevant from the perspective of contravention practice, consists of legal persons managing vehicle fleets within complex organizational structures: corporate groups, holdings, and public institutions with their own vehicle fleets. In these structures, vehicles may be owned by one legal entity (the parent company or a subsidiary specialized in fleet management) but used in the operations of other distinct legal entities (operational subsidiaries, branches, or contractual partners). This separation between vehicle ownership and operational use generates significant legal uncertainties as to the subject of contravention liability: is it the legal person owning the vehicle, the legal person using it, or both? The Contravention Code does not contain explicit provisions regulating this situation, and the mechanism established by Article 16^1 — owner liability for failure to communicate the identity of the driver — does not satisfactorily resolve the issue, as it targets only the identification of the vehicle driver as a natural person, not the delineation of liability among multiple legal persons involved in the use of the same vehicle. This normative gap means that, in practice, contravention liability in these complex organizational structures is engaged arbitrarily, depending on the specific circumstances of detection and the investigative diligence of the enforcement officer, rather than accurately reflecting the actual distribution of organizational responsibility among the entities involved.

The analysis of the normative framework and of frequent contentious situations reveals that the qualification difficulties identified in the preceding sections are directly reflected in the practice of applying contravention liability to legal persons in the field of road traffic, generating procedural dysfunctions with concrete consequences for the effectiveness of the sanctioning system and for the rights of sanctioned legal persons.

The first practical difficulty concerns the individualization of the sanction against

the legal person. The Contravention Code establishes, through Article 41, the general criteria for individualizing the contravention sanction: the gravity of the act, the circumstances of its commission, the personality of the offender, and the offender's financial situation [3]. However, these criteria were conceived primarily by reference to natural persons and translate with difficulty to collective entities. The concept of the "personality of the offender" has no direct counterpart in the case of a legal person, and the "financial situation" of the legal person — which should determine the amount of the fine to ensure a genuinely dissuasive effect — is not systematically verified by enforcement officers at the time of imposing the sanction. The practical consequence is that contravention fines applied to legal persons are generally set at fixed levels or close to the minimum prescribed by the relevant rule, without genuine individualization based on the economic capacity of the sanctioned entity, significantly diminishing their preventive effect in respect of legally persons with high financial capacity.

The second practical difficulty concerns the cumulation of the legal person's liability with the natural person's liability for the same contravention. Although Article 17 of the Contravention Code does not explicitly exclude the possibility of simultaneously sanctioning the legal person and the natural person involved, the absence of express regulation of this cumulation generates divergent practices: some enforcement officers sanction only the vehicle driver as a natural person; others sanction only the legal person; and others apply sanctions to both categories of subjects. This non-uniformity undermines the principle of equality before the law and causes the level of protection of the social values safeguarded by road contravention rules to vary depending on the individual practice of the enforcement officer rather than on the provisions of law [1, pp. 112-118].

The third practical difficulty concerns the enforcement of contravention sanctions imposed on legal persons. A contravention fine applied to a legal person is, from the enforcement perspective, significantly more complex than one applied to a natural person, requiring the identification of the legal person's assets subject to enforcement, compliance with the specific enforcement procedure applicable to commercial entities, and the handling of situations in which the legal person is in insolvency or liquidation proceedings at the time of enforcement. The Contravention Code does not contain special provisions regarding the enforcement of sanctions against financially distressed legal persons, leaving such situations to be governed by reference to the general rules of enforcement law, whose application in the contravention context is not always clear and predictable.

From a comparative law perspective, the Romanian and French experience offers relevant solutions for remedying these practical difficulties. In Romania, Government Ordinance No.2/2001 on the legal regime of contraventions — although predating the Moldovan Contravention Code — contains more detailed provisions regarding the individualization of sanctions against legal persons, requiring that the entity's turnover be taken into account [6, pp. 7-9] when setting the fine amount, thereby ensuring a genuinely dissuasive effect regardless of the economic size of the legal person. In France, the Transport Code contains express provisions on the joint liability of the transport operator for fines imposed on employed drivers for contraventions committed in the course of transport activity — a solution that eliminates qualification uncertainties regarding the subject of liability and significantly simplifies the procedure for engaging the legal person's liability in road traffic matters.

In light of these comparative experiences and the dysfunctions identified in the analysis of the Moldovan normative framework, the following ***de lege ferenda proposals*** are warranted:

1. First, the amendment of Article 17 of the Contravention Code with clear normative criteria specifying the conditions under which the act of the vehicle driver is presumed to have been committed in the interest of the employing legal person, thereby eliminating the main source of jurisprudential divergence in this field.

2. Second, the introduction of an express provision regulating the cumulation of the legal person's contravention liability with the vehicle driver's liability as a natural person, establishing the conditions and limits of this cumulation and eliminating the current non-uniform practice.

3. Third, the supplementation of the individualization criteria set forth in Article 41 of the Contravention Code with explicit references to the economic capacity of the sanctioned legal person, measured by objective indicators such as turnover or share capital, in order to ensure a genuinely dissuasive effect of the contravention fine regardless of the economic size of the sanctioned entity.

4. Fourth, the express regulation of the enforcement procedure for contravention sanctions against legal persons in insolvency or liquidation proceedings, eliminating the current normative voids that allow, in practice, evasion of the enforcement of sanctions through the legal restructuring of the sanctioned entity.

Conclusions. The research undertaken in this study has demonstrated that the contravention liability of legal persons in the field of road traffic represents, in current Moldovan law, a legal institution characterized by a significant gap between the high frequency of legal persons' involvement in road contravention relationships and the low level of normative maturity of the legal framework governing the engagement, qualification, and application of this form of liability.

The analysis of the general normative framework established by Article 17 of the Contravention Code has revealed that the alternative conditions of legal-person liability are formulated at a level of generality that renders them difficult to apply to the specific concrete situations of road traffic, in the absence of additional normative criteria to guide their uniform interpretation by enforcement officers and courts. This normative inadequacy is directly reflected in the diversity and complexity of contentious situations identified in judicial practice, generating divergent outcomes in cases with similar factual circumstances and thereby undermining the principles of equality before the law and predictability of the sanctioning system.

The practical difficulties of application — the inadequate individualization of the sanction relative to the legal person's actual economic capacity, the absence of clear regulations on the cumulation of legal-person liability with that of the natural person, and the insufficiency of the normative framework on the enforcement of sanctions — cannot be remedied through judicial interpretation or non-uniform administrative practice, but require express legislative interventions at the level of the Contravention Code. The comparative experience of Romania and France demonstrates that a clear and coherent normative framework in this field not only simplifies the procedure for engaging legal-person liability but effectively contributes to reducing the frequency of road contraventions committed in the context of collective entities' activities.

The *de lege ferenda proposals formulated in this study* — the amendment of Article 17 with clear normative criteria, the express regulation of the cumulation of liability, the adaptation of individualization criteria to the specific nature of collective entities, and the completion of the framework on the enforcement of sanctions against financially distressed legal persons — constitute necessary and urgent interventions, the implementation of which would significantly consolidate the effectiveness, predictability, and legiti-

macy of the Moldovan contravention system in the field of road traffic.

ELECTRONIC MONITORING IN COMBATING DOMESTIC VIOLENCE: COMPARATIVE ANALYSIS ROMANIA AND THE REPUBLIC OF MOLDOVA THROUGH THE LENS OF ECTHR CASE LAW

Iulian MAXIM,
Academic Year Coordinator,
"Alexandru Ioan Cuza" Police Academy, Bucharest,
Romania
ORCID: 0009-0003-4237-8300

Abstract

This article examines the impact and effectiveness of electronic monitoring systems for offenders, especially GPS ankle bracelets, as modern tools for the protection of victims of domestic violence. The study starts from the premise that traditional mechanisms of protection, such as paper-based protection orders, have often proved insufficient in situations involving high-risk offenders. The analysis highlights the evolution of the legal framework in Romania and the Republic of Moldova, the role of the European Court of Human Rights in strengthening the positive obligations of states, and the relevance of contemporary criminal-law doctrine in grounding a proportional and effective intervention.

The paper also integrates an economic perspective on the cost-benefit ratio of electronic monitoring and argues that the use of technology in criminal justice can generate real preventive effects by reducing recidivism and increasing the capacity of authorities to intervene rapidly. The central conclusion is that electronic monitoring should no longer be regarded as a mere technical instrument, but as an essential component of the effective protection of victims of domestic violence in a modern state governed by the rule of law.

Keywords: electronic monitoring, domestic violence, GPS ankle bracelet, ECHR, protection order, criminal prevention.

MONITORIZAREA ELECTRONICĂ ÎN COMBATEREA VIOLENȚEI DOMESTICE: ANALIZA COMPARATIVĂ ROMÂNIA ȘI REPUBLICA MOLDOVA PRIN PRISMA JURISTPRUDENȚEI CEDO

Abstract

Prezentul articol analizează impactul și eficiența sistemelor de monitorizare electronică a agresorilor, în special a brățărilor GPS, ca instrumente moderne de protecție a victimelor violenței domestice. Studiul pornește de la premisa că formele clasice de protecție, precum ordinul de protecție pe suport de hârtie, s-au dovedit adesea insuficiente în fața unor agresori cu grad ridicat de periculozitate. Analiza evidențiază evoluția cadrului legislativ din România și Republica Moldova, rolul jurisprudenței Curții Europene a Drepturilor Omului în consolidarea obligațiilor pozitive ale statelor și relevanța doctrinei penale contemporane pentru fundamentarea unei intervenții proporționale și eficiente.

Lucrarea integrează, de asemenea, o perspectivă economică privind raportul cost-beneficiu al monitorizării electronice și arată că utilizarea tehnologiei în domeniul justiției penale poate produce efecte preventive reale, reducând riscul recidivei și sporind capacitatea autorităților de a interveni rapid. Concluzia centrală este că monitorizarea electronică nu mai poate fi privită ca un simplu instrument tehnic, ci ca o componentă esențială a protecției efective a victimelor violenței domestice într-un stat de drept modern.

Cuvinte-cheie: monitorizare electronica, violență domestică, brățară GPS, CEDO, ordin de protective, prevenție penală.

Introduction. Domestic violence is one of the most complex and insidious forms of criminality because it occurs in a space that should normally be associated with safety, protection, and relational stability: the home. Precisely because the conduct takes place within the sphere of private life, the state was, for a long period, reluctant to intervene decisively, often under an overly broad understanding of family autonomy. The development of international human-rights law has shown, however, that the private character of family relations cannot justify institutional passivity in the face of repeated physical, psychological, or economic abuse.

Over the past two decades, the case law of the European Court of Human Rights has imposed a clear positive obligation on states: they may not confine themselves to the formal recognition of rights and protective measures, but must establish effective mechanisms capable of preventing aggression and protecting vulnerable persons [1]. Within this new conceptual framework, the electronic monitoring of offenders appears as an expression of the transformation of criminal justice from a predominantly reactive system into one oriented toward prevention and early intervention.

The methodology of this research is based on doctrinal, jurisprudential, and comparative analysis of the normative framework in Romania and the Republic of Moldova, correlated with observations on the economic sustainability of electronic monitoring. The working hypothesis is that the actual effectiveness of protection orders and preventive measures depends directly on the existence of technical instruments capable of verifying compliance in real time.

Discussions and results obtained. I. ECHR Standards: From Passivity to Enhanced Diligence. The European Court of Human Rights has played a decisive role in redefining the responsibility of states in cases of domestic violence. From the Convention perspective, protection against inhuman or degrading treatment and the safeguarding of private and family life involve not only negative obligations but also positive obligations, meaning that the state must adopt effective operational measures whenever the authorities know, or ought to know, that there is a real and immediate risk to the victim.

In *Bălșan v. Romania* [2], the Court found that the national authorities had minimized the seriousness of domestic violence and treated the acts as mere family conflicts. Such an approach was found incompatible with the requirements of the Convention because it emptied state protection of its practical content. Beyond the particular facts, the judgment sends a principled message: the lack of a prompt, coherent, and firm response by the authorities may amount to a form of institutional tolerance of violence.

In *T.M. and C.M. v. the Republic of Moldova* [3], the Court emphasized that the mere issuance of a protection order is not enough if the state lacks real mechanisms to secure its enforcement. In that case, the orders were repeatedly breached, while the authorities' response proved ineffective. The judgment is highly relevant for the present topic because it shows clearly that formal protection, unaccompanied by effective means of control, may remain purely theoretical.

Accordingly, the European standard is not limited to the existence of an adequate legal framework. It requires enhanced diligence in the execution of protective measures. It is precisely within this sphere of practical effectiveness that electronic monitoring operates, turning the abstract duty of protection into a concrete mechanism of verification, alert, and intervention.

II. Doctrinal Foundations and the Criminal-Law Justification of the Measure. In contemporary criminal-law doctrine, the legitimacy of preventive measures is assessed by reference to three fundamental requirements: legality, necessity, and proportionali-

ty. Professor Alexandru Boroi [4] emphasizes that restrictive procedural measures must serve a legitimate purpose, be adequate to the concrete risk, and not exceed what is necessary to prevent new antisocial acts. Applied to domestic violence, this perspective allows electronic monitoring to be understood as an instrument of judicial individualization and special prevention.

Electronic monitoring does not, in itself, amount to a custodial sanction, yet it produces a heightened legal control over the offender's conduct. For this reason, its justification must derive from the existence of a real risk of repeated violence, a history of breaching protection orders, or the seriousness of the threats made. In such situations, the use of an electronic device appears less intrusive than detention, but significantly more effective than a purely formal warning.

From a psychological and criminological standpoint, real-time supervision also has a deterrent effect. Awareness that any approach toward the victim can be detected instantly reduces impulsivity and limits the offender's sense of impunity. In this way, electronic monitoring becomes a tool located at the intersection of technology, prevention, and the effective protection of fundamental rights.

III. Comparative Analysis: Romania and the Republic Of Moldova. In Romania, Law No.146/2021 on Electronic Monitoring established the Electronic Monitoring Information System (SIME – Sistemul Informațional de Monitorizare Electronică) [6], conceived as a technical and institutional framework that allows authorities to supervise compliance with certain measures imposed by judicial bodies. In the field of protection against domestic violence, the essential merit of the system lies in its functional link with operative intervention mechanisms, including the national emergency service 112, which gives practical value to alerts generated by the devices.

The Romanian model has the advantage of an architecture centered on rapid response and institutional coordination. When the offender enters the prohibited perimeter or breaches other obligations set by the court, the system may generate an alert that enables the immediate dispatch of a police unit. From this perspective, the ankle bracelet is not merely a surveillance device, but also an evidentiary instrument, because location data and time intervals can confirm the breach of the imposed measure.

In the Republic of Moldova, electronic monitoring is more closely integrated into probation and judicial supervision. The emphasis lies not only on rapid intervention, but also on the continuous control of compliance with the obligations imposed on the monitored person. This model highlights the role of probation services in risk management and in building a form of supervision oriented toward preventing recidivism.

Comparatively, both systems pursue the same criminal-policy objective: transforming the protection order from a legal act with uncertain effectiveness into a genuinely enforceable instrument. The institutional differences do not alter this common purpose, but rather illustrate two complementary ways of responding to the same demand imposed by European case law: the effective, and not merely declaratory, protection of the victim.

IV. Economic Costs and Social Benefits. The debate on electronic monitoring cannot be confined to strictly legal considerations, because the sustainability of a public policy also depends on its cost-benefit ratio. In general, the daily cost of an electronic monitoring kit is lower than the daily cost of detention. Even though initial implementation requires logistical, technological, and institutional investment, maintaining the system is, in the medium and long term, less burdensome than maintaining an exclusively punitive policy.

More importantly, domestic violence generates considerable indirect costs: emer-

gency medical interventions, social-assistance services, police and prosecutorial work, repeated judicial proceedings, loss of productivity, and long-term effects on the physical and mental health of victims and child witnesses. From this perspective, electronic monitoring should not be assessed solely in terms of the cost of the device itself, but also in terms of the costs it helps avoid.

By preventing the offender from approaching the victim and by enabling rapid intervention before a new assault occurs, the state reduces not only human risk but also financial pressure on the health, judicial, and social systems. Thus, the use of technology appears both legally justified and economically rational, with social effects that go beyond the narrow sphere of criminal procedure.

V. Case Study: Preventing Assault in Real Time. A hypothetical example, built on the logic of recent judicial practice, clearly illustrates the usefulness of the system. Let us assume a preventive measure under which the defendant is prohibited from approaching the victim's home within a radius of 500 meters. Under a traditional system, the effectiveness of such an obligation depends almost entirely on the later reporting of the breach and the speed of the police response.

With electronic monitoring in place, however, the violation of the perimeter immediately triggers an alert to the dispatch center. The victim may be informed in time to secure herself, while the intervention team can be directed on the basis of GPS data provided by the system. The essential result lies in shifting the moment of state reaction: intervention occurs before the assault is committed, not after it has already happened.

The importance of this mechanism also lies in its evidentiary value. The technical data produced by the system make it possible to document the breach objectively and reduce the evidentiary difficulties specific to domestic-violence cases, where the parties' statements are often contradictory. For this reason, electronic monitoring functions simultaneously as a means of prevention and as an instrument that strengthens procedural effectiveness.

Conclusions. Domestic violence remains one of the most persistent and complex challenges faced by contemporary legal systems, because it unfolds within a sphere traditionally perceived as private, yet one that may in reality become a space of vulnerability and abuse. The evolution of European criminal law demonstrates that the effective protection of victims can no longer be achieved solely through traditional legal mechanisms; it requires the integration of technological instruments capable of ensuring rapid intervention and the prevention of violent acts.

In this context, the electronic monitoring of offenders emerges as an essential instrument of modern criminal policy, situated at the intersection of the protection of fundamental rights and the necessity of crime prevention. The analysis of the legal frameworks in Romania and the Republic of Moldova reveals a clear trend toward strengthening technological supervision mechanisms in response to the standards imposed by the European Court of Human Rights concerning the positive obligations of states in the prevention of domestic violence.

By means of electronic monitoring systems, preventive measures acquire real effectiveness and move beyond the formal limits of traditional protection orders. Real-time supervision allows the immediate detection of breaches and facilitates the prompt intervention of the authorities, significantly reducing the risk of further violence. At the same time, this form of legal control strikes a balance between the monitored person's freedom of movement and the victim's fundamental right to life, security, and physical integrity.

From an economic and social perspective, electronic monitoring proves to be not

only an efficient solution, but also a sustainable one. Lower costs in comparison with detention and the positive impact on the prevention of recidivism show that the use of technology in criminal justice can contribute to the optimization of state resources and to a higher overall level of social safety.

In conclusion, the integration of technology into criminal-prevention mechanisms marks a fundamental stage in the modernization of the justice system. Electronic monitoring should not be viewed as a mere technological innovation, but as the expression of a new understanding of the role of the state in protecting vulnerable persons. In a society where human dignity and physical integrity are core values of the rule of law, the use of electronic monitoring can no longer be regarded as a simple technological option, but as a necessary expression of the state's responsibility to prevent violence and to guarantee the real security of vulnerable persons.

THE RIGHT TO PRIVACY IN CONFORMITY WITH THE APPLICATION OF THE RIGHT TO INTEGRITY FROM THE POINT OF VIEW OF PREVENTING AND FIGHTING CORRUPTION

Daniel CRISTEA,
PhD, Chief Police Commissioner,
Criminal Investigation Office, Buzau County Police Inspectorate,
Romania
ORCID: 0000-0002-5786-2619

Abstract

The right to privacy and the right to integrity are two essential components of the protection of the person in a state governed by the rule of law, and their interaction becomes particularly relevant in the context of preventing and combating corruption. On the one hand, anti-corruption measures often involve interference in the sphere of private life – such as technical surveillance, asset verification, and access to financial data or monitoring conflicts of interest – interferences that must respect the principles of legality, necessity and proportionality. On the other hand, the right to integrity, in its moral and professional dimension, underpins the standards of conduct of public officials and supports institutional mechanisms of ethics, transparency and accountability. The relationship between the two rights is not a conflictual one, but complementary: protecting public integrity justifies certain limitations on private life, while respecting privacy guarantees the legitimacy and balance of anti-corruption measures.

The analysis demonstrates that the effectiveness of anti-corruption policies depends on the state's ability to harmonize these rights through clear regulations, judicial control and adequate procedural guarantees, thus maintaining the balance between the public interest and the protection of individual freedoms.

Keywords: privacy, integrity, criminal trial, corruption, technical surveillance, proportionality, human rights.

DREPTUL LA VIAȚA PRIVATĂ ÎN CONCORDANȚĂ CU APLICAREA DREPTULUI LA INTEGRITATE DIN PUNCT DE VEDERE AL PREVENIRII ȘI COMBATERII CORUPȚIEI

Abstract

Dreptul la viață privată și dreptul la integritate reprezintă două componente esențiale ale protecției persoanei într-un stat de drept, iar interacțiunea lor devine deosebit de relevantă în contextul prevenirii și combaterii corupției. Pe de o parte, măsurile anticorupție presupun adesea ingerințe în sfera vieții private — precum supravegherea tehnică, verificarea averilor, accesul la date financiare sau monitorizarea conflictelor de interese — ingerințe care trebuie să respecte principiile legalității, necesității și proporționalității. Pe de altă parte, dreptul la integritate, în dimensiunea sa morală și profesională, fundamentează standardele de conduită ale funcționarilor publici și susține mecanismele instituționale de etică, transparență și responsabilitate. Relația dintre cele două drepturi nu este una conflictuală, ci complementară: protejarea integrității publice justifică anumite limitări ale vieții private, în timp ce respectarea vieții private garantează legitimitatea și echilibrul măsurilor anticorupție.

Analiza demonstrează că eficiența politicilor anticorupție depinde de capacitatea statului de a armoniza aceste drepturi prin reglementări clare, control judecătoresc și garanții procedurale adecvate, menținând astfel echilibrul dintre interesul public și protecția libertăților individuale.

Cuvinte-cheie: viața privată, integritatea, proces penal, corupție, supraveghere tehnică, proporționalitate, drepturile omului.

Introduction. In the architecture of the rule of law, the protection of privacy and the integrity of the person constitute fundamental limits to the coercive power of the state. In criminal procedure, these limits are constantly put to the test, especially in the investigation of corruption offences, where the methods of proof often involve significant intrusions into the private sphere of individuals. The balance between the public interest in combating corruption and the need to protect fundamental rights thus becomes an exercise in legal finesse.

In this way, the protection of privacy and the integrity of the person constitute a hard core of fundamental rights, being the expression of human dignity and the limits that the state cannot exceed in the exercise of its coercive authority. In criminal proceedings, even if these rights are subject to limitations justified by the public interest in finding the truth, any interference must nevertheless respect the principles of legality, necessity and proportionality.

In the investigation of corruption offences, the tension between efficiency and the protection of fundamental rights becomes acute. Corruption is a crime par excellence hidden, committed in closed environments, between people who cooperate voluntarily. Therefore, judicial bodies frequently resort to special surveillance techniques, which can deeply affect the privacy and psychological integrity of the person concerned.

This study aimed to analyze, in a doctrinal and comparative manner, the way in which the right to privacy and the right to integrity must be protected in the application of criminal procedural norms, especially in the context of preventing and combating corruption.

Methods and materials applied. The analysis of the interference between the right to privacy, the right to integrity and the application of criminal procedural norms in the context of preventing and combating corruption required a complex, interdisciplinary methodological approach deeply anchored in European standards. Since the study involved both legal and psychological, institutional and comparative dimensions, the methodology used had to reflect this plurality. In this study, the methods and materials applied were structured in such a way as to allow a rigorous assessment of procedural interferences, necessary guarantees and associated risks, in accordance with the requirements of the rule of law and European case law.

The research methods included: the analytical method of legislation, which allowed the identification of the legal limits of procedural interferences and procedural guarantees necessary to protect the privacy and integrity of the person; the jurisprudential method, essential for understanding the applicable European standards; the systemic, analytically critical method, including the analytical methods applied (risk, proportionality and systemic).

Discussions and results obtained. The right to privacy is enshrined in Art. 26 of the Constitution of Romania and Art. 8 of the ECHR, and Art. 28 of the Constitution of the Republic of Moldova. The right to physical and mental integrity is guaranteed by Art. 22 of the Constitution of Romania, Art. 24 Constitution of the Republic of Moldova, and Art. 3 of the ECHR. In criminal proceedings, these rights are reflected in the provisions of the CPC of Romania and the Republic of Moldova regarding technical surveillance, searches, interceptions and other intrusive methods.

The ECHR has established that interferences with privacy must be "prescribed by law", pursue a legitimate aim and be "necessary in a democratic society" [1, & 9 et seq.].

Corruption offences are by their nature difficult to prove. They take place in opaque environments, between persons who have an interest in concealing criminal activity.

Therefore, criminal procedural legislation allows the use of special surveillance techniques, such as interceptions of communications, environmental recordings or controlled deliveries.

However, these methods represent major interferences in private life, and their application must respect the principles of:

- *Proportionality* – the measure must be appropriate to the gravity of the act;
- *Subsidiarity* – to be used only if other less intrusive methods are insufficient;
- *Effective judicial review* – the authorization must be motivated and verifiable.

E.g., taken from the following table:

Principle	**Content**	**Relevance in anti-corruption**
Legality	The measure must be provided for by law	Avoids arbitrariness
Proportionality	The interference must be appropriate to the purpose	Limited interceptions
Subsidiarity	Other less intrusive methods must be exhausted	Avoids excessive surveillance
Judicial control	Reasoned authorization	Prevents abuses

The ECtHR's case law has penalised states in cases such as: *Kruslin v. France and Huvig v. France*, for the lack of clear guarantees regarding interceptions [2, & 21]; *Roman Zakharov v. Russia*, in which the Court criticised generalised surveillance systems [3, & 165/37]; *Teixeira de Castro v. Portugal*, in which the Court set limits on the use of undercover investigators [4, & 110].

However, criminal procedural rules represent the legal framework through which the state exercises its prerogative to investigate and punish criminal acts. In this context, interferences with private life and the integrity of the person are inevitable, but they must be strictly delimited, justified and controlled. The Criminal Procedure Code (CPC) regulates a series of intrusive measures — interceptions, technical surveillance, searches, seizure of objects, obtaining financial data, use of undercover investigators — which can profoundly affect the fundamental rights of the individual. These measures are permitted only under the conditions of compliance with the principles of legality, necessity, subsidiarity and proportionality, principles enshrined both in domestic law and in the case law of the European Court of Human Rights (ECtHR).

The interception of communications is one of the most intrusive procedural measures, because it penetrates the intimate sphere of the person, affecting not only private life, but also freedom of expression, personal autonomy and psychological integrity.

Even though Art. 139 of the Romanian Criminal Code provides that interceptions may be ordered only if there is reasonable suspicion of the commission of a serious crime, the measure is proportional to the restriction of rights, other less intrusive methods have been exhausted and there is reasoned judicial authorization, in the matter of corruption interceptions are frequently used, and the risks are considerable. In this regard, we exemplify risks such as excessive extension of the duration of surveillance, interception of conversations without criminal relevance, damage to the reputation of the person concerned, even leaks of information to the press.

The ECtHR sanctioned the lack of guarantees in the cases of *Kruslin and Huvig v.*

France, underlining the need for clear and predictable rules [2, & 21].

Home search represents a profound interference in private life, affecting not only the physical space, but also the person's sense of psychological security. Art. 157-171 of the Romanian Criminal Procedure Code regulates the conditions under which searches can be carried out.

In addition to home search, computer search allows access to personal data, communication history, private documents, and body search outlines the interference in private life, as it directly affects physical integrity.

From this point of view, interference in private life is materialized due to the risks produced in the context of anti-corruption. In this regard, we mention them through excessive media coverage of searches; damage to professional reputation; psychological pressure on the person under investigation; the possibility of abuses in the absence of rigorous judicial control.

In terms of investigative activities, corruption crimes often involve hidden financial flows, which is why judicial bodies frequently request bank data, transactions, account statements or information on assets.

Art. 153 of the Romanian Criminal Procedure Code (CPC ROM) allow the prosecutor to request data on suspicious operations from financial institutions, with the authorization of the judge of rights and freedoms. Information obtained legally as a counterweight in the fight against crime has a significant impact on private life, as it reveals the personal habits of the persons concerned and not only, family relationships, health status (through payments to clinics), religious or political orientations (through donations), etc.

Even if these tools are essential in investigating corruption, they involve major risks for the psychological integrity of the person concerned, therefore the measures must be applied with maximum caution.

The interest not often in establishing and proving criminal activity creates a personal state in the balance of legality. For example, the ECtHR case *Teixeira de Castro v. Portugal*, in which the Court established that investigators cannot provoke a person to commit a crime [4, &110], an essential aspect related to legality. In this regard, Art. 148 CPC ROM provides that the undercover investigator may participate in criminal activities only within the limits of authorization, we say in order not to give the possibility and thus restrict abuses.

Thus, in investigating corruption crimes, judicial bodies frequently use intrusive measures, such as wiretapping, technical surveillance, computer searches or the use of undercover investigators. These measures, although necessary for the discovery of facts committed in secret, can and do simultaneously affect the privacy and psychological integrity of the person concerned.

The interference between the two rights is not accidental, but structural: any interference in privacy inevitably has an impact on psychological integrity, and the psychological pressure exerted on the person can transform a legal measure into an institutional abuse.

Psychological integrity is particularly vulnerable in the context of anti-corruption, due to the fact that:

- Technical surveillance is often prolonged;
- Wiretapping can capture intimate, family or professional conversations;
- Searches are excessively publicized;
- Information leaks affect the person's reputation;
- Psychological pressure during hearings can be intense.

Technical surveillance thus produces a self-censorship effect, affecting freedom of expression and personal autonomy. The person being monitored may develop anxiety, a sense of insecurity, deterioration of social relationships, damage to professional reputation, etc. As author Daniel Cristea [5, p.135] opined about such measures, the mere suspicion of surveillance has created an opaque state among the population, namely the right to express oneself through technical means (telephones) is altered due to the restraints, producing an interference in the freedom to communicate freely.

The ECtHR has also recognized these effects. For example, in the case of *Roman Zakharov v. Russia*, the Court emphasized that secret surveillance has a psychological impact even when the person is not aware of its existence [3].

In Romania, in most cases the investigation of corruption cases is often accompanied by intense media coverage. Although transparency is necessary in a democratic state, there are leaks of information from criminal files, which affect the presumption of innocence, the most important in establishing the truth until the final solution. Of course, professional reputation, family life, and psychological integrity are also affected in this segment of interference with private life. Of course, the effects are multiple and lead to other forms that affect private life, not only of the person in question, but also of others, which are produced by psychological pressure on the person and the family, thus affecting the professional career, causing irreversible damage even in the event of acquittal.

The European Court of Human Rights has sanctioned such practices. For example, in the case of *Bédat v. Switzerland*, the Court emphasized that the disclosure of information from files can affect the fairness of the procedure and the dignity of the person [6, & 51 et seq.].

Searches, especially home and computer searches, represent as we have specified above, profound interferences in private life. They can affect the dignity of the person through intrusion into personal space, exposure of intimate objects, access to sensitive data, excessive media coverage.

In this sense, the search can generate acute stress, feelings of humiliation, fear, including loss of trust in institutions.

Regarding the undercover investigator, the use of this category is essential in investigating corruption, but it involves major risks for the psychological integrity of the person concerned, such as the possibility of incitement to commit a crime or manipulating his behavior, inducing intense psychological pressure, etc.

For example, the ECtHR case *Teixeira de Castro v. Portugal*, in which the Court established that incitement to commit a crime is incompatible with the right to a fair trial [4, & 110].

Example regarding the status of these measures in the following table:

Procedural measure	**Infringement of privacy**	**Infringement of mental integrity**	**Specific risks**	**Observations**
Interceptions	Very high	High	Self-censorship, anxiety	Requires strict control
Technical surveillance	High	High	Psychological pressure	Duration must be limited
Searches	High	Medium	Humiliation, stress	Avoidance of media coverage

Undercover investigator	Medium	Very high	Manipulation, provocation	Judicial control
Leaks of information	High	Very high	Stigmatization	Disciplinary sanctions

With regard to European law, the principles of proportionality and necessity are the fundamental pillars limiting state interference in private life and the integrity of the person. The criteria of Art. 8 ECHR, provided for by law, pursues a legitimate aim and is necessary in a democratic society, are rigorously applied in the case law of the European Court of Human Rights (ECHR), in particular in cases concerning technical surveillance, wiretapping, searches and the use of undercover investigators.

In the context of preventing and combating corruption, where interferences are frequent and often extensive, the proportionality test becomes essential to prevent institutional abuses.

However, to assess the proportionality of interferences, the ECHR has developed a three-part test, regarding the necessity of the interference, in which states must demonstrate that the interference is indispensable for achieving the legitimate aim. In the matter of corruption, this presupposes the existence of a reasonable suspicion, the impossibility of using less intrusive methods and the occult nature of the act. In addition to this interference, this measure must be appropriate and not go beyond what is necessary. E.g. the ECtHR sanctioned excessive measures in the cases of *Kruslin and Huvig v. France*, where the interceptions were devoid of procedural guarantees [2, & 21]. Also the verification of procedural guarantees, in which the Court verifies whether there is effective judicial review, temporal limitation, detailed reasoning, the possibility of challenging the measure.

E.g.:

– The case of *Roman Zakharov v. Russia*, the Court established that surveillance systems must contain clear guarantees against abuse, including clear criteria for authorization, independent control, subsequent notification of the individual, where possible, destruction of irrelevant data. [3, & 229, 231]

– The case of *Big Brother Watch v. the United Kingdom*, the Court emphasized that mass surveillance is incompatible with art. 8 ECHR if there are no clear criteria for data selection, judicial review, guarantees against arbitrary access [7].

– *Digital Rights Ireland Ltd* case, the CJEU invalidated the Data Retention Directive, considering that the interference was disproportionate, there were no sufficient guarantees, the data were retained regardless of the existence of a suspicion [8, & 51 et seq.].

– *Tele2 Sverige AB* case, the CJEU established that access to traffic data must be limited to serious crimes, subject to prior authorization, proportionate to the purpose pursued [9, &113-119, 125].

In conclusion, Romania and the Republic of Moldova must continue to harmonize their legislation and judicial practice with the case law of the ECtHR and the CJEU, in order to prevent abuses and to ensure a genuine balance between the efficiency of the fight against corruption and the protection of human dignity.

The application of criminal procedural rules in the investigation of corruption offences involves a delicate balance between two apparently contradictory imperatives:

• The efficiency of the criminal prosecution, necessary for the discovery of acts committed in secret;

• Protection of fundamental rights, especially privacy and psychological integrity.

This balance is not only a moral requirement, but a legal obligation derived from the

Constitutions of the states (ROM and RM), the European Convention on Human Rights and the Charter of Fundamental Rights of the European Union.

Therefore, the methods of applying criminal procedural rules must be built on three pillars:

1. *Preventive methods* – avoiding unjustified interferences;

2. *Operative methods* – proportional and controlled application of intrusive measures;

3. *Control methods* – verifying legality and sanctioning abuses.

Preventive methods have the role of reducing the risk of unjustified interferences in privacy and the integrity of the person. They are essential in a state governed by the rule of law, because they prevent abuses before they occur.

Prosecutors, judicial police officers and judges of rights and freedoms in ROM and criminal investigation bodies and investigative judges in RM, must be continuously trained in the ECtHR jurisprudence on Art. 8 and Art. 3 and not only, on the CJEU standards on data protection, on modern non-intrusive investigation techniques, and on the ethics of using special means.

Important aspect – before authorizing an intrusive measure, the prosecutor must conduct an assessment of the risks regarding the violation of privacy, the psychological impact on the person, the risk of information leaks, including the risk of provocation to commit a crime.

The application of the second method, the operative one, represents the concrete application of the criminal procedure rules, in compliance with the principles of legality, necessity and proportionality. Their application must aim to comply with the judge's authorization, temporal limitation, data filtering and destruction of irrelevant data. In this regard, searches must be thoroughly motivated in order to order the measure as a result of the intrusion into private life, carried out with respect for the dignity of the person, limited to the object of authorization and rigorously documented.

At the same time, the use of investigators must also comply with criteria such as the prohibition of provocation to commit a crime [4, & 110] and be limited to the role of legality in the intrusion into private life.

Control methods are essential for preventing and sanctioning abuses. In this sense, there must be judicial control over the approval of measures. The judge of rights and freedoms must thus verify the existence of reasonable suspicion, the proportionality of the measure, the necessity of interference, compliance with the limits of authorization. At the same time, at the state level there must be control by the Superior Council of Magistracy (CSM), which must sanction information leaks, the unjustified use of intrusive measures, the lack of motivation, and abuses by investigators. Parliamentary control must also supervise the activity of intelligence services involved in technical support for interceptions. Last but not least, constitutional control, through which the Constitutional Court must verify legislatively and upon any notification and information the compliance of procedural norms with fundamental rights, the limits of interferences and procedural guarantees.

We mention them because in a state governed by law, policies to prevent and combat corruption must be built on a balance between the efficiency of investigating criminal acts and the protection of fundamental rights. Even if corruption represents a systemic threat to the functioning of public institutions, the fight against it cannot be justified by sacrificing the right to privacy and the integrity of the person.

In this context, the integration of the two rights in the architecture of anti-cor-

ruption policies becomes an essential condition for the legitimacy of state action. This integration presupposes:

- A holistic approach, combining prevention, education and sanction;
- A coherent regulatory framework, harmonized with European standards;
- Efficient institutional mechanisms for control and accountability;
- Procedural transparency, within the limits of the confidentiality of the investigation.

Anti-corruption policies must include explicit guarantees regarding the protection of privacy. In the absence of these guarantees, there is a risk that anti-corruption measures will be perceived as instruments of political or institutional pressure.

In this regard, there must be clear rules on the use of special techniques, such as limiting the duration of interceptions, for authorization and for the destruction of irrelevant data. In addition to these rules, compliance with Regulation (EU) 2016/679 (GDPR) and Directive (EU) 2016/680, regarding the protection of personal data in the procedure, with limiting access to sensitive data and periodic audits.

Public reporting on the use of special techniques, statistics on the duration and effectiveness of measures, secure reporting mechanisms and protection against retaliation, are essential techniques and rules in protecting enforcement and intrusion into private life.

Essentially, an effective anti-corruption policy is not one that maximizes interferences, but one that optimizes them, respecting the dignity of the person and European standards.

Conclusions. The analysis of the right to privacy and the right to integrity in the application of criminal procedural rules, especially in the context of preventing and combating corruption, highlights a structural tension between two fundamental imperatives of the rule of law: the efficiency of criminal investigation and the protection of human dignity. This tension cannot be eliminated, but can be managed through a coherent regulatory framework, through solid procedural guarantees and through an institutional culture oriented towards the respect of fundamental rights.

The right to privacy and the right to integrity represent essential limits to the coercive power of the state. They are not obstacles to the fight against corruption, but conditions for its legitimacy. Any interference in the private sphere must be provided for by law, necessary, proportionate and subject to effective judicial review. The case law of the ECTHR and the CJEU has reinforced these requirements, systematically sanctioning states that have used intrusive measures without adequate guarantees.

Investigating corruption crimes requires the use of special surveillance techniques, which can profoundly affect the privacy and psychological integrity of the person concerned. Interceptions, computer searches, the use of undercover investigators or obtaining financial data are indispensable measures in uncovering facts committed in secret. However, their application must be strictly limited, thoroughly motivated and rigorously monitored, in order to prevent institutional abuses.

Interference between privacy and psychological integrity is inevitable in the context of anti-corruption. Prolonged technical surveillance, media exposure, information leaks or psychological pressure exerted during hearings can profoundly affect the dignity of the person. Therefore, anti-corruption policies must include not only repressive measures, but also psychological protection mechanisms, procedures for limiting interference and disciplinary sanctions for violations of fundamental rights.

The integration of fundamental rights into the architecture of anti-corruption poli-

cies is essential for maintaining public trust in judicial institutions. An effective anti-corruption policy is not one that maximizes interferences, but one that optimizes them, respecting European standards and the dignity of the person. The comparative experience of European states (France, Germany, Italy), shows that the efficiency of the fight against corruption is compatible with a high level of protection of privacy and integrity, when there are solid procedural guarantees and effective judicial control.

The general conclusion is that the rule of law cannot exist without the protection of privacy and integrity of the person, and the fight against corruption cannot be credible if it sacrifices these values. The balance between efficiency and fundamental rights is not only a legal requirement, but also a condition of democratic legitimacy. Only a criminal procedural system that respects human dignity can ensure a genuine and sustainable fight against corruption.

Officer, Center for International Police Cooperation, Bucharest,
Romania
ORCID: 0009-0006-4941-2120

Abstract

The rapid development of contemporary international relations, coupled with the rise in transnational criminal activity, has led to the consolidation of international negotiation as a fundamental tool for criminal justice cooperation among states. In the context of globalization, international negotiations contribute to the development of the multilateral legal mechanisms necessary to prevent and combat transnational organized crime, including through the development of the regulatory framework established by the United Nations Convention against Transnational Organized Crime (the Palermo Convention) and through the strengthening of institutional cooperation among the competent authorities of states.

The article analyzes the role of international negotiation as a legal mechanism for resolving international disputes and as a tool for harmonizing national criminal policies to combat organized crime, terrorism, human trafficking, and other forms of cross-border crime. At the same time, the article highlights the functions of international negotiation in the development of international judicial cooperation through specialized structures such as Europol, Eurojust, and Interpol.

The research findings demonstrate that international negotiation constitutes an essential mechanism for strengthening regional and global security and for developing effective legal instruments for cooperation in preventing and combating transnational crime.

Keywords: international law, international negotiations, international security, criminal justice cooperation, transnational crime, crime prevention, international judicial cooperation.

NEGOCIEREA INTERNAȚIONALĂ CA INSTRUMENT AL COOPERĂRII JURIDICO-PENALE ÎN PREVENIREA ȘI COMBATEREA CRIMINALITĂȚII TRANSNAȚIONALE

Abstract

Dezvoltarea accelerată a relațiilor internaționale contemporane, corelată cu intensificarea fenomenelor infracționale transnaționale, a determinat consolidarea negocierii internaționale ca instrument fundamental al cooperării juridico-penale între state. În contextul globalizării, negocierile internaționale contribuie la elaborarea mecanismelor juridice multilaterale necesare prevenirii și combaterii criminalității organizate transnaționale, inclusiv prin dezvoltarea cadrului normativ instituit prin Convenția Organizației Națiunilor Unite împotriva criminalității organizate transnaționale (Convenția de la Palermo) și prin consolidarea cooperării instituționale între autoritățile competente ale statelor.

Articolul analizează rolul negocierii internaționale ca mecanism juridic de soluționare a diferendelor internaționale și ca instrument de armonizare a politicilor penale naționale în vederea combaterii criminalității organizate, terorismului, traficului de persoane și altor forme de criminalitate transfrontalieră. Totodată, sunt evidențiate funcțiile negocierii internaționale în dezvoltarea cooperării judiciare internaționale prin intermediul structurilor specializate precum Europol, Eurojust și Interpol.

Rezultatele cercetării demonstrează că negocierea internațională constituie un mecanism esențial pentru consolidarea securității regionale și globale și pentru dezvoltarea unor instrumente juridice eficiente de cooperare în prevenirea și combaterea criminalității transnaționale.

Cuvinte-cheie: drept internațional, negocieri internaționale, securitate internațională, cooperare juridico-penală, criminalitate transnațională, prevenirea criminalității, cooperare judiciară internațională.

At the same time, the intensification of transnational criminal phenomena is prompting a reassessment of the role of international negotiations in the architecture of international criminal justice cooperation, as they facilitate the harmonization of intervention mechanisms and the development of effective legal instruments to prevent and combat organized crime [6].

In the absence of negotiation, international relations would be characterized exclusively by direct confrontations, which would generate systemic instability at the global level and undermine the protection of fundamental human rights. Thus, international negotiation must be analyzed as a preventive instrument of collective security, being an integral part of the legal mechanisms for conflict management [1].

At the same time, the role of international negotiation extends to combating organized crime, terrorism, and cross-border trafficking—areas in which international cooperation is indispensable for ensuring the effectiveness of interventions by competent authorities [5].

Methods and materials applied. In conducting this research, methods specific to the field of public international law and international judicial cooperation in criminal matters were employed, namely the method of comparative legal analysis, the method of interpreting international legal norms, and the method of doctrinal analysis.

The materials used consisted of specialized works in the field of public international law and international judicial cooperation, relevant international normative documents, such as the United Nations Convention against Transnational Organized Crime (the Palermo Convention), as well as legal instruments adopted within the framework of European and international cooperation in the field of combating transnational crime.

Furthermore, the research focused on analyzing the institutional mechanisms for criminal justice cooperation developed within specialized international organizations, such as Interpol, Europol, and Eurojust, highlighting their role in facilitating the exchange of operational information and coordinating cross-border investigations.

Discussions and results obtained. I. Characteristics, Objectives, and Functions of International Negotiation. Diplomatic negotiation is one of the most important tools of international cooperation, used to manage conflicts, establish strategic partnerships, and promote the interests of states within the contemporary international system [3].

International negotiations are not merely a means of securing specific advantages, but rather a form of structural cooperation indispensable to maintaining the stability of the international system. In this context, international criminal justice cooperation achieved through negotiations directly contributes to strengthening mechanisms for preventing and combating transnational crime [6].

The complexity of international negotiations stems from the diversity of the actors involved, the cultural and legal differences between states, and the need to reconcile their divergent interests.

Another defining feature of international negotiations is the influence of geopolitical factors on the strategies adopted by states. Changes in the international context can lead to adjustments in negotiation objectives and a redefinition of the political and legal

priorities of the actors involved [2].

The lengthy duration of negotiations is a key characteristic of the process, as international agreements involve complex processes of consultation and legislative harmonization [4].

The rules of international law constitute the fundamental legal framework for international negotiations, ensuring respect for the principles of legality and the sovereign equality of states [3].

II. International Negotiation: A Means of Resolving International Disputes. International negotiation is a fundamental legal tool for resolving disputes between states and international organizations, serving as an effective alternative to the use of force in international relations [4].

In particular, negotiation is frequently used in the context of international legal cooperation in criminal matters in areas such as the extradition of offenders, international legal assistance in criminal matters, the transfer of sentenced persons, and the fight against cross-border organized crime [5].

These legal mechanisms are reinforced by multilateral legal instruments adopted under the United Nations Convention against Transnational Organized Crime (the Palermo Convention), which establishes the general legal framework for international cooperation in preventing and combating transnational organized crime [6].

At the same time, operational cooperation is supported by the work of specialized international organizations such as Interpol, which facilitates the rapid exchange of operational information among the competent authorities of states; Europol, which supports the strategic analysis of cross-border criminal phenomena at the European level; and Eurojust, which contributes to the coordination of complex international criminal investigations.

Results achieved. An analysis of the role of international negotiations highlights the fact that they are an essential tool for international cooperation in criminal matters, contributing to the development of effective mechanisms for preventing and combating transnational crime.

The research findings confirm that international negotiations facilitate the harmonization of national laws and the development of common legal instruments for combating organized crime.

At the same time, the implementation of the Palermo Convention has helped strengthen the international legal framework for combating transnational organized crime, facilitating judicial cooperation among states and the development of effective mechanisms for cross-border investigations.

Furthermore, the work of Europol, Eurojust, and Interpol demonstrates the importance of international institutional cooperation in combating contemporary crime and in developing common standards for criminal justice intervention.

An analysis of the legal mechanisms developed through international negotiations highlights the fact that the effectiveness of criminal justice cooperation depends directly on the degree of institutionalization of relations between the competent authorities of states. In this regard, the use of multilateral legal instruments adopted under the auspices of the United Nations, as well as the strengthening of operational cooperation through Europol, Eurojust, and Interpol, contributes to the development of integrated mechanisms for preventing and combating transnational organized crime.

At the same time, international negotiations facilitate the harmonization of national legislation in the field of international judicial cooperation, allowing the domestic legal

framework to be adapted to the international legal standards established by relevant multilateral conventions. This harmonization contributes to streamlining procedures for extradition, international legal assistance in criminal matters, and the transfer of convicted persons, thereby strengthening states' capacity to respond in a coordinated manner to the challenges posed by contemporary transnational crime.

At the same time, the development of institutional cooperation mechanisms between national judicial authorities and specialized international bodies contributes to increasing the efficiency of cross-border investigations and reducing the risks arising from jurisdictional fragmentation, an essential aspect for ensuring legal certainty in the current context of the globalization of criminal activity.

Conclusions. International negotiation is a complex and dynamic process conducted within a well-defined legal framework, contributing to the maintenance of stability in international relations and the development of criminal justice cooperation among states.

In the context of globalization, international negotiation has become an indispensable tool for preventing and combating transnational crime, facilitating the development of effective cooperation mechanisms among competent authorities.

Thus, international negotiation serves as a guarantee of international stability and security and is an essential element of the contemporary global legal architecture.

Abstract

The present study focuses on Japanese military personnel, as well as combatants of other nationalities integrated into Japanese troops stationed in Manchuria. The main objective of this article is to analyze the complexity of the detention regime within the Soviet concentration camp system, with particular emphasis on living conditions, abuses committed by camp administrations, and the devastating impact of the hostile environment on the psychological condition of prisoners.

At the same time, the investigation examines judicial proceedings initiated against war criminals, the dynamics of relations between the Soviet civilian population and Japanese prisoners, as well as the contacts of the latter with our compatriots detained in the same spaces of captivity. The study is based on rigorous documentation, making use of unpublished archival materials, the normative framework of the period, as well as an extensive body of specialized literature and memoirs of survivors published both domestically and abroad.

Keywords: military personnel, war crime, wounded, weapon, prisoner of war, forced labor, abuse, inhuman treatment, Japanese prisoners, detention, testimonies, human dignity.

SITUAȚIA MILITARILOR JAPONEZI AFLAȚI ÎN LAGĂRELE PENTRU PRIZONIERI DE RĂZBOI DIN URSS

Abstract

Studiul de față se concentrează asupra militarilor japonezi, precum și a combatanților de alte naționalități integrați în trupele nipone dislocate în Manciuria. Obiectivul principal al acestui articol este de a

analiza complexitatea regimului de detenție din sistemul concentraționar sovietic, punând accent pe condițiile de viață, abuzurile exercitate de administrația lagărelor și impactul devastator al mediului ostil asupra psihicului prizonierilor.

Totodată, investigația vizează procesele judiciare intentate criminalilor de război, dinamica raporturilor dintre populația civilă sovietică și prizonierii niponi, precum și contactele acestora din urmă cu conaționalii noștri aflați în aceleași spații de detenție. Demersul este fundamentat pe o documentare riguroasă, valorificând materiale de arhivă inedite, cadrul normativ al epocii, precum și o vastă literatură de specialitate și memorii ale supraviețuitorilor, publicate atât în țară, cât și peste hotare.

Cuvinte-cheie: militar, crimă de război, răniți, armă, prizonier de război, muncă forțată, abuz, tratament inuman, prizonieri japonezi, detenție, mărturii, demnitate umană.

Introduction. At the beginning of the third millennium, the collective security of humanity is inconceivable without the fundamental contribution of international institutions gradually established throughout the evolution of society. It is difficult to estimate the scale of human losses in the absence of the International Red Cross Movement, founded in 1863, whose central mission remains humanitarian assistance and the protection of victims in belligerent states.

Armed conflicts inevitably generate the phenomenon of captivity. Considering that many combatants either voluntarily lay down their arms or are captured by opposing forces, the international community developed strict legal norms to ensure the protection of these vulnerable categories. The foundations of the legal regulation concerning prisoners of war, the wounded, and civilians were laid in Geneva in 1864. Subsequently, this framework was strengthened through the Hague Conventions (1899 and 1907) and, most importantly, through the Geneva Convention of 27 July 1929—an essential legal instrument for the protection of military personnel in camps and of the civilian population during armed conflicts.

However, the experience of the Second World War demonstrated the fragility of these norms. Belligerent states frequently neglected international provisions, imposing arbitrary detention regimes dictated by radical ideologies—Nazism and communism—which transformed prisoner-of-war camps into spaces characterized by the denial of human dignity.

Methods and materials applied. The methodology applied in the elaboration of this study is based on an articulated set of historical and legal research methods. The process included documentary and critical analysis through the rigorous examination of archival sources, official acts, and administrative documents concerning the organization of the Soviet camp system, as well as the comparative method, through which the norms of international humanitarian law were assessed against the actual realities of the detention regime.

At the same time, the analysis of narrative sources made it possible to integrate memoirs and testimonies of researchers from different ideological backgrounds, while historical synthesis and contextual analysis facilitated the placement of the phenomenon within a coherent explanatory framework related to the political and military realities of the period. In addition, systemic and classificatory methods were used to structure information concerning the hierarchy of the concentrationary space, alongside the interpretative method, essential for deciphering the deeper meanings of the events under study in correlation with national and international bibliography.

Discussions and results obtained. The global conflagration of the mid-twentieth century highlighted a profound crisis of international law, as the principal belligerent parties neglected the provisions of the Geneva Convention and replaced them with arbitrary

regulations derived from Nazi and communist ideologies.

Within the Soviet sphere, the authorities justified their disregard for international treaties by arguing that German soldiers and their allies, due to the atrocities they had committed, could not benefit from prisoner-of-war status. In reality, however, this position reflected the repressive nature of the Stalinist totalitarian regime, resulting in inhuman and degrading detention conditions throughout the USSR camp network.

A component of this system was deployed on the territory of the Moldavian Soviet Socialist Republic, with the activity of these units being directly subordinated to the decision-making center in Moscow. Although recent historiography in the Republic of Moldova has begun to explore the issue of wartime captivity, new archival sources indicate the existence of research gaps that require deeper investigation. Limited attention has so far been paid to the situation of prisoners captured in the Far East during the final stages of the global conflict, particularly Japanese military personnel and combatants of other nationalities integrated into Japanese troops stationed in Manchuria.

Starting from these premises, the present article aims to introduce new data into scientific circulation regarding the detention regime of Japanese prisoners. The research objectives include the analysis of abuses committed by the Soviet administration, the impact of the hostile environment on prisoners' psychological balance, judicial proceedings initiated against war criminals, and the social interactions between prisoners, the local civilian population, and our compatriots held in captivity. The study is based on rigorous documentation, making use of unpublished archival materials, the normative framework of the period, as well as journals and memoirs published both domestically and abroad.

The analysis of these materials revealed that Soviet authorities encouraged repressive bodies to apply inhuman and degrading treatment to prisoners of war detained in USSR camps.

Against this background, communist propaganda undertook systematic efforts to create a negative image of enemy soldiers in the eyes of the civilian population. Public trials against alleged war criminals were regularly organized, and severe criminal penalties were imposed.

Beyond the administration of justice, these actions pursued another objective: to erase from the memory of Soviet citizens the catastrophic defeats suffered by the Red Army on the battlefield during 1941–1942, caused largely by the physical liquidation of experienced military personnel during the purges organized by Stalin's repressive apparatus. At the same time, the crimes of the Soviet regime against its own population—repressions, deportations, and famines that depopulated entire regions of the Soviet Union before the war—also had to be obscured.

Propaganda also influenced society to forget relatives who had lost their lives for merely speaking against the regime and to accept as heroes the uniformed executioners who had long ceased to be human.

Thus, in order to glorify the Soviet regime, the enemy was demonized and hatred toward prisoners of war detained in the USSR was actively stimulated. As a result, camp administrations and guards applied violence and committed crimes against the individuals under their custody.

Numerous cases were reported in which Soviet soldiers killed and robbed prisoners of war during escort. "In addition to those killed, many others died as a result of wounds, diseases, inhuman detention conditions, exhausting forced labor, malnutrition, lack of warm clothing, dystrophy, hypothermia, etc." [1, p. 51-52].

The cemeteries where the deceased were buried disappeared over time. Such re-

alities occurred because Soviet authorities followed their own internal normative acts concerning the treatment of prisoners of war.

According to Romanian scholars, "the international legal status of prisoners of war in the first half of the twentieth century was defined by the 'Regulations concerning the Laws and Customs of War on Land', annexed to the Fourth Hague Convention of 1907, and by the Geneva Convention concerning the Treatment of Prisoners of War of 27 July 1929" [2].

During the Second World War, these two normative acts of international law had different legal force. The norms established by the Hague Convention were mandatory for all belligerent states, whereas the provisions of the 1929 Geneva Convention were valid only among signatory states. The Soviet government refused to participate in the Geneva Conference of the summer of 1929. The USSR leadership considered that, under such circumstances, it should not assume obligations toward the "class enemy". At the time of its adoption, the 1929 Geneva Convention was perceived in Moscow as an element of bourgeois justice, incompatible with communist ideology. In the Soviet Union, the legal status of prisoners of war, both during and after the war, was established on the basis of the "Regulation on Prisoners of War", adopted on 1 July 1941 by the Council of People's Commissars of the USSR. This regulation provided for detention conditions, forced labor obligations, and criminal and disciplinary liability for refusal to obey orders" [3].

Evidently, this document only formally ensured prisoners' security under an extremely rigorous regime that human beings could barely endure. The situation was further aggravated by the fact that prisoner-of-war camps were subordinated to the NKVD of the USSR.

In April 1943, Soviet security structures were reorganized: „the NKVD was divided into the NKVD and the NKGB. In January 1945, within the NKVD, the Main Directorate for Work with Prisoners of War and Interned Civilians was established, under whose control were the camps for German soldiers and military personnel from the armies of Germany's allied countries" [4 p. 50].

Russian authors specify that "the basic document regulating detention conditions and labor use of German prisoners was Resolution No. 1798-800 of 1 July 1941 of the Council of People's Commissars, implemented through NKVD Order No.032 of 21 July 1941" [5, p. 497].

They also note that prisoners of war on Soviet territory were treated inhumanly because camp administrations did not observe the norms established by the Hague Convention of 1907 and the Geneva Convention of 1929. Soviet legislation did not include "norms prohibiting the use of prisoners in harmful and life-threatening labor" [5 p. 497-498].

Similar irregularities were identified by other scholars. It was also noted that "nothing was provided regarding the assurance of legal defense for prisoners of war under criminal investigation. At the same time, Soviet authorities ignored the obligation to inform the International Committee of the Red Cross and the government of the prisoner's state of citizenship when a prisoner was sentenced to death during detention" [5, p. 498].

These realities indicate serious violations of the fundamental rights of prisoners and emphasize the discrepancy between declared norms and actual practices in Soviet camps. Japanese prisoners of war who arrived in such camps at the end of the Second World War also faced major hardships. They were escorted from Manchuria, where the final confrontations between the Soviet Army and Japanese troops deployed there had taken place.

Due to historical circumstances, among Soviet troops there were also our compatriots: "In the spring and summer of 1944, the Bolshevik authorities, having returned to the so-called MSSR, mobilized all men aged between 18 and 50 to the Eastern Front—people

who did not know the Russian language and had no combat experience—and sent them to the most dangerous areas of the front as 'cannon fodder.' In those battles, Bessarabians lost approximately 50,000 men. But for Bessarabians, the war did not end with Germany's capitulation on 9 May 1945. Many of them were sent to the Far East, to the war against Japan" [7, p. 228]. One example is a resident of Baiuș village, Leova district: "Cernenchii Artiom. Veteran of the Second World War. He ended the war in Manchuria. Mobilized on 25 March 1944. Demobilized on 20 November 1945" [8, p. 233].

It is known that in 1945, "...on 6 August, the first atomic bomb was dropped on Hiroshima... 9 August—the day when the second atomic bomb destroyed the city of Nagasaki... At 8:47 a.m. (Japan time), on 10 August, Tokyo sent telegrams to the Japanese legations in the neutral capitals of Bern and Stockholm to be transmitted to the Allied governments, expressing its agreement to capitulate, on the condition that the Emperor's prerogatives be preserved" [9, p. 792].

Considering the authority enjoyed by Emperor Hirohito among the Japanese population, U.S. authorities agreed to preserve his status even after Japan's defeat in 1945. Thus, "the American conquerors were surprised to discover how little Emperor Hirohito's power had actually diminished. Given the chaos that could have resulted from abolishing the monarchy, and because he had played an important role in calming the conflict and unifying war-divided Japan, the Emperor retained his position." Its ancient mission to "respect harmony" saved the tradition" [10, p. 50-51].

More than half a million Japanese soldiers isolated in the Far East were forced to surrender to Soviet troops. According to Romanian scholars Laurențiu Constantiniu, Ilie Șchipor, and Vitalie Văratic, one Soviet report signed on 2 November 1945 stated that Red Army units had taken 608,360 persons prisoner during the war with Japan, including: "573,821 Japanese; 19,962 Manchurians; 7,032 Koreans; 3,699 Chinese; 2,345 Mongols; and 1,501 persons of other nationalities or ethnicities" [3 p. 574].

A group of Russian authors published an excerpt from the informational note signed by the Chief of Staff of the Armed Forces of the USSR A.I. Antonov and addressed to V.M. Molotov on December 8, 1945, in which the following is reported: "I inform you about the number of Japanese prisoners captured by the troops of the Red Army in the Far East. According to the data provided by the NKVD, a total of 608360 prisoners of the Japanese army, including Koreans and Manchurians, were taken: generals – 158, officers – 18068, sergeants and soldiers – 590134. Of this number, 368478 Japanese were transported to camps in the USSR for labor, of whom officers – 8112 persons; 58500 Japanese remained for labor outside the territory of the USSR, including in Mongolia; 18500 Japanese are on the way to NKVD camps; 92784 Japanese are in the custody of the Soviet military command and will be escorted to NKVD camps..." [11].

The same authors write that: "Most Japanese ended up in captivity beginning on August 16, 1945, from the battlefields of Manchuria, North Korea, South Sakhalin, and the Kuriles [...] where the Japanese suffered heavy losses. On August 12, senior officers and army generals were captured [...]. A large part of the prisoners were sent to labor camps to be used in construction. In accordance with the Resolution of the GKO USSR of August 23, 1945, 500 thousand Japanese prisoners arrived in camps located on the territory of Primorye and Altai regions, the Chita and Irkutsk regions, on the territory of the Buryat-Mongol ASSR, the Uzbek SSR, for the construction of the Baikal-Amur railway line, etc." [11].

It is known that Japanese soldiers who were in Soviet captivity did not prefer to write memoirs. This informational gap was supplemented by some Japanese writers, among

whom is also Haruki Murakami, who wrote about the detention conditions of Japanese prisoners in Soviet camps as well as about the situation of people convicted for political reasons in the Soviet Union, mentioning that the law of the camp was in fact: "...the law of the jungle according to which the strongest survived. When the workforce began to diminish, new wagons of prisoners arrived. Sometimes about twenty percent of them died on the way, but no one worried because of that. Most were Russians and Eastern Europeans brought from the West" [12 p. 635].

The same author writes about representatives of other nationalities brought to Siberia: "In the mine there worked not only Japanese prisoners, but also Russian criminals, political prisoners, and former officers rejected by Stalin's system. These were usually people with higher education and of exceptional quality [...] Besides Russians, the trains also brought Poles, Hungarians, and other foreigners, some of them with darker skin (Armenians or Georgians, I suppose)" [12. p. 613].

Analyzing what Haruki Murakami wrote, it is worth recalling the novel of the writer Nicolae Dabija published in 2009, "Tema pentru acasă", in which the drama of Bessarabians deported to Siberia and sentenced to forced labor in Soviet prisons full of: "spies, saboteurs, terrorists, right-wing deviationists, left-wing deviationists, Mensheviks, Socialist-Revolutionaries, anarchists, nationalists, White émigrés, prisoners of war, members of counterrevolutionary organizations, deserters, former bourgeois, former party activists, former military men, former-former-former...[...] Most of them from the Baltic Countries, from Western Ukraine and from Bessarabia: hotel doormen, cemetery guards, tram drivers, firefighters, elevator operators, railway workers, taxi drivers, high school students, because of their uniforms, were declared fascist colonels, generals, or marshals and arrested right in the street, to be sent to Siberia" [13 p. 98]. In his work, Nicolae Dabija describes the reality of the Soviet GULAG mentioning that: "The camp had one thousand beds for more than one thousand detainees, being replenished every week, depending on the number of those who had died, with new occupants, who often slept standing up, waiting for someone to die so that they could have a bed in which to rest their bones after an exhausting day of work" [13 p. 74].

One of our compatriots who had the opportunity to communicate for a period of one year (1945–1946) with Japanese prisoners of war in those regions was Vadim Pirogan, sentenced in 1941 for political reasons by the Soviet totalitarian regime.

Reconstructing in his memoirs the events he went through, he writes: "From Taishet, toward the end of the month, they sent me an assistant—a soldier from the communications and signal regiment. A young 18-year-old – Igor Mihnin, who had completed some military telephone communications courses before being taken into the army. He was sent along the route, to me, so that I could train him and help him adapt to the conditions of the Siberian taiga. He was from Saratov, had grown up on the banks of the Volga, and had never seen forests in his short life. The war, that bloody war, had ended. Japan had capitulated. Now, every day, prisoners of war taken in Manchuria and other places began to arrive in Soviet camps... They arrived by freight trains from the cities of Chita, Khabarovsk, and other cities where concentration camps existed. The Taishet camp was now also receiving Japanese prisoners, distributing them through the deserted colonies along the route. The colony at kilometer 81 was crammed with Japanese, about 1500...

The guard was military, from the army that had fought on the Japanese front. In my little house, which was located outside the zone, three officers settled. Three Soviet officers from the regular army, returned from the front. They were responsible for administering this colony of Japanese prisoners. They occupied the large room without a stove.

Vasile, a man of about 25 years old, a senior lieutenant, was responsible for the accounting sector; he also received the food for the Japanese, which was brought by vehicles from Taishet. The prisoners had arrived with their unit, just as they had been on the battlefield, with their commander and all their officers. The agreement concluded between Japan and the Soviet Union provided that the prisoners would work here, thus paying through labor for the losses caused to the Soviet country. The term – three years" [14 p. 204].

In his memoirs, Vadim Pirogan testifies that the Japanese were very disciplined, but they were not prepared to face the harsh frosts of Siberia. At the same time, he relates that the camp administration initially pretended to respect the norms of international law and allowed high-ranking officers to keep their swords. In this regard, he writes: "Some of the officers kept their swords, they had them with them. Dressed in their military uniforms, wearing summer boots, they could not withstand the Siberian frosts. Few were wearing boots or felt footwear. They did not work anywhere; they stayed in the barracks, waiting for things to become clear...

Military discipline was introduced in the colony. The soldiers obeyed the officers blindly. Food products were brought from Japan. Their food was much better than ours. They brought rice, beans, millet, canned fish. They received 400 grams of bread per day, but at first, they did not even eat that... Translators were missing; no one understood what they were saying, what they wanted... In the entire Taishet camp, about 50000 Japanese had arrived. But there was only one translator, only one man who knew the Japanese language. He was taken from one colony to another...

Lieutenant Vada, the interpreter, tried to help the colony administration understand the prisoners and their commanders. The prisoners woke up in the morning, at 6 o'clock, went outside the barracks, and on their knees, said their prayers, bowed, facing the sun, in black underwear, standing motionless..." [14 p. 204-205].

From the information, we find that the prisoners' daily schedule began with waking up at 6 o'clock, during which they were allowed to observe their religious ceremony. They were supplied with food products by the Japanese Government. As in other camps, activities ended at 22:00, except for those involved in extended work schedules. The prisoners were permanently monitored by representatives of the secret services carrying out activities in the camps. The purpose was to identify persons who had committed crimes against the population of the USSR, spies, persons planning to escape, saboteurs, and the famous suicidal soldiers kamikaze, who threw themselves toward certain death in order to fulfill their combat mission.

The guards feared the *kamikaze*, and precisely out of fear they repeatedly opened fire on some prisoners of war, whom they killed by improperly using their weapons. The cases were reported as if the Japanese had attempted to attack the guards' lives, something that had nothing in common with reality, yet the Soviet soldiers, instead of punishment, were commended for "bravery".

The officers of the secret services tried various methods to recruit agents from among the Japanese soldiers who might have feared death. They rarely succeeded because: "The Japanese have always been a people extremely conscious of the existence of death within the reality of their daily lives. However, the Japanese concept of death is simple and clear, totally different from the frightening and hideous way in which Westerners conceive death" [6 p. 99-100].

Recalling the sequence of events, Vadim Pirogan remembers how high-ranking Japanese officers fearlessly refused to fulfill the demands of the camp administration: "Great was the surprise and fury of the translator Vada, but especially of the Soviet administra-

tion, when they heard how the Japanese commander ordered those under his command not to work, to go on strike, to sabotage, to break tools, not to obey... Of course, after the speech, the Japanese commander was imprisoned, his sword was taken away, and someone else was appointed in his place... Among the Japanese prisoners there were also 'soldiers of death'. During the war, they openly went toward certain death, sacrificed their lives by order, sometimes performed 'harakiri', cutting open their bellies and thus dying for their homeland and for the sun-emperor. The NKVD sought to discover and isolate them, taking them to camps with a harsh regime. The Japanese had no desire to work and constantly sabotaged, especially in winter, during the frosts. They gathered around fires and it was no longer possible to move them from there to cut forests. As soon as the Japanese arrived here, all Soviet detainees were taken to other camps and colonies" [14 p. 205].

It should be mentioned that many prisoners died during forest clearing work in Siberian conditions. The work tools were primitive, yet the Soviet authorities did not spare them: "A secret directive of the Ministry of Internal Affairs and the MGB of the USSR no. 77/29 of April 2, 1946 provided the ways of using them for labor in production enterprises, emphasizing that they could be assigned to work in underground galleries, forestry operations, metallurgical enterprises, etc. Soviet leaders and local party activists tried to exploit the labor of prisoners to the maximum for the construction of housing and the building of new enterprises" [20].

Studying the destinies of Japanese prisoners of war in Soviet camps, the writer Haruki Murakami emphasizes in one of his works: "The norm gradually increased, for one reason or another, ... the number of accidents increased because of improper working conditions..." [12 p. 631].

Adding the following: "many people died daily and there were plenty of causes: malnutrition, overwork, collapses, floods, unsanitary conditions because of which all kinds of epidemics broke out, terrible frosts, the violence of the guards, the brutal repression of any resistance, however small. There were also cases of lynching of Japanese by their fellow countrymen" [12 p. 612].

Japanese prisoners who were part of the labor battalions of the People's Commissariat for Defense of the USSR also faced problems. The detention conditions were degrading: "...baths were lacking, the living spaces were in poor condition, there were no infirmaries, the duration of the working day was not respected... On January 1, 1946, on the construction sites and in the work sectors of the People's Commissariat for Defense there were...54 special labor battalions, in which 67809 Japanese prisoners of war were detained" [3 p. 570].

Eyewitness Vadim Pirogan also writes about the situation of Japanese prisoners in his memoirs: "The Japanese could not withstand the frosts and the diseases in the camps. They died like flies. In addition to everything else, their food was stolen... Now the prisoners were no longer the same as at the beginning, when they had arrived clean, well-cared for, neat... They had visibly deteriorated. They walked like 'ours,' hungry, dirty, unshaven, with torn clothes, dressed in old padded jackets, because their impressive uniforms had been sold, exchanged for tobacco, for food. They wrapped their heads and bodies with sheets, blankets, old scarves, burned through by the fire around which they huddled so as not to freeze..." [14 p. 206].

The Soviet authorities used Japanese labor for the construction and repair of railways, realizing that they worked well and would not endanger railway transport or people's lives. During this time, Japanese trucks transporting food products for the prisoners were attacked by local people who stole whatever they could from the trailers.

Some guards and Soviet officers also fed themselves with Japanese products, a fact mentioned by Vadim Pirogan: "By a decision of the Soviet leadership, the construction of the Taishet-Sovgavani railway, begun back in 1937, was resumed. For this purpose, the Japanese, the prisoners of war, were now being used. I continued to live in my little house together with three officers. I got up in the morning, cooked for them, and they were happy. I had plenty of food products. When the trucks with food arrived, I was allowed to climb into the truck and choose what I wanted and what was needed for the officers' food. The trucks were Japanese 'Isuza', 'Izuchi', and other brands. Next to the Japanese driver sat the Soviet sentry, because sometimes villagers stormed the trucks and stole the products transported here along the route... They lay in wait in places where the vehicles had to pass hilly roads. When they stopped near the gate of our colony, the accountant ordered me to take what I needed... At first the Japanese smoked only fine cigarettes, brought with them... When their tobacco ran out, they switched to Soviet makhorka, but even that was scarce... Then they began to sell their clothes, even exchanging food for tobacco. Our 'free men' and detainees were not ashamed, they traded heavily, acquiring for tobacco everything possible: military clothes, underwear, boots...

All these things ended up at the market, at flea markets in different cities. Many of our detainees walked along the route dressed in Japanese clothes... Seeing them from afar, you were sure you had Japanese before you, but when they came closer, you saw that the 'Japanese' was Russian, Ukrainian, or from other Soviet peoples... Black market dealers bustled everywhere—with or without permits" [14 p. 205-206].

Cases were documented when Soviet officers ordered tailors from among the convicts to sew them civilian suits from the fabric of Japanese uniforms: "This state of affairs could no longer continue, especially since now many commissions and various delegations were arriving, whose task was to study the living conditions of the prisoners.

It was checked how the prisoners were fed and clothed, because, as I said, all food products and clothes were provided by the Japanese government. The leadership of the Taishet camp urgently issued an order: within 24 hours, all items and Japanese clothes had to be returned to the warehouse, and whoever did not comply with the order would be tried.

At the wooden bed of each Japanese prisoner, a small plaque was now attached – here the daily food consumption norm was indicated" [18].

Because of deprivation and the harsh detention conditions, as well as the pressure exerted by propagandists during ideological training hours, some Japanese prisoners agreed to collaborate with the Soviet secret services. If they were exposed by their comrades, they were punished severely. The Romanian author Florin Constantin Pavlovici, a victim of political repression, writes the following lines in his memoirs: "Aurelian Gulan told us that in a prisoner-of-war camp in the Soviet Union there was a large group of Japanese soldiers. One of them informed the Soviet political officer about what his comrades thought and said. One morning, at the camp guardhouse, a Japanese prisoner appeared with a beautifully wrapped package, asked the duty officer to hand it to the commander, saluted, and returned to the barracks from which he had come. When the Russians opened the package, they found the informer's head inside it. Since white people have the impression that all yellow people look alike and since the only Japanese who could have identified the messenger had his head separated from his body, the authors of the execution remained unknown" [15 p. 265].

The Japanese writer Haruki Murakami also mentions such cases in his works: "... three more Japanese prisoners were found who had hanged themselves overnight. They

were hanging from the beams so that it would appear they had committed suicide, but it was obvious from a mile away that it had been a lynching carried out by their fellow countrymen. Most likely, the three had been informers...” [12 p. 621].

It is important to note that in the memoirs of Vadim Pirogan there is no information about Japanese prisoners who would have agreed to become informers for the Soviet secret services.

On May 25, 1946, our compatriot was released without having all of his belongings returned: “My mother’s ring, which was taken from me when I was arrested, was never returned. ‘It was lost’, that is what I was told. As a rule, the NKVD did not return gold objects... On June 25, the day of my arrest, at two o’clock in the afternoon, after five years of humiliation, suffering, and degradation, dressed in a green cotton suit, with a wooden suitcase in one hand, I headed toward the gate” [14 p. 218].

Analyzing the situation, we cannot exclude the fact that the suit worn by Vadim Pirogan had been sewn from a Japanese military uniform, because he also had with him other things exchanged for tobacco with Japanese prisoners, a fact confirmed in his memoirs: “A few days later I arrived in Kuibyshev, a large industrial center. I also went out onto the platform to get something to eat. My food had run out and I had been traveling hungry for an entire day. I had some Japanese clothes, but the train kept going and going and I was afraid to go far away in order to reach some flea market.

In Kuibyshev I stayed the whole day and right there, near the station, there was a flea market where you could find anything you wanted. But I had no money. A black rye bread cost 300 rubles. A mess tin of hot boiled potatoes was sold for 200 rubles.

I sold the clothes and bought a loaf of bread and potatoes, which the housewife poured into my fur hat, because I had neither a plate nor a mess tin. I ate with a wolfish appetite half of the bread and all the potatoes...” [14 p. 258].

In the following year, Japanese prisoners began to speak about the fact that soon they would be allowed to return home. From the information published by the Romanian authors Laurențiu Constantiniu, Ilie Șchipor, and Vitalie Văratic, we learn that in one of the informative notes signed on May 7, 1948, it is reported that: “during the period January 1 – May 1, 1948, 25,912 persons (Japanese prisoners of war) were repatriated, according to Order no. 00374/1948 of the MVD of the USSR” [3 p. 682-683].

During their stay in Soviet camps, Japanese prisoners of war occasionally received from the Japanese government postcards with views from their homeland, which reminded them of their native places. Unfortunately, not all of these reached their destination because of the negligence of the employees of the secretariats of the “сил” ministries; at other times they were stolen by employees of the Soviet repressive organs.

In this regard, a top-secret letter was sent by the leadership of the Main Directorate for Prisoners of War and Interned Civilians within the Ministry of Internal Affairs of the USSR to the leadership of the Ministry of Internal Affairs of the MSSR, requesting verification of whether, by mistake, a set of materials addressed to Japanese prisoners of war had reached Camp no. 198 located on the territory of the MSSR.

The following reply was provided to the inquiry: “To the Head of the Main Directorate for Camp Operations concerning Prisoners of War and Interned Civilians, within the Ministry of Internal Affairs of the USSR, Lieutenant General Comrade Kobulov. Moscow. Regarding No.52/2626 of 30.III.48. We inform you that in MIA Camp No.198, the 95,000 postcard forms with views for Japanese prisoners of war to which you referred were not identified. Such postcards for Japanese prisoners are not registered anywhere. At the same time, we note that there are no Japanese among the prisoners of war in the

camp. Deputy Minister of Internal Affairs of the MSSR, Major General Orlov. April 7, 1948 No.0/292" [16].

Thus, we learn that there were no Japanese military personnel in the prisoner camps of the MSSR; however, in some camps located on the territory of the USSR, among the prisoners of war there were both Japanese and our compatriots.

In the following years, the process of repatriation of Japanese prisoners of war intensified. In one of the documents published by the Romanian authors, signed by the Soviet authorities on January 18, 1950, it is mentioned that the following had been repatriated from Soviet prisoner-of-war camps: "574,718 persons from the former Japanese army" [3 p. 762].

We recall that before repatriation a large number of Japanese prisoners were forced to participate in political education lessons: "Carrying out the instructions of the Central Committee of the CPSU, the MVD organs carried out sustained activity for the political education of prisoners of war and for preparing from among them the antifascist activists. In the courses and antifascist schools that were organized, there studied... 21,137 Japanese" [3 p. 776].

Representatives of other nationalities held in Soviet camps were also obliged to participate in such lessons. One example is the camps located in Kazakhstan, about which the Romanian author Vasile Soare wrote, stating that: "In Karaganda three concentration camps were established for foreign military and civilian prisoners: Spassk No.99, Balhash No.37, and Jezkazgan No.39. Balhash and Jezkazgan were established in 1945 and functioned until the spring of 1948, when they were liquidated following the repatriation of prisoners. In the archives no data were preserved regarding the presence of prisoners of Romanian nationality, the majority being Japanese and Germans.

Spassk No.99, established in July 1941 on the structure of the Spassk division (section) of the NKVD Karlag, located 45 km from the city of Karaganda, on the territory of the former copper extraction plant 'Spassk', was the largest camp in the area.

During its entire operation, 66,160 prisoners (66,746 according to other data) passed through it, of whom: 29,777 Germans, 22,225 Japanese, 1,633 Austrians, 1,208 Poles, 1,088 Italians, 1,139 Hungarians, 195 Finns, etc.

To the figures mentioned above are added the 6,740 prisoners of Romanian nationality and more than 1,000 of other nationalities who fought in the Romanian army (Jews, Ukrainians, Armenians, 'Moldovans')" [17 p. 46-48].

Ultimately: "During the carrying out of political activities and especially during the repatriation period, from German, Japanese, Hungarian, Romanian, and Austrian prisoners of war there were received over 4,000 letters of thanks and positive appreciation addressed to the Soviet Union and to life in the camps, signed by 834,562 prisoners of war. In these letters, the prisoners of war expressed their friendship toward the Soviet Union and thanks to Comrade Stalin and to the Soviet people for the humane treatment toward them" [3 p. 778].

It is known that many prisoners were forced to sign such letters, the content of which was written by Soviet propagandists. The process of repatriation of Japanese prisoners of war to their country of origin lasted until 1950: "...through a TASS communiqué of April 22, 1950, the completion of the repatriation of Japanese prisoners of war was announced.

After the completion of repatriation, only military personnel from among the prisoners of war convicted of crimes, those under investigation, as well as others withheld from repatriation for other reasons, remained in the USSR" [3 p. 778-779].

On January 1, 1953, from this category there were detained in camps and other institutions of the USSR: "1,476 Japanese, of whom 1,456 convicted and 20 without conviction. Interned civilians numbered 411, of whom 406 were convicted and 5 without conviction. Prisoners of war numbered 1,065, of whom 1,050 were convicted and 15 without conviction. Among the convicted prisoners there were 29 generals, 385 officers, 636 soldiers and non-commissioned officers" [3 p. 810].

In one of the judicial trials against war criminals, the Japanese general Yamada Otozo was targeted, accused of attempting to provoke a bacteriological war against the USSR. Studying the biography of this general of the Imperial Japanese Army, we learn that he was a veteran of several wars: the Russo-Japanese War of 1904-1905; the Sino-Japanese War of 1938; and the Second World War: "Born on November 6 in Nagano Prefecture. He pursued military studies in Tokyo. In November 1902, he graduated from the Military Academy of the Imperial Army, receiving the rank of second lieutenant. In June 1903, being assigned to service in the 3rd Cavalry Regiment, he was promoted to the rank of lieutenant. In February 1905, he was granted the rank of senior lieutenant and appointed instructor at the military college of the land army. In 1912 he was promoted to the rank of captain. In November 1912 he graduated from the elite Higher Academy of the Imperial Army, from which many famous Japanese military men graduated" [18].

He subsequently achieved a successful career, reaching the rank of General of the Army in 1940. From July 18, 1944, he was appointed commander of the army in Manchuria, being the last commander of the Kwantung Army: "He was preparing for the inevitable confrontation with the troops of the USSR, understanding that under the conditions of an army weakened after battles he would not be able to count on help. Thus, Yamada tried, within the limits of possibility, to strengthen the positions with the forces available to him, forming 8 new infantry divisions and 7 infantry brigades from poorly trained volunteers.

During the campaign that began on August 9, 1945, in the Manchurian operations, the Soviet troops bypassed the well-fortified Japanese sectors and destroyed the Japanese military units that were isolated and left without the support of tanks and artillery, causing them enormous losses within a few days and considerably affecting the Japanese defense.

After several unsuccessful counteroffensive attempts, on August 20, 1945, the commander was forced to capitulate with the Kwantung Army. Among the 600,000 prisoners was also Otozo Yamada, who was escorted to the city of Khabarovsk. On December 25–30, 1949, the military tribunal of the district, in closed session, examined the case of the Japanese prisoners, including Yamada. The former commander of the Kwantung Army was accused of attempting to unleash a bacteriological war against the USSR.

He was sentenced to 25 years of detention in a corrective labor camp. On March 12, 1950, Yamada Otozo was escorted to Camp No.48 in Cherntsy. In July 1950, at the request of the government of the People's Republic of China, Yamada and other former Japanese military men were transferred to China to be tried for crimes committed on the territory of that country.

Yamada acknowledged guilt for the crimes committed by his subordinates and served five years of imprisonment in the city of Fushun. On February 22, 1956, at the age of 75, by Resolution of the Presidium of the Central Committee of the CPSU 'On the Early Release of the Japanese General Yamada', Yamada Otozo was pardoned and repatriated to Japan. He died in 1965 at the age of 83" [27].

Romanian authors also wrote about the judicial trial against General Yamada Otozo and other Japanese military personnel, stating that: "In connection with the trial of the

main war criminals in Tokyo, the former adviser to the German military attaché in Tokyo, Lieutenant Colonel von Petersdorf, was interrogated, and he testified at the trial as a witness for the Soviet prosecution. Also prepared were the testimonies of Major General Matsumura, Colonel Semidzima, and the former emperor of Manchukuo, Pu Yi—as witnesses for exposing the criminal Japanese military clique, who testified at the International Tokyo Trial [...].

The investigation was carried out, and at the end of December 1949 the Public Trial of Khabarovsk was organized against the former commander of the Japanese Guandong Army, General Yamada, the former commanders of the sanitary and veterinary directorates of the above-mentioned army, Kajizuka and Kawashima, and against a group of workers of the so-called 'Anti-Epidemic Detachment No.731', which was preparing bacteriological warfare against the Soviet Union.

In this case, 12 defendants were sentenced to various prison terms" [3. p. 780].

It should be mentioned that even General of the Army Yamada Otozo was forced to write a letter of thanks to the Soviet authorities for the good conditions he had benefited from during his detention in Soviet camps.

Soviet propaganda transformed the reading of thank-you letters by prisoners of war on the day of their repatriation to their country of origin into a ceremony. They were gathered on the railway station platform, where, at the command of the camp administration, several of them, stepping out of formation one by one, expressed gratitude to the Soviet authorities for the "humanism" shown toward them during detention.

These actions were organized at the instruction of the leadership of the Ministry of Internal Affairs of the USSR. Thus: "On June 16, 1949, all camp chiefs were informed of the order signed by the Deputy Minister of Internal Affairs of the USSR, Colonel General I. Serov, which provided the following: 'to obtain from all prisoners repatriated to their country of origin letters of thanks addressed to the Soviet government. To organize assemblies and rallies during which prisoners should make entries with positive content in opinion books, etc. These actions are necessary to combat slanderous messages launched against the USSR from abroad'" [5. p. 512].

In reality, the thank-you letters could not cover up the information regarding the multiple deaths recorded among the prisoners because of the disastrous conditions in the Soviet camps. There were considerable losses among the prisoners of war as well.

As the Romanian author Florentina Dolghin mentions: "In 1945 about 600,000 Japanese ended up in captivity. Of them, 53,000 died, according to Japanese data" [19 p. 40].

Thus, the prisoners were repatriated, but the work concerning the exposure of spies of foreign secret services gained momentum in the USSR. The political leadership demanded that the fight against foreign agents be intensified also in the union republics. Repeated reference was made to letters previously sent to the Ministry of Internal Affairs of the MSSR, among them the top-secret letter No.52/3477 signed on April 19, 1948, by the Deputy Head of the Main Directorate for Prisoners of War and Interned Civilians within the Ministry of Internal Affairs of the USSR, Lieutenant General A. Kobulov, which had the following content: "In January 1948, in Moscow, the leadership of the employees of the Ministry of Internal Affairs and of the Directorate for the Administration of Camps for Prisoners of War was gathered in connection with issues referring to operational work with agents from among the prisoners [...] Taking into account that the German secret services created a network of agents from among traitors—Soviet citizens who had lived in the temporarily occupied territory—a priority task of our services consists in exposing them and liquidating German agents on the territory of the Soviet Union.

This is necessary because there is a risk of establishing connections between the German secret services and the Anglo-American ones. All the above mentioned regarding the German secret services applies equally to the struggle against the American and Japanese secret services acting against the Soviet Union" [20].

Under the cover of fighting spies of foreign secret services, a campaign of demonization of representatives of certain capitalist countries began. Among them were also the Japanese.

Paradoxically, activities of denigrating the Japanese were also carried out by Soviet propaganda on the territory of the MSSR. As a reason served the photographs placed in places of honor in the homes of some Bessarabians, which immortalized scenes from the Russo-Japanese War of 1904-1905, in which many of our compatriots had participated.

Thus, the Soviet repressive organs identified that the Japanese enjoyed the sympathy of many locals. We recall that: "Bessarabians under Russian military occupation were forced to participate in the Russo-Japanese War of 1904–1905" [21, p. 10].

As author Florentina Dolghin states: "the period of the Russo-Japanese War of 1904–1905 remained in history through a remarkable chivalrous, humane attitude of the victors toward the defeated and captured prisoners. It was 'the last clash between gentlemen in history'" [28].

In this context: "in Bessarabian, Russian, and Japanese folklore, recruitment songs and poems appeared in which the Port Arthur fortress is mentioned, for which fierce battles were fought" [21, p. 15].

In order to impose a new interpretation of these events, Soviet propaganda requested that lectures be delivered in state institutions regarding the victory of the Soviet Army at Port Arthur in the summer of 1945, in order to cover up the shameful capitulation of Russian troops in December 1904 before the Japanese armies.

In the archival materials, the minutes of the meeting of the officers of the Militia School in the city of Chișinău, held on March 31, 1948, at the central headquarters of the Ministry of Internal Affairs of the MSSR, are preserved. During this meeting, the deputy head of the school for education, Deomin, justified the delay in making the work Port Arthur available to the students, declaring the following: "Regarding educational work, I confirm that we correctly understood the tasks of the Central Committee of the Communist and Bolshevik Party concerning the raising of the level of ideological education in groups outside study hours. Probably the lecturers were not fully involved in this activity and thus we failed to achieve the expected results. At present, however, the reading of the book 'Port Arthur' and other books is taking place, books which enrich the volume of knowledge of the collective, and the students take an active part in discussions on these books" [22].

Later, in this educational institution as well as in others across the USSR that trained specialists for the Soviet repressive organs, substantial batches of books written by Soviet authors arrived, in which capitalist countries with developed economies, including Japan, were discredited.

In the manual published by the Soviet author N.F. Kuznetsova, it is stated that: "Japan is a country in which crime increased catastrophically after it was occupied by the USA. In 1963, 1,557,809 crimes were recorded there. For every 100 thousand people of the population, 3,899 persons were convicted" [23, p. 219].

A different opinion in this regard is offered by author Ronald Dore, who states that after the Second World War, Japan faced major social and economic problems. Gradually, however, the situation began to improve.

Analyzing the factors that contributed to Japan's economic leap after the war, he mentions that: "Such a sudden improvement took place precisely during the period when Japan was occupied by American troops" [24, p. 149].

It is necessary to mention that some Soviet authors achieved remarkable careers due to their criticism of Japan and the Japanese. One example is author N.F. Kuznetsova, who published a series of such materials in her works, specifying that: "In Japanese prisons in 1963 there were 47% more people than in 1940... In Japan, crimes against property constitute 2/3 of the total number of crimes recorded... Japan occupies first place in the world in the number of transport-related offenses. Four times more people died because of these offenses than in the USA. At the same time, Japan occupies first place in smuggling, trafficking, and drug consumption" [23, p. 219-221].

After this follows that: "In Japan there are 5,000 gangster bands bringing together 170 thousand people" [23, p. 225].

Another Soviet author writes that: "Many cities in the USA, in the industrial zones of Europe and Japan, are expanding, forming gigantic urban agglomerations, 'megalopolises'".

Under capitalism, this process of rapid urbanization leads to an increase in population numbers and to the uncontrolled growth of criminality in these large cities" [25, p. 119].

There were also Soviet authors who declared that only capitalist countries were characterized by crimes such as: "terrorism, illicit drug trade, counterfeiting money, crimes against property, concealment of wealth obtained through criminal means, following thefts from museums, art galleries, churches, as well as from the illicit arms trade. Around 60% (in Japan) and 90% (in England, USA) of the crimes committed are those against property" [26, p. 59].

Teaching staff in the educational institutions of the force ministries constantly instructed students in the field of fighting foreign spies. The same thing happened in the Militia School in the city of Chișinău. During the lessons, the possible ways of spies infiltrating the territory of the USSR were reviewed.

Japan was permanently included in the list of countries generating danger. In this regard, the Soviet authors V. Kurleandskii and M. Karpushin warned that: "In judicial practice there are cases when Japanese ships entered the territorial waters of the USSR because of bad weather. The crews of these ships declared that they had strayed from their route because of the storm. All crew members were obligatorily subjected to checks, and only if it was proven that they did not intend to cross the border illegally were they not criminally punished" [27, p. 162].

Analyzing these works, we find that the authors took some information from the Soviet press published by propagandists, without verifying its accuracy.

Thus, referring to the newspaper "Известия, 31 мая 1963 г.", N.F. Kuznetsova writes: "In capitalist countries, the crime of child kidnapping is widespread. The USA occupies first place in such crimes.

Japan, before being militarily occupied by the USA, did not know that such crimes existed and could not even translate their names into Japanese. However, in the last 10 years in Japan, 300-500 children are kidnapped annually. Five thousand children kidnapped over 17 years of the Americanization of the country—this is the bitter statistic of this type of crime in Japan" [23, p. 222].

In another case, taking information from the newspaper "Правда, 2 июля 1967 г.", N.F. Kuznetsova states that in Japan many people died because of poisoning from

poor-quality food products: "Around 90% of food products in Japan are sold without any information regarding origin. Very often the quality of the marketed milk leaves much to be desired. Water with synthetic fat is mixed into it" [23, p. 229].

In contrast to the statements of N.F. Kuznetsova come the assertions of the Romanian authors Constantin Bușe and Zorin Zamfir, who found that: "In the 1960s, the growth of the Japanese economy reached rhythms never before seen in any capitalist country. By the end of the 1960-1970 decade, Japan ranked first in the world in shipbuilding, the production of transistor radios, as well as in the production of automobiles, plastics, and synthetic fibers, and produced more steel than West Germany, England, and France taken together. Japan's influence and prestige in the world, due to its economic power, ultra-modern technologies, diligence and tenacity, the talent and discipline of the Japanese people, became incomparably greater than what its political and military leaders had wanted or achieved during the period between 1868 and 1945" [28, p. 369-370].

At the same time, the situation in the USSR deteriorated. Against this background, at the beginning of the 1990s, some Soviet authors began publishing books to offer useful advice to citizens on how to protect themselves from criminals in the country, specifying that the number had grown sharply of: "groups of professional criminals specialized in apartment thefts, vehicle theft, crimes committed in the street (violence, beatings, vandalism, etc.). A considerable part of the population became victims of criminality. People were afraid to leave their homes in the evening and could not lead a normal way of life. Many leave their native place and come to share the fate of refugees. In the country, more than 2 million crimes are committed annually. A number of criminologist scholars consider that the real figure is much higher, around 10 million. Unfortunately, estimates show that every citizen once or twice during life may become a victim of criminality" [29, p. 4-5].

The same situation can be observed today in the Russian Federation, where many authors continue to criticize Japan and the Japanese in their books. The authors L. Vedenskaia and L. Pavlova offer the following recommendations to lawyers: "In Japan, during a discussion, it is not customary to look each other in the eyes, whereas for us, in order to establish normal contact with a person, according to psychologists, one must look at the interlocutor 60–70% of the time during the discussion.

Shy people, who look aside or downward during conversation, do not inspire trust" [30, p. 40].

At the same time, in the opinion of other Russian authors, the psychology of contemporary Japanese is a reflection of the education received over many centuries in accordance with the provisions of the samurai code.

They are accustomed to honoring their given word so as not to lose their dignity. They are always ready to risk their lives to defend their country, their own honor, as well as the honor of the family to which they belong.

Reconstructing historical events, the Russian author E. Iakovlev states that: "In the 1890s... the samurai became the core of the reformed Japanese army and navy, occupying positions as officers and generals. More than 20,000 former samurai joined the police. Two-thirds of the central apparatus were occupied by former samurai and members of their families. Around 40% of teachers were former samurai. They occupied these positions ennobling them with the values on which they had been educated. They were distinguished by honor, dignity, incorruptibility, spirit of sacrifice, etc." [31 p. 240].

Qualities that were certainly lacking in Soviet leaders, accustomed to presenting crimes against the people as acts of heroism. Much more sincere were some war veterans who eventually admitted that some heroic deeds in their biographies were in reality

crimes.

At an event dedicated to war veterans that took place in 2012, retired Colonel Piotr Rudeaghin participated, born on July 7, 1925, in the village of Sergeevka, Krasnodar region, into a worker's family. After graduating from school, he was mobilized into the Red Army.

For a period, he was a fighter in a partisan detachment, after which he became a platoon sergeant of the rifle company of the Ukrainian Front. Later, he graduated from the military medical school and in 1945 was appointed medical instructor in the Motorized Brigade in Transbaikalia... in 1952 he graduated from the Faculty of Law of the University of Odesa... in 1966 he was appointed lecturer at the Militia School of the Ministry of Internal Affairs of the USSR in the city of Chișinău, where he worked for more than 20 years.

During military-patriotic education classes, he told students how, while escorting a train of Japanese prisoners of war, he had been attacked by a *kamikaze* who threw himself at him trying to neutralize him by applying martial arts techniques.

According to P. Rudeaghin, the Japanese prisoner caught him by surprise, but he managed to use his firearm, mortally wounding him. The superior of the train reported the incident to the leadership, mentioning the spirit of bravery shown by the young Soviet soldier Piotr Rudeaghin.

Generations of militia officers heard this legend, and only in 2012 did Piotr Rudeaghin admit that in fact, during service, he had accidentally pulled the trigger and killed a Japanese prisoner of war who was sleeping in the upper bunk of the railway car during transport.

He was saved from trouble by the head of the train, who presented the situation as an attempt on the life of the Soviet soldier by a Japanese prisoner of war. Unfortunately, this is not the only case when a crime committed by a Soviet soldier against a prisoner of war was presented as an act of heroism.

A great number of such falsifications were included in history textbooks published during the Soviet totalitarian regime. Paradoxically, the representatives of the communist totalitarian regime, who conducted political training courses and educated hundreds of thousands of prisoners of war in Soviet camps to become pacifists, over the years launched a series of wars of aggression against sovereign states.

The same criminal policy was also adopted by the autocratic regime in the Russian Federation, which at the present stage, violating the norms of international law, maintains under military occupation territories belonging to other countries.

In 2014, Russian military troops invaded Ukraine, killing with particular cruelty both soldiers and civilians. The war continues to this day. The international community is shocked by the barbarism displayed by soldiers of the Russian army, by the way the norms of international humanitarian law are violated, by acts of torture applied against the civilian population, as well as by video footage of the demonstrative beheading of Ukrainian prisoners captured by Russian troops.

The detention conditions of Ukrainians held in the custody of the authorities of the Russian Federation are degrading. It is evident that the criminal manifestations of the Kremlin leadership generate imminent risks for humanity. During military actions, cases of the use of chemical weapons and other weapons prohibited by international legal acts by Russian troops against Ukrainian soldiers have been reported.

In such a situation, we inevitably remember the judicial trial against the Japanese General Yamada Otozo and the workers of the so-called "Anti-Epidemic Detachment No. 731", as well as the biological and other types of evidence from the criminal case, which remained both in the USSR and in China. In this regard, we cannot exclude the possibility

that these were not destroyed but were used in experiments to create much more dangerous chemical and bacteriological weapons.

In this context, it is necessary to analyze for what purpose Russian propaganda spreads rumors such as: "The coronavirus has become an element of the trade war between the USA and China, a method of reducing the population on the planet, launched by the secret services..." [32, p. 90].

In reality, it is known that China cooperates very closely in many areas with the Russian Federation. Unfortunately, recently more information has appeared regarding the support provided to the Russian Federation by China in the war of aggression against Ukraine.

It should be noted that the autocratic regime in the Russian Federation and some of its allies present a danger to global security. They allow themselves to openly threaten certain states that they may be attacked at any moment by Russian troops. Among the targets, as usual, Japan is also included.

Former Minister of Defense of the Russian Federation Sergei Shoigu spoke about this at a meeting with North Korean leader Kim Jong-un, who visited Russia. Knowing about the recent provocations carried out by North Korea toward Japan, S. Shoigu, while presenting strategic bombers, remarked sarcastically: "They can fly from Moscow to Japan and back" [33].

The behavior of the rulers of the Russian Federation at the present stage does not differ from that of fascist leaders during the Second World War. At their command, Russian ballistic missiles daily make victims among the civilian population of Ukraine.

Both adults and children are being killed. These criminal actions can be stopped only with the involvement of all countries that advocate respect for international law and democratic values.

It is the only solution to demonstrate to dictatorial regimes that the Nuremberg and Tokyo trials were conducted in order to send a clear signal to the international community that no country has the right to threaten the independence and sovereignty of another country, to use force to militarily occupy territories that do not belong to it, and to commit crimes against the population of a foreign country.

At the same time, efforts must be strengthened to free Ukrainian civilians and military personnel held captive on the territory of the Russian Federation under inhuman and degrading conditions similar to those in the Soviet camps where hundreds of thousands of prisoners of war of different nationalities lost their lives, including around 50,000 Japanese.

Conclusion. The study of the legal regime and detention conditions of prisoners of war in the Soviet Union reveals a striking discrepancy between the imperatives of international humanitarian law and the realities of the Stalinist concentration camp system. Although the international normative framework, defined by the Hague and Geneva Conventions (1929), provided theoretical guarantees for the protection of captured combatants, the authorities in Moscow subordinated these obligations to ideological and political interests, leaving room for arbitrariness and systematic abuses.

The daily realities in Soviet camps, marked by forced labor under conditions of extreme exhaustion, chronic malnutrition, and severe deficiencies in medical assistance, transformed the experience of captivity into a mechanism of inhuman and degrading treatment. In this context, the Japanese contingent captured in the Far East represented a particularly vulnerable category, the high mortality rate being the direct consequence of an administration that ignored human dignity in favor of economic exploitation.

A defining aspect of this period was the use of propaganda as an instrument for legitimizing violence. Through public show trials, orchestrated letters of gratitude, and ideological re-education programs, the regime attempted to conceal the repressive nature of the system, constructing a façade of compliance with international norms. The analysis of the Japanese case demonstrates that these practices were not isolated incidents, but constitutive elements of a totalitarian system aimed both at exploiting labor and at the psychological disintegration of the enemy.

Ultimately, the treatment applied to Japanese prisoners of war and those of other nationalities remains indisputable evidence of the repressive nature of the Soviet regime. The lessons drawn from this case study reaffirm the imperative of strengthening international mechanisms for monitoring and protecting human rights. In a world marked by new instabilities, the strict observance of humanitarian norms remains the only guarantee for preventing the repetition of historical tragedies and for protecting human integrity in the face of any totalitarian ideology.

Proposal de lege ferenda. In order to prevent violations of the rights of prisoners of war, it is necessary to strengthen the international legal framework by establishing mandatory mechanisms for monitoring detention facilities under the direct control of neutral international organizations. This reform could include extending the powers of international tribunals so that they would not act only punitively, but would also actively monitor compliance with legal norms and the conduct of armed conflicts in real time.

It is also imperative to establish a stricter sanctions regime for states and individuals responsible for inhuman treatment, together with the introduction of a centralized and mandatory system for recording and reporting the situation of prisoners in order to eliminate the risk of enforced disappearances. At the same time, the legal framework must guarantee the inalienable right to legal assistance and communication with the outside world, combined with rigorous training of military personnel in the field of international humanitarian law. The implementation of these complex measures would contribute to the transition from theoretical protection to effective protection, preventing captivity from becoming an instrument of repression or exploitation.

Abstract

This study analyzes the evolution and consolidation of the international legal framework concerning the criminalization of torture in the context of armed conflicts, highlighting its status as a peremptory norm of international law (jus cogens) and its implications for international criminal responsibility. The research begins with the early regulations established by the Hague Conventions of 1907, which set the first legal limits on the conduct of belligerents, and continues with the significant developments introduced by the Geneva Conventions of 1949 and the Additional Protocols of 1977, which explicitly enshrined the absolute prohibition of torture and inhuman treatment.

The article systematically examines the recognition of torture as an international crime in modern legal instruments, particularly in the Rome Statute of the International Criminal Court, where it is classified both as a war crime, when committed in connection with an armed conflict, and as a crime against humanity, when it forms part of a widespread or systematic attack directed against a civilian population. In this regard, the dual legal regime of incrimination is emphasized, as well as the constitutive elements of the offense, including specific intent and the purposes pursued (such as obtaining information, punishment, intimidation, or discrimination).

Furthermore, the study pays particular attention to the mechanisms for engaging international criminal responsibility, analyzing the role of ad hoc international criminal tribunals (such as the International Criminal Tribunal for the former Yugoslavia and the one for Rwanda) in the development of relevant jurisprudence, as well as the contribution of the International Criminal Court to the consolidation of applicable legal standards. Fundamental principles such as individual criminal responsibility, the non-applicability of statutes of limitation to international crimes, and the inadmissibility of invoking superior orders as a justification for torture are also highlighted.

At the contemporary level, the article identifies several major challenges affecting the effective enforcement of international legal norms. These include the jurisdictional limitations of the International Criminal Court, determined by the principle of complementarity and by the refusal of certain states to ratify the Rome Statute, as well as practical difficulties in evidence collection and the execution of arrest warrants. At the same time, the study examines political pressures exerted by powerful states, which may affect the independence and functioning of international criminal justice mechanisms.

In conclusion, the study reveals a significant gap between international legal norms, which establish the absolute prohibition of torture, and the practical reality of their enforcement. Although the normative framework is well-developed and coherent, its effectiveness is limited by political, institutional, and operational fac-

tors, thereby undermining, to a certain extent, the fundamental objective of international criminal law: the prevention and punishment of the most serious violations of fundamental human rights.

Keywords: torture, war crime, armed conflict, human rights, jus cogens, International Criminal Court, international criminal responsibility.

TORTURA ÎN CONFLICTELE ARMATE: INCRIMINARE ȘI RĂSPUNDERE PENALĂ INTERNAȚIONALĂ

Abstract

Prezentul studiu analizează evoluția și consolidarea cadrului juridic internațional privind incriminarea torturii în contextul conflictelor armate, evidențiind caracterul său de normă imperativă de drept internațional (jus cogens) și implicațiile asupra răspunderii penale internaționale. Cercetarea pornește de la reglementările incipiente consacrate în Convențiile de la Haga din 1907, care au stabilit primele limite juridice privind conduita beligeranților, continuând cu dezvoltările semnificative aduse de Convențiile de la Geneva din 1949 și Protocoalele adiționale din 1977, ce au consacrat în mod explicit interdicția absolută a torturii și a tratamentelor inumane.

Articolul examinează în mod sistematic consacrarea torturii ca infracțiune internațională în instrumentele juridice moderne, în special în Statutul de la Roma al Curții Penale Internaționale, unde aceasta este calificată atât ca crimă de război, atunci când este comisă în legătură cu un conflict armat, cât și ca crimă împotriva umanității, în cazul în care face parte dintr-un atac generalizat sau sistematic îndreptat împotriva populației civile. În acest sens, se subliniază dublul regim juridic al incriminării, precum și elementele constitutive ale infracțiunii, inclusiv intenția specifică și scopul urmărit (obținerea de informații, pedepsirea, intimidarea sau discriminarea).

De asemenea, studiul acordă o atenție deosebită mecanismelor de angajare a răspunderii penale internaționale, analizând rolul instanțelor penale internaționale ad-hoc (precum Tribunalul Penal Internațional pentru fosta Iugoslavie și cel pentru Rwanda) în dezvoltarea jurisprudenței relevante, precum și contribuția Curții Penale Internaționale la consolidarea standardelor juridice aplicabile. Sunt evidențiate principiile fundamentale precum responsabilitatea penală individuală, imprescriptibilitatea crimelor internaționale și inadmisibilitatea invocării ordinului superior ca justificare pentru comiterea torturii.

În plan contemporan, articolul identifică o serie de provocări majore care afectează eficiența aplicării normelor juridice internaționale. Printre acestea se numără limitele jurisdicționale ale Curții Penale Internaționale, determinate de principiul complementarității și de refuzul unor state de a ratifica Statutul de la Roma, precum și dificultățile practice în colectarea probelor și executarea mandatelor de arestare. Totodată, sunt analizate influențele politice exercitate de statele puternice, care pot afecta independența și funcționarea mecanismelor de justiție penală internațională.

În concluzie, studiul relevă existența unui decalaj semnificativ între normele juridice internaționale, care consacră interdicția absolută a torturii, și realitatea practică a aplicării acestora. Deși cadrul normativ este bine dezvoltat și coerent, eficiența sa este limitată de factori politici, instituționali și operaționali, ceea ce compromite, într-o anumită măsură, realizarea obiectivului fundamental al dreptului penal internațional: prevenirea și sancționarea celor mai grave încălcări ale drepturilor fundamentale ale omului.

Cuvinte-cheie: tortură, crimă de război, conflict armat, drepturile omului, jus cogens, Curtea Penală Internațională, răspundere penală internațională.

Introduction. The evolution of human civilization has been accompanied since its very origins by the element of violence [1, p.133]. Violence represents one of the most serious violations of human dignity and one of the fundamental constants of human existence, manifesting itself throughout history in varied forms and intensities.

The phenomenon of organized armed violence can be traced back to the era of pre-state formations, which possessed armed groups, continuing with the well-structured armies of great ancient empires, the military forces of feudal lords, and up to the armies of the modern era. Nevertheless, the central and immutable element of any military force, throughout history, has remained and continues to be the human person – the combatant [1, p.133].

What distinguishes human beings from other forms of life is the capacity to evolve and regulate their own behavior, including in situations of conflict. It is upon this capacity that an international legal framework has been progressively built, aimed at limiting violence in relations between states. War, as the extreme form of organized violence, has become the subject of increasingly elaborate international regulations.

International humanitarian law, crystallized through the Geneva Conventions of 1949 and their Additional Protocols, expressly prohibits any form of torture, degrading treatment, or mutilation applied to protected persons in the context of armed conflicts.

The prohibition of torture is enshrined in both universal instruments and in international humanitarian law, being qualified as a grave breach that entails the criminal responsibility of its perpetrators. Furthermore, the effectiveness of protection mechanisms is often limited by practical difficulties, such as the impossibility of collecting evidence, the destruction of judicial infrastructure, or the lack of state cooperation, which necessitates the strengthening of normative and institutional guarantees at the international level, as well as the development of effective mechanisms for holding perpetrators criminally accountable for such acts.

In the context of armed conflicts, torture falls within the category of serious violations of human rights, being prohibited by both international human rights law and international humanitarian law. It affects the essential core of rights inherent to the human being, grounded in human dignity, and frequently manifests itself within armed conflicts through acts of violence against civilians or persons outside of hostilities. Such acts fall within the sphere of the most serious crimes of concern to the international community, being susceptible to qualification as war crimes or crimes against humanity [8, pp.101-110].

As Nigel Rodley and Matt Pollard note, many aspects of the international public order in the modern world were shaped as a reaction to the events of the Second World War. The United Nations, at the center of international cooperation, proclaims in the first article of its Charter, as one of its purposes, the achievement of international cooperation in promoting and encouraging respect for human rights and fundamental freedoms without distinction as to race, sex, language, or religion. When the United Nations came into existence and began drafting instruments intended to identify the principal norms on human rights, the experience of the atrocities of the Second World War made it inevitable to address the issue of torture. Accordingly, the Universal Declaration of Human Rights of 1948 prohibited torture, giving rise to a prohibition that has since been embedded in various international instruments on the protection of human rights [13, pp.45-46].

Aggression has always been associated with the violation of human rights. Unfortunately, social progress and the development of humanist ideas have not improved the situation with regard to human rights at the international level, and the numerous conflicts from the Second World War to the current wars in Ukraine and the Middle East have demonstrated the inability of international sanctioning mechanisms, with the law of the strongest continuing to operate and generating crimes on a horrifying scale.

This article aims to examine how the phenomenon of torture is criminalized in international criminal law, as well as the mechanisms through which criminal responsibility arises in cases where such acts are committed in armed conflicts. The paper also analyzes the main challenges facing the international criminal justice system in combating such acts, including the jurisdictional limits of the International Criminal Court. To this end, the analysis will be structured beginning with the international legal framework for the criminalization of torture, continuing with torture in armed conflicts — criminalization and international criminal responsibility — and concluding with contemporary challenges

in the application of international criminal responsibility.

Materials and methods: This study was elaborated through the use of a body of primary and secondary legal materials, selected according to their relevance to the investigated subject matter. The methodological foundation of the research consists of the dogmatic method, which ensures the systematic interpretation of applicable international legal norms. The historical method and the comparative method were also employed, each distinctly contributing to the rigorous and comprehensive analysis of the investigated phenomenon.

Discussions and results obtained. The international legal framework for the criminalization of torture in armed conflicts is a layered and coherent one, built on three pillars: international criminal law, international human rights law, and international humanitarian law. These three normative systems confer upon the prohibition of torture an absolute and universal character, the violation of which entails individual criminal responsibility.

From the long list of normative acts dedicated to the prevention and combating of torture, the most relevant ones for both combatants and civilians are cited below.

The Regulations respecting the Laws and Customs of War on Land, Annex to the Fourth Hague Convention of 1907 concerning the Laws and Customs of War on Land, provides in Article 4 that "Prisoners of war are in the power of the hostile Government, but not of the individuals or corps who capture them. They must be humanely treated" [2]. Article 4 of the Regulations annexed to the Fourth Hague Convention of 1907 does not contain an express prohibition of torture, but establishes an obligation of humane treatment of prisoners of war. Therefore, any form of ill-treatment, including torture, is implicitly excluded.

The Geneva Conventions of 1949 and the Additional Protocols of 1977 provide that persons taking no active part in the hostilities, including members of armed forces who have laid down their arms and those placed hors de combat by sickness, wounds, detention, or any other cause, shall in all circumstances be treated humanely, without any adverse distinction founded on race, colour, religion or faith, sex, birth or wealth, or any other similar criteria [7].

The Universal Declaration of Human Rights, adopted on 10 December 1948, provides in Article 5: "No one shall be subjected to torture or to cruel, inhuman or degrading treatment or punishment" [3].

The International Covenant on Civil and Political Rights, adopted on 16 December 1966 in New York, stipulates in Article 7: "No one shall be subjected to torture or to cruel, inhuman or degrading treatment or punishment. In particular, no one shall be subjected without his free consent to medical or scientific experimentation" [4].

The European Convention for the Protection of Human Rights and Fundamental Freedoms, adopted in 1950, stipulates in Article 3: "No one shall be subjected to torture or to inhuman or degrading treatment or punishment" [5].

The First United Nations Congress on the Prevention of Crime and the Treatment of Offenders, held from 22 August to 3 September 1955 in Geneva, established a set of minimum rules for the treatment of prisoners, subsequently approved by the Economic and Social Council through Resolution No.663 C (XXIV) of 31 July 1957 and supplemented by Resolution No.207 (LXII) of 13 May 1977. Thus, "Article 31 of this document provides that corporal punishment, confinement in a dark cell, and all cruel, inhuman, or degrading punishments shall be completely prohibited as disciplinary sanctions. Article 32(1): Punishments by close confinement or reduction of diet shall never be inflicted unless the medical officer has examined the prisoner and certified in writing that he is fit to sustain

it. Article 33: Instruments of restraint, such as handcuffs, chains, irons, and straitjackets, shall never be applied as a punishment. Chains and irons shall not be used as restraints" [6, p.11].

The UN Convention of 1984 against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment, in Article 1, establishes the concept of torture and defines it as a distinct and the most serious form of ill-treatment, characterized by the intensity of suffering, intent, and the involvement of a public authority agent, in relation to cruel, inhuman, or degrading treatment [9].

A landmark moment in the development of international criminal law, including in the area of torture, was constituted by the International Criminal Tribunal for the former Yugoslavia. The Trial Chamber found that the prohibition of torture had acquired the status of jus cogens, which may be defined as a peremptory norm in international law from which no derogation is permitted. The Tribunal further identified as elements of the offence of torture "the intentional infliction, by act or omission, of severe pain or suffering, whether physical or mental, for the purpose of obtaining information or a confession, or of punishing, intimidating, humiliating, or coercing the victim or a third person, or for any reason based on discrimination of any kind against the victim or a third person. For such an act to constitute torture, one of the parties must be a public official or must, in any event, act in a non-private capacity, for example, as a de facto organ of a state or of any other entity exercising authority" [10].

The Rome Statute and the establishment of the International Criminal Court represent the apex of legal evolution in the criminalization of torture, codifying the jurisprudence of previous international tribunals, surpassing the limits of the Convention against Torture, and establishing a permanent mechanism for holding perpetrators accountable [11].

Although international law has evolved significantly in the area of the prohibition of torture — from the Hague Conventions to the Rome Statute and the establishment of the International Criminal Court — the reality is that the practice of contemporary armed conflicts demonstrates a profound gap between the written norm and the reality on the battlefield.

Reality demonstrates that both armed conflicts and "special military operations" create a permissive environment for the application of torture, premised on justifications such as defeating the adversary, national defense, ideological or religious excuses, or as a "method of interrogation", as evidenced by the judgment of the International Criminal Tribunal for the former Yugoslavia in the Furundžija case, in which the Tribunal held that the prohibition of torture had acquired jus cogens status and that torture committed in a military context entails individual criminal responsibility.

Torture in Armed Conflicts: Criminalization and International Criminal Responsibility: According to Article 1 of the UN Convention against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment of 1984, torture means "any act by which severe pain or suffering, whether physical or mental, is intentionally inflicted on a person for such purposes as obtaining from him or a third person information or a confession, punishing him for an act he or a third person has committed or is suspected of having committed, or intimidating or coercing him or a third person, or for any reason based on discrimination of any kind, when such pain or suffering is inflicted by or at the instigation of or with the consent or acquiescence of a public official or other person acting in an official capacity. It does not include pain or suffering arising only from, inherent in or incidental to lawful sanctions" [9].

The Rome Statute of 17 July 1998 of the International Criminal Court criminalizes torture both as a crime against humanity (Article 7(1)(f)) and as a war crime (Article 8(2)(a)(ii); Article 8(2)(c)(i)) [11]. The Statute does not provide a definition of torture; accordingly, in 2002 the Elements of Crimes was adopted, an auxiliary instrument that details element by element each offence provided for in the Statute.

Thus, according to the Elements of Crimes, torture as a crime against humanity is understood as "the intentional infliction of severe physical or mental pain or suffering upon one or more persons in the custody or under the control of the perpetrator, provided that such pain or suffering does not arise only from, and is not inherent in or incidental to, lawful sanctions, committed as part of a widespread or systematic attack directed against any civilian population, with the perpetrator's knowledge of or intent that the conduct be part of such an attack" [12, p.5].

Regarding torture as a war crime, the Rome Statute of the International Criminal Court divides war crimes into those committed in international armed conflict and those committed in non-international armed conflict.

Torture as a war crime in international armed conflict is understood as "the intentional infliction of severe physical or mental pain or suffering upon one or more persons protected under one or more of the Geneva Conventions of 1949, committed for the purpose of obtaining information or a confession, as punishment, intimidation, coercion, or for any reason based on discrimination of any kind, in the context of and in association with an international armed conflict of which the perpetrator was aware, as well as the factual circumstances that established the protected status of the victim" [12, p.10].

Torture as a war crime committed in a non-international armed conflict is understood as "the intentional infliction of severe physical or mental pain or suffering upon one or more persons who were hors de combat or were civilians, medical personnel, or religious personnel taking no active part in the hostilities, committed for the purpose of obtaining information or confessions, as punishment, coercion, intimidation, or for any reason based on discrimination of any kind, committed in the context of and in association with a non-international armed conflict of which the perpetrator was aware, as well as the factual circumstances that established the protected status of the victim" [12, p.22].

Following the analysis of the concept of torture as set out in the 1984 UN Convention and the Rome Statute of the International Criminal Court, a fundamental difference based on two key pillars is identified:

1. The 1984 UN Convention limits torture to acts committed by state representatives, whereas the Elements of Crimes of the Rome Statute has a broader scope, encompassing non-state actors as well — a reality of contemporary armed conflicts where non-state groups are active participants. An example of a non-state group involved in contemporary armed conflicts is the "Wagner Group" in Ukraine.

2. The 1984 UN Convention is an instrument of international human rights law that obliges states to prohibit torture, whereas the Elements of Crimes of the Rome Statute is an instrument of international criminal law that guides international criminal responsibility.

A reference point in refining the concept of torture as a war crime was the International Criminal Tribunal for the former Yugoslavia, *the Furundžija case*, which provided a definition of torture in international humanitarian law as "the intentional infliction, by act or omission, of severe pain or suffering, whether physical or mental, for the purpose of obtaining information or a confession, or of punishing, intimidating, humiliating, or coercing the victim or a third person, or for any reason based on discrimination of any

kind against the victim or a third person. For such an act to constitute torture, one of the parties must be a public official or, in any event, must act in a non-private capacity, for example, as a de facto organ of a state or of any other entity exercising authority". The Trial Chamber of the Tribunal further held that rape and other serious sexual assaults in situations of armed conflict may constitute torture (*the* Čelebići *case*). Accordingly, the Tribunal confers upon the prohibition of torture the status of a jus cogens norm [10].

In the context of armed conflicts, human rights violations acquire a systemic character, directly affecting what legal scholarship describes as the "immutable core of fundamental rights", which includes the right to life, the prohibition of torture and inhuman or degrading treatment, and the right to a fair trial. These rights are absolute in character, being inherent to human nature, inalienable and indispensable to the existence of the individual, which is why they cannot be restricted even in exceptional circumstances such as war [14].

In academic literature, Stuart Casey-Maslen emphasizes that torture committed in the context of and in direct connection with an armed conflict constitutes, unequivocally, a war crime under international law. Furthermore, the author highlights that when committed as part of a widespread or systematic attack directed against a civilian population, with knowledge of that attack, torture falls within the category of crimes against humanity, regardless of whether it occurs within or outside an armed conflict. With regard to the relationship between torture and genocide, it is noted that torture is not autonomously qualified as an act of genocide, even when committed with the specific intent to destroy, in whole or in part, a protected group. However, in certain circumstances, torture may constitute a material element of genocidal acts, insofar as it involves causing serious bodily or mental harm to members of the targeted group [15].

Contemporary legal scholarship emphasizes that torture, while constituting in itself a serious violation of fundamental rights, acquires a higher legal gravity when committed as part of a widespread or systematic attack directed against the civilian population, thereby being qualified as a crime against humanity. In this regard, crimes against humanity represent autonomous international offences, characterized by the scale or organized nature of the acts of violence and their orientation against civilians, encompassing acts such as torture, murder, or sexual violence. An essential aspect is that these crimes may be committed both in the context of international and non-international armed conflicts, without requiring the existence of an inter-state conflict, and may be attributed to both state and non-state actors involved in hostilities. Furthermore, although international mechanisms such as the International Criminal Court provide the legal framework for sanctioning such acts, their effectiveness is often limited by deficiencies in national justice systems and by the lack of effective international cooperation in this area. In this context, the International Criminal Court plays an essential role in holding perpetrators criminally accountable, pursuant to the Rome Statute of the International Criminal Court, which confers upon it jurisdiction over the most serious offences, including genocide, crimes against humanity, and war crimes. However, the effectiveness of this mechanism is limited by the principle of complementarity and by jurisdictional constraints, particularly in situations where states are not parties to the Statute or do not cooperate with the international court, which in practice leads to difficulties in ensuring effective criminal accountability for acts of torture committed in armed conflicts [16].

The analysis of criminal responsibility for war crimes highlights the fact that International Humanitarian Law establishes a set of binding norms applicable during armed conflicts, the serious violation of which entails legal responsibility. Within this framework,

serious violations of the norms enshrined in the Geneva Conventions and the Rome Statute of the International Criminal Court may constitute war crimes, engaging both individual responsibility and, under certain conditions, state responsibility. The distinct role of command responsibility, as a particular form of individual criminal responsibility specific to international criminal law, is also noteworthy. In this context, holding perpetrators criminally accountable represents an essential mechanism for ensuring compliance with the laws of war and for preventing abuses during armed conflicts.

The evolution of individual criminal responsibility for serious violations of human rights reflects the profound transformation of international law, from a system centered exclusively on states to one that recognizes the direct responsibility of individuals for acts committed under state authority. Traditionally, state officials enjoyed broad immunity for acts performed in the exercise of their functions, and international law did not effectively regulate their conduct toward their own citizens. This paradigm was radically altered after the Second World War, when, in the wake of the atrocities committed, the principle of individual criminal responsibility in international law was established, in particular through the Nuremberg trials, which held that individuals may be held accountable for war crimes and crimes against humanity, regardless of their official position or superior orders received. This evolution formed the basis for the subsequent development of international criminal law and the consolidation of modern mechanisms for sanctioning acts such as torture, enshrining the idea that the protection of human dignity requires not only the establishment of norms but also the institution of effective mechanisms for holding perpetrators of serious violations accountable [17].

The author Rogier Bartels highlights that, within international criminal law, the legal qualification of armed conflicts constitutes a determining element for establishing the applicability of international humanitarian law norms and, implicitly, for engaging international criminal responsibility for war crimes. In this regard, the distinction between international armed conflict and non-international armed conflict, enshrined in fundamental instruments such as the Geneva Conventions of 1949 and the Additional Protocols of 1977, directly influences both the scope of application of legal norms and the legal characterization of unlawful acts. Furthermore, the jurisprudence of international criminal courts, particularly the ad hoc tribunals and the International Criminal Court, has played an essential role in clarifying these concepts, developing relevant criteria — such as the intensity of violence and the degree of organization of the parties involved — for identifying the existence of an armed conflict. At the same time, an erroneous qualification of the nature of the conflict may generate negative consequences both for the correct application of international humanitarian law and for the respect of the procedural rights of the accused, including the right to a fair trial, which underscores the need for a rigorous and coherent approach in the legal qualification of armed conflicts.

In the doctrine of international criminal law, it is emphasized that the criminalization of torture has deep historical roots, having been recognized as a serious violation of the laws and customs of war since the post-World War I period, when it was included in the list of international crimes drawn up at the Paris Peace Conference of 1919. Even in the absence of an initial conventional codification, the prohibition of torture was grounded in customary law and in the "dictates of humanity", enshrining the idea that the infliction of suffering for punitive or coercive purposes is inadmissible. Subsequently, this prohibition was reinforced by the jurisprudence of the Nuremberg Tribunal, which held that superior orders cannot constitute a justification for acts of torture or other inhumane treatment. The subsequent normative evolution led to the express consecration of torture as an in-

ternational offence in legal instruments such as Control Council Law No. 10, which was later adopted and further developed in the statutes of the ad hoc international criminal tribunals and in the Rome Statute of the International Criminal Court. Today, torture is recognized both as a war crime and as a crime against humanity, applicable also in non-international armed conflicts and, under certain conditions, even in the absence of an armed conflict [18].

In the context of contemporary armed conflicts, legal scholarship highlights that serious violations of international humanitarian law norms are not limited to direct acts of violence but may also include indirect forms of harm to the integrity of the person, such as the refusal or obstruction of humanitarian assistance. Thus, the deliberate deprivation of essential resources such as food, water, or medical care may lead to serious suffering and may be qualified as a war crime, insofar as it affects the civilian population or persons outside of hostilities. This perspective underscores the fact that the protection afforded by International Humanitarian Law aims not only at prohibiting direct violence but also at preventing any practices that may generate suffering incompatible with human dignity. Among the most recent conflicts, mention may be made of the invasion of Ukraine in 2022, the conflict in Sudan in 2023, the Hamas invasion of Israel at the end of 2023 and the Israeli invasion of the Gaza Strip, including the broader conflict in the Middle East. All of these conflicts record massive violations of human rights. The use of various types of weapons, abuses against prisoners and civilians in occupied territories, the destruction of vital infrastructure, as well as acts of atrocity specific to warfare represent a negative dimension of armed confrontation. These criminal acts have no justification and must be sanctioned with severity. In such circumstances, two determining factors of criminal responsibility for war crimes arise: 1) prosecution, which is an extremely difficult process; and 2) adjudication. In such circumstances, prosecution is extremely difficult, the main challenge being the collection and preservation of evidence.

The analysis of the international normative framework for the criminalization of torture in armed conflicts reveals the existence of a layered and coherent legal system, progressively constructed from the Hague Conventions of 1907 to the Rome Statute of the International Criminal Court and the Elements of Crimes, which confer upon the prohibition of torture an absolute and universal character. Nevertheless, the existence of a solid and well-constructed normative framework does not in itself guarantee effectiveness. The enormous gap between the written norm and the reality of contemporary armed conflicts demonstrates that the criminalization of torture remains insufficient in the absence of effective mechanisms for enforcement and criminal accountability. It is precisely this gap that constitutes the fundamental challenge of international law, which will be examined further below.

Contemporary Challenges in the Application of International Criminal Responsibility. The founding treaty of the International Criminal Court, known as the Rome Statute with its Elements of Crimes, grants the Court jurisdiction over four main crimes: 1) genocide; 2) war crimes; 3) crimes against humanity; and 4) the crime of aggression [19]. Established for the investigation and punishment of crimes of such magnitude as to trigger concern and involvement at the international level, it is paradoxically not equipped with a police force capable of acting freely on the territory of affected states. Investigators find themselves in the position of having to cooperate with or overcome the resistance of precisely those authorities whose inaction necessitated international intervention. The challenge, particularly with regard to states that are openly or tacitly hostile to such investigations, lies in finding the right combination of legal coercion and, to the

extent possible, direct action to enable proper investigations to be conducted [20, p.363].

Ensuring the protection and prosecution of these crimes is extremely difficult, the first problem being the loss or destruction of evidence. According to testimonies from citizens of various regions who were present in areas of armed conflict, mass executions of the civilian population took place during the period of occupation, people were tortured, women were abused and raped, and many citizens disappeared. Without doubt, in such circumstances, access to justice and the benefit of a fair trial are inconceivable. The most alarming aspect is that the majority of evidence is destroyed or disappears, which significantly complicates the investigation of cases. This problem is further aggravated by the principle of complementarity, according to which the International Criminal Court intervenes only when the state concerned is unable or unwilling to investigate, thereby creating a vicious circle. It is precisely those states that allow the destruction of evidence that also obstruct national investigations [14].

Beyond the practical challenges related to the collection of evidence, the effectiveness of the International Criminal Court is also limited by the refusal of certain world powers to recognize its authority. The International Criminal Court, on the one hand, has potentially unlimited geographical jurisdiction over international crimes; at the same time, the attitude of some of the world's most influential states — the Russian Federation, the United States, China, India, and Israel — which are not members of the International Criminal Court, must not be overlooked. The absence of these states creates a serious impunity gap, as their citizens and officials cannot be prosecuted without their voluntary cooperation.

Furthermore, the United States imposed sanctions against officials of the International Criminal Court who issued an arrest warrant in the name of Israeli Prime Minister Benjamin Netanyahu [21]. Russia withdrew its signature from the Statute in 2016 following the opening of the investigation into Crimea [22]. Although the International Criminal Court issued an arrest warrant for Israeli Prime Minister Benjamin Netanyahu, he visited Hungary — a founding member state of the Court — without any consequences, and on several occasions, Hungary declared its intention to withdraw from the Court [23].

This demonstrates that political pressure can undermine the very foundations of international criminal justice. Under these conditions, victims of international crimes are often left without access to justice, and the principle of the inevitability of punishment is gravely compromised.

Conclusion. The analysis of the international normative framework for the criminalization of torture in armed conflicts reveals the existence of a layered and coherent legal system, progressively constructed from the Hague Conventions of 1907 to the Rome Statute of the International Criminal Court and the Elements of Crimes, which confer upon the prohibition of torture the character of a jus cogens norm, being criminalized both as a crime against humanity and as a war crime, applicable in both international and non-international armed conflicts.

Nevertheless, the existence of a normative framework does not in itself guarantee practical effectiveness. The gap between the written norm and the reality of armed conflicts constitutes the fundamental challenge of the international criminal justice system. The destruction of evidence, the obstruction of national investigations, the absence of an international police force, and the refusal of certain world powers to recognize the jurisdiction of the Court create conditions of impunity in which victims of international crimes are often left without access to justice.

Recent cases — the conflict in Ukraine, the Hamas invasion of Israel, the Israeli in-

vasion of the Gaza Strip, and the conflict in the Middle East — demonstrate that the international mechanism for holding perpetrators criminally accountable is subject to unprecedented political pressures. The sanctions imposed by the United States against officials of the International Criminal Court, Russia's withdrawal from the Rome Statute, and the visit of Israeli Prime Minister Benjamin Netanyahu to Hungary — a Member State of the Court — without any legal consequences, demonstrate that political will remains the determining factor in the effective application of international criminal law. The principle of the inevitability of punishment is gravely compromised at the international level.

International criminal justice stands at a historic crossroads: either it consolidates its authority and independence from political pressures, or it risks becoming a formal instrument devoid of real effectiveness. Overcoming these challenges requires the strengthening of international cooperation in the collection of evidence, the expansion of the universality of the Rome Statute, and the reinforcement of mechanisms for the protection of victims in conflict zones.

Abstract

A quarter of a century after the adoption of the United Nations Convention against Transnational Organized Crime (Palermo, 2000), current geopolitical and technological realities have surpassed the scenarios for which that legal framework was originally designed. The classical model of hierarchical clandestine organizations has been replaced by fluid networks lacking a visible center, capable of symbiotically integrating into the formal economy and acting as autonomous geopolitical actors.

Drawing upon the "wave theory" proposed by Phil Williams (2024), the conceptual analyses developed by Iurie Larii (2020, 2025), and the studies on paramilitary formations conducted by Radion Cojocaru and Andrei Cazacicov (2017), this article examines the contemporary transformations of transnational organized crime (TOC). The analysis highlights the expansion of hybrid illicit markets, cybercrime, the reconfiguration of human trafficking in the context of regional conflicts, and the security implications for states affected by systemic vulnerabilities, such as the Republic of Moldova.

The article concludes that, in the absence of a fundamental reconceptualization of the phenomenon and strengthened regional cooperation, current legal instruments risk becoming increasingly obsolete.

DOMENIILE DE MANIFESTARE, TENDINȚELE ȘI DINAMICA CRIMINALITĂȚII ORGANIZATE TRANSNAȚIONALE

Abstract

La un sfert de secol de la adoptarea Convenției Națiunilor Unite împotriva Criminalității Organizate Transnaționale (Palermo, 2000), realitățile geopolitice și tehnologice actuale au devansat scenariile pentru care a fost conceput acel cadru juridic. Modelul clasic al asociațiilor clandestine piramidale a fost înlocuit de rețele fluide, lipsite de un centru vizibil, capabile să se contopească simbiotic cu economia formală și să acționeze ca actori geopolitici autonomi.

Utilizând ca repere „teoria valurilor" propusă de Phil Williams (2024), analizele conceptuale realizate de Iurie Larii (2020, 2025) și cercetările privind formațiunile paramilitare semnate de Radion Cojocaru și Andrei Cazacicov (2017), prezentul articol examinează mutațiile contemporane ale criminalității organizate transnaționale (COT). Analiza evidențiază expansiunea piețelor hibride, a criminalității cibernetice, reconfigurarea traficului de ființe umane pe fondul conflictelor regionale și impactul de securitate asupra unor state cu vulnerabilități sistemice, precum Republica Moldova.

Se concluzionează că, fără o reconceptualizare fundamentală a fenomenului și o cooperare regională consolidată, instrumentele juridice actuale riscă să devină anacronice.

***Cuvinte-cheie**: criminalitate organizată transnațională, procese geopolitice, globalizare, piețe ilicite, criminalitate cibernetică, droguri, trafic de ființe umane, spații hibride, zona gri.*

Introduction. A quarter of a century after the adoption of the United Nations Convention against Transnational Organized Crime (Palermo, 2000), contemporary geopolitical and technological transformations have substantially outpaced the operational and conceptual assumptions underpinning this legal framework. The traditional model of hierarchical, territorially anchored clandestine organizations has progressively given way to fluid, decentralized and adaptive network structures, characterized by the absence of a discernible center of command and by a high degree of integration within licit economic systems. In certain contexts, such networks increasingly function as autonomous actors with quasi-geopolitical attributes.

Building on Phil Williams' "wave theory" (2024), the conceptual frameworks advanced by Iurie Larii (2020, 2025), and the empirical analyses of paramilitary formations conducted by Radion Cojocaru and Andrei Cazacico (2017), this article examines the evolving manifestations of transnational organized crime (TOC). The study focuses on the expansion of hybrid illicit markets, the intensification of cyber-enabled criminal activities, and the structural reconfiguration of human trafficking dynamics in the context of regional armed conflicts. It further assesses the implications of these developments for states exposed to systemic vulnerabilities, with particular reference to the Republic of Moldova.

Discussions and results obtained. I. The International Conventional Framework and Its Conceptual Limitations. A retrospective assessment of the quarter-century that has elapsed since the adoption of the United Nations Convention against Transnational Organized Crime at Palermo in December 2000 highlights the axiomatic role of this legal instrument as a genuine cornerstone of contemporary transnational criminal law [1]. At the time of its codification, the international community operated with a predictable typology of the threat: strictly hierarchical groups, quasi-military internal structures, an exclusive focus on financial profit accumulation, and operations conducted entirely outside the legal framework. During that period, the traditional Sicilian mafia model and the major Colombian cartels, such as the Medellín Cartel, constituted the principal empirical and analytical benchmarks.

In the contemporary landscape, however, this restrictive interpretative framework risks becoming anachronistic. The phenomenon that the Palermo Convention sought to circumscribe has metamorphosed into a multidimensional criminal universe characterized by diffuse and profoundly destabilizing structural complexity [2]. From a doctrinal perspective, the Palermo Convention deliberately avoided formulating an exhaustive conceptual definition of transnational organized crime, opting instead for a pragmatic approach based on the enumeration of its essential constitutive elements: the association of a group composed of at least three persons, the existence of a durable structure over time, the purpose of obtaining material or financial benefits, and the presence of a clear transnational dimension.

This definitional prudence, dictated at the time by the imperatives of international diplomatic consensus, proved to be a double-edged sword. On the one hand, it ensured the political success of the document by facilitating its near-universal ratification, currently bringing together 190 States Parties. On the other hand, it generated a major conceptual vacuum, subsequently filled in national practice by fragmented legislative paradigms that are often incompatible with one another.

Contemporary criminological doctrine emphasizes this gap, arguing that the UN definition, deeply rooted in the realities of the 1990s, has become partially outdated. It is incapable of fully capturing the essence of modern networks, which no longer operate in direct opposition to the state but increasingly develop relationships of structural symbi-

osis with it, often evolving into autonomous geopolitical actors.

Within this analytical framework, the valorization of domestic scholarly contributions becomes imperative for deciphering regional specificities and the nuances of criminal manifestations. In this regard, professor Iurie Larii addresses, in his textbook "*Criminology*" [3], as well as in the seminal study "*The Impact of Globalization and Geopolitical Processes on Transnational Organized Crime*" [4], the theoretical, conceptual, and macro-geopolitical dimensions of the phenomenon. The author substantiates the thesis that "organized crime, particularly its transnational form, constitutes one of the most serious threats not only to the security of individual states but also to the entire international community," expressly warning that "its danger intensifies with the increasing levels of mobility, flexibility, and adaptability to political and socio-economic changes".

This integrated theoretical perspective provides the epistemological key to understanding why national public policies and international strategies traditionally focused on prevention and suppression often fail to mitigate or outpace the accelerated dynamics of the phenomenon. This criminological diagnosis resonates profoundly with contemporary geopolitical realities, where the rigidity of state mechanisms is continuously counterbalanced by the fluidity and transformative capacity of hybrid criminal networks.

In another related dimension of specialized research, scholars Radion Cojocaru and Andrei Cazacicov, in their study "*Illegal Paramilitary Formation as a Form of Manifestation of Organized Crime*" [5], investigate the various forms through which criminal networks manifest themselves. The authors rigorously highlight the clear legal and doctrinal distinctions that this type of organization presents in relation to other classical forms of criminal association, while also outlining the essential structural characteristics and qualification criteria of illegally operating paramilitary formations. These scientific contributions prove fundamental for deciphering the regional specificity of the criminogenic phenomenon, providing indispensable explanatory benchmarks for the analysis of security vulnerabilities in the Republic of Moldova and throughout the post-Soviet space, where the presence of hybrid militarized structures has left deep marks on institutional stability.

II. Dynamics of Global Illicit Markets: Polycriminality, Synthetic Drugs and the Cyber Vector. This theoretical diagnosis concerning the obsolescence of the traditional conventional framework is fully confirmed by global empirical data reflected in recent monitoring reports. Thus, the Global Organized Crime Index 2025, developed under the auspices of the *Global Initiative Against Transnational Organized Crime* [6], indicates that an alarming number of 66 states—representing more than one-third of the total membership of the United Nations—are situated within the zone of maximum systemic risk, defined by the critical intersection of high levels of criminality and extremely low institutional resilience. This statistical configuration reflects the accelerated proliferation of global illicit markets, dominated by the complex phenomenon of polycriminality.

In this context, the expansion of synthetic drugs, comprehensively documented by UNODC in the *World Drug Report* 2024 [7], has already surpassed the historic fentanyl crisis in North America in both scale and severity, spreading at a geometric rate throughout Europe and Southeast Asia. To decipher the underlying drivers of this development, Phil Williams [8], in his seminal study "*The Fifth Wave: Organized Crime in 2040*", proposes a conceptual periodization articulated through successive waves. This analytical paradigm traces the transformation of the phenomenon from classical mafia manifestations and traditional narcotics trafficking networks, through the transitional phase marked by the impact of economic globalization and the explosion of cybercrime, culminating in what the author designates as the "fifth wave". Within this new era, transnational organized

crime is metamorphosing from an external threat into a structural phenomenon deeply embedded within the technological, digital, and geopolitical architecture of the contemporary world.

The same author judiciously observes that the reconfiguration of market preferences toward synthetic drugs and the creation of customized cocktails of psychoactive substances—combining stimulants with depressants—constitute a fundamental qualitative paradigm shift in illicit markets, extending far beyond a mere quantitative evolution in the supply of prohibited substances. Similarly, illicit activities that were once classified as marginal "non-violent" offenses—such as cybercrime and large-scale macroeconomic fraud—have migrated directly into the core of global economic disorder, asymmetrically and severely affecting states whose digital and institutional architectures exhibit systemic vulnerabilities.

Criminologist McKenzie O'Brien, whose theses are incorporated into Williams' prospective research [8], accurately captures the essence of this structural transformation. She demonstrates that contemporary criminal organizations, guided by a pragmatic instinct for adaptation to technological opportunities, have capitalized on the Internet, transforming it from a mere communication tool into an optimized infrastructure for the delivery of illicit services. This new operational environment has proven infinitely more accessible to users, considerably more resistant to traditional investigative methods due to encryption technologies, and, consequently, substantially more profitable from a financial perspective.

From a domestic perspective, researcher Veaceslav Ursu [9], in his doctoral dissertation "*Organized Crime: Criminological and Criminal-Law Aspects*", as well as in subsequent specialized studies co-authored with other scholars [10], provides an in-depth criminological analysis of the phenomenon through the prism of the evolution of the criminal policy of the Republic of Moldova. According to Veaceslav Ursu, organized crime constitutes a complex social phenomenon manifested through the activities of criminal groups oriented toward obtaining illicit profits. In this regard, he emphasizes that the primary instrument of systemic subversion employed by such groups is the legalization of criminal proceeds (money laundering), achieved through the channeling and infiltration of illicit capital into the lawful civil economy. This criminological diagnosis acquires even greater relevance in the current context of accelerated technological advancement. The availability of vast illicit financial resources enables modern criminal organizations to recruit and instrumentalize professional elites specializing in cybersecurity and information technology.

III. Human Trafficking and the Impact of Geopolitical and Climate Crises. Alongside emerging digital threats, human trafficking remains one of the most profitable and resilient sectors of transnational organized crime. In their study, Iurie Larii and Oleg Pohilă rigorously examine the mechanisms and criminological particularities of sexual exploitation targeting women and minors [3]. The authors bring to the forefront profound structural vulnerabilities—such as endemic poverty, chronic social exclusion, and major deficiencies within the educational system—which function as genuine recruitment and victimization vectors exploited by transnational criminal networks.

The normative dimension of this issue is further developed by Florena Esther Sterschi in her doctoral dissertation "*Transnational Crime: Criminal Sanctioning Framework and Prevention and Counteraction Policies*". The author emphasizes that the theoretical significance of the research lies in defining the conceptual foundations of criminal law and integrating extensive theoretical and practical material for identifying the operation-

al directions of organized crime [11]. Through this approach, new epistemological coordinates are established regarding the theoretical and methodological framework specific to the management of transnational organized crime, highlighting the urgent necessity of harmonizing criminal and criminal procedural legislation at both regional and international levels. Such normative unification constitutes an essential prerequisite for eliminating bureaucratic barriers and ensuring a rapid and effective judicial response to the investigation of complex cross-border crimes.

Looking toward future developments, Phil Williams [8] adds a particularly severe prospective dimension to this analysis. He argues that mass migratory flows generated by the intensification of global climate imbalances will fundamentally reshape the criminal geography of the twenty-first century, transforming migrant smuggling and illicit migration-related activities into what he describes as the "primary growth sector of the twenty-first century". This perspective emerges as a natural consequence of the convergence of asymmetric demographic pressures, environmental degradation, and the chronic inability of state institutions to effectively manage large-scale displaced populations.

Similarly, the high-intensity armed conflict triggered by the Russian invasion in February 2022 has reshaped the traditional profile of human trafficking in Ukraine, generating a hybrid criminal phenomenon that combines forced migration flows with illicit strategies aimed at evading military obligations [13]. Following the entry into force of the new mobilization legislation in May 2024—which lowered the conscription age threshold from 27 to 25 years and introduced mandatory military registration for all males between the ages of 18 and 60 through the centralized digital platform "Oberig" [14]—an exponential increase was recorded in the number of Ukrainian male citizens seeking the assistance of clandestine networks to leave the country illegally. Their primary objective was to avoid operational conscription into the armed forces [13, 15].

According to statistical data published by the State Border Guard Service of Ukraine, the highest concentration of attempted illegal border crossings was documented along the borders with Romania and the Republic of Moldova. These geographical areas present immediate physical vulnerabilities that were rapidly exploited for logistical purposes by transnational smuggling networks [16]. Investigative journalism and tactical assessment reports issued by the authorities reveal a concerning financial picture: the fees charged for facilitating illegal departure range between USD 5,000 and USD 22,000 per individual, with prices varying according to route complexity, risk level, and the logistical methods employed [13; 15; 17].

In this regard, the United Nations Office on Drugs and Crime (UNODC) issued an official warning in its July 2025 reports, concluding that the prolonged state of war has profoundly altered Ukraine's criminal landscape. The facilitation of illegal border crossings and assistance in evading military recruitment have crystallized into an autonomous and aggressively expanding field of criminal activity [19]. The same report highlights a significant economic transformation: while traditional transit flows for high-risk narcotics such as cocaine and heroin have experienced severe contractions due to the disruption of port and airport hubs, the domestic production and distribution infrastructure for synthetic drugs—particularly cathinones and methadone—has undergone explosive growth, being controlled by criminal groups capable of maintaining stable clandestine laboratories within the country [19].

This regional dynamic validates Phil Williams' fundamental thesis [8], according to which armed conflicts and acute governance deficits generate lucrative opportunities for organized crime by instantly transforming systemic vulnerabilities into major sourc-

es of profit. In the specific context of Ukraine, legal restrictions on leaving the country imposed upon military-age men—although legitimate from the perspective of national defense—have indirectly created a vast space for exploitation by clandestine networks, which have successfully monetized fear of death and the desperation associated with conscription. The phenomenon illustrates the exceptional adaptive capacity of organized crime to exploit emerging economic niches within volatile geopolitical environments.

IV. Economic Crime, Institutional Capture and Criminal Hybridization. From a functional perspective, economic crime and sophisticated money-laundering mechanisms constitute the true backbone of transnational organized crime (TOC), representing the channels through which illicit profits are cleansed and integrated into the formal economy. The primary strategic objective of any criminal organization is the long-term protection and preservation of accumulated capital. To achieve this state of financial immunity, criminal networks do not seek the violent replacement of state authority; rather, they pursue infiltration and the exercise of indirect, covert control over key public institutions.

The principal vectors of institutional penetration are systemic corruption and strategic blackmail, through which public officials and civil servants are either co-opted or coerced into serving the private agendas of criminal groups. Consequently, public institutions constitutionally entrusted with the prevention and suppression of crime are subverted from within, becoming logistical shields that provide protection, confidential information from ongoing investigations, or an appearance of legal legitimacy for illicit activities. This doctrinal assertion is corroborated by the recent historical experience of the Republic of Moldova, where the infamous one-billion-dollar banking fraud demonstrated the capacity of criminal networks to achieve institutional capture and to undermine the state's principal regulatory and oversight structures.

Furthermore, technological innovations function as a force multiplier for criminal networks. In his analyses, Williams predicts that by 2040, transnational organized crime will shift its operational epicenter into "hybrid spaces"—quasi-convergent environments in which the virtual and physical dimensions become fully intertwined. Within this emerging ecosystem, the implementation of artificial intelligence algorithms is expected to play a profoundly disruptive role, possessing the capacity to exponentially amplify existing threats, introduce new criminal typologies into the digital sphere, and irreversibly transform the methods used to investigate criminogenic risks.

Another alarming trend is the growing convergence and functional hybridization between transnational organized crime structures and terrorist or insurgent movements. In this regard, Radion Cojocaru and Andrei Cazacicov, in their studies dedicated to the dynamics of illegal paramilitary formations, observe that "in recent years the phenomenon of organized crime has intensified, advancing to a new level—transnational—which indicates an increased social danger" [5, p.62]. The authors demonstrate that such paramilitary formations can no longer be regarded as mere local gangs; rather, they represent a distinct and highly militarized form of organized crime manifestation. These groups possess specific structural attributes, including the capacity for territorial control, the use of military-grade weaponry, and the adoption of asymmetric warfare tactics—characteristics that pose unprecedented challenges to national security systems.

V. The New Geography of Crime: Criminal Hubs and Autonomous Geopolitical Actors. Along the same line of macro-structural analyses, T. Hall and his collaborators [21] emphasize that this phenomenon can no longer be regarded as a marginal anomaly but rather constitutes a fundamental and structural dimension of contemporary globalization.

The spatiality of transnational organized crime (TOC)—manifested through underground circuits of speculative capital, fixed cross-border logistical routes, and informal financial systems such as hawala—operates according to its own economic logic. Although these logics are conceptually distinct from those governing licit economies, they are deeply intertwined with the official circuits of corporate globalization, exploiting border liberalization and the fluidity of international transactions to conceal their operations.

Phil Williams expands this conceptual framework by identifying and mapping a number of global urban logistical nodes—such as Dubai, Marbella, and major emerging megacities—which he classifies as "criminal hubs" and "super-hubs". In the author's view, these spaces function as strategic nodes characterized by a high degree of "eigenvector centrality", interconnected on a global scale through secure illicit flows. A crucial theoretical conclusion is that such an "illegal geography" should not be simplistically interpreted as a temporary epiphenomenon of local underdevelopment; rather, it is structurally embedded within the very financial, legal, and logistical architecture of modern economic globalization.

This qualitative transformation of traditional criminal actors into genuine autonomous geopolitical actors represents one of the most disruptive developments for the rules-based international order. A study conducted in March 2026 at the initiative of the European Parliament [2] identifies and conceptualizes three emerging macro-structural categories on the international stage:

1. State-opposed criminal groups;
2. State-embedded criminal groups;
3. State-sponsored criminal groups.

Williams complements this analytical framework by arguing that major authoritarian powers—including the Russian Federation, the People's Republic of China, the Islamic Republic of Iran, North Korea, and Syria—are increasingly employing organized crime networks as asymmetric instruments of geopolitical competition within the "gray zone", transforming transnational criminal activities into tools for destabilizing Western democracies.

Another emerging field of research concerns the direct impact of climate change on the dynamics of organized crime. Mark Williams [2] advances the thesis that the accelerated degradation of the natural environment will inevitably generate new market niches arising from the acute scarcity of vital resources, including access to potable water reserves, food security, and control over critical mineral deposits indispensable for the global transition toward green energy. Organized crime structures are likely to seek monopolistic control over these scarcity-driven markets. Criminologist Lucia Tiscornia, whose conclusions are incorporated into Phil Williams' prospective model [8], argues that climate change produces significant imbalances in essential resource markets, facilitating their capture and control by organized criminal structures. Within this framework, accelerated environmental degradation and competition for strategic resources are likely to intensify the infiltration of criminal groups into vulnerable economic sectors and transnational supply chains.

From the perspective of domestic criminological doctrine, Iurie Larii highlights the necessity of a complex and multidimensional approach to organized crime, including an analysis of its geopolitical implications, considering such a perspective indispensable for identifying effective mechanisms for preventing and reducing the social danger generated by this phenomenon [4]. This methodological correlation demonstrates that security policies can no longer remain confined within purely judicial paradigms but must incor-

porate broader ecological and global strategic analyses.

VI. The Republic of Moldova Case Study: Systemic Vulnerability and Regional Projection. Within this complex international context, the Republic of Moldova constitutes an illustrative analytical model of a state structurally affected by multiple institutional vulnerabilities and security deficits. Geostrategically positioned at the fluid intersection between the European Union and the post-Soviet space, confronted with the existence of a de facto separatist territory (the Transnistrian region) where the constitutional authority of Chișinău is absent, and historically affected by systemic corruption and the capture of public institutions by oligarchic structures, the Republic of Moldova exemplifies how transnational organized crime (TOC) capitalizes on and amplifies latent governance crises. The transnational phenomenon not only exploits state weaknesses but actively instrumentalizes them in order to secure operational spaces of impunity.

In this regard, the large-scale embezzlement of the domestic banking system through the operation commonly known as the "one-billion-dollar bank fraud"—representing the macroeconomic equivalent of approximately 12–13% of the country's Gross Domestic Product (GDP), according to official estimates of the International Monetary Fund [22] and analyses published by the Civil Forum for Asset Recovery [23]—generated a profound systemic shock for a fragile emerging economy. The seminal study authored by Vincent Arnold [24] provides a detailed mapping of the financial engineering schemes and technical mechanisms employed in this large-scale fraud, while extensive investigations conducted by the Open Dialogue Foundation [25] reveal cross-party political connections and alarming dimensions of institutional capture.

Furthermore, large-scale operations conducted by Europol during 2026, which resulted in the dismantling of complex transnational narcotics trafficking networks, together with the documented systematic use of banking and settlement channels located in the Transnistrian region for illicit money-laundering operations, demonstrate that national vulnerability has evolved into a dangerous capacity for criminal projection at the regional level.

Professor Iurie Larii complements this criminological picture by introducing a macro-geopolitical analytical dimension, arguing that "national and international policies focused on the prevention and suppression of organized crime fail to mitigate the very rapid evolution of the phenomenon" [4, p.397]. In the author's view, this chronic operational gap necessitates "addressing the issues raised by organized crime, including through the assessment of its geopolitical dimensions", thereby transcending the traditional and purely criminal-law perspective, which has proven insufficient in relation to the current dynamics of threats. For the Republic of Moldova, adopting such an interpretative framework has gone beyond the sphere of mere doctrinal debate. It has become an imperative national security necessity, dictated directly by its sensitive geographical position along the fault line of competing geopolitical interests and by the persistence of the structural problems affecting the state apparatus.

In this context, the final sentence of 19 years' imprisonment handed down in April 2026 against a prominent oligarchic leader directly involved in orchestrating the banking fraud [26] underscores the depth and advanced degree of criminal infiltration into the highest echelons of power. Ultimately, the case of the Republic of Moldova demonstrates the necessity of definitively abandoning the narrow paradigms of classical security. It requires the adoption of a multidimensional and holistic analytical perspective, within which transnational organized crime is treated as a complex and hybrid adaptive system, capable of navigating fluidly across and erasing the traditional boundaries between legal-

ity and illegality, local and global, and public and private.

VII. Correlation with the Sustainable Development Goals (SDGs) and Strategic Recommendations. Analyses published by the United Nations Office on Drugs and Crime (UNODC) during the period 2024-2025 [27], documented through the official United Nations platform dedicated to monitoring the Sustainable Development Goals (SDGs), highlight the direct destructive impact that transnational organized crime exerts upon the 2030 Agenda. The phenomenon systematically undermines the foundations of peace, stability, and good governance (SDG 16), negatively affects the macro-structural indicators of global public health (SDG 3), hinders sustainable economic growth (SDG 8), and deepens socio-economic inequalities (SDG 10). Simultaneously, it stimulates and finances the illegal exploitation and accelerated degradation of natural resources and planetary ecosystems (SDGs 13, 14, and 15).

In order to formulate an effective defensive response capable of disrupting this dynamic of deterioration, Phil Williams proposes a series of strategic recommendations of critical importance, founded upon the necessity of reconfiguring contemporary security policies:

➢ *Doctrinal Paradigm Shift.* The focus of state institutions should move away from rigid attempts aimed exclusively at the physical apprehension of individual offenders and toward holistic strategies designed to limit, fragment, and eliminate the market opportunities and logistical resources available to criminal networks.

➢ *Adoption of Advanced Technologies.* Law enforcement agencies should prioritize the early and large-scale implementation of disruptive innovations in the fields of artificial intelligence, quantum computing, and advanced predictive data analytics.

➢ *Disruption of Logistical Nodes.* International operational resources should be strategically concentrated on the identification, structural degradation, logistical displacement, and complete dismantling of global criminal hubs and super-hubs.

➢ *Integrated Strategic Response.* A modern approach requires the formal recognition that transnational organized crime has increasingly been incorporated as an instrument of asymmetric geopolitical competition employed by authoritarian states, a reality that necessitates a coordinated strategic and defense-oriented response.

In conclusion, the research demonstrates that transnational organized crime has surpassed the boundaries of the classical paradigm established by the Palermo Convention, evolving into a complex, adaptive phenomenon deeply integrated into contemporary geopolitical, economic, and technological dynamics. The transformation of criminal networks into fluid, digitalized structures capable of exploiting institutional vulnerabilities, regional conflicts, and globalization processes confirms the necessity of reconsidering the conceptual and operational framework for the prevention and suppression of this phenomenon.

The analysis has shown that the expansion of cybercrime, the growth of synthetic drug markets, the reconfiguration of human trafficking patterns, and the intensification of institutional capture mechanisms generate direct risks to both national and international security. At the same time, the case of the Republic of Moldova illustrates how governance deficits, systemic corruption, and geopolitical vulnerabilities can transform fragile states into favorable environments for the expansion of transnational criminal networks.

Therefore, the effective counteraction of transnational organized crime requires the abandonment of exclusively repressive approaches and the adoption of a multidimensional strategy based on strengthening international judicial cooperation, enhancing the technological capabilities of law enforcement institutions, harmonizing normative mech-

anisms, and integrating the geopolitical dimension into security policies. In the absence of such reforms, traditional legal instruments risk becoming inadequate in relation to the dynamics and adaptive capacity of contemporary organized crime.

ONLINE CRIME AGAINST MINORS AND THE RESPONSE OF CRIMINAL POLICY: BETWEEN REACTION AND PREVENTION

Natalia SĂVULESCU,
PhD Candidate,
University of Political and Economic European Studies "Constantin Stere",
Republic of Moldova
ORCID: 0009-0000-0648-3312

Abstract

The accelerated development of digital technologies, coupled with the increasingly easy and early access of minors to the internet, has led to a profound transformation of the social environment in which they interact, learn, and develop. Social media platforms, instant messaging applications, and online games have become spaces frequently visited daily by children and adolescents, offering them various forms of communication and education, while at the same time exposing them to highly complex risks that are often difficult to verify, control, or stop.

In this context, cybercrime directed against minors has experienced an alarming increase, both in terms of frequency and diversity of manifestations. Phenomena such as online sexual exploitation, the distribution of pornographic materials involving minors, cyberbullying, the process of "grooming" (through which an adult gains the trust of a minor for abusive purposes), or digital blackmail (sextortion) seriously affect the physical, psychological, and emotional integrity of victims. These offenses are often facilitated by the relative anonymity provided by the online environment, the lack of adequate supervision, and the low level of digital education among both minors and parents. The intense social consequences deriving from these forms of criminality are not merely individual and generate long-term trauma among victims. Unfortunately, minors are often unaware of the dangers they are exposed to within this wide range of social interaction, becoming, in most cases, victims of online abuse and violence.

Keywords: online crime; minors; online sexual exploitation; grooming; cyberbullying; criminal policy; crime prevention; child protection; digital security.

CRIMINALITATEA ONLINE ÎMPOTRIVA MINORILOR ȘI RĂSPUNSUL POLITICII PENALE: ÎNTRE REACȚIE ȘI PREVENȚIE

Abstract

Dezvoltarea accelerată a tehnologiilor digitale, dublată de accesul tot mai facil și timpuriu al minorilor la internet, a determinat o transformare profundă a mediului social în care aceștia interacționează, învață și se dezvoltă. Platformele de socializare, aplicațiile de mesagerie instant și jocurile online au devenit spații frecventate zilnic de copii și adolescenți, oferindu-le diverse forme de comunicare și educație, dar expunându-i în același timp unor riscuri foarte complexe și de multe ori destul de greu de verificat, controlat sau stopat.

În acest context, criminalitatea informatică îndreptată împotriva minorilor a cunoscut o creștere alarmantă, atât în ceea ce privește frecvența, cât și diversitatea formelor de manifestare. Fenomene precum exploatarea sexuală online, distribuirea de materiale pornografice cu minori, hărțuirea cibernetică (cyberbullying), procesul de „grooming" (prin care un adult câștigă încrederea unui minor în scopuri abuzive) sau șantajul digital (sextortion) afectează grav integritatea fizică, psihică și emoțională a victimelor. Aceste infracțiuni sunt adesea facilitate de anonimatul relativ oferit de mediul online, de lipsa unei supravegheri adecvate și de nivelul redus de educație digitală atât în rândul minorilor, cât și al părinților. Consecințele sociale intense care derivă din aceste forme de criminalitate, nu sunt de natura individuală și generează traume de lungă durată în rândul victimelor. Din nefericire, minorii nu conștientizează pericolul la care se expun în fața acestei palete largi de socializare, transformându-se în cea mai mare parte în victime ai abuzului și violenței online.

Cuvinte-cheie: criminalitate online; minori; exploatare sexuală online; grooming; cyberbullying; politică penală; prevenirea criminalității; protecția minorilor; securitate digitală.

Introduction. The accelerated digitalization of contemporary society has produced major changes in the way children and adolescents socialize, learn, and develop. The possibility of accessing the internet almost without restrictions, the frequent use of social media platforms, and constant interaction in the online environment have opened important opportunities for information, communication, and self-expression. At the same time, this virtual framework has also generated increased vulnerabilities, raising the risk that minors may become victims of abusive behaviors. Manifestations such as cyberbullying, grooming, or sextortion reflect modern types of threats specific to a digital space characterized by anonymity, rapid dissemination of information, and the absence of geographical boundaries.

From this perspective, the protection of minors requires increased attention from the state, the justice system, and criminal policy. This does not refer only to the law itself, but also to the way in which the state chooses to counteract this phenomenon, namely the totality of measures, strategies, and decisions applied to eliminate this intrusive issue from everyday life. Therefore, in the current context, in order to protect minors from the wide range of offenses to which they are exposed, a continuous adaptation of the traditional instruments of state intervention is necessary.

Methods and materials applied. Currently, the response of criminal policy lies at the intersection between repressive intervention, through sanctions, and preventive methods, which include education, parental responsibility, and the establishment by law of obligations for social networks (Facebook, Instagram, TikTok, etc.), so that they prevent and combat illegal content, especially when minors are involved. In other words, this implies a rethinking of how certain types of content are delivered across these social media platforms. For example, starting in December 2025, Australia became the first country to ban the use of social media by minors under the age of 16, a measure supporting the European Union's efforts to protect young users online. Moreover, Spain's Prime Minister, Pedro Sánchez, stated: "Social media has become a failed state. If we want to protect our children, there is only one thing we must do: take back control." Sánchez used this metaphor to describe the online environment, arguing that digital platforms often function as lawless territories where misinformation prevails over truth and hate speech is tolerated.

Therefore, these measures are adopted precisely due to the risks children face when exposed to content inappropriate for their mental development. Platform owners will be held accountable for the content; in other words, in the case of manipulative or illegal content, they will be required to remove it, and if they fail to do so, the state or the European Union may take action against them.

Studies demonstrate that the level of hate, violence, and illegal content imposed on children—content that children do not choose, but which adults choose to provide—has reached such an extent that extreme solutions must be considered. This issue has become a major concern, with countries such as Spain approving the Digital Services Act within the European Union precisely to address it. Therefore, the European Commission must take measures against toxic algorithms, hate, and violence, with the ultimate goal of protecting children.In Romania as well, representatives of the National Students' Council support regulating access to social networks. However, expert opinions regarding banning or limiting access for minors under 16 are divided between the need to protect mental health and the technical difficulty of implementation.

Experts from "Save the Children Romania" warn that over 22% of Romanian children aged 11-15 show symptoms of psychological withdrawal when access to devices is interrupted. The organization recommends a complete ban under the age of 13 and strict measures for adolescents. Psychologists also emphasize that the online environment has become unsafe, exposing children to bullying, misinformation, and inappropriate content. However, there are also opponents of such measures who argue that a total ban is difficult to enforce, as children will find ways to bypass restrictions. At the same time, experts from Europuls highlight that such a ban could create a dangerous "glass globe" effect and that developing responsible digital behavior is a more sustainable solution.

Certainly, at present, no social media platform is a safe environment for a child aged 8-16 for three main reasons. First, there is the high exposure to harmful content; the algorithms that shape the delivered information are designed to keep users engaged as long as possible, not to protect their mental health. A child does not have fully developed self-control, just as adults sometimes lack it. Second, a major risk is the exploitation of personal data; platforms collect personal data extensively, and children automatically become easy targets for media violence, with a real risk of developing aggressive behavioral patterns in the long term. Third, there are cybersecurity risks, as children are easy targets for phishing, scams, online grooming, sextortion, identity theft, doxxing, and cyberstalking. Increasingly frequent are cases where attackers exploit the lack of digital maturity.

Discussions and results obtained. **I. Exposure to Harmful Content and the Impact of Algorithms**. The first major risk is the constant exposure to age-inappropriate content. Social media platforms operate based on algorithms that prioritize content capable of keeping users engaged for as long as possible. The main purpose of these mechanisms is not to protect mental health, but to maximize time spent on the platform and, consequently, advertising revenue.In the case of children, this logic becomes problematic. Minors do not have fully developed self-control or the critical capacity necessary to filter the information they receive. Algorithms can amplify:

- Violent or sexualized content;
- Dangerous challenges;
- Unrealistic beauty standards;
- Hate speech;
- Misinformation.

Over time, repeated exposure to such materials can influence a child's emotional and behavioral development. In addition, reward mechanisms (likes, views, shares) stimulate digital addiction, affecting concentration and emotional balance.

II. Exploitation of Personal Data and Media Violence. The second major risk is related to the massive collection of personal data. Platforms such as TikTok, Instagram, Facebook, and YouTube operate based on the data economy. They collect information such as search history, content preferences, viewing duration, approximate location, and interactions with other users. In the case of children, the problem is even more serious, as they do not fully understand the consequences of sharing personal data. As a result, detailed behavioral profiles are created, which can influence the type of advertising displayed, the recommended content, and the way in which the child is commercially targeted.In the long term, such profiling can contribute to the formation of "information bubbles" and to shaping preferences before the minor has the ability to make autonomous and informed decisions. Thus, children become vulnerable targets for aggressive commercial strategies or informational manipulation.Moreover, media violence refers to the representation or promotion of acts of physical, psychological, or sexual aggression with-

in various media products, such as films, video games, social networks, news, or other digital platforms.This constant exposure can have significant effects on the development of minors. Firstly, repeated contact with such content may contribute to the normalization of aggressive behavior, with minors beginning to perceive violence as an acceptable reaction in certain situations. Additionally, frequent consumption of violent content may lead to a decrease in sensitivity toward the suffering of others, a phenomenon known in the specialized literature as desensitization.

Many researchers argue that there is an inseparable link between criminality and media violence. For example, according to Judith Lazăr, a French scholar known for her studies on mass media, communication, and the influence of media on society, "the link between criminality and media violence operates through socialization mechanisms, as mass media gradually and progressively gains ground over other agents of socialization, acting simultaneously and over the long term on the cognitive, affective, and behavioral levels" [1, p.182].

"In fact, the danger lies precisely in the long-term effect of audiovisual media, which reflects a symbolic, fictitious, and opulent world that strongly contrasts with the 'real world' and everyday reality. This 'discrepancy' can act as a powerful source of frustration for children and individuals with psychosocial difficulties—vulnerable groups who are unable to distinguish between the real and the symbolic world" [2, p.53].

III. Cybersecurity Risks. The third pillar of risk is vulnerability to cybercrime. The lack of digital maturity and excessive trust in the online environment turn minors into easy targets for attackers.

Phishing is a method of fraud through which attackers attempt to obtain sensitive data (passwords, banking details, authentication codes) through messages that appear legitimate. For example, a message that seems to come from a social media platform or a fake prize offer in an online game. The child is redirected to a fake website where they enter their data, which is later used to compromise accounts or commit financial fraud.

Scams (online frauds) are deceptive schemes through which offenders obtain money or information through manipulation. In the case of minors, the most common include fictitious sales of in-game items, fake accounts promising popularity or followers, or individuals posing as influencers or company representatives. Children, attracted by quick rewards or social validation, may become victims without realizing the risk.

Online grooming represents the process by which an adult gradually gains the trust of a minor for the purpose of sexual exploitation. This process generally includes several stages:

1. Initiating contact (through online games or social networks);
2. Building a relationship of trust;
3. Isolating the child from parents or friends;
4. Requesting intimate images or proposing a meeting.

The major danger lies in the fact that the minor perceives the aggressor as a "friend", which reduces their ability to protect themselves.

Sextortion is a form of sexual blackmail. After obtaining intimate images (through manipulation or hacking), the aggressor threatens to publish them unless they receive money or additional compromising material. For a minor, the psychological pressure can be devastating, leading to severe anxiety, constant fear, isolation, and depression. In many cases, the victim does not seek help out of shame or fear.

Identity theft involves the use of a minor's personal data to create fake accounts or commit fraud. Children frequently share photos, the name of their school, their date of

birth, and their location. This information can be used to build fake profiles or manipulate others.

Doxxing and cyberstalking: Doxxing involves publishing a child's personal data (address, phone number, school) without consent, while cyberstalking refers to repeated online monitoring and harassment. Both forms can create a deep sense of insecurity and fear.

The three dimensions—harmful content, data exploitation, and security risks—demonstrate that the social media environment, in its current form, is not adapted to the developmental level of children aged 8 to 16. Algorithms are designed to maximize engagement, not psychological protection. Massive data collection turns minors into subjects of commercial profiling, while their emotional and cognitive vulnerability makes them ideal targets for cybercriminals. Given the diversity and complexity of offenses committed against minors in the online environment—such as phishing, scams, grooming, sextortion, identity theft, doxxing, or cyberstalking—it becomes imperative to adapt Romanian legislation and criminal policy.

At present, many of these acts are not specifically criminalized, being classified under general categories of offenses (harassment, blackmail, fraud), which limits the effectiveness of law enforcement. Consequently, it is necessary for the state, on the one hand, to ensure a clear and detailed criminalization of each form of online crime, so that there is legal certainty regarding acts considered illegal, and on the other hand, to establish clearly defined and proportionate penalties that reflect the seriousness of the acts and the vulnerability of minors. Furthermore, national legislation must be aligned with European and international standards in order to allow coherent application and effective cooperation with international bodies such as Europol and INTERPOL. In addition to the forms of online exploitation of minors mentioned above, it is important to recognize that the digital environment can, in certain contexts, transform minors from victims into perpetrators of unlawful acts. Juvenile delinquency in the online environment manifests through behaviors such as cyberbullying, the distribution of intimate images of other minors, or even digital blackmail. This intersection between the status of victim and perpetrator highlights the need for a criminal policy that combines rapid response with preventive measures, digital education, and appropriate supervision. In this regard, prevention strategies aim not only to protect minors from offenders, but also to reduce the risk of them becoming involved in illegal activities themselves.

As *a conclusion* to the data presented above, it can be stated that criminal law alone cannot protect minors in the online environment. There is a need for global harmonization and an integrated policy, meaning a coherent and unified approach to this issue. Therefore, in order to combat this pervasive phenomenon, action must be taken on several levels:

• From a legal and criminal perspective: clear criminalization of each form of online offense (grooming, phishing, sextortion, etc.), well-proportioned and promptly applicable penalties, and judicial procedures adapted to the digital environment;

• From a preventive and educational perspective: digital education in schools and within families, awareness campaigns for children, parents, and teachers, and training minors to recognize online dangers and report incidents;

• From a technological and platform regulation perspective: obligations for social networks to filter and remove harmful content, data protection and control over aggressive profiling of minors, rapid reporting and intervention systems, and strict measures regarding the delivery of inappropriate or harmful content.

In conclusion, with in criminal policy, the implementation of corrective or restorative justice requires, in addition to action on all the aspects mentioned above, the involvement of specialized state institutions, namely competent judicial bodies in civil and criminal matters. Their role is to ensure the application of legal norms and to contribute to restoring the balance between citizens' rights and obligations, a balance disrupted by acts contrary to the rule of law. In this context, alongside general mechanisms of social control, the essential role of criminal law and the criminal justice system becomes evident. These represent institutionalized instruments through which the state formulates and applies a specific legal response to criminal behavior or situations that present the appearance of an offense. Through the functioning of these mechanisms, one of the fundamental objectives of criminal policy is achieved, namely the prevention and control of criminality. According to "extensive" or comprehensive approaches, combating criminality in general, including through criminal sanctions, acquires preventive connotations.

Regarding typologies of prevention, specialized literature identifies, based on the definition, usefulness, and nature of preventive activities, the following types:

• *Prevention of juvenile delinquency* is characterized by individual educational measures and represents a specific field of social sectoral policies—anti-crime policies—involving aspects related to education, health, living conditions, social assistance services, public authorities, and non-governmental organizations;

• *General crime prevention* aims at inhibiting unlawful behavior through the threat of punishment;

• *General (indirect) prevention* targets macro-social factors influencing criminal behavior;

• *Primary prevention* focuses on modifying criminogenic factors and conditions in the global physical and social environment;

• *Secondary prevention* targets groups at higher risk of engaging in antisocial or illegal acts;

• *Tertiary prevention* involves preventing recidivism and supporting the social reintegration of individuals who have committed offenses;

• *Social prevention* aims to identify and address the factors of criminality through complex programs;

• *Situational prevention* focuses on supervising and shaping the immediate environment in order to eliminate pre-delinquent situations.

In addition to this classification, specialized literature also promotes another operational classification, reflected in current European practices, which emphasizes public involvement in the implementation of criminal policies. Thus, Recommendation No. R (83) 7 of the Council of Europe regarding public participation in criminal policy highlights that social prevention should focus on:

• Providing proper information to parents regarding the causes, symptoms, and prevention of juvenile delinquency;

• Adequate training of teaching staff to address adaptation problems;

• Ensuring the professional integration/reintegration of young people, especially those with deviant behavior;

• Involving community associations in local and urban development to improve quality of life and reduce criminogenic factors.

Child protection in the digital era requires a rethinking of traditional criminal policy. Although criminal law remains indispensable, its effectiveness is limited in the absence of preventive mechanisms. Prevention becomes the essential condition for effective protec-

tion through digital education, parental responsibility, platform regulation, and international cooperation.

An optimal model combines:

- Preventive measures that reduce the risk of victimization;
- Proportionate sanctions for serious offenses;
- Monitoring and accountability of the digital environment;
- A balance between child protection and respect for fundamental rights.

Only an integrated approach, combining prevention with proportionate repressive measures, can ensure real, sustainable, and effective protection of minors in the contemporary digital space.

Joseph Savirimuthu, in the article "*The EU, Online Child Safety and the Role of Media Literacy*", published in the International Journal of Children's Rights (2011), stated that "media education continues to play an important role in the governance of children's online safety in the European Union" [4].

The Organisation for Economic Co-operation and Development (OECD), analyzing children's safety and well-being in the digital environment, states: "Children are online more than ever [...] While there are real and important opportunities, increased time spent online may also increase exposure to digital risks. Many of these are online versions of known offline risks (bullying, racism, fraud, and sexual predation). Children must be provided with the (digital) skills and tools necessary to recognize and manage these risks, without unjustifiably limiting their online opportunities" [6].

Anya Kamenetz, an American journalist, states in her book "*The Art of Screen Time*" that "children need not only limits on technology use, but also active guidance from parents to learn how to navigate safely in the digital environment" [7].

Andy Crouch, American author and commentator, argues in "*The Tech-Wise Family*" that "in a world dominated by screens, the responsibility of adults is to create an environment in which children are protected, but also formed to use technology with discernment" [9].

Diana Graber, American educator and promoter of digital literacy, states in her book "*Raising Humans in a Digital World*" that "digital education is not only about protecting children from online dangers, but also about preparing them to make responsible and ethical decisions in the virtual environment" [8].

Abstract

This article proposes a criminological analysis of the personality of the scammers, structured into three complementary levels: conceptual-theoretical, psychological, and empirical. In the first part, the concept of the offender's personality is examined through the lens of the main criminological perspectives: biological, psychological, and sociological. It demonstrates that the offender's personality constitutes a dynamic bio-psycho-social system, formed through the socialization process, which cannot be reduced to a single causal variable.

In the second part, the defining psychological traits of the fraudster are analyzed through the Dark Triad model (narcissism, Machiavellianism, and subclinical psychopathy). Their interaction generates a personality structure oriented toward the systematic manipulation of victims, the exploitation of their vulnerabilities, and the rationalization of criminal conduct as a legitimate act of intellectual superiority. The fraudster's motivation is predominantly instrumental, organized around greed, the need for prestige, and the playful element of manipulation inherent in scamming.

This theoretical construction is empirically validated through the analysis of a corpus of 50 court rulings issued by the courts of the Republic of Moldova between 2024 and 2025, in fraud cases pursuant to Article 190 of the Criminal Code. The article emphasizes the need for a multidimensional preventive approach that integrates legal and digital education for the population, alongside a penal policy oriented toward understanding the psychological mechanisms of fraudulent behavior.

PROFILUL CRIMINOLOGIC AL ESCROCULUI: ÎNTRE CONSTRUCȚIE TEORETICĂ ȘI REALITATE JUDICIARĂ

Abstract

Articolul propune o analiză criminologică a personalității escrocului, structurată pe trei niveluri complementare: conceptual-teoretic, psihologic și empiric. În prima parte, este examinat conceptul de personalitate a infractorului din perspectiva principalelor orientări criminologice: biologică, psihologică și sociologică, demonstrându-se că personalitatea infractorului constituie un sistem bio-psiho-social dinamic, format în cadrul procesului de socializare și imposibil de redus la o singură variabilă cauzală.

În partea a doua, sunt analizate trăsăturile psihologice definitorii ale escrocului prin prisma modelului Triadei Întunecate (narcisism, machiavellism și psihopatie subclinică), care, în interacțiunea lor, generează o structură de personalitate orientată spre manipularea sistematică a victimelor, exploatarea vulnerabilităților acestora și raționalizarea conduitei infracționale ca act legitim de superioritate intelectuală. Motivația escrocului este preponderent instrumentală, organizată în jurul cupidității, nevoii de prestigiu și elementului ludic al manipulării.

Construcția teoretică este validată empiric prin analiza unui corpus de 50 de hotărâri judecătorești pronunțate de instanțele din Republica Moldova în perioada 2024-2025, în cauze de escrocherie conform art. 190 Cod penal. Articolului subliniază necesitatea unei abordări preventive multidimensionale, care să integreze educația juridică și digitală a populației, alături de o politică penală orientată spre înțelegerea mecanismelor psihologice ale comportamentului fraudulos.

Cuvinte cheie: personalitatea infractorului, escrocherie, profil criminologic, factor determinant, comportamentul fraudulos, analiză empirică, indicator criminologic.

Introduction. Within contemporary criminology, the analysis of the criminal personality transcends the scope of mere statistical description, aiming to understand the mechanisms governing deviant behavior and criminality as a complex social phenomenon. This approach seeks not only to clarify determining factors and causal relationships but also to formulate the scientific pillars necessary for the individualization of sentences [8] and the optimization of crime prevention strategies.

Personality does not merely represent the context in which criminal interest arises; it directly shapes the modus operandi. In cases of scam, personality traits dictate the selection of the victim, the complexity of the scenario, and the persistence in criminal conduct. Thus, the author's personality traits transform criminal opportunity into a lifestyle in which social skills and interpersonal interaction are directed toward manipulation, while the absence of compassion and empathy facilitates the act of depriving victims of their assets.

The concept of the criminal personality remains a conventional one. Although there are no psychophysical traits that belong exclusively to those who break the law, the identification of behavioral constants allows for the study of the offender as a distinct social and psychological type. This analysis is essential for understanding how the interaction between individual values, biological variables, and the social environment generates the criminal act.

It is recognized that criminal law is variable in space and time; there are no *sui generis* crimes *per se*. Criminological research demonstrates that no personality qualities can be isolated as belonging only to the offender, as the way in which social, psychological, and biological factors combine within an individual's character structure determines the degree of social dangerousness and the form of manifestation of adverse social behavior. Consequently, the study of personality becomes the key to understanding why, under identical social conditions, one individual chooses social conformity, while another resorts to fraudulent actions to obtain illicit gains.

Methods and materials applied. The research is based on a mixed methodology, combining a theoretical analysis of specialized literature with an empirical study of national judicial case law, consisting of a set of 50 court rulings issued by the courts of the Republic of Moldova between 2024 and 2025 in fraud cases pursuant to Article 190 of the Criminal Code of the Republic of Moldova.

The methods applied include the analysis and synthesis of specialized literature, the historical method for reconstructing the evolution of the concept of the criminal personality, the comparative method for correlating theoretical models with national judicial reality, as well as quantitative and qualitative methods for extracting, systematizing, and criminologically interpreting the indicators derived from the analyzed court rulings.

Discussion and results obtained. **I. The Criminal Personality: Concept and Theories.** Personality is the social quality of the individual, formed within social interaction (the socialization process). Personality is not a biological given but a result of socialization,

being the reflection of society upon the person's psyche. A human is born as an individual and only over time becomes a personality under the influence of socialization institutions [17, p.233]. The individual exerts and confirms their personality through activity, which transforms biological potential into character traits and aptitudes.

The study of personality represents the cornerstone for fundamental disciplines such as psychology and sociology, holding major relevance in the criminological analysis of criminals and their *modus operandi*. According to Alfred Adler's vision, the individual is the architect of their own self, shaping their personality through a freely chosen lifestyle which, once fixed, becomes the central pillar of all their behaviors. This perspective is complemented by Erich Fromm, who argues that personality is a set of psychological qualities through which humans actively shape both their own course of life and the culture in which they live.

The evolution of this concept also implies an orientation of the personality from the past toward the present and future. Gordon Allport defines personality as a system in which adult motives become autonomous and independent of childhood orientations, emphasizing the intentional character of decisions and actions. In addition, Raymond Cattell defines personality through traits modeled as a relatively permanent response to social conditions, while Karen Horney emphasizes the security of the person, starting from every human's need to control anxiety and feel protected.

In the view of these authors, personality is constituted as an autonomous system of traits and motives, actively created by the individual through the interpretation of their own experience. It is not a construct determined by instincts, but represents a conscious lifestyle that utilizes social and cognitive forces, which form the individual's subjective reality.

Personality represents the integration mechanism through which a biological individual is transformed into a social actor. It constitutes the unique synthesis of experiences acquired within the community, which each person processes and converts into their own system of beliefs. When this system of beliefs and conduct enters into conflict with the fundamental norms of society, the individual's personality becomes the object of study for criminal law, moving from the purely psychosocial sphere into that of legal liability.

In this sense, the Criminal Code of the Republic of Moldova, in Article 14, defines a crime as "a prejudicial act, provided for by criminal law, committed with guilt and punishable by criminal law". The subject of this act, the criminal, is defined through the prism of responsibility and maturity, being the physical person who possesses discernment and has reached the age threshold established by law for criminal liability [1]. The correlative analysis between the legal definition of the crime and the psychosocial notion of the offender reveals the link between the norm and the individual. The crime is the act, while the criminal is the bearer of the traits that make that act possible.

A crime represents the external manifestation, in the form of a prejudicial and intentional act, of antisocial behavior. However, it does not appear in isolation but as a result of the interaction between the criminogenic characteristics of the personality and situational factors. Personality acts as a filter for external influences, such that internal traits may remain latent or materialize into criminal behavior, depending on the specific circumstances of the environment [15, p.17].

From a criminological perspective, the criminal personality is a synthesis of biological, psychological, social, and cultural traits with a high degree of stability, defining the individual who has committed a crime [9, p.35]. This is distinguished from the personal-

ity of other citizens by its antisocial orientation and the social danger it represents. The concept has a relative character and is strictly determined in time, from the moment the crime is committed until the sentence is served [10].

In criminology, the *criminal personality* is analyzed through three classic perspectives:

- *Biological*: Physical, genetic, and constitutional characteristics, including pathological traits, outline a distinct type of human behavior. The biological and bio-anthropological orientation was explored by Cesare Lombroso, who promoted the theory of the "born criminal"; by Ernst Kretschmer, who highlighted the correlation between body structure and temperament; and by Olof Kinberg, who considered that an individual might become a delinquent if their biopsychic structure does not allow them to adapt to environmental stimuli;
- *Psychological*: This approach analyzes mental processes, internal conflicts, and character traits. It includes the "Central Core" theory (Jean Pinatel), which identifies egocentrism, lability, aggressiveness, and affective indifference as traits that can trigger criminal acts [11]; the theory of conditioning and traits (Hans Eysenck), which explains the criminal personality through the interaction of neuroticism, extraversion, and psychoticism; the psychoanalytic perspective (Sigmund Freud), which views criminality as a result of the imbalance between the Id, Ego, and Superego; and the inferiority complex theory (Alfred Adler), according to which feelings of inferiority can generate antisocial acts as a form of compensation;
- *Sociological*: This approach highlights the determining role of the socio-cultural context in the formation of criminal behavior. The differential association theory (Edwin Sutherland) argues that criminality is not inherited but learned within close groups, through the transmission of both techniques and justifications for the act. Risk factors are multidimensional, as the criminal personality can be shaped by socialization deficiencies in childhood, disorganized families, physical abuse, school failure, and the influence of deviant peers.

Thus, the criminal personality represents a bio-psycho-social system formed as a result of one's existence, being an individual form of negative social relations [5, p.141]. Approaching the personality from an axiological perspective allows us to view the individual through the conceptual triad proposed by Petre Andrei:

- *Homo Faber* – the pragmatic dimension of the individual, oriented toward transforming the environment. In a criminal context, this creative energy is diverted, with the capacity for action being channeled toward achieving illicit or destructive goals;
- *Homo Sapiens* – the rational and cognitive subject. The alteration of reality perception processes through self-justification mechanisms generates errors in judgment that underpin the decision to violate legal norms;
- *Homo Valens* – the human as a being capable of conceiving, possessing, and applying a system of values and ethical landmarks. The degradation or absence of this value system eliminates internal moral barriers, allowing antisocial impulses to manifest without censure [12, p.140].

The evolution of these theories marks the transition from a rigid and deterministic vision, which considered the criminal to be conditioned exclusively by their biology, to a multidimensional approach. Today, the criminal personality is perceived as a dynamic system in which the interaction of genetic factors, psychological traumas, and socialization deficiencies creates a unique response to the pressures of the social environment.

Each individual constitutes a totality, and their integrity manifests through specific

individual bio-psycho-socio-cultural forms as well as social qualities [4, p.147]. This allows us to perceive personality as an ensemble of interconnected components and to understand how they interact with each other and with the whole [15, p.77]. The personality of each individual is the product not only of existing social relations but also of their own development and self-perception. Therefore, reducing the criminal personality solely to sociological or psychological aspects is inadmissible, and criminological study must be based on the unity of biological, social, and psychological factors in their interaction.

This integrative perspective on personality can be applied to study the specifics of different criminal typologies. Character traits do not appear chaotically but unite into configurations adapted to the pursued goal. No other category of criminals shows more clearly how humans build their own personality than scammers. In their case, internal traits and external influences blend in a subtle way for the manipulation and exploitation of victims' trust, a core element of fraud and scamming.

II. Criminological Profile of the Fraudster. The analysis of the **s**cammer's psychological profile is linked to the general theory of the criminal personality. Considered a particular form of delinquency, scam cannot be explained by a single causal variable; rather, it derives from the dynamic interaction between the individual's psychic peculiarities, motivational determinants, and environmental factors that facilitate the materialization of the criminal act.

The behavior of the scammers is not a chaotic act but is governed by an internal logic, being perceived by the perpetrator as a subjectively opportune action grounded in intrinsic motivation. In this context, motives do not function merely as simple impulse factors but represent the very finality of the action, giving an internal meaning to the criminal endeavor for the active subject [15, p.29].

Contemporary research in criminological psychology has identified a distinct personality profile associated with those who engage in scam, described as the "Dark Triad" [13], which comprises three types of offensive, yet non-pathological, personality traits: Machiavellianism, narcissism, and subclinical psychopathy. All three involve, to varying degrees, an antisocial character with behavioral tendencies toward self-promotion, emotional coldness, duplicity (a "two-faced" person), and aggression.

Narcissism constitutes a fundamental component of the scammer's personality. Narcissistic traits involve a sense of entitlement, superiority, grandiosity, and dominance. Narcissism can motivate an individual to act unethically for their own benefit and can alter perceptions regarding their own capabilities, fueling the belief that they can successfully commit scams [14]. From this perspective, the scammer does not perceive deception as a transgression, but as a confirmation of their superiority over their victims.

Machiavellianism represents the most defining trait for the scammer typology. Machiavellian traits involve manipulation to achieve one's own goals, a lack of morality, an absence of empathy, and cynicism. This term is suitable for professional scammers because they act deliberately and strategically to exploit the vulnerabilities of their victims; they believe that interpersonal manipulation is the key to success in obtaining profits that are not rightfully theirs.

Subclinical psychopathy reflects a dangerous symbiosis of criminal thinking and behavioral traits, refined through a sense of entitlement, an inclination toward deception and manipulation, a lack of empathy and remorse, and the perspective that other individuals are mere resources to be exploited for the satisfaction of personal needs.

An analytical synthesis of these three components reveals that, although they partially overlap, each contributes differently to scamming behavior: psychopathy provides

cold detachment, Machiavellianism ensures the capacity for long-term planning and strategic manipulation, while narcissism fuels the sense of self-grandiosity.

However, the motivational content of scamming cannot be reduced to isolated psychological phenomena, such as material need or immediate interests, although these play an essential role in the process of activating conduct. Interest derives directly from necessity, as interest acts as a mediator between the state of necessity and the criminal decision, dictating the direction and intensity of the efforts made by the scammer in achieving their goals [7, p.42].

The scammer's motivation is predominantly instrumental and is organized around well-defined psychological vectors. Scamming behavior is explained through the Fraud Triangle model, which identifies three determining forces: motivation (pressure), opportunity, and rationalization. Most criminals reach the decision to commit a crime with very little prior reflection, without truly evaluating the consequences. However, the applicability of this model varies significantly depending on the criminal profile.

While for occasional criminals, the decision to commit a crime often occurs with minimal prior reflection and a superficial evaluation of consequences, for professional scammers – especially those operating within organized groups – spontaneity is practically absent. In these cases, the scamming conduct is the result of detailed, elaborate scenarios strategically targeted at specific victims.

The etiological analysis of scamming reveals that greed, the need of prestige, and the playful component are not mere occasional motives, but constitute the core traits of the scammer's personality. Unlike other categories of criminals, in the case of scammers, these dimensions intertwine to generate a complex psychic mechanism:

1. Greed acts as the primary engine, transforming the desire for profit into an imperative that justifies any form of deception.

2. The need for prestige fuels the fundamental psychological mechanism through which the criminal succeeds in inducing and maintaining the victim in error. The scammer requires the appearance of success to become credible to their victims.

3. The playful element explains the self-confidence and pleasure felt during the manipulation process, transforming the fraud scenario from a simple illicit act into a demonstration of intellectual superiority over the victim.

In the architecture of the scammer's personality, greed, the need for prestige, and the playful dimension do not function as isolated elements but complement each other in a structural symbiosis, being intrinsically present in the totality of their illicit actions [16, p. 90]. If greed establishes the material objective, prestige provides the tools necessary to build a credible facade through duplicity, while the playful element fuels the execution mechanism through the pleasure of manipulation and the underestimation of risk. This motivational triad transforms scamming from a simple result-oriented offense into a complex manifestation of the criminal psychotype, where success is validated not only by the profit obtained but also by the projected social recognition and the intellectual satisfaction of the control exercised over the victim.

III. Empirical Analysis Based on National Judicial Case Law. The analysis is based on 50 court rulings issued between 2024-2025 in cases of aggravated fraud pursuant to Article 190 of the Criminal Code of the Republic of Moldova [2]. This mixed approach allows for the validation, highlighting, or, where appropriate, the correction of theoretical models using data from the national judicial system. The quantitative data extracted from the sentences are treated not as an end in themselves, but as indicators of deeper psychological realities.

The first dimension of the analysis targets the socio-demographic characteristics of the defendants, as "the criminal personality cannot be understood outside the social context in which it was formed and in which it acts" [4, p.152].

	Analyzed indicator	Absolute value	Rate
1	Male	**38**	**76%**
2	Female	**12**	**24%**
3	Secondary education	**34**	**68%**
4	Higher education	**10**	**20%**
5	No education	**6**	**12%**
6	Unemployed	**43**	**86%**
7	Employed	**7**	**14%**
8	Unmarried	**28**	**56%**
9	Married	**16**	**32%**
10	Divorced	**6**	**12%**
11	With dependent children	**15**	**30%**
12	Without dependent children	**35**	**70%**
13	With prior criminal record	**20**	**40%**
14	Without prior criminal record	**30**	**60%**

Table 1. Socio-demographic profile indicators of defendants in scam cases (2024-2025)

The gender distribution of the 50 analyzed defendants reveals a male predominance of 76% (38 men compared to 12 women). The female presence is characteristic of the scamming typology, which primarily involves relational, communicative, and affective manipulation means; women are frequently involved in schemes based on direct emotional manipulation (such as the "relative involved in an accident" scheme) or fictitious trade schemes through proximity relationships which, naturally, generate a certain degree of presumed trust.

The distribution by education level indicates that 68% of the defendants have secondary education, 20% have higher education, and 12% hold no formal qualifications. The analysis shows that defendants with higher education resort to more sophisticated deception schemes, such as complex contractual scams, abuse of administrative office, or manipulation within currency exchange schemes. In contrast, defendants with secondary or incomplete education utilize more standardized but no less effective schemes, such as fictitious online sales, job promises, or street scams. Therefore, the determining factor is not the level of education, but the degree of social intelligence.

The most revealing socio-demographic indicator from a criminological perspective is occupational status. Over 75% of the defendants did not have an official job at the time the acts were committed, which far exceeds the unemployment rate in the population of the Republic of Moldova (approximately 4 during the analyzed period) [3] and cannot be explained exclusively by economic factors. Specifically, scamming is chosen by these individuals not as a solution to poverty, but as a faster and easier alternative to obtaining

gain, rejecting work as a social norm. In other words, these defendants were not unemployed because they could not find work, but because scamming offered them a faster and less demanding gain than labor. This hypothesis is further supported by the fact that 40% of the defendants had prior criminal records for similar acts, proving the persistence of this conduct model and the unwillingness to manifest socially accepted behavior.

Data regarding marital status confirms the profile of an individual with low social attachment: 56% of the defendants are unmarried, 32% are married, and 12% are divorced. Correlated with the indicator regarding dependent children – 70% of the defendants have no parental responsibilities – there emerges the profile of an individual with high social mobility and a clear indifference toward criminal risks. The analyzed data confirms that the absence of family obligations among the defendants is associated with a high number of illicit acts and recidivism.

40% of the defendants had prior criminal records at the time the court's decision was rendered. This indicator demonstrates that the criminal penalty did not exert the intended behavioral rehabilitation function, with defendants returning to the same illicit activities after serving their sentences. From the perspective of the Dark Triad, this persistence reflects an overestimation of one's own abilities to avoid punishment (narcissism), the belief that the system can be circumvented (Machiavellianism), and the absence of moral values and fear of consequences (psychopathy).

	Analyzed indicator	Absolute value	Rate
1	Sole perpetrator	**43**	**86%**
2	Group of 2 or more perpetrators	**7**	**14%**
3	Single criminal episode	**21**	**42%**
4	2–10 criminal episodes	**16**	**32%**
5	Serial, over 20 episodes	**13**	**26%**
6	Single victim per case	**31**	**62%**
7	2–5 victims per case	**14**	**28%**
8	Over 10 victims per case	**5**	**10%**
9	Victim and perpetrator unknown to each other	**34**	**68%**
10	Victim and perpetrator known to each other	**16**	**32%**

Table 2. Structure of the criminal action in scam cases (2024-2025)

The analysis of participation shows that 86% of the cases involve a sole perpetrator, compared to only 14% involving a group of two or more defendants. This proportion reflects that a scammer with a narcissistic and Machiavellian profile manifests a low tolerance for sharing control and profits with other participants, as the manipulation of the victim is perceived as an act of personal superiority.

The 7 cases involving a plurality of perpetrators invariably present more complex schemes where the division of roles is a necessity. For example, in the "relative involved in an accident" scheme, the scammers' roles were divided: some generated emotional shock via telephone calls, while others physically collected the cash. It should be noted that the damages caused by scammers operating in a group are significantly more substantial than those committed by a sole perpetrator.

Analysis by the number of victims per case highlights that 62% of cases involve a single victim, 28% involve between 2 and 5 victims, and 10% involve more than 10 victims. The distribution of criminal episodes denotes a structural duality in the perpetrator-victim interaction: while 42% of subjects acted occasionally, limiting themselves to a single episode, the remaining 58% manifest a clear tendency toward multiplicity. Among these, 32% recorded between 2 and 10 episodes, and 26% exhibit a serial character, a fact that attests to the transformation of scamming into a stable method of gain and a professionalization of criminal conduct. Criminal seriality implies not only the absence of remorse but also a progressive refinement of manipulation techniques and the permanent polishing and adjustment of the scenario.

	Analyzed indicator	Absolute value	Rate
1	Deception	**50**	**100%**
2	Abuse of trust	**15**	**30%**
3	Use of digital environment	**14**	**28%**
4	Exclusively remote negotiations	**20**	**40%**
5	Fictitious trade / Undelivered services	**16**	**32%**
6	Fictitious employment abroad	**8**	**16%**
7	Loans-credits	**10**	**20%**
8	“Relative involved in an accident” scheme	**6**	**12%**
9	Spontaneous scam	**6**	**12%**
10	Organized fraud / Fictitious investments	**4**	**8%**

Table 3. Psychological mechanism and typology of criminal schemes in scam cases (2024-2025)

The analysis of the 50 court rulings allowed for the identification of five main typologies of criminal schemes, each corresponding to a distinct set of personality traits.

The fictitious trade and undelivered services scheme (the most frequent) relies on the use of digital platforms (999.md, Viber, WhatsApp, Facebook) to sell non-existent goods. This scheme requires digital adaptability and calculated anonymity, as the author does not need to build a lasting relationship of trust, limiting themselves to creating an illusion of credibility sufficient to convince the victim to perform a financial transfer.

The fictitious employment abroad scheme involves a higher level of planning and the gradual building of credibility. This scheme requires patience, organizational capacity, and an ability to maintain a fictitious identity over a long period.

The “relative involved in an accident” scheme illustrates a strategy of exploiting intense emotions in real-time, where the success of the crime depends on the author’s ability to suspend the victim’s critical thinking. This process is facilitated by absolute emotional neutrality and total indifference toward the suffering of others.

Street scamming involves traits of impulsivity through which the author capitalizes on an immediate opportunity without planning, relying on distraction techniques and the exploitation of basic social empathy.

The fact that 100% of the analyzed cases involve inducing and/or maintaining error confirms the nature of scamming as a crime of cognitive and psychological manipulation.

In this context, the author does not resort to coercion but aims to manipulate the victim's decision-making process, causing them to act voluntarily against their own interests.

The abuse of trust through personal relationships scheme (30% of cases) requires the most psychological resources. The author builds and maintains a friendship, kinship, or professional relationship over a long period, simulating affection and loyalty, only to ultimately exploit that exact relationship. The author feels entitled to use the victim's resources for their own benefit.

Thus, the analysis of the 50 court rulings allows for the formulation of an empirical criminological profile of the scammer active within the legal space of the Republic of Moldova. From a socio-demographic perspective, the typical scammer is a man, with secondary education, without a legitimate occupation, single and without children, who acts individually and has a prior criminal record for similar acts in 40% of cases. The absolute dominance of error and the frequency of abuse of trust confirm that scamming is a purely psychological aggression against reason, where the author substitutes physical coercion with calculated duplicity, exploiting the victim's loyalty.

Similarly, the analysis reveals a diversified spectrum of strategies, from the digital anonymity of fictitious trade or the impulsive opportunism of street scams, to the cynicism and psychological cruelty of the "accident" scheme. Each method reflects a distinct profile in which the criminal adjusts their level of planning and emotional involvement to halt the victim's critical thinking and ensure the desired outcome.

Conclusions. The analysis of the scammer's criminological profile, conducted by corroborating theoretical constructs with empirical data extracted from 50 court rulings issued in the Republic of Moldova between 2024-2025, demonstrates that the criminal personality cannot be reduced to a single causal variable. Instead, it represents a dynamic bio-psycho-social system, formed within the process of socialization and shaped by the interaction of genetic, psychological, and environmental factors.

Classical theories have contributed to outlining a multidimensional vision of the criminal personality in which scamming occupies a distinct place. Unlike violent crimes, scamming does not rely on force, but on a specialized psychological structure organized around the Dark Triad (narcissism, Machiavellianism, and subclinical psychopathy), which transforms the cognitive and psychological manipulation of the victim into a source of intellectual and financial satisfaction.

The empirical profile outlined confirms that, in the absence of individualized psychosocial rehabilitation programs, the criminal penalty does not exert the expected preventive function on this category of criminals. They are characterized by a structural resistance to normative consequences. Furthermore, the clear tendency toward the digitalization and diversification of scamming schemes requires a multidimensional preventive approach. This should integrate legal and digital education for the population, the perfection of forensic investigation tools, and a penal policy oriented not only toward sanctioning but also toward a profound understanding of the psychological mechanisms that generate and perpetuate this type of criminal behavior.

Snejana CIOCHINĂ,
PhD Student,
University of European Studies of Moldova
ORCID: 0000-0002-4838-642X

Abstract

The present study is devoted to the analysis of the legal regime of the special limitation period applicable to contraventional liability in relation to the offences provided for in Article 179 of the Contravention Code of the Republic of Moldova, concerning unauthorized constructions and unauthorized interventions in existing constructions.

The research is based on a systematic interpretation of the relevant contraventional provisions, with emphasis on the particularities that justify the establishment of a special limitation period, distinct from the general rule. In this context, the conditions for the applicability of the special limitation period, the starting point of its running, and the impact of the legal classification of the act on the determination of prescription are examined, especially in cases where the offence may be characterized as continuous.

The analysis reveals practical difficulties arising from normative ambiguities and the lack of uniform interpretative benchmarks, which may affect the predictability of sanctioning. Consequently, the study formulates interpretative guidelines aimed at ensuring a coherent and consistent application of the limitation period in the field of construction-related contraventions.

Keywords: contraventional limitation period, special limitation period, unauthorized constructions, continuous contravention, contraventional liability, legal certainty.

DETERMINAREA ȘI APLICAREA TERMENULUI DE PRESCRIPȚIE A RĂSPUNDERII CONTRAVENȚIONALE ÎN CAZUL FAPTELOR PREVĂZUTE LA ART. 179 COD CONTRAVENȚIONAL AL REPUBLICII MOLDOVA

Abstract

Studiul este consacrat analizei regimului juridic al termenului special de prescripție a răspunderii contravenționale aplicabil faptelor prevăzute la art. 179 din Codul contravențional al Republicii Moldova, având ca obiect construcțiile neautorizate și intervențiile neautorizate asupra construcțiilor existente.

Cercetarea valorifică interpretarea sistemică a normelor contravenționale incidente, cu accent pe particularitățile care justifică instituirea unui termen special de prescripție, distinct de regula generală. În acest context, sunt examinate condițiile de incidență ale termenului special, momentul de început al curgerii acestuia, precum și impactul calificării juridice a faptei asupra determinării prescripției, în special în ipoteza caracterului continuu al contravenției.

Analiza relevă dificultăți de aplicare generate de ambiguități normative și de lipsa unor repere unita-

re în practică, susceptibile de a afecta previzibilitatea actului de sancționare. În consecință, sunt formulate concluzii orientate spre clarificarea cadrului interpretativ și consolidarea unei aplicări coerente a instituției prescripției în domeniul construcțiilor.

Cuvinte-cheie: prescripție contravențională, termen special de prescripție, construcții neautorizate, contravenție continuă, răspundere contravențională, securitate juridică.

Introduction. The statute of limitations for administrative liability is one of the fundamental institutions of administrative law, playing a crucial role both in ensuring the stability of legal relationships and in guaranteeing respect for individuals' fundamental rights and freedoms. In the context of the Republic of Moldova, the Administrative Offenses Code expressly regulates this institution, establishing time limits within which a person may be held administratively liable. This paper aims to analyze how the statute of limitations for administrative liability is determined and applied in the case of the acts provided for in Article 179 of the Administrative Offenses Code of the Republic of Moldova, concerning unauthorized construction and unauthorized alterations to existing structures.

The choice of this topic is not coincidental, as unauthorized construction constitutes a distinct category of administrative offenses, characterized by their persistence over time and by specific legal and social consequences. Consequently, correctly determining the point at which the statute of limitations begins to run, as well as the proper application of the relevant legal provisions, raises practical and theoretical issues that require careful analysis.

Methods and materials applied. In this study on the legal framework governing the special statute of limitations for administrative liability applicable to offenses in the field of urban planning and construction, analytical methods specific to legal and administrative studies were employed. The following were applied: the method of logical-legal analysis, deductive and inductive methods, the comparative method, as well as the method of synthesis, which facilitated the formulation of theoretical and practical conclusions on this topic.

The research's supporting materials include normative acts from the administrative law of the Republic of Moldova, particularly the Administrative Code and related legislation on urban planning and construction, alongside specialized doctrine, national case law, and relevant doctrinal opinions. The study is also based on international documents and scholarly works that directly address the issue of legality in construction permitting and unauthorized interventions on the built environment.

Discussions and results obtained. The statute of limitations for administrative liability is a ground that precludes the imposition of an administrative sanction after the expiration of a period established by law, either from the date the offense was committed or, in the case of continuing offenses, from the date it was discovered. As specialized doctrine indicates, the purpose of the statute of limitations is to ensure the stability of social relations, as well as to prevent legal uncertainty that might arise as a result of a prolonged period of time elapsing since the commission of the administrative offense.

Upon analyzing domestic legal doctrine, we have noted that the statute of limitations for administrative liability serves multiple functions, as follows: first, it serves to stabilize legal relationships, since, after the expiration of the statutory period, the person can no longer be sanctioned, which brings clarity and certainty regarding their legal status; second, the statute of limitations serves to encourage the competent authorities to investigate and sanction administrative offenses within a reasonable timeframe, which contributes to increasing the efficiency of the administrative justice system; third, it pro-

tects the individual from prolonged prosecution, which could unjustifiably affect their rights and freedoms protected by both the Constitution and international treaties.

The Administrative Offenses Code of the Republic of Moldova provides for two categories of statutes of limitations: the general statute of limitations and the special statute of limitations. According to Article 30 of the Administrative Offenses Code, the general statute of limitations for holding a person administratively liable is 18 months, and the special statute of limitations is 24 months from the date the administrative offense was committed. In our opinion, the current regulation of the statute of limitations for administrative offenses is fairer both for law enforcement agencies, which will have sufficient time for detection, analysis/investigation, and sanctioning, and for the victim or society, which have a vested interest in restoring social justice and preventing the commission of new offenses.

In this way, both general and specific prevention can be achieved, and, on the one hand, a sense of security regarding protected social values can be fostered, and, on the other hand, trust in the authority of the law can be established.

In addition to establishing general and special statutes of limitations for administrative liability, the legislature must expressly enshrine the rule that, in cases where an administrative offense simultaneously meets the elements of a criminal offense, the statute of limitations provided for under criminal law applies. Such a legislative solution is particularly relevant in the context of the present analysis, given that certain acts involving the construction of unauthorized structures may exceed the scope of administrative offenses and, depending on the degree of concrete social danger, may be legally classified as criminal offenses.

Upon analyzing the provisions of Article 179 of the Code of Administrative Offenses, we find that it penalizes the construction of structures of any category, as well as works involving the modification, renovation, reinforcement, and major repair of buildings and structures, without a building permit. Depending on the scale and consequences of such unauthorized construction, the act may also meet the elements of a criminal offense, for example under Article 258 of the Criminal Code (Violation of rules governing the use, repair, and modification of apartments in a residential building). In this situation, the applicable statute of limitations will no longer be the special 24-month period, but rather the statute of limitations for criminal liability, which is considerably longer—3 years.

This dual regulation raises the issue of correctly determining the legal nature of the act committed and, by extension, the applicable statute of limitations.

Article 179 of the Code of Administrative Offenses of the Republic of Moldova provides for liability for "unauthorized construction and unauthorized alterations to existing structures." According to the law, the construction of any category of structures, as well as work involving modification, renovation, reinforcement, and major repairs of buildings and structures—regardless of the type of ownership or intended use—without a building permit issued in the prescribed manner is punishable by a fine.

As noted by S. Ciochina and D. Cojocari, Article 179 of the Code of Administrative Offenses contains the following elements constituting the offense: "the generic legal object—represents social relations in the field of construction [4, p. 177], which directly pertain to violations of legislation and regulatory documents in construction, as well as the construction of unauthorized structures and unauthorized alterations to existing structures. Furthermore, the objective aspect may manifest itself through action or inaction. Therefore, establishing the administrative offense involves, first and foremost, accurately determining the objective aspect as a constituent element of the offense. Thus, Article

177(3) provides for nine variants of the objective aspect, and paragraph (4) provides for three variants of the objective aspect, which are subject to a special statute of limitations.

By comparison, we note that Article 179 provides for only four variants of the objective element, and all are subject to the same special statute of limitations of 24 months provided for in Article 30(3) of the Code of Administrative Offenses" [1, pp. 129–130].

It is important to note that the administrative offense provided for in Article 179 may be committed both actively (by actually carrying out unauthorized construction) and by omission (by failing to comply with the obligation to obtain a building permit in advance).

A comprehensive analysis of Article 179 reveals that the subject of administrative liability for this category of offense may be: a natural person, a person in a position of responsibility, or a legal entity.

One of the most important characteristics of the act provided for in Article 179 is its continuous nature. Unauthorized construction is not a one-time act, but one that extends over time, both through the very existence of the structure and through the legal and social effects it produces.

According to Article 30(9) of the Code of Administrative Offenses, in the case of a continuing offense or a prolonged offense, the statute of limitations begins to run from the date on which the last act or omission occurred. Thus, if a person constructs an unauthorized building, the administrative offense does not continue for the entire duration of the building's existence, except in cases where a court order for demolition or legalization of the building is issued. This particularity has major consequences for determining the statute of limitations.

This means that the competent authorities may establish the administrative offense within 24 months from the completion of construction work of any category, as well as work involving modification, renovation, reinforcement, and major repairs of buildings and structures.

From a practical standpoint, the continuing nature of the administrative offense provided for in Article 179 has significant implications for the possibility of holding the perpetrator administratively liable.

However, this legislative approach must be carefully analyzed, as it does not create situations of legal uncertainty. For example, a person who carries out unauthorized construction for 6 months and who has not been detected by the authorities may be held administratively liable at any time during the following 24 months, which does not affect the principle of legal certainty and contributes to the restoration of social equity.

As time passes, criminal or administrative offenses become increasingly difficult to investigate and gather evidence confirming a person's involvement in their commission. Furthermore, the perpetrator themselves suffers from the constant fear of being punished or, conversely, enjoys the possibility of avoiding punishment.

The statute of limitations was known to the Greeks, the Romans, and in feudal laws. For example, Article 263 of Ioan Sturza's Criminal Code of 1826 regulated the statute of limitations, stating that "by prescription, guilt and punishment are extinguished" [2].

The Romanian author E.C. Decusară notes in his work that Article 56 of the 1926 Criminal Code provided for a review to the detriment of the acquitted party, reproducing the following provision: "anyone who has been found innocent by a court may, for the offense of which they were accused, be required to clear their name a second time, provided that the statute of limitations has not expired since the time of the first trial" [3 p. 9].

We note that over time, the statute of limitations has been regarded by the legislature as an institution of criminal procedure, a fact we also observed in the Penal Code

of Charles II, which stipulated that, "in the event of a conflict between two or more successive laws concerning the statute of limitations for public prosecution or penalties, the law providing for the shortest statute of limitations shall apply". Here, too, we observe adherence to the principle of humanism and the application of the law most favorable to the offender.

To correctly determine the starting point of the statute of limitations for administrative liability, we consider it necessary to first examine the concept of "term".

The Explanatory Dictionary of the Romanian Language offers several definitions of the term "term", including:

1. A predetermined date for the execution of a payment, obligation, etc.;

2. A (predetermined) period of time within which something must be accomplished or occur;

3. A future event that is certain to occur but uncertain as to the date on which it will occur [4].

For its part, the Criminal Code does not expressly regulate the concept of "time limit," addressing in Article 60 only the time periods within which state authorities must take all necessary actions to identify and punish the guilty party. In turn, Article 230 of the Code of Criminal Procedure expressly provides that "time limits in criminal proceedings are time periods within which or upon the expiration of which procedural actions may be taken in accordance with the provisions of this Code" [5].

It is important to note that the statute of limitations for administrative offenses is always linked to the imposition of administrative sanctions or penalties. An increase in the severity of the penalty directly leads to a change in the statute of limitations. Thus, the statute of limitations varies depending on the severity of the administrative offense and, consequently, on the severity of the penalty.

Consequently, to achieve the purpose of administrative law, the sanction must be applied promptly to remedy the harm, restore social justice, and prevent the commission of new offenses, because the later administrative liability is imposed relative to the date of the offense, the less effective it becomes, since its consequences may have been remedied or the victim's trust in state authority may have been eroded.

Correctly determining the point at which the statute of limitations begins to run is an essential matter in the application of the provisions of Article 179 of the Misdemeanor Code.

After a comprehensive analysis of the provisions of Article 30 and the offense described in Article 179, we have determined that this constitutes a continuing offense, which triggers the application of the special time limit provided for in Article 30(3). However, the mere application of the 3-year statute of limitations is not sufficient, because, as mentioned, we are dealing with a continuing offense. This fact necessitates the application of the special statute of limitations under the conditions of Article 30(9), which provides that, in the case of a continuing or extended offense, the statute of limitations begins to run from the date of the last act or omission.

In practice, determining the moment of the offense's discovery proves to be a matter prone to interpretative difficulties, particularly in cases involving successive findings or when the investigative activity is carried out by distinct authorities. For example, in the area of unauthorized construction, the National Inspectorate for Technical Supervision may issue a finding report, but this may be subject to judicial review. In such a scenario, the issue arises of determining the relevant starting point for the statute of limitations, namely whether it is calculated from the date the first finding report was drawn up or

from the moment the judicially validated report becomes final.

Another issue frequently encountered in practice concerns the scenario of successive modifications made to an unauthorized structure through subsequent additions or extensions. In this context, the legal distinction hinges on the choice between the existence of a continuing offense and the presence of multiple distinct acts. The approach derived from case law indicates that, to the extent that subsequent interventions are organically integrated into the structure of the initial construction, without affecting the material and legal unity of the unlawful conduct, the act retains its continuous nature, and the statute of limitations begins to run from the time of the last finding.

Another significant issue in the application of Article 179 concerns the relationship between the statute of limitations and the subsequent obtaining of a building permit. If the person who carried out the unauthorized construction obtains, after the finding, a building permit that legalizes the work performed, the question arises as to whether this eliminates administrative liability and, implicitly, whether the statute of limitations continues to run.

From a theoretical perspective, it is generally accepted that obtaining a building permit after the work has been completed does not negate the administrative offense nature of the act committed at the time of construction, since the offense exists independently of subsequent legalization. However, in practice, courts tend to apply the principle of proportionality and consider that, to the extent that the construction was subsequently authorized, the public interest in sanctioning the act is diminished, which may influence both the imposition of the sanction and the calculation of the statute of limitations.

Article 179 of the Code of Administrative Offenses falls within the scope of the special 24-month statute of limitations, pursuant to Article 30(3) of the same code. This legislative provision constitutes an exception to the general 18-month statute of limitations set forth in paragraph (2) of the same article and is justified by the specific nature of offenses in the construction sector.

Unlike the general 18-month statute of limitations applicable to simple administrative offenses, the special 24-month statute of limitations reflects the legislature's intent to grant authorities a longer period to identify, investigate, and penalize acts of unauthorized construction. This 6-month difference can be crucial in practice, given the complexity of these cases, which often involve technical expert opinions, document reviews, and assessments of the impact on building safety and the environment.

A fundamental aspect of the current regulation, provided for in Article 30(5) of the Code of Administrative Offenses, is that the statute of limitations begins to run from the date the offense was committed. This provision is of paramount importance in the case of the continuing offense under Article 179.

Although the offense is of a continuing nature (unauthorized construction and maintenance over time), the law establishes a clear point in time from which the 24-month period begins to run. In legal doctrine and practice, the "date of commission" for a continuing offense is, as a rule, the date the act ceases, that is, the date the unauthorized construction work is completed or the date of the last unauthorized intervention on the existing structure.

It becomes impossible to penalize past offenses: If a person completed an unauthorized construction more than 24 months ago, and this offense was not detected and penalized during that period, the statute of limitations has expired. Even if the authorities discover the construction today, they can no longer impose a fine, as the right to impose administrative liability has expired.

Extinction of liability, not of the obligation to demolish: It is important to note that the statute of limitations extinguishes the right to impose an administrative penalty (fine), but does not affect the civil or administrative obligation to demolish the unauthorized construction if such demolition is ordered by another legal instrument (e.g., a separate court ruling).

In practice, determining the exact date on which the act was "committed" can be difficult, especially in the case of construction projects carried out in successive phases or in the absence of clear evidence (invoices, contracts, witness statements). In such situations, the investigating authorities and courts must determine, based on the evidence, the point at which the unlawful act was completed.

Another practical issue concerns situations where the unauthorized construction is subsequently modified through extensions or further alterations. If these modifications are substantial and can be considered distinct new acts, the 24-month period will run from the date of each modification for the corresponding part of the construction. If, however, the modifications are minor and do not alter the essence of the initial act, the date of commission may be considered to remain that of the initial construction.

The introduction of the special 24-month period for Article 179 represents an improvement over the previous regulation, as it acknowledges the complexity of these cases. Nevertheless, the 24-month period remains relatively short given the specific dynamics of the construction sector, where:

Findings are often made ex officio, and the supervisory authorities (the State Construction Inspectorate) may have limited resources.

Unauthorized construction may be detected late, especially in less accessible areas.

Litigation procedures (challenging inspection reports) can take months or even years, and the 24-month period runs independently of these, except for the interruption provided for in paragraph (5/1).

Therefore, although the 24-month period is more generous than the general one, its practical effectiveness depends on the authorities' promptness in acting and finalizing the proceedings within this timeframe.

An important safeguard against the premature expiration of liability is the interruption mechanism provided for in Article 30(5¹) of the Code of Administrative Offenses. According to this provision, the statute of limitations is interrupted if, prior to the expiration of the 18- or 24-month periods, the administrative offense case is referred to the court for adjudication.

This means that once the case is filed with the court, the statute of limitations is suspended. From that point on, the time required for the trial no longer counts toward the 24-month period. This provision safeguards the ability to punish the offense even when the judicial process is prolonged, preventing delays in the judicial system from leading to the statute of limitations expiring.

Although case law and legal doctrine recognize the continuous nature of the offense under Article 179, the current text of Article 30(5)—which establishes that the statute of limitations begins to run from the date of commission, not from the date of discovery—creates a certain tension with the specific nature of continuous offenses. While for an instantaneous offense (e.g., speeding), the date of commission is clear, for a continuing offense (e.g., an unauthorized construction that "exists" for years), this date is less evident.

To enhance legal certainty and avoid divergent interpretations, any legislative reform could expressly clarify, either in Article 30 or in a special law, that:

For continuing offenses, the "date of commission" is considered to be the date of the

last material act of enforcement or, as the case may be, the date on which the offense was brought into compliance with the law through the obtaining of a permit.

The continued existence of the construction over time, without further acts of execution, does not constitute an extension of the statute of limitations.

Such clarification would bring administrative offense legislation into line with the constitutional principles of legal predictability and would protect individuals who, after a considerable period of time, can no longer be held liable for an old offense that was not detected in a timely manner by the authorities.

Conclusions. A first conclusion is that the administrative offense in question is not a one-time occurrence, but rather one that continues over time by virtue of the very existence of the unauthorized structure. According to Article 30(9) of the Code of Administrative Offenses, the 24-month statute of limitations begins to run from the date of the last act or omission, which corresponds, in practice, to the completion of construction work or the last unauthorized intervention. This provision provides predictability, as liability expires 24 months after the act has been completed, not at an indefinite interval following its discovery. At the same time, it requires enforcement authorities to act promptly, as the expiration of the statute of limitations precludes the imposition of sanctions, without, however, affecting the civil or administrative obligation to demolish the structure.

The second conclusion is that the introduction of the special 24-month time limit for Article 179 (as opposed to the general 18-month time limit) reflects the legislature's recognition of the particular complexity of cases involving urban planning and construction. However, practice shows that the 24-month period can be difficult to meet in situations involving technical expert opinions, complex reviews of urban planning documentation, the handling of voluminous evidence, or the challenge of official reports in court. Although the interruption mechanism provided for in Art. 30(5^1) (referral of the case to court) offers partial protection against premature prescription, the practical effectiveness of the time limit depends largely on the promptness of the authorities to act.

Another conclusion is that the dual classification—administrative offense vs. criminal offense - creates uncertainty in determining the applicable statute of limitations.

If the act of unauthorized construction meets the elements of a criminal offense (for example, Article 258 of the Criminal Code—violation of the rules governing the use, repair, and alteration of apartments in a residential building), the applicable statute of limitations is no longer the special 24-month period, but rather the statute of limitations for criminal liability (typically 3 years or more). This dual regulation creates uncertainty for the person concerned, who cannot know with certainty the applicable statute of limitations until the authorities have definitively classified the act. To enhance legal certainty, either a clearer delineation of the criteria for distinguishing between a misdemeanor and a felony in this area or a standardization of the time limits would be required.

A final conclusion is that, although legal doctrine and practice recognize the continuing nature of the misdemeanor under Article 179, the current text of Article 30(5) of the Misdemeanor Code stipulates that the statute of limitations begins to run from the date the misdemeanor was committed, without expressly defining this point in time for continuing offenses. To eliminate divergent interpretations and enhance the certainty of legal relations, a potential legislative reform could clarify either in Article 30 or through a special law that, for continuing offenses, the "date of commission" is considered to be the date of the last material act of execution (e.g., completion of construction), and that the mere maintenance of the construction over time, without new acts of execution, does not extend the statute of limitations. Such clarification would bring the legislation on ad-

ministrative offenses into line with the principle of legal predictability, enshrined in the Constitution and European law.

TRACKING AND RECOVERING OF CRIMINAL ASSETS

Octavian PAVLOVSCHI,
PhD Candidate,
"Ștefan cel Mare" Academy of the Ministry of Internal Affairs,
Prosecutor, Chișinău Municipal Prosecutor's Office, Rîșcani Office,
Republic of Moldova
ORCID: 0009-0007-4733-7603

Abstract

This scientific paper provides a multidimensional analysis of the process of tracking and recovering criminal assets, a field of paramount importance for the security architecture and effectiveness of criminal justice in the Republic of Moldova. The research begins with the historical evolution of the institution of confiscation, moving on to the integration of the "follow the money" principle. The role of precautionary seizure as an essential procedural guarantor in repairing damages is analyzed in detail. A vast chapter is dedicated to global synergy and international cooperation, analyzing operational channels of information exchange (CARIN, Egmont Group), the efficiency of Joint Investigation Teams (JIT) over classic Letters Rogatory, and the challenges of offshore jurisdictions.

The paper delves into cooperation tactics in the sphere of virtual assets, highlighting innovative tools such as the new Interpol alerts (Silver Notice) and the stages of blockchain forensics. Special attention is also given to procedural guarantees through the lens of ECHR jurisprudence, which validates extended and in rem confiscation.

Finally, the study highlights the normative framework, through Law no. 4/2026, for the repatriation and social reuse of confiscated assets, transforming the proceeds of crime into resources for the community.

Keywords: money laundering, parallel financial investigations, precautionary seizure, international cooperation, CARIN, Egmont Group, JIT, Silver Notice, extended confiscation, blockchain forensics, social reuse.

URMĂRIREA ȘI RECUPERAREA BUNURILOR INFRACȚIONALE

Abstract

Prezenta lucrare științifică analizează procesul de urmărire și recuperare a activelor infracționale, un domeniu de maximă importanță pentru arhitectura de securitate și eficacitatea justiției penale din Republica Moldova. Cercetarea debutează cu o incursiune în evoluția istorică a instituției confiscării și recuperării, trecând la integrarea principiului „follow the money" în legislația națională. Este analizat detaliat rolul sechestrului asigurător ca garant procesual esențial în repararea prejudiciului. Un capitol vast este dedicat sinergiei globale și cooperării internaționale, analizând canalele operative de schimb de informații (CARIN, Grupul Egmont), eficiența echipelor comune de investigație (JIT) în detrimentul comisiilor rogatorii clasice, precum și provocările jurisdicțiilor offshore.

Lucrarea aprofundează tacticile de cooperare în sfera activelor virtuale, evidențiind instrumente inovatoare precum noile alerte Interpol (Silver Notice) și etapele analizei blockchain forensics. De asemenea, este acordată o atenție deosebită garanțiilor procesuale prin prisma jurisprudenței CEDO, care validează confiscarea extinsă și măsurile in rem.

În final, studiul evidențiază adoptarea cadrului normativ, prin Legea nr. 4/2026, pentru repatrierea și reutilizarea socială a bunurilor confiscate, o măsură ce transformă produsele infracțiunii în resurse pentru binele comunității.

Cuvinte-cheie: spălarea banilor, investigații financiare paralele, sechestru asigurător, cooperare internațională, CARIN, Grupul Egmont, JIT, Silver Notice, confiscare extinsă, blockchain forensics, reutilizare socială.

Introduction. The evolution of criminality in the 21st century has demonstrated a clear transition from traditional forms of crime to corporate-type criminality, motivated exclusively by profit maximization. In this context, criminal justice systems focused solely on the deprivation of liberty of offenders have proven to be insufficient. The prison sentence, applied to leaders of criminal groups or corrupt officials, is often perceived by them as an assumed "occupational risk", as long as the illicit wealth remains intact and is transferred to close associates or proxies. Therefore, globally, the paradigm of combating serious crime has shifted from sanctioning the person to tracking and neutralizing the proceeds of crime. The Republic of Moldova, being in the midst of the European integration process and having to manage the consequences of historical financial frauds (such as the bank fraud or the "Laundromat" type money laundering schemes), was forced to rapidly adapt its legislation. Although the creation of the Criminal Asset Recovery Agency (ARBI) in 2017 represented a major institutional progress, the asset recovery process remains, sometimes, cumbersome and riddled with legislative and judicial obstacles. This paper aims to dissect the tension between national norms and international requirements, analyzing the constitutional and jurisprudential foundations that must guide this fight.

Methods and materials applied. This research uses a complex methodological toolkit. Firstly, the logical-legal analysis method was essential to dissect the national legal texts - especially Art. 106 (Special confiscation) and Art. 106[1] (Extended confiscation) of the Criminal Code of the Republic of Moldova, as well as the provisions regarding the application of seizure from the Criminal Procedure Code (Art. 203 and subsequent) [1]. Through the comparative law method, we mirrored these provisions with the fundamental international acts to which the Republic of Moldova is a party [2]:

- The United Nations Convention against Transnational Organized Crime (Palermo Convention, 2000);
- The United Nations Convention against Corruption (Merida Convention, 2003);
- The Council of Europe Convention on Laundering, Search, Seizure and Confiscation of the Proceeds from Crime and on the Financing of Terrorism (Warsaw Convention, 2005).

Also, we used the historical method to trace the evolution of the concept of seizure and "extended confiscation" in Moldovan law, from its introduction to the most recent amendments dictated by EU directives (especially Directive 2014/42/EU). The factual material was supplemented by the analysis of the judicial practice of the Supreme Court of Justice of the RM, the Decisions of the Constitutional Court, and the jurisprudence of the European Court of Human Rights (ECHR).

The tracking and recovery of criminal assets have gone through a complex evolutionary process, transforming from a simple accessory measure into an independent penal policy instrument. Historically, the confiscation of assets was viewed strictly as a complementary punishment or a safety measure applied to the visible instruments of the crime. This limited approach proved to be ineffective in the face of modern organized crime, which generates profits masked through financial engineering. Internationally, a turning point was the adoption of the UN Convention against Transnational Organized Crime (UNTOC) in 2000 and the UN Convention against Corruption (UNCAC) in 2003, which laid the foundations for global cooperation for asset repatriation.

In the Republic of Moldova, the evolution was marked by the elaboration of the analytical study regarding the mechanisms of asset recovery and confiscation in the Republic of Moldova, developed by the Basel Institute on Governance at the request of the United Nations Development Programme (UNDP), within the project "Strengthening the

capacities of the National Anticorruption Centre to exercise the functions of preventing and analyzing corruption", financed by the Ministry of Foreign Affairs of Norway [8]. Consequently, the transition from a fragmented system to an integrated policy was achieved through the creation, in 2017, of the Criminal Asset Recovery Agency (ARBI), a structure designed to conduct financial investigations at European standards.

The backbone of any crime-fighting strategy is the "follow the money" principle. In national legislation, the materialization of this principle is done through the "parallel financial investigation". The Criminal Procedure Code defines parallel financial investigations as the totality of criminal prosecution actions, special investigative measures and/or actions provided by Law No.48/2017 regarding the Criminal Asset Recovery Agency carried out with the purpose of accumulating evidence regarding the suspect, the accused, the civilly responsible party, the defendant or the convicted person, their patrimony and the assets that are in their effective ownership, the patrimony of the owner and the administrator of the assets that are in the effective ownership of the suspect, accused, civilly responsible party, defendant or convicted person, in order to recover the criminal assets or with the purpose of identifying and tracking the assets that are or may be subject to freezing and confiscation measures [2]. These represent the link that connects the simple identification of the proceeds of crime to its freezing and confiscation.

The identification and tracking of assets (tracing) represent the essential analytical component of the asset recovery process. The efficiency of this process depends directly on the ability of the competent authorities to unmask complex property dissimulation schemes. For the success of recovery, financial investigations must not be consecutive to the criminal one, but parallel: while the criminal investigation seeks evidence of guilt, parallel financial investigations focus on money flows. [1] The fundamental techniques applied in this phase include:

- ***Financial profile analysis*:** Reconstructing the history of the suspect's income and expenses to identify undeclared sources;
- ***The expenditure method*:** Identifying owned assets by comparing luxury expenditures with official revenues;
- ***Forensic Accounting*:** Using forensic accounting techniques to detect the manipulation of commercial registries or fictitious transfers.

Efficient tracking also requires the interconnection of databases, including querying the Real Estate Register, the Public Services Agency (for vehicles and companies) and, primarily, the register of beneficial owners to go beyond legal fronts. Additionally, OSINT (Open Source Intelligence) techniques allow the identification of assets by analyzing the digital presence of suspects, where valuable assets that do not appear in official registers are frequently exposed.

Once the assets are identified, the precautionary measure of judicial seizure (freezing) is required. This constitutes an imperative procedural act, elaborated by the state, consisting of the application of prohibitions on the disposal or temporary use of the suspected or accused person's assets.

From a strategic perspective, the seizure represents the cornerstone of the recovery process, its primary goal being the prevention of the dissipation, concealment, destruction or alienation of illicit assets during the criminal process. Its importance lies in guaranteeing the efficiency of the act of justice: without this measure, confiscation decisions would remain simple "decisions on paper", the state being in a factual impossibility to recover the damage. Thus, the rapid application of the seizure acts as a material guarantee of the applicability of special or extended confiscation.

In accordance with Art. 203 of the Code of Criminal Procedure of the RM, the seizure is applied to ensure the reparation of the damage, the civil action or the possible confiscation [2].

The entire mechanism is structured into four fundamental stages:

1. Tracking criminal assets and accumulating evidence (parallel financial investigations);
2. Freezing criminal assets (instituting the seizure);
3. Confiscation of criminal assets and reparation of damages (judicial stage);
4. Restitution and capitalization of assets (reintegration into the legal circuit or social use).

The role of the Criminal Asset Recovery Agency (ARBI) is crucial in the first two stages. Procedurally, after the identification of suspicious assets through parallel investigations, the prosecutor presents a motivated request to the investigating judge. Based on the court's authorization, a ruling is issued, and ARBI or the criminal prosecution officers proceed to the effective application of the seizure, which involves inventorying, detailed description, and prohibiting trading in public registers (RBI, ASP, etc.).

To remedy the historical challenge of asset depreciation during long trials, the law gives ARBI the responsibility of administering and conserving them [3].

In the situation where the goods are perishable, amortize rapidly or require maintenance costs disproportionate to their value (e.g., luxury cars, machinery, fluctuating shares), the legislation allows their anticipatory sale, with or without the owner's consent (under conditions regulated by the court). The resulting sums are deposited into secure treasury accounts. This mechanism, which transposes European directives, guarantees that the state will collect the real value in case of confiscation or that the exact countervalue will be returned to the acquitted person, avoiding the return of a damaged asset.

In a globalized criminal economy, international cooperation has ceased to be an auxiliary mechanism, becoming the sine qua non condition for the success of any financial investigation. The Republic of Moldova bases its efforts on universal conventional pillars: the Palermo Convention (2000) on transnational organized crime, the Merida Convention (2003) against corruption and, specifically, the Warsaw Convention (2005) of the Council of Europe. The latter represents a qualitative leap, imposing on state parties the obligation to provide assistance not only for the identification of assets, but also for the effective execution of precautionary measures and confiscation orders.

Beyond formal procedures, the success of "following the money" depends on the speed of operative data exchange. The Republic of Moldova, through ARBI, actively participates in "Asset Recovery Office" (ARO) type networks, such as the CARIN Network (Camden Asset Recovery Inter-Agency Network), developed by EUROPOL, which represents an informal network of practitioners and experts in identifying, seizing and confiscating the proceeds of crime, spanning 61 jurisdictions from several states including EU ones, but also 13 international organizations. These platforms allow direct contact between experts to locate assets before submitting a formal request for assistance [12]. Complementarily, the exchange of financial information through the Egmont Group facilitates the traceability of suspected money laundering flows, offering investigators the necessary "map" for instituting cross-border seizures [13].

Apart from the CARIN Network and the Egmont Group, there are other vital international mechanisms and bodies for cross-border cooperation and recovery. These include:

- **EUROJUST:** Facilitates the coordination of complex investigations, the Republic of Moldova cooperating through a liaison prosecutor.

• **EUROPOL (SIENA):** Manages the secure information system SIENA, which ensures the exchange of operative data regarding transnational organized crime.

• **INTERPOL:** Provides access to global databases and allows 24/7 operative data exchange between member states.

• **SELEC (Southeast European Law Enforcement Center):** Supports Southeast European states through liaison officers and national contact points, facilitating the rapid flow of information and joint regional investigations.

• **UNODC (United Nations Office on Drugs and Crime):** Supports member countries and manages the GlobE network, intended for information exchange between national contact points in transnational corruption cases.

• **Regional networks:** there is cooperation with regional networks such as ARSIN, RRAG, ARIN-AP, ARIN-WA and ARIN-EA, essential for tracking assets in jurisdictions in Africa, Latin America and Asia-Pacific [6].

When criminal assets are located abroad, the classic mechanism remains that of mutual legal assistance or Letters Rogatory. However, under the influence of Directive 2014/42/EU [7], there is a tendency to simplify procedures through:

• **Mutual recognition:** The ability of courts in the Republic of Moldova to request the direct execution of a seizure or confiscation order in another member state of international treaties.

• **Joint Investigation Teams (JIT):** These allow Moldovan prosecutors and foreign counterparts to act in a coordinated manner, eliminating bureaucratic barriers and allowing the simultaneous execution of searches and seizures in multiple jurisdictions.

• **Asset repatriation:** A final stage that involves negotiating the sharing of confiscated assets between the requesting and requested state, according to international "asset sharing" standards.

In an increasingly dematerialized financial environment, the notion of "asset" has undergone profound mutations. Virtual assets (e.g., cryptocurrencies like Bitcoin, Ethereum or stablecoins like USDT) are not just simple computer data, but represent forms of digital value that can be electronically transferred, stored or traded. According to the new European regulations (MiCA Regulation no. 2023/1114), the regulatory framework for crypto-assets has become extremely strict, focusing on transparency, combating money laundering and investor protection. Virtual assets are recognized as financial instruments that can be used both for licit purposes and for money laundering or terrorism financing.

From the perspective of the legislation of the Republic of Moldova, virtual assets must be interpreted through the lens of Art. 106 of the Criminal Code as being "goods" or "values", regardless of their form (digital or physical), because they incorporate a certain economic value that can be transformed into fiat currency. By the end of 2025, the illicit volume through crypto-assets reached global records of tens of billions of dollars [9], forcing authorities to adopt new tools.

Investigating crimes involving virtual assets requires a paradigm shift: from tracking bank payment orders to blockchain analysis. To understand how money tracking works in the digital environment, it is essential to visualize the "trace" left on the blockchain. Although addresses are pseudonymous, their flow is public and immutable.

From a procedural point of view, the digital investigation goes through a specific cycle of blockchain forensics:

• **Identification:** Determining the blockchain networks used (Bitcoin, Ethereum, etc.) and understanding the typology of the fraud, including the digital wallets associated with the suspect.

• **Collection and Preservation:** Downloading and securing data from the blockchain. Since the ledgers are public, a classic interception warrant is not necessary, but the data integrity must be legally protected by applying cryptographic functions (hash).

• **Analysis (On-Chain) and cluster analysis:** Using advanced tools (such as clustering algorithms offered by analytical platforms like Chainalysis Reactor) to discover how money is layered through mixers, smart contracts or decentralized bridges. Investigators can group seemingly distinct addresses into a single "cluster" belonging to the same criminal entity.

• **Examination through VASP:** Correlating digital addresses with real-world identities. The tracking ends with the identification of "nodes" (Exchanges or Virtual Asset Service Providers) where anonymity meets banking regulations and where crypto-assets are converted into real money. Here, Know Your Customer (KYC) rules are applied, allowing the identification of the beneficial owner.

To respond to the explosion of money laundering through digital assets, Interpol piloted an essential tool: Silver Notice [10], initially launched as a testing program at the beginning of 2025, including 51 states. This international alert is issued exclusively for locating and identifying criminal assets, facilitating the rapid freezing of cryptocurrencies and hidden wealth globally, before suspects convert them into fiat currency.

The identification and seizure of digital assets involve specific technical procedures:

• **Control over private keys:** Unlike real estate, "ownership" over cryptocurrencies is given by the possession of the private key or the seed phrase. Freezing involves the transfer of assets from the suspect's wallet to a secure state-controlled wallet (administered by ARBI).

• **Exchange-level seizure:** If the assets are kept on a centralized platform (VASP), the prosecutor issues an emergency freezing request or a seizure ordinance to the compliance departments of the service provider.

Extended confiscation (Art. 106^1 CC RM) can also be ordered on crypto wallets with values that clearly exceed the licit income of the accused. However, due to the high volatility of cryptocurrencies, ARBI must use the anticipatory sale mechanism or order immediate conversion into fiat currency to conserve the seized value until the final sentence is pronounced.

A persistent challenge in the asset recovery architecture is the interaction with off-shore jurisdictions. These territories are frequently used by organized criminal groups and corrupt politically exposed persons due to two essential features: corporate opacity (which hides the real beneficiary through trust structures or shell companies) and rigorous bank secrecy. Recovery from off-shore often hits strict laws that prohibit banks from disclosing information. Because formal instruments like Letters Rogatory are lengthy procedures, often used by lawyers to delay the process through local appeals, success depends on rapid tactics. The exchange of "FIU-to-FIU" information (through the Office for Prevention and Fight against Money Laundering of the RM and the Egmont Group) represents the main method to overcome these obstacles in the intelligence phase. This exchange allows investigators to obtain the "map" of transactions and locate off-shore accounts before filing a formal request for mutual legal assistance (MLA), thus preventing the dissipation of funds.

For the execution of formal requests (MLA), investigators invoke the provisions of multilateral conventions, such as the UN Convention against Corruption (UNCAC) or the UN Convention against Transnational Organized Crime (UNTOC). Article 46 of UNCAC imperatively stipulates that a state cannot refuse legal assistance solely on the grounds of

bank secrecy, thus obliging authorities in off-shore jurisdictions to collaborate. In cases of extreme opacity or with non-cooperative jurisdictions, success also depends on the pressure exerted through international evaluation mechanisms (such as MONEYVAL or FATF), forcing the respective jurisdictions to provide data about beneficial owners under the penalty of inclusion on the "grey list" of financial centers.

An essential tactic recommended in interacting with funds directed to off-shore is non-conviction based confiscation (also known as civil confiscation). This in rem procedure is extremely efficient, sometimes becoming the only solution when the criminal has fled to the off-shore jurisdiction, has died, or benefits from immunity. The approach allows the state (e.g., through ARBI or the prosecutor's office) to request the court to transfer the assets into state ownership based on civil standards of proof, focusing on the illicit nature of the asset and not on the personal conviction of the owner, with provisions for extending applicability even if the person is released from criminal liability or punishment, as well as confiscation from third parties if they knew or should have known that the assets come from criminal activities or were transferred to avoid confiscation; at the same time, the confiscation of the original asset is provided, or, if it cannot be found, the court can order the confiscation of another asset of equal value.

The *Cosovan v. Republic of Moldova* (No.2) Judgment, delivered by the European Court of Human Rights (ECtHR) on October 8, 2024, is a fundamental precedent that clarifies the limits of special confiscation in the absence of a criminal conviction (non-conviction based confiscation) in relation to the presumption of innocence [13]. This judgment gives a legal "green light" to the authorities in the Republic of Moldova to use special and extended confiscation mechanisms more courageously in corruption or money laundering files where a final conviction cannot be obtained, provided that the procedure is focused on the assets (in rem) and not on the personal culpability of the individual.

In specialized literature, the need to establish clear delimitation signs between the two forms of confiscation has been emphasized.

- **Special confiscation** (Art. 106 CC RM) is directly linked to the criminal act brought to judgment, targeting the assets used or intended for the commission of the crime or resulting directly from it. Here, the burden of proof is absolute ("beyond any reasonable doubt"), and the causal link must be certainly proven by the prosecutor [1].
- In contrast, **extended confiscation** (Art. 106^1 CC RM) targets a state of unjustified enrichment, deduced from an overall criminal behavior. It allows the confiscation of assets whose value considerably exceeds the licit income of the convicted person, when the court is convinced that they originate from criminal activities. Here operates a more flexible standard of proof – "the balance of probabilities" [1].

The introduction of extended confiscation generated fears regarding the violation of the presumption of innocence and the right to property. These were settled by the Constitutional Court of the RM through Decision No.6 of April 16, 2015. The Court ruled that the presumption of the licit character of acquiring wealth is not an absolute one, but a relative one (juris tantum), which can be overturned by evidence in the criminal process. Thus, extended confiscation was declared constitutional, being justified by the major public interest to combat corruption and organized crime [5].

The final point of the recovery mechanism is the destination of the funds. Responding to European standards, Law No.4 of February 5, 2026, regarding the use for social purposes or in the public interest of confiscated assets, was adopted, promulgated by the Decree of the President of the RM No.540-X and officially published on February 26, 2026 [4]. This innovative normative act radically changes the paradigm: the recovered

amounts, including those repatriated from foreign jurisdictions, are no longer lost as a simple accounting figure in the state budget.

According to Article 2 of Law No.4/2026, the mechanism distinguishes two main directions of redistribution:

- **Social use:** Involves the redistribution of assets and sums of money to support medical, educational, cultural services and marginalized groups, with the primary goal of improving the quality of life and moral reparation of communities.
- **Use in the public interest:** Aims at allocating assets to public authorities and institutions, especially from the national defense, public order, and national security system, for the modernization of infrastructure and the consolidation of the functional capacities of the state.

To ensure transparent governance of this process, the law provides for the establishment of the "Commission for the management of confiscated assets" under the Ministry of Justice. This commission, conceived as a collegial body composed of 9 members (representatives of the relevant ministries – Finance, Internal Affairs, Health, Education, etc. – and of civil society), is responsible for evaluating and approving requests for the use of assets.

The exact financial distribution, established by law, ensures equitable financing:

- **70%** are transferred to the state budget to cover general damages;
- **20%** are redirected exclusively for the non-reimbursable financing of projects with a social or environmental impact proposed by non-governmental organizations;
- **10%** are reserved for strengthening the operational capacities of law enforcement institutions directly involved in asset recovery.

Conclusions. The evolution of criminal asset recovery in the Republic of Moldova demonstrates a mature transition from strictly punitive justice to restorative justice, oriented towards neutralizing the profit of transnational criminal organizations. The efficiency of combating financial crime no longer resides exclusively within national borders, but fundamentally depends on global synergy. The transition from cumbersome letters rogatory to the dynamism of Joint Investigation Teams (JIT), as well as the exchange of operative information through structures like the Egmont Group and other international mechanisms, represent crucial steps in reducing the reaction time of authorities. In addition, the adaptation of investigators to the complexity of offshore jurisdictions and the assimilation of advanced blockchain traceability methods define the modern profile of the investigation.

In parallel with the development of these offensive tools (judicial seizure and extended confiscation), the state must ensure strict respect for procedural guarantees outlined by ECHR and national jurisprudence. Finally, the legislative mechanism for the repatriation and social reuse of confiscated assets (regulated by Law No.4/2026) represents the moral triumph of the criminal process, demonstrating to society that the state has the power to transform the proceeds of organized crime into a public resource destined for the common good.

METHODS OF ACQUIRING AND EXTINGUISHING PROPERTY RIGHTS IN THE PUBLIC DOMAIN

Carolina BELEAEV,
PhD Candidate,
Lawyer, City Hall Drochia,
Republic of Moldova
ORCID: 0009-0002-8808-3615

Abstract

Membership in the public domain is offered either by the nature of the property or by the will of the legislator, and the acquisition and extinction of the ownership right of the holders in the public domain is carried out in specific ways, regulated by law – with the mandatory observance of the legal characteristics (the inalienability, the imprescriptibility and the inessibility thereof).

The modalities of acquiring the right of ownership in the public domain of the state or administrative-territorial unit, to be investigated, are: public acquisition; the transfer of some goods from the private domain of the state or of the administrative-territorial unit in the public domain thereof; other ways stipulated by the law such as: accesion, confiscation, sale-purchase or exchange made for a cause of public utility.

And the ways of extinguishing the right of property in the public domain to be discussed in the following are: the destruction of the good, the transition from the public domain to the private domain, the cessation of the use or public interest. All the ways of acquiring and extinguishing the property right mentioned above, necessarily require strict compliance with the legal provisions – public domain goods having a special legal regime applicable.

Keywords: public domain, acquisition of ownership, extinction of ownership, expropriation, public use, public utility, public acquisition.

MODURILE DE DOBÂNDIRE ȘI DE STINGERE A DREPTULUI DE PROPRIETATE ÎN DOMENIUL PUBLIC

Abstract

Apartenența la domeniu public este oferită fie de natura bunului fie de voința legiuitorului, iar dobândirea și stingerea dreptului de proprietate a titularilor în domeniul public se realizează prin modalități specifice, reglementate de lege – cu respectarea obligatorie a caracterelor juridice (inalienabilitatea, imprescriptibilitatea și insesizabilitatea acestora).

Modalitățile de dobândire a dreptului de proprietate în domeniul public a statului sau unității administrativ-teritoriale, care urmează a fi cercetate constituie: achiziția publică; trecerea unor bunuri din domeniul privat al statului sau al unității administrativ-teritorială în domeniul public al acestora; alte moduri prevăzute de lege cum ar fi: accesiunea, confiscarea, vânzarea-cumpărarea sau schimbul făcut pentru o cauză de utilitate publică.

Iar modalitățile de stingere a dreptului de proprietate în domeniul public care urmează a fi discutate în cele ce urmează constituie: pieirea bunului, trecerea din domeniul public în domeniul privat, încetarea uzului sau al interesului public. Toate modalitățile de dobândire dar și de stingere a dreptului de proprietate menționate supra, în mod obligatoriu necesită realizarea în strictă conformitate cu prevederile legale – bunurile domeniului public având un regim juridic special aplicabil.

Cuvinte-cheie: domeniu public, dobândirea dreptului de proprietate, stingerea dreptului de proprietate, expropriere, uz public, utilitate publică, achiziție publică.

Introduction. The public domain constitutes those goods, public or private, by their nature or express provision of the law, must be preserved and transmitted to future generations, representing values intended to be used in the public interest, directly or through a public service, and are subject to an administrative regime, respectively a mixed regime, in which the regime of public power is decisive, these goods being owned or, where appropriate, owned in the protection of legal persons governed by public law [1, p.53].

The importance of the research of the subject on the ways of acquiring and extinguishing the right of property in the public domain derives from the essential role that this right has in the organization and functioning of the state and administrative-territorial units, as well as in ensuring the satisfaction of the public interest.

The legal regime of the public domain presents distinct peculiarities to private property, being characterized by inalienability, imprescriptibility and inalienability, which imposes special rules by the birth and termination of this right.

In this context, the analysis of ways of acquiring and extinguishing public property rights is necessary for the understanding of the legal mechanisms by which goods are integrated into the public domain or, where appropriate, removed from this legal regime.

Methods and materials applied. In the elaboration of this publication, theoretical and normative materials were used. The research methodology used to study the ways of acquiring and extinguishing property rights in the public domain is based on a set of scientific methods specific to the legal field, which allow the analysis, interpretation and systematization of the applicable legal norms.

In the process of elaboration of the work, the following research methods were mainly used: *the juridical-dogmatic method* – through which the legal norms governing the legal regime of public property were analyzed, as well as the ways of acquiring and extinguishing this right; *the logical method* – used for formulating legal conclusions and arguments, as well as for the correct interpretation of the legal norms.

The purpose of this paper is the legal analysis, the study of different theoretical aspects of the topic addressed and the analysis of the legal norms governing the acquisition of the right of ownership, as well as the celke extinguishing the right of ownership of the public domain owners.

Discussion and results obtained. The area of public goods may be subject to change. This would mean that some goods that are part of the private domain may pass into the public domain, and some public domain goods may disappear or pass into the private domain.

At the legislative level, an express enumeration for the acquisition of the right of ownership is provided, but namely for territorial units, in Article 2 of the Law No.523/1999 on Public Ownership of Territorial Administrative Units, in which provides the following ways:

a) By natural means;

b) By public procurement, carried out under the law;

c) By transmission to public property of the administrative-territorial unit of the public property of the state or by transmission of public property of one administrative-territorial unit in the public property of another;

d) By expropriation for a cause of local public utility;

e) On the basis of the decision of the court;

f) By donations or by connections accepted by the board of the administrative-territorial unit;

g) By obtaining incomes and goods under the law;

h) Following the renunciation of the right of ownership of immovable property in the manner established by the legislation in force;

i) Following the implementation of public-private partnership projects.

The right of public property, as a whole, is acquired through specific ways provided by law, focused on the general interest.

The main ways we want to highlight are: *public procurement*; *the transfer of goods from the private domain of the state or the administrative-territorial unit to the public domain*; *other ways provided by law such as*: *accession*, *confiscation*, *sale-purchase or exchange made for a cause of public utility*.

In accordance with the provisions of the new Law No.325/2025 on public procurement, public procurement constitutes the acquisition, by means of a public procurement contract, of goods, services or works by one or more contracting authorities from economic operators selected by these authorities, regardless of whether the goods, services or works are intended for a public purpose or not.

For the purposes of the topic addressed, we consider it appropriate to intervene with the provision of a succinct, clearer notion. Thus, public procurement, as a way of acquiring the right of ownership in the public domain, constitutes the sum of all procedures, under the law, by which a contracting authority (primary, government, state institution) acquires (procurator), by means of a contract – goods, works or services from private sector economic operators, using public money to meet public needs.

Therefore, through a special procedure, which requires strict compliance, certain public goods of public utility can be purchased from the state budget or the local public budget (for example, a bus – for the provision of local transport services).

Expropriation for a cause of public utility is another way to pass a good into the public domain. Thus, according to the provisions of the Law on expropriation for a cause of public utility No.488/1999 – expropriation for a cause of public utility constitutes the transfer of goods and property rights from private property to public property, the transfer to the state of public property belonging to an administrative-territorial unit or, as the case may be, the ceding to the state or to an administrative-territorial unit of patrimonial rights for the purpose of performing works for public utility of national interest or local interest, under the conditions provided by law, after a fair and prior compensation.

As an eloquent example would be the case when it is planned to build a road of national interest that according to the project would pass over the private property of a physical person. In this case, in compliance with all legal requirements, the good of the natural person passes from the private domain into the public domain of the state.

This special process of forced acquisition of immobile goods was created by the French Revolution, which proclaimed the right of property as a natural and intangible right, opposing it to the sovereignty of the state and introducing the principle that no one can be expropriated except for a cause of public utility and only after just and prior compensation. The positive legislator was obliged to establish certain principles which would be a guarantee for private property against abuse and arbitrariness of the administration [3, p.76].

The transfer from private property to public property by means of donation documents. This way, although rare, is not excluded, given that any natural or legal person can donate a good to the state or administrative-territorial unit. For example, a legal entity could donate a special truck to a municipality needed in the sanitation sector of the locality.

The transfer of some goods from the private domain of the state or the administrative-territorial unit into the public domain of the state. Although less frequently found in practice, however, is also a way of acquiring the right of ownership in the public domain. The condition, as in the rest of the cases, is that the property is taken over to serve local or national public use or interest. Therefore, the effect received as a result of the application of this process constitutes the transition of the good from an economic management to a special protection regime according to the legislation in force.

Accession is another way provided by law by which a good and the right of ownership over it may be in the public domain.

According to the doctrinaire Baies Sergiu by "accesion" means the union of one good with another, that is, the union of two or more things to create one [2, p.70].

The Civil Code regulates two types of accessibility: furniture and real estate.

➢ *Real Estate Accesion* – can take place in two ways: *natural* – resulting from events, natural phenomena, without the need for human activity and involvement; and *artificial* – resulting from direct human intervention on the good (regulation of Articles 521-522 Civil Code of the RM).

In the case of the approached topic, *real estate accesion* is the closest to being a way of passing a good in the public domain. For example, in the event of a river bank breaking off from the edge of a river belonging to a natural person, and as a result of natural phenomena (calamities), a portion of the previously steep occurred adhesion to a land in the public domain belonging to the state or administrative-territorial unit.

Confiscation is a way of acquiring the right of ownership by the state as the proper holder. This method is the transfer of a person's good into public property. The rule indicates that confiscation occurs only as a result of the commission of a crime or contravention, being a safety measure or sanction for the perpetrator, only on the basis of a court decision or in cases provided by law, by an administrative act (as the case may be). The seizure may be special (it applies to property that has served to commit a crime, resulted as a result of the commission of a crime or was acquired by committing the crime) and extensive (applicable in a criminal trial, usually allowing for the confiscation of property that exceeds the income officially declared by the person).

It is important to note that this way of acquiring ownership is characteristic only for the state as a public domain holder.

Confiscation also has a preventive and sanctioning role, contributing to deterring the commission of illegal acts and restoring the rule of law. At the same time, this reflects the intervention of the state in the protection of fundamental social values, through forced transfer of goods into public patrimony.

The sale-purchase or exchange made for a cause of public utility are also ways of acquiring a good and the right of ownership of the public domain owner, but as procedures include typical, simpler, similar actions to those in the private sector. Thus, through a simple sale-purchase contract or exchange contract, the state, or administrative-territorial unit may pass a utility or public use good in the public domain.

The basic rule for buying and selling is always public procurement, however, the law always provides a threshold of an amount in which public domain owners can buy the good without applying to the public procurement procedure.

For an exchange contract, special provisions are not provided for in the public domain, and it can be applied very simply, only in compliance with all the general legal provisions.

The natural way – is also a way of acquiring property rights in the public domain, but

the legislator does not intervene with certain specifications in this way, probably because it is a natural way to acquire the right on a good for the state or administrative-territorial unit in respect of riches of any kind which are formed or will be formed naturally in its territory or in the basement of the country.

Overall, the above-mentioned modalities are most applicable in practice ways of acquiring ownership in the public domain.

Next, we want to reiterate the so-called golden rule - public property is inalienable, imprescriptible and unnoticeable, so its termination can only take place under the strict conditions of the law.

In particular, the right of public property may cease, by the following means: *the destruction of the good, the passage from the public domain into the private domain, the cessation of use or public interest.*

The loss of the good – if a good in the public domain perishes in its materiality, regardless of the cause (legal or illegal), the right of ownership is extinguished given the fact that the property does not exist in nature.

The transition from the public domain to the private domain of the state or the administrative-territorial unit – is another way of ceasing the ownership right of the public domain owner.

This method requires strict observance of a special procedure, and the basis for the transition from the public domain to private can only be an administrative act: government decision for the public domain of the state and decisions of local/rational councils for the public domain of administrative-territorial units.

In the context of this approach, from the existing legal framework, it would be appropriate to mention Law No.121/2007 on the Administration and De-Etatization of Public Property.

In accordance with the provisions of the above-mentioned law on the *de-etatization of public property activity* that includes the transmission of public patrimony in private property under the present law (privatization), as well as the transmission in concession, fiduciary administration, other activities aimed at diminishing the participation of the state or of administrative-territorial units in the administration of public property.

Termination of use or public interest – another way to terminate the right of ownership of the state/administrative-territorial unit, which is applicable to if the good no longer serves an interest of the community, is no longer used by the public or no longer fulfils its intended purpose – in accordance with the provisions of Article 471 of the Civil Code. An eloquent example of this method outlines the constructions and land on which the constructions from many administrative-territorial units that were previously used as public baths by the inhabitants of the respective unit were located. Thus, with the development and modernization of housing-communal services, as well as the evolution of technologies that make present in each home of personal bathrooms – the respective immobile goods have lost its quality of 'use and public interest'.

However, this state of affairs requires a finding by an administrative act anyway – with the passing of the respective public domain assets into the private domain – normally in the same act.

In practice, identifying the exact timing of the end of public use may raise difficulties, which is why an objective administrative assessment based on criteria such as usability, social utility and maintenance costs of the asset is necessary.

Public interest is the fundamental criterion governing both the acquisition and extinction of the right of public property, being the element of balance between the needs

of the community and the efficient management of the public patrimony.

In doctrine and practice, it is emphasized that the legal regime of goods belonging to the public domain is closely related to the notion of public utility, this being the essential criterion of delimitation between goods owned by the public and private property.

Thus, a good is maintained in the public domain as long as it effectively serves a general interest, be it local or national. When this purpose disappears, it is justified to modify the legal regime of the good, by passing it in the private domain, under the law.

At the same time, it should be noted that the management of public domain goods implies not only a right, but also an obligation of public authorities to ensure their conservation, protection and rational exploitation. In this respect, the authorities do not act in a discretionary manner, but within the limits strictly established by the legal norms, any deviation from these rules may attract their legal liability, under the law.

Another important aspect is the fact that the modification of the legal regime of public goods must be justified not only legally, but also economically and socially. In other words, the mere temporary lack of use of a good is not sufficient to justify the cessation of public use, and a complex analysis of the appropriateness and necessity of maintaining it in the public domain is necessary. This approach ensures the stability of the public patrimony and prevents any arbitrary or unfounded decisions.

Also, as regards the mechanisms for acquiring and extinguishing public property rights, it is noted that they are closely correlated with the evolution of public policies and with the needs of society. The state intervenes through normative and administrative acts in order to permanently adapt the structure of the public patrimony, according to the priorities of economic, infrastructural and social development.

Last but not least, it should be pointed out that the principles governing public property — inalienability, imprescriptibility and inalienability — are not mere theoretical rules, but essential legal guarantees for protecting the interest of the community. These principles limit the possibility of alienating public goods and ensure that they remain permanently affected by the purpose for which they were created or acquired.

Consequently, the analysis of ways of acquiring and extinguishing property rights in the public domain reveals a necessary balance between the stability of the public patrimony and the flexibility of its administration, a balance which is achieved through the legal norms and the intervention of the competent public authorities.

Conclusions. The analysis of the ways of acquiring and extinguishing property rights in the public domain highlights the complex and dynamic character of this legal regime, oriented exclusively to the satisfaction of the public interest and the permanent adaptation of the state patrimony and of the administrative-territorial units to the needs of the society.

The acquisition of the right of public property is carried out in ways strictly regulated by law, such as public procurement, expropriation for public utility, accession, confiscation, donations, exchange, sale-purchase under the law, as well as the transfer of private property into the public domain. These legal instruments are intended to ensure the formation and consolidation of public assets in order to achieve the general interest.

At the same time, the extinction of the right of public property occurs exclusively under the conditions provided by law, by the destruction of the good, its passing into the private domain, the termination of its use or public interest or by other expressly regulated modalities.

These mechanisms confirm the special character of public property, governed by the principles of inalienability, imprescriptibility and inalienability.

In the context of those analyzed supra, we intervene with the proposal of lege ferenda, which provides a clear identification of the criteria of appreciation of „public interest and use" and identification of the criteria when it can be found that the use and public interest have ceased to be present – as the purpose of avoiding divergences in practice.

In conclusion, the legal regime of public property reflects the importance of a rigorous and responsible administration of state assets, and the improvement of the normative framework within the meaning of *de lege ferenda proposal* would contribute to strengthening legal certainty and better protection of the public interest.

THE ILLEGAL CIRCULATION OF FIREARMS AND AMMUNITION IN THE CRIMINAL LAW OF THE REPUBLIC OF MOLDOVA: AN ANALYSIS OF THE MODALITIES OF ACQUISITION, MANUFACTURING, REPAIR, MODIFICATION, AND ILLEGAL COMMERCIALIZATION PROVIDED UNDER ARTICLE 290 OF THE CRIMINAL CODE OF THE RM

Alexandru STOLEARENCO,
PhD Candidate,
"Ştefan cel Mare" Academy of the Ministry of Internal Affairs,
Republic of Moldova
ORCID 0000-0001-9484-0796

Abstract

The persistence of criminal phenomena associated with the illegal circulation of firearms and ammunition in the Republic of Moldova highlights the need for an in-depth analysis of the factual modalities through which their legal regime is violated.

In this context, the illegal acquisition, manufacture, repair, modification of construction or marking, and commercialization of firearms, ammunition, and their essential components represent distinct forms of manifestation of the illicit arms circuit, capable of generating increased risks to public order and state security. The complexity of these conducts requires the identification of their defining elements and the establishment of clear legal criteria for distinguishing between the normative modalities provided under Art. 290 CC RM, in order to avoid misclassification and ensure a uniform application of criminal law.

At the same time, the latent nature of these modalities necessitates the clarification of their essential features, with a view to strengthening the interpretative framework and enhancing the effectiveness of mechanisms for preventing and combating arms-related criminality in a criminogenic context marked by the diversification of this phenomenon.

Keywords: firearms, ammunition, acquisition, manufacture, commercialization, illicit circulation.

CIRCUITUL ILEGAL AL ARMELOR ȘI MUNIȚIILOR ÎN DREPTUL PENAL AL REPUBLICII MOLDOVA: ANALIZA MODALITĂȚILOR DE PROCURARE, FABRICARE, REPARARE, MODIFICARE ȘI COMERCIALIZARE ILEGALĂ PREVĂZUTE LA ARTTICOLUL 290 CP RM

Abstract

Persistența fenomenului infracțional asociat circulației ilegale a armelor și munițiilor în Republica Moldova relevă necesitatea unei analize aprofundate a modalităților faptice prin care se realizează încălcarea regimului juridic al acestora.

În acest context, procurarea, fabricarea, repararea, modificarea construcției ori a marcajului și comercializarea ilegală a armelor, munițiilor și componentelor esențiale ale acestora constituie forme distincte de manifestare a circuitului ilegal al armelor, susceptibile de a genera riscuri sporite pentru ordinea publică și securitatea statului, iar complexitatea acestor conduite impune identificarea elementelor definitorii și stabilirea unor criterii clare de delimitare juridico-penală între modalitățile normative prevăzute la art. 290 Cod penal al Republicii Moldova, în vederea evitării confuziilor de încadrare juridică și a asigurării unei aplicări unitare a legii penale.

Astfel, o atenție deosebită revine acestor modalități, caracterizate printr-un grad ridicat de latență, ceea ce impune clarificarea trăsăturilor lor definitorii în vederea consolidării cadrului interpretativ și eficientizării mecanismelor de prevenire și combatere a criminalității asociate armelor, într-un context criminogen marcat

de diversificarea formelor de manifestare a fenomenului infracțional.

Cuvintele-cheie: arme, muniții, procurare, fabricare, comercializare, circuit ilegal.

Introduction. In the context of the growing criminal phenomenon associated with the illegal circulation of firearms and ammunition, the criminal law analysis of the factual modalities through which their legal regime is violated acquires particular importance. The diversification of criminal manifestations in this field, as well as the use of increasingly sophisticated methods for the acquisition, manufacture, modification, or illegal commercialization of firearms, require a reassessment of the existing interpretative framework and its adaptation to current criminogenic realities.

In this regard, the applicable legislation and specialized literature provide multiple approaches concerning the content and delimitation of the normative modalities of offenses related to the illicit arms circuit, highlighting the interpretative difficulties generated by the complexity of such conduct. At the same time, judicial practice reveals the existence of certain inconsistencies in the process of legal classification, mainly determined by the insufficient clarity of the criteria for distinguishing between the different modalities provided by criminal law.

Therefore, this study is based on the hypothesis that, under the specific conditions of the Republic of Moldova, clarifying the defining features of the factual modalities regulated by Article 290 RM Criminal Code and establishing rigorous criteria for their legal delimitation may significantly contribute to ensuring a uniform application of criminal law and to enhancing the effectiveness of mechanisms for preventing and combating criminality associated with illicit arms trafficking.

Methods and materials applied. This research is based on a doctrinal and normative analysis of the criminal law regulations governing the illicit circulation of firearms and ammunition, corroborated with the examination of relevant judicial practice in the Republic of Moldova. The study employs comparative, systemic, and interpretative methods in order to highlight the specific features of the factual modalities of the offense provided under Article 290 Criminal Code and to distinguish them from other forms of illicit conduct.

The materials analyzed include specialized doctrinal works, national legal provisions, and relevant judicial decisions concerning the interpretation and application of the applicable legal framework. The research focuses on identifying the defining elements of each normative modality and on establishing clear legal criteria for their delimitation, with a view to ensuring a uniform interpretation of the criminal law provision.

Discussions and results obtained. The analysis of the factual modalities through which the objective side of the offence provided for in Article 290 CC RM is carried out reveals the complex and multifaceted nature of unlawful conduct in the field of the illicit circulation of firearms and ammunition, while the diversity of these modalities, ranging from the acquisition and manufacturing of firearms to their repair, modification of construction or marking, and illegal commercialization, reflects not only the distinct stages of introducing and maintaining firearms in the illicit circuit, but also the varied mechanisms through which this criminal phenomenon manifests itself, thus demonstrating that each normative modality has its own distinct criminal-law content, determined by the specific nature of the material acts, the moment of intervention in the circulation of firearms, and the purpose pursued by the offender.

In this regard, the factual modality of *acquiring firearms* occupies a distinct place within the structure of the objective side of the offence provided for in Art. 290 of the

Criminal Code, as it concerns the initial moment of obtaining control over the material object and, unlike carrying or possession, which presuppose the exercise of an already established control, acquisition marks the entry of the firearm or ammunition into the sphere of the offender's possession.

In the jurisprudential and normative understanding [3], the acquisition of firearms, cold weapons, ammunition, or explosive substances is defined as obtaining them through various means such as purchase, receipt free of charge or as a donation, exchange, debt settlement, pledge, reward, loan, lease, or even finding, while the criminal nature of the act is not determined by the legal form of the transaction, but by the absence of a legal framework authorizing such acquisition, namely the lack of authorization from the competent authorities.

In the same vein, the doctrinaire Brînză S. emphasizes that the acquisition of possession of a firearm or of goods following an illicit transaction, whether onerous or free buy, exchange, receive as a gift, on account of a debt, as a loan, as a reward or as a pledge to guarantee a legal obligation, thus highlights the acquisition of a legal essence. possession over the asset, regardless of the apparent title of acquisition [2, p.632].

A detailed approach to the notion of "procurement" is also found in Russian criminal doctrine, in the context of the interpretation of Art. 222 of the RF Criminal Code, a norm close in structure and purpose to Art. 290 of the RM Criminal Code. Thus, the author Kokin D. shows that by procurement, as an illegal act, we must understand those actions as a result of which firearms, their essential parts or ammunition are transferred into the illegal, temporary or permanent possession or use of the person who meets the characteristics of the subject of the crime [13, p.93].

In this sense, procurement includes purchase in violation of the legal order, receipt as a donation, exchange for goods or values, transmission as a loan, receipt on account of a debt, as payment for work performed or services performed, as well as any other form of transfer of possession. At the same time, it is emphasized that this sphere also includes the illegal procurement and temporary acquisition of weapons for various purposes, including criminal ones, as well as the appropriation of weapons, their component parts or ammunition found.

On the other hand, in order to clearly distinguish between licit and illicit conduct, it is necessary to delimit the notion of illegal procurement from that of legal procurement. In this regard, the author Ulianovschi X., analyzing this factual modality, shows that legal procurement is understood as the purchase of firearms and ammunition from specialized stores, duly authorized by the specially authorized body, under the conditions of the existence of the procurement permit issued to the holder [10, p.564].

In the absence of such an authorization title, any form of obtaining the weapon or ammunition, even an apparently benign one, such as accepting them as a gift or appropriating a found asset, is likely to meet the constitutive elements of the crime, to the extent that the person keeps the asset without immediately handing it over to the competent authorities or without initiating the legal authorization procedure.

However, from the perspective of criminal policy, the legislator does not wait for a concrete prejudicial result to occur, but sanctions in advance the moment the weapon is introduced into the unauthorized possession circuit, considering that the very acquisition of such an object without right creates a real and objective state of danger for the social relations that ensure public security in the field of the weapons and ammunition regime.

Another factual modality provided for by Art. 290 Criminal Code of the Republic of Moldova (CC RM) is the manufacture of weapons, essential components and ammunition,

which, although less frequently encountered in judicial practice, this conduct has a particular legal relevance, as it already marks the very initial stage of the appearance of the material object of the crime, namely the moment of creating the technical means capable of functioning as a weapon or ammunition.

From a legal and criminal perspective, manufacturing means the production or realization, by industrial or artisanal means, of weapons, ammunition or their essential components, by making assemblies or subassemblies which, through integration, acquire the ability to fire, produce an explosion or cause injuries, the notion including not only the complete realization of a weapon, but also the elements without which the mechanism could not function according to its technical purpose.

In international law, the concept of „illicit manufacturing" is outlined in the Protocol against the Illicit Manufacturing of and Trafficking in Firearms, Their Parts and Components and Ammunition, supplementing the United Nations Convention against Transnational Organized Crime. According to this instrument, illicit manufacturing involves the production or assembly of firearms or their components without a license or authorization issued by the competent authority of the state in which the activity takes place, as well as without compliance with marking obligations [6].

In the same sense, the Russian doctrine emphasizes that in the framework of industrial production, the manufacture of firearms is carried out exclusively on the basis of permits and licenses issued by state bodies, within specialized enterprises, with the involvement of gunsmiths and qualified personnel. The production process is a technically complex one, assuming compliance with rigorous standards of design, processing and assembly, which is why the state reserves control over this activity.

In this respect, manufacturing is clearly distinguished from acquisition, as while acquisition presupposes obtaining possession of an already existing weapon, manufacturing entails the very creation of the material object, namely the introduction into circulation of a new weapon or ammunition, a distinction which justifies the separate treatment of these modalities within the structure of the objective side of Art. 290 CC RM, with manufacturing representing the original moment of the physical existence of the object that may subsequently be carried, possessed, commercialized, or appropriated.

Manufacturing, like the other factual modalities provided for in Art. 290 Criminal Code (except for theft), has a formal character, the crime being considered consummated from the moment of obtaining the finished product, that is, when the weapon, component part or ammunition acquires the functional ability for which it was made, and since the norm does not condition liability on the production of a subsequent material result, the simple completion of the technical process of creation is sufficient to meet the material element.

From this perspective, the question of delimiting the phase of the attempt arises in the hypothesis in which the direct manufacturing process is interrupted for reasons independent of the perpetrator's will. We consider that, to the extent that the subject has begun the execution of the manufacturing acts and these are directly part of the achievement of the material element of the crime, but the finished product was not obtained for reasons beyond his will (for example, the intervention of law enforcement agencies), we are in the presence of a punishable attempt, within the meaning of the general rules regarding the phases of the crime.

Repairing weapons, essential components and ammunition constitutes one of the normative ways of committing the crime provided for in Art. 290 CC RM, which, compared to other conduct such as illegal carrying or possession, is characterized by a higher level of latency, as technical interventions on weapons are usually carried out in private

spaces or in restricted environments, being difficult to detect in the absence of specialized investigative activities [11, p.35].

From a legal-criminal perspective, repair is understood as the activity aimed at restoring a weapon or ammunition that has technical defects, wear or alterations to its initial parameters to a functional state, and in a technical-legal sense, it involves intervention on the mechanisms, parts or component assemblies, in order to eliminate defects and restore lost functional qualities, which involves the restoration, replacement or adjustment of damaged elements, so that the object regains its suitability for use according to its technical purpose, without leading to the emergence of a new object, but to the regaining of the useful properties of the existing one.

In this regard, we highlight the findings of the author Chirița V., who, analyzing the objective side of the norm of Art. 290 CC RM, mentions that repair involves a set of operations performed on defective weapons to restore them to a condition that ensures their safe operation according to their intended purpose, without modifying their construction [2, p.141].

In a similar view, Russian criminal doctrine emphasizes that repair consists, on the one hand, in eliminating defects in firearms, their essential parts and related devices, including those intended to change the firing mode, and on the other hand, in actions that restore the striking properties of the weapon or the ability to use its components within certain weapons systems. Also, being qualified as repair and adaptation of the weapon or its components to the individual needs of the owner, when such interventions influence the technical or functional parameters of the object [17, p.48].

Special legislation [4] stipulates that the repair of weapons is permitted exclusively in authorized workshops, regardless of their form of ownership, which have a license and authorization issued by the competent authorities. Outside this legal framework, any intervention aimed at restoring the functionality of a weapon or ammunition constitutes a form of illegal repair, likely to meet the elements of the objective side provided for in Art. 290 Criminal Code of the Republic of Moldova.

In this logic, repair is conceptually distinguished from other technical interventions on weapons, as it does not aim to create a new object, but to restore the existing one to its functional parameters, an essential aspect for the correct delimitation of this factual modality within the framework of the analyzed criminal norm.

Next, we will analyze separately another way of achieving the objective side provided for in Art. 290 of the Criminal Code, namely, modifying the construction or marking of weapons, methods that will be examined separately.

Regarding the modification of the construction, this involves changing or transforming, without the appropriate authorization or in violation of the procedure established by law, the essential parts or components of the weapon, in such a way as to create the possibility of using it for purposes other than those provided by the manufacturer or under conditions other than those permitted by the applicable legal regime.

This category includes, for example:

- Cutting the barrels of long weapons to a length below the legally permitted limit, an intervention that modifies both the ballistic parameters and the legal category of the weapon;
- Adapting weapons to mount devices to reduce the noise produced when firing, which influences the technical characteristics and the way of use;
- Modifying the firing mechanism in order to carry out serial firing, by transforming a semi-automatic weapon into one capable of automatic fire;
- Modifying the construction of weapons with a folding stock, so that firing is also

possible in the folded position, which alters the operating conditions provided by the manufacturer;

• Replacing or modifying the firing pin, the extractor claw or the front wall of the bolt, interventions that affect the functioning of the firing mechanism;

• Replacing the barrel or modifying its channel, including changing the caliber or internal structure, with a direct impact on ballistic performance.

Thus, in a detailed analysis, it is observed that all these actions have in common the fact that they affect the technical structure of the weapon at the level of essential elements, determining the modification of the functional parameters or the applicable legal regime.

In this continuity, what is essential is not only the material act of the intervention, but the fact that it is carried out without the necessary authorization or in violation of the procedures established by law.

However, it should also be noted that not every intervention on a weapon constitutes modification in the criminal sense. Activities such as lubricating or cleaning the weapon, adjusting or replacing the handle, the front or rear sight, the handle plates, the groove, the stock, the safety spring, or other similar actions performed on a functional weapon do not constitute violations of the law, to the extent that they do not alter the essential technical structure and do not change the purpose or legal regime of the weapon, given that these interventions fall within the scope of permitted maintenance or customization, without affecting the fundamental constructive characteristics.

Therefore, modification of the construction of weapons, within the meaning of Art. 290 CC RM, must be understood as an unauthorized intervention on essential structural elements, capable of changing the technical parameters or functional purpose of the weapon, thus distinguishing itself from simple maintenance or adjustment operations that do not affect the essence of the mechanism.

This normative method was retained in the following case from judicial practice: *R.C. during the period from May 20 to June 18, 2015 in the village of Misovca, Ialoveni county, manufactured from the smooth-bore hunting weapon, with the series and no. "Y00848", into the atypical sawn-off weapon, by modification, by cutting the barrel to 295 mm and the stock, a fact confirmed in the Ballistic Expertise Report, later in the village of Fundul Galbenei, Hincesti county, the same indicated weapon was carried, kept and its ammunition in the amount of three 20-caliber hunting cartridges with centerfire "with machine guns" diameter of 4 mm, without the appropriate authorization. Through his intentional actions, Rusu Cristian committed the carrying, keeping, manufacturing of the firearm and ammunition without the appropriate authorization, a crime provided for by art. 290 paragraph (1) Criminal Code* [8].

Thus, those analyzed in the case at hand confirm the relevance of the delimitation between permitted technical interventions and those that constitute modifications in a criminal sense, highlighting that any unauthorized intervention on the essential structural elements of the weapon, capable of altering its technical parameters or destination, attracts the incidence of criminal liability, even in the absence of a subsequent use of the weapon for criminal purposes.

Next, in order to establish the specifics of the modification of the marking considered as an illicit act, it is necessary to specify that this term is to be understood as the set of identification elements such as the series, code, industrial symbol or other distinctive signs that are applied to the metal surface of the weapon by mechanical, laser or electrochemical engraving or printing, at a technical depth sufficient to ensure their durability, namely at a minimum level of approximately 0.076 mm.

Therefore, in order to ensure the identification and traceability of each firearm, the UN Firearms Protocol imposes on states the obligation to ensure the unique marking of each firearm at three essential moments: at the time of manufacture, at import, and at the transfer from state stocks to the civilian circuit.

For this reason, the specialized doctrine emphasized that the applied marking must meet certain fundamental technical requirements, namely, according to the opinion expressed by N.S. Kudinova, the marking must allow for the verification and identification of the object, have a long term of existence, be easily detectable, demonstrate resistance to aggressive environments and abrasive actions, as well as ensure the possibility of forensic identification, thus demonstrating that the marking is designed to be durable, legible and susceptible to expertise, precisely to prevent the integration of the weapon into an anonymous illicit circuit [15, p.46].

In this context, marking modification involves intentional intervention on these identification elements, with the aim of altering or suppressing the possibility of individualizing the weapon. In practice, this conduct can take various forms, such as: erasing or erasing the serial number, partial alteration of numbers or letters, re-engraving or overwriting with other data, applying a false marking, replacing the plate or the element on which the number is printed, as well as the deliberate destruction of the identification area.

Therefore, the modification of the marking of weapons within the meaning of Art. 290 RM Criminal Code, must be understood as any intentional and unauthorized intervention on the identification elements, capable of compromising the traceability and individualization of the weapon, this conduct being likely to facilitate its integration into the illegal circuit and to hinder the activity of criminal prosecution bodies.

Continuing the analysis of the normative modalities provided for in Art. 290 CC RM, it is necessary to examine separately the illegal trade in weapons or ammunition, as well as their essential components.

Commercialization means the introduction into the civilian circuit of weapons, ammunition or essential parts through acts of alienation for a fee or free of charge, carried out systematically or occasionally, regardless of whether they aim to obtain a material benefit or not.

Although, at first glance, the notion of trade would essentially imply the operation of sale-purchase or procurement of goods or services [5], within the meaning of the norm provided for in art. 290 RM Criminal Code, it has a broader scope, covering other equivalent legal forms through which the good is transmitted to another person, such as exchange, gift or other ways of transmitting possession or detention of the respective object.

In this sense, it can be observed that marketing represents the opposite side of the previously analyzed factual modality, namely procurement, the two conducts being, in essence, components of the same legal relationship of transmission of the good, one aiming at its acquisition, and the other at its alienation.

In confirmation of the above, we find relevant opinions in Russian criminal doctrine, where unanimously, several scholars understand by illegal trading of firearms, their main parts and ammunition the action of definitive alienation of these goods into the ownership of other persons as a result of an illicit transaction, whether onerous or free, such as sale, gift, exchange, etc., thus emphasizing that such alienation must be irreversible, unlike situations in which the object is only temporarily transmitted to another person for use or storage [13, p.93; 12, p.103; 14, p.59].

However, we cannot fail to note the position expressed in the national doctrine by the authors S. Brînza and V. Statii, which highlights an important delimitation regard-

ing the legal qualification of such conduct. According to them, viewed as a distinct way of trading weapons, equipping a criminal organization with weapons for the purpose of committing crimes does not attract liability under Art. 290 RM Criminal Code, but is to be qualified according to Art. 284 para. (1) RM Criminal Code [1, p.263], which incriminates the creation or management of a criminal organization.

In such situations, such a purpose is due to the existence of a competition between the general norm and the special norm, since the provision of Art. 284 CC RM expressly includes among the manifestations of criminal activity the provision of the criminal organization with weapons and instruments for committing crimes, which is why, as a consequence, according to the rule enshrined in Art. 116 CC RM, in the event of competition between the general norm and the special norm, the latter applies with priority, since it is in a relationship of logical subordination to the general norm [9, p.193].

Therefore, as a conclusion to what has been said, we also mention the fact that although the illegal trade in weapons, ammunition or their essential components, by its very nature, represents an activity that is difficult to investigate and, in many situations, difficult to demonstrate in terms of evidence, national judicial practice nevertheless knows cases in which such conduct has been found and sanctioned by the courts.

In this regard, by way of example, we mention the following case from judicial practice: *D.I., in circumstances unknown to the criminal investigation body, came into possession of a "TT" model pistol, industrial caliber 7.62x25mm, and an "RPG-18" model anti-tank grenade, which he kept without proper authorization until May 14 and 15, 2014, respectively.*

Subsequently, with the aim of alienating this weapon and ammunition without proper authorization, in order to obtain profit, namely monetary means in the amount of 1,000 euros, which according to the official exchange rate of the National Bank of Moldova is equivalent to the amount of 18,717 lei, on May 14, 2014, in the municipality of Chisinau, he sent a "TT" model pistol to citizen M.M., a journalist within the Organized Crime and Corruption Reporting Program cal.7,62x25mm.

By the actions the Court decides to find D.I. guilty of committing the offense provided for in art. 290 par. (2) letter b) of the Criminal Code of the Republic of Moldova [7].

The analyzed case illustrates the typical mechanism of illegal trafficking, in which unauthorized possession is followed by the introduction of the weapon into the illicit circuit through an act of transmission to a third party, highlighting the staged nature of the conduct and the role of trafficking as an essential link in the dissemination of weapons outside the legal framework.

Conclusions. The findings of the research demonstrate that the current regulation of acts concerning the illicit circulation of firearms and ammunition, although providing a general framework of criminalization, does not in all cases ensure a sufficiently clear delimitation of unlawful conduct, which may lead to divergent interpretations in the process of legal classification. In particular, it has been established that the absence of explicit normative criteria regarding the nature of the intervention on the material object and the moment of its integration into the illicit circuit generates practical difficulties in the uniform application of criminal law.

In this context, the need for a reformulation of the legal provision in a more precise manner, better aligned with current criminogenic realities, is emphasized through the use of clearer legal concepts and by extending the scope of regulation to certain forms of conduct which, although presenting an evident social danger, are not sufficiently explicitly reflected in the legal text. Such a legislative intervention would contribute not only to increasing the predictability of the criminal norm, but also to enhancing its effectiveness

in preventing and combating the analyzed criminal phenomenon.

THE ROLE OF PUBLIC POLICIES IN PREVENTING AND COMBATING CRIME

Niki Nicolae POPESCU,
Battalion Commander,
"Alexandru Ioan Cuza" Police Academy, Bucharest, Romania
ORCID: 0009-0004-2926-4103

Abstract

Crime represents a complex and dynamic social phenomenon, influenced by the economic, technological, and cultural transformations of contemporary society. In this context, public policies play a crucial role in preventing and combating criminality, serving as the main instrument through which the state intervenes to ensure public order and safety. This paper aims to analyze the role and effectiveness of public policies in managing crime, highlighting both their preventive and repressive dimensions.

The research methodology is qualitative, based on the analysis of specialized literature, national and international strategic documents, and relevant empirical studies. The study examines the main types of crime prevention policies, namely primary, secondary, and tertiary prevention, as well as control and sanctioning measures. Furthermore, the paper emphasizes the importance of inter-institutional cooperation and partnerships between the public and private sectors in the effective implementation of public policies.

The findings indicate that effective public policies are those adapted to emerging forms of crime, particularly cybercrime, economic crime, and transnational crime. The integration of modern technologies, the use of statistical data, and the adoption of evidence-based approaches significantly enhance the efficiency of interventions. At the same time, the study highlights the need for an integrated approach that combines preventive and control measures, taking into account the social, economic, and cultural factors that contribute to criminal behavior.

In conclusion, public policies represent a fundamental pillar in combating crime; however, their effectiveness depends on their adaptability to societal changes and on strong institutional cooperation. The development of coherent, flexible, and prevention-oriented strategies is essential for ensuring long-term social security and stability.

Keywords: crime, public policies, prevention, control, security, institutional cooperation, strategy, cybercrime, intervention, evidence-based policies.

ROLUL POLITICILOR PUBLICE ÎN PREVENIREA ȘI COMBATEREA CRIMINALITĂȚII

Abstract

Criminalitatea reprezintă un fenomen social complex și dinamic, influențat de transformările economice, tehnologice și culturale ale societății contemporane. În acest context, politicile publice joacă un rol esențial în prevenirea și combaterea infracționalității, constituind principalul instrument prin care statul intervine pentru menținerea ordinii și siguranței publice. Lucrarea de față își propune să analizeze rolul și eficiența politicilor publice în gestionarea fenomenului infracțional, evidențiind atât dimensiunea preventivă, cât și cea represivă a acestora.

Metodologia utilizată este una calitativă, bazată pe analiza literaturii de specialitate, a documentelor strategice naționale și internaționale, precum și a studiilor empirice relevante. Sunt examinate principalele tipuri de politici de prevenire, respectiv prevenirea primară, secundară și terțiară, precum și măsurile de control și sancționare a criminalității. De asemenea, lucrarea abordează importanța cooperării interinstituționale și a parteneriatelor dintre sectorul public și cel privat în implementarea eficientă a politicilor publice.

Rezultatele analizei evidențiază faptul că politicile publice eficiente sunt cele adaptate la noile forme de criminalitate, în special la criminalitatea informatică, economică și transnațională. Integrarea tehnologiilor moderne, utilizarea datelor statistice și adoptarea unei abordări bazate pe dovezi contribuie semnificativ la

creșterea eficienței intervențiilor. Totodată, se subliniază necesitatea unei abordări integrate, care să combine măsurile de prevenire cu cele de control, având în vedere factorii sociali, economici și culturali care favorizează apariția criminalității.

În concluzie, politicile publice reprezintă un pilon fundamental în combaterea criminalității, însă eficiența acestora depinde de capacitatea de adaptare la schimbările societale și de colaborarea între instituții. Dezvoltarea unor strategii coerente, flexibile și orientate spre prevenire este esențială pentru asigurarea securității și stabilității sociale pe termen lung.

Cuvinte-cheie: criminalitate, politici publice, prevenire, combatere, securitate, cooperare instituțională, strategie, criminalitate informatică, intervenție, politici bazate pe dovezi.

Introduction. Crime constitutes one of the most complex and enduring challenges faced by contemporary society, producing direct consequences for public security, economic stability and social cohesion. In recent decades, processes associated with globalization, rapid technological development and increased population mobility have contributed to the diversification and growing sophistication of criminal phenomena. Consequently, alongside traditional forms of offending, new manifestations of crime have emerged, including cybercrime, economic crime and transnational crime, all of which challenge conventional mechanisms of prevention, control and repression.

Within this dynamic context, public policies represent essential instruments through which the state seeks to address, regulate and manage the criminal phenomenon. Such policies comprise a coherent set of legislative, institutional and social measures designed both to reduce the underlying causes of crime and to ensure an appropriate response to unlawful conduct. Their role is therefore not confined to the punitive or repressive dimension of criminal justice, but also extends to the development of effective preventive strategies, grounded in the identification of risk factors and in the promotion of social values capable of discouraging deviant behaviour.

The relevance of an integrated approach to public policies in the field of crime has become increasingly apparent, particularly in light of the complexity of the phenomenon and the interdependence of the factors that generate and sustain it. Interinstitutional cooperation, community participation and the use of modern technological instruments constitute key elements for enhancing the effectiveness of public interventions. At the same time, the adoption of an evidence-based policy approach allows public decision-making to be grounded in empirical data and facilitates the continuous assessment of the outcomes achieved.

The aim of the present paper is to analyse the role of public policies in the prevention and control of crime, with particular emphasis on the main mechanisms of public intervention and on their effectiveness in the current social and institutional context. The paper also seeks to identify the challenges posed by emerging forms of crime and to underline the need to adapt public strategies to the evolving realities of contemporary society.

The research hypothesis is based on the premise that the effectiveness of public policies in the field of crime depends on their capacity to adapt to social and technological transformations, as well as on the degree of cooperation among the institutions involved. From this perspective, the development of flexible, integrated and prevention-oriented policies represents an essential condition for ensuring public security and long-term social stability.

The Theoretical Framework of Public Policies in the Field of Crime. Analysis of public policies in the field of crime requires an understanding of the theoretical foundations on which such policies are based. Public policies may be understood as the set of decisions and actions adopted by state authorities in order to manage issues of general interest, including the prevention and control of criminality. In this field, they include

legislative, institutional and social measures aimed both at reducing risk factors and at sanctioning unlawful conduct.

An essential feature of public policies is their dynamic character, determined by social, economic and technological developments. Accordingly, their effectiveness depends on their capacity to adapt to new forms of crime and to incorporate modern mechanisms of intervention. The policy-making process involves several stages, including the identification of the problem, the formulation of solutions, implementation and evaluation of outcomes. These stages allow public interventions to be continuously adjusted and improved.

With regard to crime prevention, the specialised literature generally distinguishes between three main levels of intervention: primary, secondary and tertiary prevention. Primary prevention is directed at the population as a whole and seeks to reduce the general causes of crime through measures such as education, social development and the strengthening of community values. Secondary prevention focuses on vulnerable groups and aims to reduce the risk of involvement in criminal activities through specific support and intervention programmes. Tertiary prevention is addressed to individuals who have already committed offences and seeks to reduce reoffending through rehabilitation and social reintegration measures.

The theoretical grounding of public policies in the field of crime is also influenced by several major criminological perspectives. Strain theory explains criminality through the existence of tensions between socially accepted goals and the legitimate means available for achieving them. Social control theory emphasizes the role of social institutions, norms and interpersonal bonds in maintaining social order and preventing deviant behaviour. Rational choice theory, in turn, argues that individuals may engage in criminal conduct following an assessment of the potential costs and benefits of such behaviour.

The theoretical framework therefore highlights the need for an integrated approach to public policies, capable of combining preventive measures with mechanisms of control and social reintegration. Such an approach is necessary given the complexity of the criminal phenomenon and its continuous transformation within contemporary society [1].

Materials and methods applied. The present paper employs a qualitative research methodology, appropriate for the analysis of complex social phenomena such as crime and the public policies associated with it. The choice of this methodological approach is justified by the need to gain an in-depth understanding of the mechanisms through which public policies influence the prevention and control of crime, as well as of the broader context in which such policies are designed and implemented.

The main method used is *documentary analysis*, consisting of the examination of specialised literature in the fields of criminology and public policy. Relevant academic works, scientific articles and reference studies addressing the relationship between public policies and the criminal phenomenon were analysed. This approach enables the identification of the main concepts, theories and explanatory models used in the field.

The research also includes the *analysis of official documents*, such as national and international strategies on crime prevention and control, institutional reports and public policies adopted at governmental level. These sources provide a practical perspective on the manner in which policies are formulated and implemented, as well as on their effectiveness in different institutional and social contexts.

Another important methodological element is *comparative analysis*, used to highlight the similarities and differences between various models of public policy. This method contributes to the identification of good practices and effective solutions applied in other states or institutional contexts.

The data used in the research are secondary in nature, being drawn from public and

validated sources, which contributes to the credibility and relevance of the information analysed. Data interpretation is carried out through a critical approach, aimed at highlighting both the strengths and the limitations of existing public policies.

The methodology adopted allows for a complex and coherent analysis of the role of public policies in the prevention and control of crime, providing a solid basis for the formulation of conclusions and recommendations. At the same time, it emphasizes the importance of an interdisciplinary and evidence-based approach in the development of effective public policies [2].

Discussions and results obtained. **I. The Role of Public Policies in Crime Prevention**. Public policies play a fundamental role in crime prevention, constituting one of the main instruments through which the state seeks to reduce the factors that facilitate criminal behaviour. Crime prevention represents a proactive approach, aimed at limiting risks before offences are committed and thereby contributing to the maintenance of public security and social stability. In this respect, primary prevention focuses on reducing the general causes of crime through education, social development and inclusive public measures, while secondary prevention is directed towards vulnerable groups exposed to a higher risk of involvement in criminal activities.

A first essential dimension of public policies in this field concerns the implementation of preventive measures. These may include educational programmes, public awareness campaigns and social initiatives designed to reduce both individual and collective vulnerabilities. Education has a central role in shaping social values and norms capable of discouraging deviant behaviour, while also contributing to the development of a social environment based on responsibility, civic participation and respect for the law.

At the same time, public policies aim to identify and support vulnerable groups that may be exposed to a higher risk of criminal involvement. Early interventions, such as counselling programmes, social integration measures and educational support, may contribute to reducing the likelihood of unlawful conduct. From this perspective, cooperation between public institutions, non-governmental organisations and local communities is essential for the effective implementation of preventive strategies.

Another important element is the use of modern technologies in crime prevention. Surveillance systems, data analysis and digital tools can facilitate the rapid identification of risks and enable timely intervention by the competent authorities. Moreover, the use of statistical data contributes to grounding public policies in empirical evidence, thereby increasing their relevance and effectiveness. However, the use of technological instruments must be accompanied by adequate safeguards, in order to ensure respect for fundamental rights and to prevent excessive or disproportionate forms of intervention.

The role of the community is also essential in preventing crime. Citizen involvement in preventive activities, including community safety programmes, contributes to strengthening the relationship between the population and state institutions. Such cooperation facilitates the early identification of social problems and increases public trust in the authorities, which is a necessary condition for the legitimacy and effectiveness of public policies in this field.

Public policies aimed at crime prevention must therefore be integrated, flexible and adapted to current social realities. Their effectiveness depends on the capacity to combine educational, social, institutional and technological measures, as well as on the level of cooperation between public authorities and the community. A well-founded preventive approach can contribute significantly to reducing crime and to creating a safer and more stable social environment [3].

II. Public Policies in Combating Crime. Combating crime represents an essential

dimension of public policies, aimed at identifying, sanctioning and deterring criminal conduct. Unlike prevention, which has a proactive character, combating crime involves direct intervention by state institutions after antisocial acts have occurred, with the purpose of restoring the rule of law and protecting society.

A central role in this process is played by repressive measures, which include criminal and administrative sanctions imposed on persons who violate the law. These measures perform both a punitive and a preventive function, as they seek not only to sanction unlawful behaviour, but also to discourage potential offenders. The effectiveness of sanctions depends on their proportionality, the promptness of their application and the public perception of the certainty of punishment.

The institutions involved in combating crime, such as the police, prosecution services and courts, have complementary responsibilities in the enforcement of the law. The police are responsible for preventing and investigating offences, prosecution services coordinate criminal proceedings, while courts ensure the adjudication of cases and the application of sanctions. The effective functioning of these institutions depends on professionalism, adequate resources and compliance with the principles of the rule of law.

Interinstitutional cooperation is a key element in the effective fight against crime, particularly in the case of complex offences, such as economic or transnational crime. Cooperation between national and international institutions facilitates the exchange of information, the coordination of actions and the strengthening of intervention capacity. In this context, partnerships with international organisations and specialised agencies become particularly important.

Another important aspect is the use of modern technologies in combating crime. Digital tools, integrated databases and information analysis contribute to the rapid identification of offenders and to the efficiency of investigative processes. At the same time, technology supports the development of data-driven strategies, allowing for a more effective allocation of institutional resources.

Public policies aimed at combating crime must therefore be coherent, effective and adapted to the complexity of the criminal phenomenon. Their success depends on the proper functioning of institutions, cooperation among them and the integration of modern technologies. A balanced approach, combining sanctions with reintegration measures, contributes to reducing crime and strengthening social security [4].

III. Contemporary Challenges and Emerging Forms of Crime. Recent developments in contemporary society have produced significant transformations in the structure and manifestation of the criminal phenomenon. Globalization, rapid technological development and increased population mobility have facilitated the emergence of new forms of crime, which are more complex, more sophisticated and often more difficult to control. These changes generate major challenges for public policies, which must constantly adapt in order to respond effectively to new risks.

One of the most relevant emerging forms of crime is cybercrime. This category includes offences such as online fraud, cyberattacks, data theft and illegal access to information systems. The transnational nature of these offences, together with the difficulty of identifying perpetrators, requires the development of modern strategies based on international cooperation, specialised institutional capacity and the use of advanced technologies. At the same time, the increasing dependence of society on the digital environment amplifies vulnerability to such threats.

Organised transnational crime also represents an increasingly serious threat, involving complex criminal networks that operate across national borders. Drug trafficking, trafficking in human beings and smuggling are only some examples of criminal activities

that require a coordinated response at international level. The absence of effective cooperation between states may limit the capacity of authorities to intervene and may facilitate the expansion of these criminal networks.

Another important aspect concerns the continuous adaptation of offenders to control and sanctioning measures. Criminal actors increasingly use modern technologies and innovative methods in order to avoid detection, which requires public authorities to constantly develop new strategies, investigative tools and institutional responses. This dynamic relationship between criminal innovation and institutional reaction highlights the need for flexible and forward-looking public policies.

Emerging forms of crime therefore underline the necessity of flexible, integrated and risk-oriented public policies. Their effectiveness depends on the capacity to adapt to rapid social and technological changes, on international cooperation and on the responsible use of modern technologies in the prevention and control of crime [5].

IV. Assessing the Effectiveness of Public Policies. The assessment of the effectiveness of public policies in the field of crime prevention and control represents an essential process for optimizing state intervention and adapting it to social realities. The analysis of effectiveness involves examining the results achieved in relation to the objectives initially established, as well as identifying the factors that influence the success or limitations of such policies.

A first evaluation criterion is represented by performance indicators, such as the crime rate, the level of recidivism, the degree of public perception of safety and the effectiveness of law enforcement processes. The decrease in crime rates and the reduction of recidivism are relevant indicators of the effectiveness of public policies; however, they must be analysed in correlation with broader social and economic factors. Moreover, citizens' perception of public safety represents an important element, as it reflects the level of trust in state institutions.

Another essential aspect is the analysis of good practices, which allows the identification of effective models of intervention. Examples of evidence-based policies implemented in various states demonstrate the importance of using statistical data and empirical research in the development of public strategies. Community-oriented prevention programmes, the use of modern technologies and the strengthening of interinstitutional cooperation are factors that can significantly contribute to increasing the effectiveness of public policies.

However, public policies also face a number of limitations and vulnerabilities. These include insufficient financial and human resources, lack of coordination among institutions and the difficulty of adapting to emerging forms of crime. In addition, certain policies may have only a limited impact if they are not correlated with social and economic measures aimed at addressing the underlying causes of criminality.

The continuous evaluation of public policies is therefore essential for identifying such deficiencies and for adjusting strategies accordingly. In this respect, the adoption of an evidence-based approach allows public decision-making to be grounded in concrete data and increases the effectiveness of interventions. Constant monitoring of outcomes and the involvement of relevant stakeholders contribute to improving the quality and coherence of public policies [6].

Conclusions and recommendations. The analysis carried out in the present paper highlights the essential role of public policies in the prevention and control of crime, as they represent one of the main instruments through which the state intervenes in order to maintain public order and social security. The complexity of the criminal phenomenon, intensified by globalization and technological development, requires the adoption of coherent, flexible and adaptive strategies capable of responding to new social realities.

One of the main aspects emphasized in this paper is the importance of maintaining a balance between preventive and repressive measures. Crime prevention, through education, social intervention and support for vulnerable groups, contributes to reducing the underlying causes that generate criminal behaviour. At the same time, control measures based on law enforcement and the effective sanctioning of offenders remain essential for deterring and limiting the criminal phenomenon.

The paper also underlines the crucial role of interinstitutional cooperation and partnerships between the public and private sectors. Combating crime, especially modern forms such as cybercrime and transnational crime, cannot be carried out effectively in the absence of close cooperation between institutions at both national and international levels. The exchange of information and the coordination of actions are decisive factors in increasing the effectiveness of public interventions.

Another important element is the use of modern technologies and the adoption of an evidence-based approach. The integration of statistical data, information analysis and digital tools contributes to the development of public policies that are more effective and better adapted to contemporary realities. Continuous policy evaluation makes it possible to identify deficiencies and to adjust strategies according to the results achieved.

With regard to recommendations, it is necessary to develop integrated public policies that combine preventive and control measures, taking into account the interdependence of social, economic and cultural factors. It is also necessary to strengthen institutional capacity through the allocation of adequate resources and the continuous professional training of personnel involved in the prevention and control of crime.

At the same time, international cooperation should be intensified, and the legislative framework should be adapted to emerging forms of crime. The promotion of education and social awareness should remain a priority, as it contributes to the development of a culture of legality and responsibility.

In conclusion, the effectiveness of public policies in the field of crime depends on their capacity to adapt to societal changes and to integrate modern mechanisms of intervention. A strategic approach based on cooperation, prevention and innovation is essential for ensuring long-term public security and social stability [7].
