Abstract

The study examines the procedure for reviewing, during the criminal investigation phase, motions seeking authorization of procedural actions that interfere with fundamental rights and freedoms. The analysis focuses on the role of the investigating judge as a guarantor of the legality and proportionality of such interferences within the framework of criminal procedure law.

The main investigative actions requiring judicial authorization are identified, including searches, bodily examinations, seizure of objects and documents, and compulsory placement in medical institutions for expert evaluation. The paper also addresses exceptions to prior judicial authorization, particularly in cases of flagrante delicto and urgent circumstances, emphasizing the necessity of an effective ex post judicial review.

The research highlights deficiencies in the current legal framework, notably the lack of clear requirements regarding the content of the prosecutor's motion and the reasoning standards of judicial rulings. In this context, the case law of the European Court of Human Rights is invoked, which requires the existence of genuine safeguards against arbitrariness and "relevant and sufficient" reasons for authorizing interferences.

Particular attention is given to the principle of proportionality, analyzed as a fundamental standard for assessing the necessity and legitimacy of procedural measures. The study argues for the explicit recognition of this principle within criminal procedural law.

In conclusion, the paper advances de lege ferenda proposals aimed at strengthening judicial control, ensuring consistency in practice, and maintaining a proper balance between the interests of criminal justice and the protection of fundamental rights.

Keywords: *criminal investigation, investigating judge, judicial authorization, evidentiary procedures, fundamental rights, interference, judicial control, proportionality, prosecutor's motion, search, flagrante delicto, urgent circumstances, ECtHR case law.*

PROCEDURA CONTROLULUI JUDICIAR AL ANUMITOR MĂSURI PROBATORII CARE ADUC ATINGERE DREPTURILOR FUNDAMENTALE ÎN PROCESUL PENAL

Abtract

Studiul analizează procedura de examinare, în faza urmăririi penale, a demersurilor privind autorizarea acțiunilor procesuale care implică ingerințe în drepturile și libertățile fundamentale ale persoanei. Accentul este pus pe rolul judecătorului de instrucție ca garant al legalității și proporționalității acestor ingerințe, în contextul reglementărilor Codului de procedură penală.

Sunt identificate principalele acțiuni de urmărire penală ce necesită autorizare judiciară, precum percheziția, examinarea corporală, ridicarea de obiecte și documente sau internarea în scop de expertiză. Totodată, sunt analizate excepțiile de la regula autorizării prealabile, în special în cazurile de infracțiune flagrantă și situații care nu suferă amânare, subliniindu-se necesitatea unui control judiciar ulterior efectiv.

Lucrarea evidențiază insuficiențele cadrului normativ, în special lipsa unor cerințe clare privind conținutul demersului procurorului și standardele de motivare a încheierii judecătorului de instrucție. În acest context, este valorificată jurisprudența Curții Europene a Drepturilor Omului, care impune existența unor garanții reale împotriva arbitrariului și a unor motive „relevante și suficiente" pentru autorizarea ingerințelor.

Un rol central îl ocupă principiul proporționalității, analizat ca standard esențial în evaluarea necesității și legitimității măsurilor procesuale. Se susține necesitatea consacrării exprese a acestui principiu în legislația procesual-penală.

În concluzie, studiul formulează propuneri de lege ferenda orientate spre consolidarea controlului judiciar, uniformizarea practicii și asigurarea unui echilibru efectiv între interesele justiției penale și protecția drepturilor fundamentale.

Cuvinte-cheie: urmărire penală; judecător de instrucție; autorizare judiciară; procedee probatorii; drepturi fundamentale; ingerință; control judiciar; proporționalitate; demersul procurorului; percheziție; infracțiune flagrantă; caz ce nu suferă amânare; jurisprudența CtEDO.

Introduction. The procedure for authorizing investigative actions that entail interference with a person's fundamental rights and freedoms constitutes one of the most sensitive mechanisms of contemporary criminal proceedings. In a state governed by the rule of law, the balance between the need to detect and combat criminal offences and the obligation to respect fundamental rights—such as personal inviolability, the inviolability of the home, and the secrecy of communications—is achieved, in essence, through judicial review exercised by the investigating judge.

The provisions of the Criminal Procedure Code of the Republic of Moldova (hereinafter, the CPC) establish a general framework for such interferences without providing an exhaustive list of the evidentiary measures subject to authorization, instead opting for a substantive criterion focused on the nature of the rights affected. This legislative technique necessitates a systemic analysis of the relevant legal provisions, as well as of judicial practice and the standards developed in the case-law of the European Court of Human Rights.

At the same time, the existence of exceptions to the rule of prior authorization—*particularly in cases of a flagrant offence or situations not permitting delay*—raises complex issues concerning the delimitation of the powers of the criminal investigation bodies and the effectiveness of subsequent judicial review. From this perspective, a rigorous examination becomes essential of the procedure for seising the investigating judge, the content of the prosecutor's applications, and the criteria for assessing the legality and proportionality of such interferences.

This study seeks to analyse, in a systematic and critical manner, the procedure for

examining applications for the authorization of evidentiary measures that interfere with fundamental rights at the stage of criminal investigation, highlighting both the normative gaps and the directions of development necessary for strengthening procedural safeguards.

Methods and materials applied. In the preparation of this study, research methods specific to the field of criminal procedure law were employed, enabling a comprehensive and coherent analysis of the procedure for authorizing investigative actions that interfere with fundamental rights.

The primary method used was the ***legal-textual analysis***, through which the provisions of the Criminal Procedure Code were examined and interpreted, particularly those governing the competence and authorization procedure exercised by the investigating judge. The case-law analysis ***method facilitated*** the use of relevant judicial decisions, both at the national and European levels, in order to highlight practical application issues and the standards concerning the justification of interferences with fundamental rights.

This approach was complemented by ***the systemic method***, which allowed for the correlation of general and special legal norms, with a view to identifying the regulatory framework applicable to various evidentiary measures.

In addition, the ***comparative method*** was employed, by reference to the standards developed in the case-law of the European Court of Human Rights, in order to assess the compatibility of national regulations with the requirements of the European Convention on Human Rights.

At the same time, a ***critical method*** was applied, aimed at identifying legislative gaps and practical deficiencies, as well as at formulating *de lege ferenda* proposals.

The empirical material of the research included relevant judicial practice, the case-law of the Constitutional Court of the Republic of Moldova, as well as the jurisprudence of the European Court of Human Rights concerning the protection of fundamental rights within criminal proceedings.

Discussions and results obtained. Article 301 para. (1) of the Criminal Procedure Code (CPC) does not expressly enumerate the investigative actions that require authorization by the investigating judge, instead placing emphasis on the rights that may be affected: "*Investigative actions involving the restriction of personal inviolability, the inviolability of the home, the secrecy of correspondence, telephone conversations, telegraphic communications and other communications, as well as other actions provided by law, shall be carried out with the authorization of the investigating judge*".

Given the general nature of this provision, the specific evidentiary measures (investigative actions) subject to prior judicial authorization must be identified across various provisions of the general part of the CPC, where the procedural law explicitly requires authorization by the investigating judge:

– **Body examination, as well as the collection of bodily discharge samples or other biological samples from the injured party, suspect, or accused without their consent** (Articles 60 para. (4/1); 64 para. (3/1); 66 para. (2/1); 119 paras. (1), (2) and 301 para. (3) CPC);

– **Search** (Article 125 para. (3) CPC);

– **On-site examination without the consent of the person whose right to the inviolability of the home is restricted** (Article 118 para. (2) CPC), as well as other investigative actions carried out at the domicile (Article 12 para. (2) CPC). "Examination, search, seizure of objects, and other procedural actions at the domicile (...) may be carried out only with

the consent of the person residing at that address or on the basis of appropriate authorization" (Article 279 para. (3) CPC);

– **Exhumation of a corpse** (Article 121 CPC);

– **Seizure of objects and documents containing state, commercial, or banking secrets, as well as the collection of information regarding telephone communications** (Article 126 para. (2) CPC);

– **Placement of a person in a medical institution for the purpose of conducting a forensic medical or psychiatric examination** (Articles 152 and 301 para. (3) CPC).

Criminal procedural law provides, as an exception, the right and possibility for the criminal investigation body to carry out certain procedural actions that normally require authorization by the investigating judge, even in the absence of such authorization.

"The situations indicated are strictly limited by law, in order to prevent the criminal investigation body from committing abuses that may lead to serious violations of fundamental human rights and freedoms" [19, p. 113].

Article 301 para. (2) of the CPC specifies those investigative actions which, in cases of flagrante delicto and in situations not permitting delay, may exceptionally be carried out without prior authorization by the investigating judge—namely, search, on-site examination at the domicile, and the seizure of assets following a search.

Additionally, provisions of the Article 119 para. (2) CPC allow, in cases of flagrante delicto, the performance of a body examination without prior judicial authorization; however, the investigating judge must be informed within 24 hours of the action carried out, with the submission of the relevant case materials for the purpose of reviewing the legality of that measure.

Provisions of the Article 125 para. (4) CPC and Article 205 para. (5) CPC provides for the possibility of conducting a search and ordering the seizure of assets without prior authorization by the investigating judge not only in cases of flagrante delicto, but also in situations not permitting delay, as factual grounds. The legal basis in such cases is the reasoned order of the prosecutor.

The European Court of Human Rights criticized, in the case of *Varga v. Romania* (Judgment of 1 April 2008), the excessively broad powers of the prosecutor in ordering searches, as well as the lax and incomplete legal provisions, finding that the applicants did not benefit from the minimum level of protection against arbitrariness required under Article 8 of the Convention. "...in the absence of a prior judicial warrant, the search in question was not subject to any a priori control; the Court observes that, at the material time, the first two applicants did not benefit from any effective remedy enabling them to obtain a posteriori judicial review of the legality and justification of the search... Consequently, having been carried out in the absence of a warrant and, as appears from the record, without the presence of attesting witnesses, the search conducted by the prosecutor did not comply with the minimum safeguards required by law and was not subject to judicial control" (§73) [11].

In the context of the above, it is necessary to identify the meaning of the notions "*in case of a flagrant offence*", "*in case of flagrante delicto*", and "*in situations not permitting delay*".

According to Article 6 point 10) CPC, *flagrante delicto* is defined as an offence discovered at the moment of its commission or before its effects have been fully realized.

The definition provided in Article 513 CPC of a *flagrant offence* allows the conclusion

that this notion has a broader scope compared to the notion of *flagrante delicto*, since a flagrant offence is not only an offence discovered at the moment of its commission, but also an offence whose perpetrator, immediately after its commission, is pursued by the victim, eyewitnesses, or other persons, or is caught near the place where the offence was committed with weapons, instruments, or any other objects that give grounds to presume his participation in the offence.

In accordance with Article 6 point 6) CPC, *a situation not permitting delay* is considered to exist where there is a real risk that evidence will be lost or destroyed, that the suspect or accused may hide in the premises concerned, or that other offences may be committed.

The investigating judge must be informed by the criminal investigation body, within 24 hours, about the performance of the actions indicated in Article 301 para. (2) CPC, as specified in Articles 119 para. (2), Art. 125 para. (4), and Art. 205 para. (5) CPC. For the purpose of review, the materials of the criminal case must be submitted, reflecting the expediency and legality of the investigative actions carried out without prior judicial control. Where sufficient grounds exist, the investigating judge, by a reasoned ruling, declares the investigative action lawful or, as the case may be, unlawful.

In this regard, "*the European Court has held that, in the absence of a search or seizure warrant, this deficiency may be offset by ex post facto judicial review of the legality and necessity of such a measure. However, such review must be effective (Delta Pekárny A.S. v. the Czech Republic, 2 October 2014, §§ 92, 93; Stoyanov and Others v. Bulgaria, 31 March 2016, § 128)*" [1, pt. 21].

The ECtHR concludes that, in the absence of a search warrant and of subsequent judicial review, the contested measure amounted to an interference with the applicant company's "*home*" which was not "*in accordance with the law*" within the meaning of Article 8 § 2 of the Convention [8, §§ 31-30; 9, §§ 11-13].

The legal grounds for initiating the procedure for the authorization of investigative actions are, in accordance with Article 304 para. (1) CPC, the reasoned order of the competent authority and the prosecutor's application requesting authorization to carry out the respective actions.

Both investigative practice and certain doctrinal sources [17, p. 9-133] indicate that there are no essential differences between the content of the orders and that of the applications.

The Constitutional Court "*notes that submitting applications to the investigating judge for the authorization of investigative actions, special investigative measures, and procedural coercive measures falls within the exclusive competence of the prosecutor*" [2, pt. 23].

According to one opinion, which we support, the prosecutor's application "*in itself also constitutes an act of seising the court*" [5, p. 163].

The provisions of Article 304 para. (2) CPC, indicate only the information that must be included in the descriptive part of the order, leaving without express regulation the content of the application.

According to Article 255 para. (4) CPC, one copy of the order initiating the authorization procedure remains with the investigating judge.

"*The order must contain reasoning demonstrating that the interference by state agents in the private life of the person is provided for by law, is necessary in a democratic society, pursues a legitimate aim, and complies with the principle of proportionality*" [16, p. 698].

"*In order to ensure the confidentiality of the criminal investigation, the application is not submitted to the court registry, but directly to the investigating judge*" [16, p. 699], "*who records it in a separate register*" [13, pt. 2.12].

"*The investigating judge must be provided with safes in which procedural documents and other materials, registers, and other items requiring secure storage are kept under conditions of maximum confidentiality...*" [18, p. 55].

"*Materials concerning the authorization of investigative actions, as well as special investigative measures carried out with the authorization of the investigating judge, shall be submitted to the courts in sealed envelopes, on the surface of which shall be indicated the case number assigned by the authority that initiated the criminal case, the legal provision under which the application/material was prepared, the name and surname of the prosecutor who submitted the application/material, as well as a summary of the essence of the requested actions. The information on the sealed envelope shall not contain data that would allow the identification of the person or the object in respect of which the investigative actions were directed*" [14, pt. 107].

"*The court clerk and the judicial assistant working with the investigating judge, who have access to confidential information falling within the competence of the investigating judge, are equally responsible for maintaining confidentiality and are liable, in accordance with the applicable legislation, for its disclosure*" [14, pt. 112].

In cases where the legalization of investigative actions is requested (Article 301 para. (2) CPC), i.e., ex post judicial review, the material submitted to the investigating judge must contain data justifying the performance of the respective procedural action without prior authorization by the investigating judge, namely data confirming the existence of a *flagrant offence*, *flagrante delicto*, or a *situation not permitting delay*.

"*Pursuant to Article 305 para. (6) CPC, for the purpose of verifying the legality of procedural actions not permitting delay, carried out by the criminal investigation body or by operative investigative bodies, during their legalization, as the case may be, the person in respect of whom or at whose domicile the respective action was carried out shall be lawfully summoned to the court hearing, with the participation of the authors of the application*" [13, pt. 2.10].

"*The investigating judge must be informed, within 24 hours from the completion of the respective action, about the performance of procedural actions for which the authorization of the investigating judge is required but which were carried out without such authorization*" [13, pt. 2.10].

The materials to be attached to the order and the application must confirm the existence of legal grounds and the necessity of carrying out or applying the respective actions or measures.

"*Where necessary, the investigating judge is entitled to request the materials of the criminal case in order to verify the necessity of authorizing the investigative actions requested by the criminal investigation body and the prosecutor, since the legislation does not prohibit the investigating judge from examining all the materials of the criminal case*" [19, p. 77].

The application concerning the performance of investigative actions, special investigative measures, or the application of procedural coercive measures is examined by the investigating judge within the territorial jurisdiction of the criminal investigation body [15, p. 699], in a closed hearing, with the participation of the prosecutor and, where ap-

propriate, the criminal investigation officer. "*No record of the examination of such applications shall be drawn up*" [13, pt. 2.13].

The Constitutional Court "*notes that the examination of applications by the investigating judge at the place where the criminal investigation or special investigative measure is carried out, pursuant to Article 300 para. (4) CPC is closely linked to the territorial competence of the prosecutor who directly conducts or personally supervises the criminal investigation. Thus, the contested provision, by establishing the territorial competence of the investigating judge in exercising judicial review, refers to the place where the criminal investigation is carried out, within the territorial jurisdiction of the prosecutor's office*" [2, pt. 24].

The application submitted under Article 305 CPC may be withdrawn by the person who filed it—the prosecutor—or by the hierarchically superior prosecutor. "*The withdrawal of the application shall be made in writing and entails the immediate termination of the procedure by a ruling*" [16, p. 465].

In order to ensure the prompt execution of the requested actions, the application for the authorization of investigative actions and special investigative measures shall be examined on the day it is submitted.

"*For the prompt examination of the application, the investigating judge shall coordinate in advance the date and time of the court hearing*" [19, p. 78].

Within the prescribed time limit, the investigating judge opens the court hearing, announces which application will be examined, and verifies the powers of the participants in the proceedings, as well as any requests for recusal.

The prosecutor who submitted the application substantiates its grounds and reasons and subsequently answers the questions of the investigating judge and of the participants in the proceedings.

At the hearing for the examination of the application concerning the authorization of special investigative measures, a representative of the authority conducting special investigative activities may also participate, where it is deemed necessary to provide certain explanations.

The examination of the application begins with the verification by the investigating judge of the prosecutor's powers [18, p. 60].

If persons whose interests are affected by the application, or their defense counsel and representatives, participate in the hearing, they shall be given the opportunity to provide explanations and to examine all the materials submitted for the consideration of the application.

When the legalization of a search carried out in situations not permitting delay is requested, the prosecutor must summon the person at whose premises the search was conducted, and the investigating judge must verify whether measures have been taken to ensure that person's presence [4, p. 32, 33].

Following the assessment of the merits of the application, the investigating judge, by ruling, authorizes the performance of the investigative action or the special investigative measure, or the application of procedural coercive measures, or rejects the application.

"*The ruling of the investigating judge shall be delivered in a closed hearing*" [15, p.698].

"*Following judicial review, after hearing the submissions of the prosecutor and the summoned person, if present, and if sufficient grounds existed for carrying out the respective action without prior authorization by the investigating judge, the latter, by a reasoned*

ruling, declares the investigative action lawful; otherwise, the investigative action shall be declared unlawful" [13, pt. 2.10].

The judicial ruling authorizing investigative actions shall indicate: the date and place of issuance; the name and surname of the investigating judge; the official and authority that submitted the application; the authority conducting the investigative actions; the purpose of carrying out such actions and the person to whom they relate; as well as a statement on the authorization or rejection of the action. Where objections are raised by the defense counsel, legal representative, suspect, accused, or defendant, the ruling must provide reasons for accepting or rejecting them. It shall also specify the duration for which the action is authorized, the official or authority empowered to execute the ruling, and bear the signature of the investigating judge, certified by the court's seal.

In the ECtHR judgment *Lisovaia v. Moldova*, it was noted that "*...the applicant argued that the ruling of the investigating judge authorizing the search contained no reference to the period for which the action was authorized, as required by Article 306 CPC*" [7, § 18].

In the same case, the ECtHR "*...observes that, in fact, the content of the search warrant issued by the investigating judge in the present case almost entirely replicated the police report and contained no information as to the reasons why the search of the applicant's apartment was believed to yield evidence (see: Mancevschi v. Moldova, § 48, 07.10.2008, and Golovan v. Ukraine, § 61, 05.07.2012). In these circumstances, the Court finds that the national authorities failed to fulfil their obligation to provide 'relevant and sufficient' reasons for issuing the search warrant. Consequently, there has been a violation of Article 8 of the Convention*" [7, § 21].

It cannot be excluded that, during the examination of the application, an exception of unconstitutionality may be raised, including ex officio, on the basis of a ruling [12, pt. 6].

In the case of *Blečić v. Croatia*, the ECtHR emphasized that, when state authorities are required to take into account the interests of various groups of citizens, they are inevitably compelled to choose those that prevail, without always identifying an ideal solution; this is the reason why, in this field, authorities enjoy a broader margin of appreciation. Each time the investigating judge authorizes the performance of investigative actions, he determines the extent to which the rights of both procedural subjects and other persons will be limited. In this context, the principle of proportionality acquires major relevance [9].

In the case of *Olsson v. Sweden*, the ECtHR held that an interference is considered necessary in a democratic society when it is based on a pressing social need and, above all, is proportionate to the legitimate aim pursued. The task of determining the necessity and proportionality of the interference resulting from an investigative action lies with the investigating judge, who is obliged to provide reasons for the decision in light of these principles derived from the ECtHR's case-law [10].

Criminal procedural law does not expressly require the application of the proportionality test in the content of rulings issued following the examination, in accordance with Article 305 CPC, of applications for the authorization or legalization of investigative actions. However, the principle of proportionality must be applied in all cases where the necessity of interference is established.

In this regard, we support the proposal to include proportionality as a principle of criminal proceedings. "*From the perspective of developing the principle of proportionality in national criminal procedure, certain conclusions may be formulated as recommenda-*

tions. The principle of proportionality must be applied in all cases where the necessity of interferences is established.... In this regard, and as a de lege ferenda proposal, we consider it necessary to recognize, as a principle of criminal procedure, that of proportionality between the interferences carried out and the aim pursued, which would imply determining the existence of a pressing social need that justified it" [3, pp. 64, 81].

Although Article 306 CPC does not expressly provide for it, as a rule, the rulings of the investigating judge authorizing investigative actions indicate that such decisions are subject to appeal by way of recourse within 15 days from the moment the person became aware of the respective ruling. This mention is legally justified by the provisions of Article 305 para. (8) CPC in conjunction with Article 437 para. (1) point 4) CPC. In such cases, the recourse is examined in accordance with the provisions of Title II, Chapter IV, Section 2, § 2 of the Special Part of the CPC.

Where the prosecutor's recourse against a ruling of the investigating judge refusing to authorize special investigative measures is upheld and the respective ruling is quashed, the Criminal Chamber of the Court of Appeal issues, in addition to its decision, a judicial warrant authorizing the special investigative measure requested by the prosecutor. Although the issuance of such a warrant does not expressly follow from the provisions of Article 439 CPC, appellate courts rely in such cases on the provisions of Articles 6 point 25/1) and Art. 12 para. (2) CPC.

Conclusions. The analysis of the procedure for examining applications for the authorization of investigative actions involving interference with fundamental rights highlights the decisive role of the investigating judge in ensuring the legality and legitimacy of criminal proceedings. Judicial review, whether exercised *a priori* or *a posteriori*, constitutes an indispensable safeguard against arbitrariness and potential abuses by criminal investigation bodies.

The current regulatory framework, although functional, is characterized by a certain degree of generality and normative fragmentation, particularly with regard to the content of the prosecutor's application and the standards for reasoning the rulings of the investigating judge. Practice demonstrates that, in the absence of clear requirements, there is a risk of formalization of judicial review, which is contrary to the standards established in the case-law of the European Court of Human Rights regarding the need for "*relevant and sufficient*" reasons.

Furthermore, the mechanisms allowing derogation from prior authorization, although justified by the need for оперативность, must be interpreted restrictively and subjected to effective subsequent judicial review, based on a genuine assessment of the existence of exceptional circumstances. In this context, the effectiveness of *ex post* review depends on the completeness of the materials submitted and on the active involvement of the investigating judge.

A central element emerging from the analysis is the necessity of strengthening the principle of proportionality in criminal procedure. Although implicitly recognized, its application is not uniform and it is not expressly enshrined as a fundamental principle. The explicit establishment of this principle would contribute to the harmonization of practice and its alignment with European standards, requiring a systematic assessment of the relationship between the interference carried out and the legitimate aim pursued.

In cases where authorization of investigative actions is refused, the possibility for the prosecutor to challenge the respective ruling by way of recourse within 15 days ap-

pears to be inappropriate/irrational, since, according to the current regulatory framework and judicial practice, the requirement of expediency—an indispensable condition in the procedure for authorization by the investigating judge and for the conduct of evidentiary measures—is adversely affected.

In light of the above, there are justified grounds for opting for a revision of the procedure of judicial review in criminal investigation, primarily through legislative means. The provisions of Article 312 CPC essentially regulate the procedure for judicial review of detention and alternative measures to detention provided for in Article 311 CPC. For this reason, the application by analogy of Article 312 CPC to the rulings indicated in Article 302 para. (2) CPC encounters difficulties in national judicial practice. The same considerations apply to the corresponding application of Articles 437-451 CPC (when examining recourses against rulings of the investigating judge), which are primarily intended for challenging criminal judgments delivered on the merits by first-instance courts.

Therefore, it is appropriate to introduce a distinct provision (for example, Article 313/1 CPC) regulating the procedure for recourse against the rulings provided for in Article 305 para. (8) CPC and Article 306 CPC, with a shortened time limit for recourse of three days, taking into account that the contested decisions are issued during the criminal investigation stage. An alternative would be to restructure the provisions of Article 312 CPC, adapting their content to cover recourses against other rulings of the investigating judge beyond those concerning pre-trial detention, house arrest, and alternative measures. A compromise solution would be to reduce to three days the time limit for recourse against the rulings of the investigating judge indicated in Article 473 para. (3/1) CPC.

In conclusion, the improvement of the normative framework and judicial practice in the field of authorization of investigative actions should focus on: clarifying the content requirements of applications and rulings, strengthening effective judicial review, strictly limiting exceptions to prior authorization, and expressly enshrining the principle of proportionality. Only under these conditions can a genuine balance be ensured between the efficiency of criminal investigation and the protection of fundamental rights.

Abstract

Cross-border organised crime within the European Union is characterised by extreme dynamism, requiring proactive measures from European and national law enforcement agencies to mitigate the risks posed by this extremely dangerous criminal phenomenon. This highly dangerous criminal phenomenon poses risks to European society, which may react strongly if European and national authorities fail to intervene effectively to mitigate the criminal activity generated by cross-border organised crime.

This paper aims to present the main characteristics of cross-border organised crime, in the context of recent technological changes, particularly in the virtual environment. To achieve the proposed objectives, two specific strategic analysis methods (PESTEL and SWOT) were employed, enabling the accurate identification of the main characteristics of organised crime. Subsequently, based on these characteristics, certain proposals were formulated to mitigate the criminal phenomenon generated by organised crime groups. The work initiated by this scientific research is to be continued by the authors to identify the structural changes that have occurred within organised crime groups and their impact on the criminal phenomenon.

Keywords: organised crime, cross-border, drugs, money laundering, corruption, encryption.

CRIMINALITATEA ORGANIZATĂ TRANSFRONTALIERĂ: RISCURI LA ADRESA SECURITĂȚII NAȚIONALE

Abstract

Criminalitatea organizată transfrontalieră la nivelul Uniunii Europene este caracterizată printr-o dinamicitate extremă, fiind necesare măsuri pro-active din partea structurilor europene și naționale de aplicare a legii pentru diminuarea riscurilor generate de acest fenomen criminogen extrem de periculos. Acest fenomen criminogen foarte periculos induce riscuri la nivelul societății europene care poate reacționa virulent în situația în care autoritățile europene și cele naționale nu intervin eficient pentru diminuarea fenomenului infracțional generat de criminalitatea organizată transfrontalieră.

Lucrarea de față își propune să prezinte principalele caracteristici ale criminalității organizate transfrontaliere, în condițiile modificărilor tehnologice recente, în special în domeniul mediului virtual. În cadrul lucrării, pentru îndeplinirea obiectivelor propuse, au fost utilizate două metode specifice analizei strategice (PESTEL și SWOT), care au permis identificarea corectă a principalelor caracteristici ale criminalității organizate. Ulterior pe baza acestor caracteristici au fost formulate anumite propuneri pentru diminuarea fenomenului criminogen generat de grupările de criminalitate organizată. Lucrul inițiat prin această cercetare științifică urmează să fie continuat de autori pentru identificarea modificărilor structurale care au apărut în

cadrul grupărilor de criminalitate organizată și impactul acestora asupra fenomenului criminogen.
Cuvinte-cheie: criminalitate organizată, transfrontalier, droguri, spălare bani, corupție, criptare.

Introduction. Cross-border organised crime has become a persistent threat, having recently shown a significant negative trend in terms of public order and safety, with a worrying projected trajectory in terms of its impact on citizens and communities; these persistent risks are such that they could also affect the national security of the Member States of the European Union (EU).

The EU-SOCTA 2025 analysis, carried out by Europol, shows that cross-border organised crime within the European Union has become far more complex, and the methods used are far more varied and subtle, characterised as having a 'new DNA' adapted to the digital environment and capitalising on the opportunities generated by a geopolitical context marked by a high degree of fluidity and unpredictability. Thus, the threats posed by organised crime groups operating across borders within EU Member States are pervasive and serious, given that organised crime groups have the ability to adapt their modus operandi very rapidly, and their ability to adapt to new tools available online, including the use of artificial intelligence (AI) is very high [1].

The primary aim of organised crime groups is to obtain vast sums of money through illegal means, thereby undermining national economies, the rule of law and society as a whole. At the same time, there has recently been active collaboration between organised crime groups and state and non-state entities that use hybrid means to misinform and influence public opinion with the aim of discrediting the fundamental institutions of the rule of law, with a noticeable shift in the allocation of resources, expertise and protection to achieve their objectives. Thus, it can be said that a fluid boundary is emerging between ideological motivations and profit, the aim being to destabilise the rule of law at the state level, as well as to discredit public institutions in order to create a favourable climate for carrying out illicit activities.

It is noted that organised crime groups are characterised by increased dynamism and flexibility, being constantly concerned with anonymising their activities or creating the appearance of legality for the activities carried out, by exploiting existing vulnerabilities in the social, economic or judicial system. Furthermore, another identified characteristic is the use by cross-border organised crime groups of violent means to achieve their objectives, with aggressive incidents having increased recently, a fact which reveals that these groups have consolidated their presence and confidence in their own capabilities. These frequent acts of violence erode public confidence in the state's ability to protect its own citizens and significantly undermine trust in the state law enforcement agencies responsible for dismantling organised crime groups.

The profits generated by criminal groups are on a par with those generated by multinational corporations; there are reports of criminal entities concealing profits derived from illegal activities within the legitimate economy, thereby multiplying illegally obtained funds into lawful funds circulating within the legitimate economic sphere. This highlights the considerable ability of organised crime groups to adapt to changes in the criminal environment and to adjust to the activities of law enforcement authorities.

Organised crime groups are not constrained by borders, neither those within the EU nor those between the EU and the rest of the world. At the same time, organised crime

is increasingly fuelled online, namely through the exploitation of digital and internet infrastructure by criminal networks [2].

Methods and materials obtaine. In order to accurately characterise cross-border organised crime, qualitative analyses specific to the strategic analytical field were carried out. In this context, the PESTEL and SWOT analytical methods were used to conduct a comprehensive assessment of the subject area, namely the analysis of cross-border organised crime. The strategic-level analytical methods chosen to characterise and assess the impact of cross-border organised crime at European Union level proved highly valuable for this scientific endeavour, as they were useful for structuring existing information and for drawing certain hypotheses and analytical conclusions in a scientific manner.

Furthermore, to ensure the scientific article was properly substantiated, official sources from European institutions such as Europol and Frontex were analysed, as well as scientific articles written by renowned experts in the field, which enabled an accurate characterisation of cross-border organised crime at EU level.

Although the focus was on the situation of organised crime at EU level, the conclusions and analytical hypotheses can be extrapolated to other countries, and even globally, given that although these organised crime groups exhibit certain characteristics specific to their region of origin, their modus operandi are generally common and display a considerable degree of uniformity worldwide.

The main aim of the scientific approach taken in this article was to identify the risks posed by cross-border organised crime at EU level and to the national security of Member States, as well as to formulate possible solutions to mitigate these risks and the associated vulnerabilities.

Results obtained from the application of strategic-level analytical methods. In order to characterise organised crime, it was necessary to employ specific methods of strategic analysis; the PESTEL method was chosen, as it allows for a comprehensive analysis of the political, economic, social, technological, environmental and legal factors related to the criminogenic phenomenon generated by organised crime.

Cross-border organised crime is fuelled by these factors, yet at the same time influences them; the asymmetric nature of this threat stems from the fact that organised crime groups act without any scruples to achieve their primary objective, which is to obtain funds by any means, but especially by illicit means.

P – Political:

• **Geopolitical instability:** Active military conflicts on the EU's borders (Ukraine, the Middle East) are creating new routes for the trafficking of arms, drugs and human beings, diverting the attention of law enforcement agencies from effectively combating organised crime, as they are preoccupied with maintaining order and national security in areas close to active military conflict. In this context, active military conflicts exacerbate the illicit activities carried out by organised crime groups, which identify the opportunities generated by these active wars, in the sense that state control is deficient in these areas, a factor that allows illicit activities to take place, including the use of weapons found in these sensitive and vulnerable areas.

• **Divergent political will:** Although there is cooperation between EU Member States, and between the authorities responsible for preventing and combating organised crime, differing national priorities and the rise of movements challenging multilateralism can hinder the exchange of information between EU Member States. Another aspect that

has come to light recently is the rise of extremist political forces calling for the dissolution of the EU and closer ties with states with authoritarian political regimes, such as the Russian Federation, Belarus, etc. The actions of these extremist political forces may lead to divisions within European institutions and may affect the decision-making process, including by blocking important initiatives at both the strategic and operational levels.

• **Institutional corruption:** The infiltration of local and national political structures remains the primary means by which organised crime networks secure protection and access to public contracts. The phenomenon of corruption is extremely dangerous, given that organised crime groups manage to corrupt high-ranking public officials in order to protect their illicit activities and to channel money obtained through illegal means into the legal financial system. Recently, there has been a noticeable trend among leaders of cross-border organised crime groups to corrupt political leaders who are concerned solely with political success by any means, without verifying the source of the money donated by these organisations or their interests in achieving their illicit objectives. The greatest risk posed by corruption is the corruption of officials within European Union institutions involved in implementing cooperation mechanisms to combat cross-border organised crime, including those responsible for establishing EU-level regulations in strategically sensitive areas.

E – Economic:

• **Money laundering through the legal economy:** Infiltration of the real estate, logistics and hospitality sectors to introduce funds obtained by organised crime groups through illicit means into the legal economic circuit. Organised crime groups carry out activities to launder money and introduce illicit funds into the legal economic circuit, with the aim of multiplying the funds obtained and further financing their illicit activities. The risks posed by these activities are very high, given the interest of organised crime groups in infiltrating the political sphere to gain material advantages and influence decisions taken at the level of state institutions.

• **Economic disparities:** The cost-of-living crisis and inflation increase citizens' vulnerability, making them more susceptible to recruitment into drug-courier networks or networks involved in the illegal transport of migrants. In this context, organised crime groups exploit the economic vulnerabilities of the population, both to recruit members more easily and to fuel public discontent with the aim of undermining the credibility of the state's fundamental institutions, including law enforcement agencies.

• **The cryptocurrency black market:** The use of digital assets for rapid cross-border transactions that bypass the traditional banking system and tax monitoring. To this end, the use of cryptocurrencies enables organised crime groups to anonymise financial transactions and transfer large sums of money without risking detection of the funds' true origin.

S – Social:

• **Changing patterns of drug use:** The rising demand for synthetic drugs and cocaine among young people directly fuels the illicit revenues generated by organised crime networks. Drug use, particularly among young people, is on the rise, a trend that allows organised crime groups to diversify their range of psychotropic substances on the illicit market. This escalation in the use of high-risk drugs places pressure on law enforcement agencies, which are forced to allocate substantial additional resources to dismantling organised crime groups specialising in drug trafficking.

• **Forced migration:** The exploitation of migrant flows by organised crime groups specialising in human trafficking, turning humanitarian crises into opportunities for profit. Organised crime groups exploit the vulnerabilities of people in areas with migration potential who wish to migrate to European Union Member States, with the aim of recruiting these individuals for sexual exploitation or as cheap labour. To achieve this objective, organised crime groups act as intermediaries between migrants and unscrupulous businesspeople seeking to exploit the cheap labour generated by migrants, in some cases taking advantage of the inefficiency of law enforcement authorities in detecting these situations of vulnerability among migrants arriving illegally in the EU.

• **Perception of safety:** A decline in trust in public institutions in certain regions can lead to a lack of cooperation from the public with law enforcement agencies. In this context, organised crime groups act directly or through intermediaries, including by offering financial inducements to certain public officials, with the aim of damaging the image of law enforcement agencies in EU Member States. The public reacts to these external 'stimuli' by losing trust in these institutions, a factor that leads to the proliferation of organised crime due to a lack of cooperation between the public and the police.

T – Technological:

• **Artificial Intelligence (AI):** Used for deep fakes in financial fraud, the automation of cyber-attacks and the optimisation of logistics routes. Organised crime groups are increasingly using artificial intelligence to facilitate online fraud affecting citizens, companies and public institutions across the EU. Currently, the scale, variety and sophistication of online fraud are unprecedented, driven by artificial intelligence. At the same time, the (online) sexual exploitation of children is evolving, with generative AI being used to produce online material containing child sexual abuse, to secure online communities of offenders and to facilitate the expansion of online grooming of children. Another risk is posed by cyber-attacks targeting critical infrastructure, governments, companies and citizens. These attacks exploit specific vulnerabilities in digital infrastructure, taking advantage of system access data and targeting data theft to generate illicit profits. Advances in artificial intelligence will further refine the modus operandi and make it easier to identify targets of cyber-attacks.

• **Crime-as-a-Service (CaaS):** "The democratisation of crime", where groups can obtain and use specialised ransomware software or hacking experts via online channels such as the Dark Web.

• **Communication encryption:** The use of ultra-secure messaging platforms that make lawful interception virtually impossible without physical access to devices. Organised crime groups are increasingly concerned with securing their communications so that their members cannot be intercepted by law enforcement agencies or the police. In this context, organised crime groups are investing significant sums in developing their own secure communication technologies or adapting commercially available ones to meet their needs for secure communication that cannot be intercepted by law enforcement agencies.

E – Environment:

• **Environmental crimes:** The rise in illegal trafficking of toxic waste, illegal logging and poaching, which are becoming highly profitable markets due to stricter green regulations. Illegal waste management is a financially motivated crime that maintains close links with the legal waste management sector and employs experts from within it. The

involvement of organised crime groups in waste trafficking, particularly of highly toxic waste, brings significant benefits to these groups, but, on the other hand, has a negative impact on the environment, the economy and the health and safety of EU citizens. At the same time, illegal logging and poaching allow organised crime groups to consolidate their position in the illicit market and to obtain illicit funds that can be used in other areas of interest to them.

• **Impact of drug laboratories:** Soil and water pollution through the discharge of chemical waste from the production of synthetic drugs (particularly in the Netherlands and Belgium). Organised crime groups specialising in the production and trafficking of synthetic drugs are not concerned with compliance with environmental legislation, being interested in the disposal, in any form, of chemical waste resulting from the production process, in order to avoid the identification of these illegal laboratories by anti-drug authorities in EU Member States.

L – Legal:

• **Asymmetrical legal regulations:** Discrepancies in penalties for the same offences across different EU countries allow groups to base their operations in more lenient jurisdictions. In this regard, organised crime groups choose Member States where penalties for specific illicit activities are not as severe.

• **Crypto regulation (MiCA):** New European laws aim to close financial loopholes, but their technical implementation is lagging behind the pace of criminal innovation. Organised crime groups have the ability to adapt rapidly to the measures put in place by European and national authorities to make financial transfers via crypto currencies more transparent.

• **Extradition challenges:** Complex and lengthy legal proceedings make it difficult to bring criminal leaders operating from outside the EU (for example, from Dubai or Latin America) to justice. In this context, members of organised crime groups choose to flee to these states, which apply cumbersome extradition procedures, relying on these relaxed regulations through which they can escape punishment for a very long time or even permanently, through the statute of limitations.

A *SWOT analysis of cross-border organised crime* allows for an accurate assessment of the criminal phenomenon generated by organised crime within EU Member States, and across the entire European Union, and for the identification of proactive measures that can be taken to effectively counter the proliferation of organised crime groups.

S – Strengths	W – Weaknesses
• **Legislative and institutional framework:** The existence of specialised agencies such as Europol (police cooperation), Frontex (cooperation between border police forces), Eurojust (judicial cooperation) and the EPPO (European Public Prosecutor's Office for the protection of the EU budget). • The **EMPACT platform:** A multidisciplinary cooperation model enabling EU Member States to prioritise and jointly	• Legislative fragmentation: Differences between national criminal codes create legal loopholes that criminal networks exploit to avoid extradition or the confiscation of assets. • Infiltration of the legitimate economy: Over 80% of criminal groups use legitimate businesses as a front, making them extremely difficult for law enforcement agencies to detect using traditional methods.

tackle major threats (drug trafficking, cybercrime, etc.). • **Financial resources:** Substantial budgets allocated to border security (Frontex) and the digitalisation of law enforcement agencies across EU Member States. • **High resilience:** Europe has the highest resilience index globally (6.28), thanks to its consolidated democracy and the rule of law.	• Bureaucracy: Data-sharing processes between 27 states can be slower than the pace at which criminal networks, which make extensive use of digital tools, adapt. • Shortage of specialist staff: A lack of experts in cyber-investigations and complex financial analysis within many national police forces.
O – Opportunities	**T – Threats**
• **Artificial Intelligence (AI):** Using 'predictive policing' algorithms and big data analysis to identify suspicious financial flows before funds disappear into tax havens. • **Expanding the EPPO's powers:** Strengthening the authority of the European Public Prosecutor's Office could drastically reduce fraud involving European funds and cross-border VAT fraud. • **International partnerships:** Strengthening cooperation with key transit countries (in the Western Balkans or Latin America) to dismantle criminal networks at source. • **Strict regulations on cryptocurrencies:** Implementing the MiCA regulation to limit the use of cryptocurrency-generated assets in money laundering.	• Criminal use of AI: Generation of deepfakes for major financial fraud, automation of cyberattacks and advanced encryption of communications. • High-level corruption: Infiltration of strategic ports (e.g. Rotterdam, Antwerp, Constanța) and border crossing points by corrupting key personnel within control structures. • Geopolitical context: The war in Ukraine and instability in the Middle East are creating new trafficking routes (e.g. weapons, people) and diverting security resources away from economic and financial crime. • Agility and flexibility of networks: Modern criminal groups no longer have a pyramidal structure (rigid hierarchy), but are fluid networks with no clear 'leaders', making them almost impossible to completely dismantle in a single operation.

Main characteristics of organised crime at the european union level. Europol has identified 821 dangerous criminal networks operating within the EU, most of which have a transnational structure and have been active for over 10 years. Organised crime generates billions of euros in profits annually across the EU. In 2024, coordinated actions through the EMPACT platform led to over 12,000 arrests and the seizure of assets worth €1 billion. Over 80% of organised crime networks use legitimate business structures to conceal their illicit activities, particularly in the logistics, transport and hospitality sectors [3]. Criminal groups are present in all European Union countries and often operate across borders; 70% of organised criminal groups are, in fact, active in more than three Member States [4].

Recently, Europe has become a global "hotspot" for technology-dependent crime, and the IOCTA 2024 Report, produced by Europol, highlights the fragmentation of threats due to the use of Artificial Intelligence for phishing and malware attacks [5]. Artificial Intelligence has become a "game changer" in many areas, including cross-border organised crime, in the sense that criminal groups are using new technologies to gain an advantage

over law enforcement agencies, including in relation to social engineering, recruitment, complex fraud, the production of child sexual exploitation material and cyber-attacks on critical infrastructure.

The European Council has identified the following seven EU priorities in the field of crime for the 2026-2029 EMPACT cycle: These priorities take account of the fact that serious and organised crime is gradually destabilising our societies (for example, through the spread of violence and corruption), is increasingly taking place online, and is being greatly accelerated by artificial intelligence and other new technologies. These priorities are: identifying and dismantling the criminal networks and individuals posing the greatest threat; tackling the fastest-growing crimes in the online environment: cyber-attacks, online child sexual exploitation and online fraud schemes; combating drug trafficking; combating migrant smuggling and human trafficking; combating offences involving firearms and explosives; dismantling networks involved in environmental crime; combating economic and financial crime, such as VAT fraud and intellectual property offences [6].

To mitigate the risks posed by organised crime, the following measures must be implemented:

- Increasing funding for European organisations responsible for combating organised crime and managing the EU's external border, namely Europol, which acts as an information hub and provides technical and analytical support to EU Member States, and Frontex, the agency responsible for controlling the EU's external borders;

- Enhancing the European Multidisciplinary Platform Against Criminal Threats (EMPACT) for the period 2026–2029, which has already established clear priorities, namely a focus on preventing cyber-attacks and reducing high-risk drug trafficking;

- Increasing the level of inter-institutional cooperation within EU Member States, specifically between police, customs, tax authorities and EU agencies (Europol, Eurojust, Frontex, EPPO) to streamline the process of dismantling cross-border organised crime groups;

- Carrying out checks in areas with a high risk of criminal activity, namely major European ports, to inspect containers arriving from third countries that are used to conceal drug or human trafficking, taking advantage of the very large volume of goods that must be processed within a very short timeframe;

- Stepping up the exchange of operational intelligence with countries in South America (e.g. Brazil, Ecuador) to combat maritime drug trafficking routes to European ports, as well as with other countries in the Middle East and North Africa (MENA) region, in particular to reduce illegal migration and human trafficking from these highly sensitive areas, as well as with certain countries in the Western Balkans, which act as a hub for drug and arms trafficking;

- The continuation of large-scale programmes connecting law enforcement agencies across different continents, namely EL PAcCTO 2.0 and CRIMJUST – these initiatives facilitate the creation of Joint Investigation Teams (JITs) between Latin American countries (e.g. Peru and Bolivia in 2025) and EU Member States, providing common regional standards for evidence gathering in cases of transnational organised crime and EU ACT (2023–2028) – a €19 million programme focusing on heroin routes from Afghanistan, which provides tailored technical assistance to partner countries along the route to disrupt illicit financial flows;

- Identifying high-risk countries in terms of money laundering, with the aim of requiring banking institutions to exercise heightened vigilance in transactions with these

entities;

- Amending legislation in EU Member States that does not sufficiently penalise offences specific to cross-border organised crime, possibly by producing a European Commission-level guide recommending certain minimum penalties across all EU Member States.

Conclusions. Cross-border organised crime poses serious risks to European security and to the national security of EU Member States. Recent changes in organised crime stem from criminal groups adopting online methods by shifting criminal activities to the online environment or using new information technologies to diversify their criminal methods.

Organised crime groups have become highly adaptable, capable of rapidly adjusting their criminal methods to counter the actions and operations carried out by European and national law enforcement authorities.

In order to effectively combat cross-border organised crime, European and national authorities need to step up the exchange of information both at national level and between EU Member States; however, it is becoming increasingly important for this exchange of information to also take place with third countries that pose a risk of crime at EU level.

Another priority is to increase funding for law enforcement agencies in EU Member States, as well as for European institutions responsible for combating cross-border organised crime (e.g. Europol, Frontex). The allocation of additional resources will help to reduce crime across the European Union, whilst improving the institutions' image among the public.

Without proactive measures being taken by EU Member States and European institutions, organised crime will proliferate, and the consequences for European society will be particularly severe.

The work initiated by this scientific research is to be continued by the authors to identify the structural changes that have occurred within organised crime groups and their impact on criminal behaviour.

COLLABORATIVE ACTIVITY IN UKRAINE THROUGH THE LENS OF CRIMINAL LAW: FROM CRIME RECORDING TO SENTENCING

Yevhen PYSMENSKYY,
PhD, University Professor,
Vice-Rector for Research,
Academician I.M. Lutskyi, King Danylo University,
Ivano-Frankivsk, Ukraine
ORCID: 0000-0001-7761-7103

Abstract

The study examines quantitative indicators of criminal law measures against collaborative activity in Ukraine from March 2022 to 2025, covering the period of martial law imposed in response to the full-scale invasion by the Russian Federation. The empirical basis consists of official statistical data from the Office of the Prosecutor General and the State Judicial Administration of Ukraine on crimes against Ukraine's national security, pre-trial investigations, and final convictions for collaborative activity under Article 111-1 of the Criminal Code of Ukraine.

The analysis traces the full enforcement chain – from the registration of criminal offences and notification of suspicion through referral of proceedings to court and adoption of final judicial decisions, including the imposition of punishment. The study identifies three qualitatively distinct stages of criminal law response: a pre-2022 period of largely declaratory application; an unprecedented surge in registrations following the full-scale invasion; and a gradual systemic stabilisation characterised by growing conviction rates from 2023 onwards.

Based on the findings, the study draws conclusions regarding systemic imbalances in law enforcement practice and formulates recommendations aimed at improving criminal law policy in the context of countering collaborationism during armed conflict.

ACTIVITATEA COLABORATIVĂ ÎN UCRAINA PRIN PRISMA DREPTULUI PENAL: DE LA ÎNREGISTRAREA INFRACȚIUNILOR LA CONDAMNARE

Abstract

Studiul examinează indicatorii cantitativi ai măsurilor de drept penal împotriva activității de colaborare în Ucraina în perioada martie 2022–2025, acoperind intervalul stării de război instituite ca răspuns la invazia pe scară largă a Federației Ruse. Baza empirică este constituită din date statistice oficiale ale Oficiului Procurorului General și ale Administrației Judiciare de Stat a Ucrainei privind infracțiunile împotriva securității naționale a Ucrainei, investigațiile preliminare și condamnările definitive pentru activitate de colaborare prevăzute la articolul 111-1 din Codul penal al Ucrainei.

Analiza urmărește întregul lanț de aplicare a legii – de la înregistrarea infracțiunilor și notificarea suspiciunii, până la trimiterea cauzelor în instanță și adoptarea hotărârilor judecătorești definitive, inclusiv aplicarea pedepselor. Studiul identifică trei etape calitativ distincte ale reacției dreptului penal: perioada anterioară anului 2022, caracterizată printr-o aplicare în mare parte declarativă; o creștere fără precedent a înregistrărilor după invazia pe scară largă; și o stabilizare sistemică graduală, caracterizată prin creșterea ratelor de condamnare începând cu anul 2023.

Pe baza constatărilor, studiul formulează concluzii privind dezechilibrele sistemice din practica aplicării legii și propune recomandări menite să îmbunătățească politica penală în contextul combaterii colaborationismului în timpul conflictului armat.

Cuvinte-cheie: Ucraina, drept penal, justiție penală, securitate națională, activitate de colaborare, stare de război, aplicarea legii.

Introduction. Over the twenty-five-year period of validity of the Criminal Code of Ukraine (hereinafter – the CCU), the criminal law provisions concerning liability for offences against the foundations of national security have undergone substantial changes in the context of the Russo-Ukrainian war, which began in 2014 with the seizure of Crimea and continues to this day [2; 5; 8; 10].

A significant milestone in the struggle for the consolidation of Ukrainian statehood was the full-scale invasion of Ukraine by Russian troops on 24 February 2022. Since that time, martial law has been introduced in Ukraine and remains in force. This phase of the war became a distinct and powerful factor contributing to the intensification of legislative activity, particularly in the sphere of criminal law protection of Ukraine's national security [6; 12; 17]. It was precisely with the onset of full-scale open aggression that a number of new criminal law provisions concerning offences against the state and its interests were introduced into Ukrainian legislation. One of these innovations was Article 111-1 of the CCU, which establishes liability for such a form of treasonous conduct as collaborative activity (collaborationism) [1; 7; 9; 16; 21]. This provision has remained unchanged to date and is actively relied upon in law-enforcement practice.

It is important to emphasize that, during the initial stage of Russian aggression against Ukraine, the formation of Ukraine's legal policy in the sphere of de-occupation of part of its territory and its subsequent reintegration was largely characterized by uncertainty and the absence of a unified, clear, and balanced position regarding persons who, in one way or another, cooperated with the aggressor state [15, p. 418]. Therefore, the introduction of the relevant prohibition constitutes a considerable achievement of the lawmakers, since it ensures the differentiation of criminal liability for betrayal of one's state in the form of cooperation with the enemy, which, as a general rule, occurs under conditions of occupation [14, p. 115]. The context of occupation justifies the application to collaborators of more lenient criminal law measures in comparison with the general provision on high treason (Article 111 CCU) [11].

The criminal law norm establishing liability for collaborative activity (Article 111-1 CCU) is comprehensive in nature and distinguishes between various forms of cooperation with the enemy depending on the sphere of such activity (informational, political, educational, administrative, military, etc.) (See Table).

Parts of Article 111-1 CCU	**Constituent Act**	**Type of Activity**	**Principal Punishment**	**Additional Punishment**
1	Public denial of armed aggression against Ukraine; calls to support the aggressor state or occupation administration; calls for cooperation with them or for non-recognition of Ukraine's sovereignty over temporarily occupied territory	Informational activity (public speeches, appeals) engaging in	Disqualification from holding certain offices or certain activities for 10 to 15 years	None

2	Voluntary occupation of a position not connected with managerial or administrative-economic functions in unlawful authorities	Administrative activity	Disqualification for 10 to 15 years	Confiscation of property or none
3	Propaganda in educational institutions aimed at facilitating aggression or introducing educational standards of the aggressor state	Educational activity	Corrective labour up to 2 years, or arrest up to 6 months, or imprisonment up to 3 years	Disqualification for 10 to 15 years
4	Transfer of material resources to illegal armed groups or conducting business activity in cooperation with the aggressor state	Economic and material assistance	Fine up to 10,000 tax-free minimum incomes or imprisonment from 3 to 5 years	Disqualification and confiscation of property
5	Voluntary occupation of leadership positions in unlawful authorities; participation in organizing illegal elections/referenda	Political and organizational activity	Imprisonment from 5 to 10 years	Disqualification and confiscation of property or none
6	Organization of political events or informational activity in cooperation with the aggressor state (without elements of treason)	Political and informational activity	Imprisonment from 10 to 12 years	Disqualification and confiscation of property or none
7	Voluntary occupation of positions in unlawful judicial/law-enforcement bodies; participation in armed formations of the aggressor state or assistance thereto	Service in coercive structures or participation in hostilities	Imprisonment from 12 to 15 years	Disqualification and confiscation of property or none

Since Article 111-1 CCU has remained stable, the question arises as to the effectiveness of its application within the framework of criminal law policy formulated by Ukrainian authorities. Existing criminal law studies in Ukraine indicate the presence of problems associated with the application of Article 111-1 CCU [3; 20; 22], among which is the actual effectiveness of criminal law protection in this sphere when assessed through key quantitative indicators of investigative and judicial practice.

The study of these indicators for the period 2022–2025 was conducted on the basis of statistical data from criminal justice authorities concerning offences against the foundations of Ukraine's national security, as well as information on pre-trial investigations

and final convictions for collaborative activity (Article 111-1 CCU).

In view of the foregoing, the purpose of this article is to provide a comprehensive analysis of the quantitative indicators of the application of criminal law measures for collaborative activity in Ukraine during the period of martial law (March 2022–2025), from the registration of criminal offences to the delivery of convictions, and to identify the principal trends in enforcement practice in order to formulate scientifically grounded recommendations for improving the effectiveness of criminal law counteraction to collaborationism.

The study employs a comprehensive approach combining legal and general scientific methods aimed at a thorough examination of the issue of criminal law counteraction to collaborative activity in Ukraine:

- **Dogmatic legal method** – applied to analyse the content and structure of Article 111-1 CCU, determine its place within the system of criminal law norms concerning treasonous conduct, and establish its relationship with related offences, namely high treason (Article 111 CCU) and aiding the aggressor state (Article 111-2 CCU);
- **Empirical method** – quantitative analysis of the practice of applying Article 111-1 CCU, based on official criminal statistics of the Office of the Prosecutor General of Ukraine and the State Judicial Administration of Ukraine [4; 13; 18; 19];
- **Statistical method** – used to calculate averages, shares, ratios, and trends, with charts employed for visual presentation of changes and comparative analysis;
- **Comparative legal method** – applied to compare indicators of criminal law response at different procedural stages, from registration to conviction, as well as to compare the practice of exemption from punishment for collaborators with general systemic indicators of Ukraine's criminal justice system, thereby revealing systemic disproportions and counter-trends in enforcement practice;
- **Illustrative method** – used for graphical representation of the dynamics of key indicators of criminal prosecution under Article 111-1 CCU in the form of charts demonstrating relationships between procedural stages and trends during the analysed period.

A critical (evaluative) approach was employed to analyse the effectiveness of criminal law policy, substantiate enforcement problems, and identify the imbalance between the declarative objectives of legislation and the actual practice of liability.

Criminal Law Protection of the Foundations of Ukraine's National Security. The relevant group of criminal offences is concentrated in Chapter I of the Special Part of the CCU, including Article 111-1 CCU on liability for collaborative activity. These offences are characterized by encroachments upon the most fundamental values: the constitutional foundations of existence, sovereignty, territorial integrity and inviolability of the Ukrainian state, as well as its defence capability and security. Accordingly, they are regarded as the most dangerous compared with other forms of criminally punishable conduct. Their increased harmfulness is primarily determined by the specific nature of the protected legal interest, namely the foundations of national security as a system-forming element of statehood.

At the same time, for a long period in Ukraine these criminal law provisions performed predominantly a preventive function, remaining, until the beginning of the Russo-Ukrainian war, an instrument of state protection that was rarely applied in practice. This is evidenced by an analysis of the key indicators of law-enforcement activity (see Figure 1).

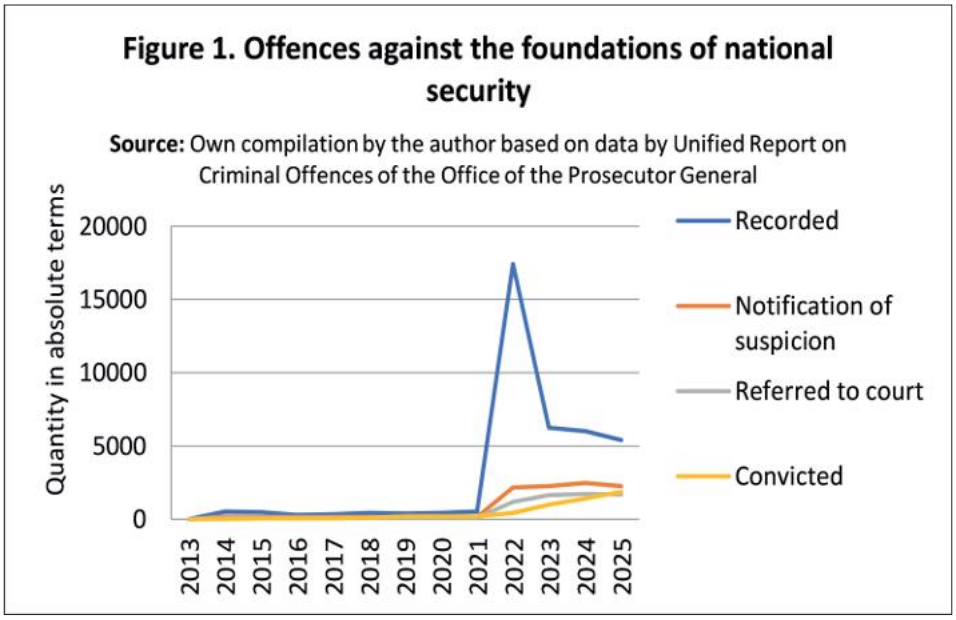

Figure 1. *Offences against the foundations of national security*

Statistics concerning offences against the foundations of Ukraine's national security for the period 2013-2025 clearly reveal three qualitatively distinct stages of the state's criminal law response.

Stage I (2013–2021) was characterized by relatively low and stable rates of recorded offences within this category (from 8 in 2013 to 520 in 2021), which confirms the thesis regarding the predominantly declarative nature of the relevant criminal law provisions during the pre-war period. Even after the outbreak of the armed conflict in 2014, when the number of registered proceedings increased to 527, the overall trend remained restrained, while conviction rates were extremely modest (31 persons convicted in 2014).

Stage II (2022) was marked by an unprecedented surge: the number of registered criminal offences increased more than thirty-three times compared with the previous year. At the same time, this indicator contrasted sharply with outcomes at subsequent stages of criminal proceedings: notices of suspicion were issued in respect of only 12.4% of registered cases, indictments were referred to court in 6.9%, and convictions were secured in merely 2.5%. At the initial stage of the full-scale invasion, the criminal justice system lacked sufficient resources to respond adequately to the volume of newly registered proceedings.

Stage III (2023–2025) reflects stabilization and gradual qualitative improvement in enforcement practice. The number of registered offences declined, whereas conviction indicators demonstrated sustained growth: 983 in 2023, 1,434 in 2024, and 1,871 in 2025. Significantly, in 2025 the number of judgments that entered into legal force exceeded the number of proceedings referred to court during that same year. This is explained by the completion of cases initiated in previous periods.

The foregoing data confirm that criminal law provisions establishing liability for offences against the foundations of national security acquired genuine practical significance only under conditions of full-scale armed aggression, while the effectiveness of their application remains in a state of dynamic, though still incomplete, development.

Dynamics of Detecting Collaborative Activity. Under Ukrainian criminal legislation (beginning in 2022), an entire system of criminal law provisions concerning treasonous conduct has emerged. The relationship among these offences is determined by a hier-

archical structure in which high treason (Article 111 of the CCU) constitutes the general norm, whereas aiding the aggressor state (Article 111-2 CCU) and collaborative activity (Article 111-1 CCU) function as special norms in relation to it. Most forms of collaborative activity (Parts 1-6 of Article 111-1 CCU) thereby constitute privileged forms of high treason. Aiding the aggressor state, however, frequently overlaps normatively with the provision on collaborative activity [15, p. 335].

All of these offences are united by a common specific legal object, namely the complex of vital values upon which Ukraine's national security is based (constitutional order, sovereignty, territorial integrity, etc.), which become the target of destructive treasonous conduct.

An analysis of the data presented in Figure 2, which reflects the registration of criminal offences related to treasonous conduct for the period 2022-2025, makes it possible to formulate several principal observations concerning the structure and dynamics of this category of proceedings.

Figure 2. Recording criminal offences of treasonous conduct

Source: Own compilation by the author based on data by Unified Report on Criminal Offences of the Office of the Prosecutor General

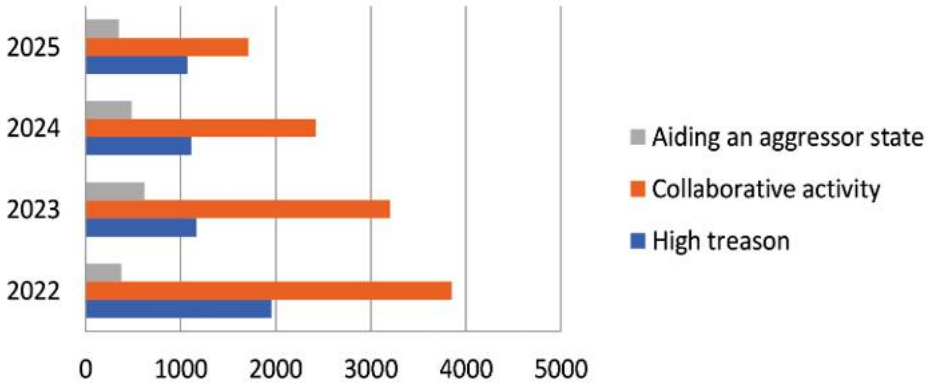

***Figure 2**. Recording criminal offences of treasonous conduct*

Throughout the analysed period, Article 111-1 CCU remained by far the most common basis for registration among the three examined provisions. The share of collaborative activity within the structure of registered treason-related offences consistently predominated, fluctuating between 60% and 64%. All three components of the examined body of offences demonstrate a stable downward trend. In particular, the number of proceedings under Article 111-1 CCU declined from 3,851 in 2022 to 1,714 in 2025, representing a decrease of more than half (55.5%) over four years.

At the same time, it should be understood that a reduction in the number of registrations does not unambiguously indicate a decline in the actual manifestations of treasonous conduct. Significantly, despite the absolute decrease in registrations across all three categories, their relative proportions remained practically unchanged throughout the analysed period. The share of high treason fluctuated from 31.6% (2022) to 37.7% (2025), while aiding the aggressor state ranged from 6.1% (2022) to 12.3% (2025).

The analysed data confirm that criminal law responses to collaborative activity remain in a state of gradual, though not yet completed, systemic stabilization, characterized

by a transition from the stage of mass initial registration of offences to the subsequent stage of their realization through substantive judicial determinations. Evidently, this process reflects the overcoming of the institutional imbalance of the first years of the full-scale invasion and the formation of a settled practice of legal assessment of various forms of treasonous conduct under conditions of prolonged martial law.

The State of Criminal Prosecution for Collaborative Activity. Pursuant to paragraph 14, part 1, Article 3 of the Criminal Procedure Code of Ukraine, criminal prosecution constitutes a stage of criminal proceedings that begins at the moment a person is formally notified of suspicion in the commission of a criminal offence. From the perspective of substantive criminal law, prosecution represents the initial form of the implementation of criminal liability, which is fully realized only upon the delivery of a conviction by a court.

An analysis of the data presented in Figure 3, reflecting the relationship between the number of registered proceedings and the number of notices of suspicion issued for collaborative activity during 2022-2025, makes it possible to identify fundamentally important patterns at the stage of criminal prosecution.

Figure 3. Notification of suspicion of collaborative activity

Source: Own compilation by the author based on data by Unified Report on Criminal Offences of the Office of the Prosecutor General

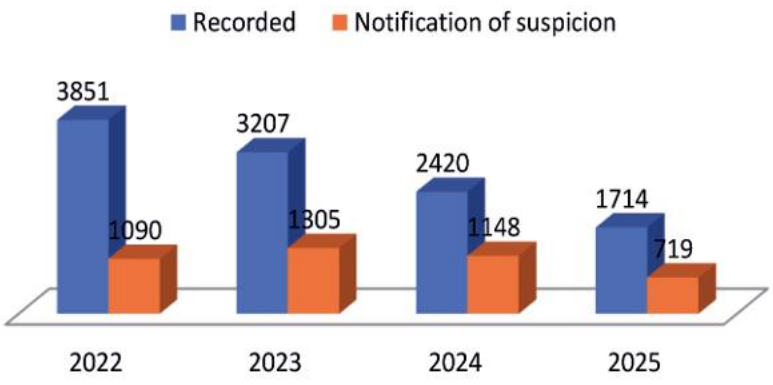

***Figure 3**. Notification of suspicion of collaborative activity*

Over the entire analysed period, out of 11,192 registered proceedings under Article 111-1 of the CCU, notices of suspicion were issued in 4,262 cases, representing 38.1% of the total volume. Thus, more than six out of ten registered proceedings fail to reach criminal liability even in its initial form. At the same time, this indicator functions as an important "filter" within the system of criminal law response to collaborative activity.

Particular attention should be paid to the dynamics of the transformation rate, that is, the proportion of notices of suspicion relative to the number of registered proceedings in each respective year. In 2022, this indicator amounted to 28.3% (the lowest value), reflecting the objective inability of pre-trial investigative bodies to process the unprecedented number of registrations during the first year of the full-scale invasion. In 2023, a noticeable improvement occurred, as the indicator rose to 40.7%. In 2024, the highest value for the entire period was recorded—47.4%—which may indicate both a qualitative improvement in investigative practice and the natural "maturation" of investigations initiated in previous years.

From a criminal law perspective, the identified imbalance between the registration stage and the stage of notification of suspicion has at least two dimensions. The first concerns the quality of initial registration: it cannot be excluded that some proceedings under Article 111-1 CCU are initiated at the registration stage on the basis of information that is not subsequently confirmed during the investigation. The second aspect relates to the specific nature of Article 111-1 CCU: in particular, a significant proportion of persons in respect of whom proceedings are registered remain in temporarily occupied territories or outside Ukraine, thereby making the achievement of pre-trial objectives impossible.

Closure of Criminal Proceedings Concerning Collaborative Activity at the Pre-Trial Investigation Stage. The closure of criminal proceedings consists in the final termination of criminal prosecution without referral of the case to court for substantive consideration. In general terms, closure constitutes legal confirmation at the pre-trial stage of the impossibility of implementing criminal liability, thereby serving as a key safeguard against arbitrariness and as an instrument for the rational use of state resources. Relevant grounds may include the absence of the event of a crime, the absence of constituent elements of an offence, the death of the suspect, and similar circumstances.

An analysis of the data presented in Figure 4, reflecting the dynamics of the closure of criminal proceedings concerning collaborative activity at the pre-trial stage during 2022–2025, makes it possible to identify another fundamentally important characteristic of the established enforcement practice.

Figure 4. Closure of proceedings for collaborative activity by pre-trial investigation authorities

Source: Own compilation by the author based on data by Unified Report on Criminal Offences of the Office of the Prosecutor General

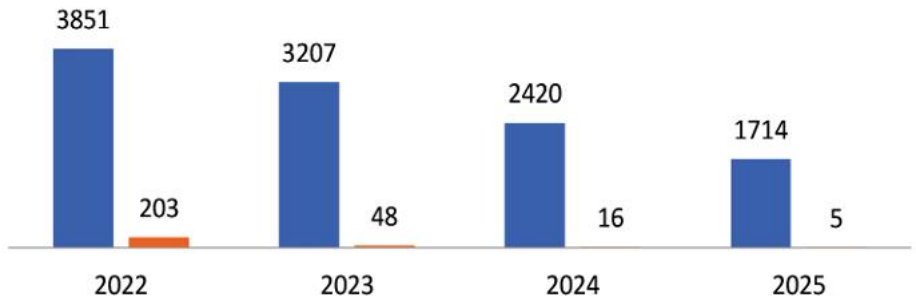

***Figure 4**. Closure of proceedings for collaborative activity by pre-trial investigation authorities*

Over the entire four-year period, out of 11,192 registered proceedings under Article 111-1 CCU, pre-trial investigative bodies closed only 272 cases, representing merely 2.43% of the total number. The most revealing feature is not the absolute number of closed proceedings, but its dynamics. In 2022, 203 proceedings were closed (5.27% of registered cases); in 2023, 48 (1.50%); in 2024, 16 (0.66%); and in 2025, only 5 (0.29%). Over four years, the number of closed proceedings decreased by a factor of 40.6—from 203 to 5—and the pace of this reduction was consistently steep.

It is also important to compare the number of closed proceedings with the number of notices of suspicion issued within the same reporting year. In 2022, for every 1,090 notices of suspicion there were 203 closures, yielding a ratio of 1:5.4. In 2023, this ratio changed sharply: 48 closures to 1,305 suspicions (1:27.2). In 2024, there were 16 closures to 1,148 suspicions (1:71.8), and in 2025 only 5 closures to 719 suspicions (1:143.8).

This progressively increasing asymmetry indicates that investigative practice is becoming ever more oriented toward continuing proceedings and issuing notices of suspicion rather than terminating cases, even in circumstances where sufficient grounds for closure may well exist. Such a situation requires separate professional analysis.

The State of Referring Criminal Cases on Collaborative Activity to Court. In Ukraine, the completion of a pre-trial investigation through the referral of an indictment to court constitutes the final stage of pre-trial proceedings and demonstrates the existence of a sufficient evidentiary basis for the public substantiation of a person's guilt before a court. The transfer of case materials to court terminates the jurisdiction of the pre-trial investigative authorities and initiates the judicial stage of criminal proceedings.

Figure 5. Criminal cases referred to court for collaborative activity

Source: Own compilation by the author based on data by Unified Report on Criminal Offences of the Office of the Prosecutor General

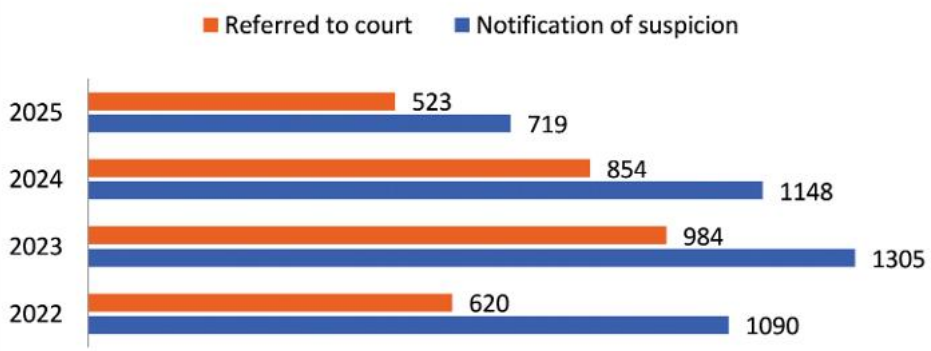

***Figure 5**. Criminal cases referred to court for collaborative activity*

An analysis of the data presented in Figure 5, reflecting the relationship between the number of notices of suspicion and the number of criminal cases referred to court for collaborative activity during 2022-2025, makes it possible to identify the patterns governing the transition from notification of suspicion to the commencement of judicial review.

During the analysed period, out of 4,262 cases in which a person was notified of suspicion, 2,981 were referred to court, representing 69.9% of the total number. This figure is significantly higher than the rate of transformation of registrations into suspicions (38.1%). Accordingly, a person notified of suspicion for collaborative activity appears before a court with a probability of nearly 70%, which serves as an indicator of relative procedural certainty once the stage of criminal prosecution has been reached.

In absolute terms, the number of cases referred to court fluctuated substantially: increasing from 620 in 2022 to 984 in 2023 (58.7%), followed by a moderate decline to 854 in 2024 (13.2%), and a more substantial decrease to 523 in 2025 (38.8%). The decline in 2025 should be viewed as a consequence of the reduction in the number of notices of suspicion issued in the same year (719 compared with 1,148 in 2024).

No less important is the analysis of cases that did not reach the stage of referral to court after a notice of suspicion had been issued. In 2022, such cases numbered 470 (43.1% of suspicions); in 2023, 321 (24.6%); in 2024, 294 (25.6%); and in 2025, 196 (27.3%).

Out of 11,192 registered proceedings, 4,262 reached the stage of suspicion (38.1%), while 2,981 reached the stage of referral to court (26.6% of the initially registered total). Nearly three quarters of all registered proceedings did not proceed to the judicial stage. At the same time, this indicator cannot be directly interpreted as a "failure" of the system: it reflects both procedurally justified filters operating at each stage of proceedings and objective structural limitations caused by the specific nature of investigating offences committed under conditions of occupation.

Thus, the stage of referral to court constitutes the relatively most effective link in the process of criminal law counteraction to collaborative activity: reaching nearly 70% transformation of suspicions into court proceedings, it demonstrates stable and comparatively high effectiveness.

Results of Judicial Consideration of Criminal Cases Concerning Collaborative Activity. The examination of judicial data on criminal cases under Article 111-1 of the CCU, broken down into three possible outcomes (conviction, acquittal, and termination of proceedings by the court), makes it possible to identify the principal tendencies of judicial practice (Figure 6).

Figure 6. Verdicts in court cases concerning collaborative activity

Source: Own compilation by the author based on data by Unified Report on Criminal Offences of the Office of the Prosecutor General

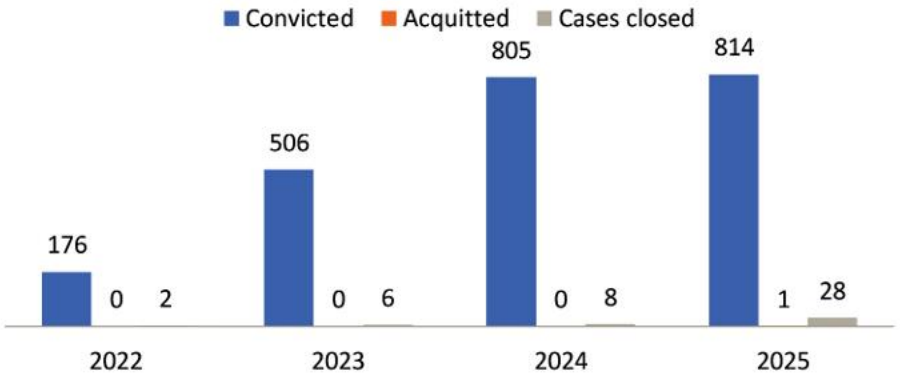

***Figure 6**. Verdicts in court cases concerning collaborative activity*

During the analysed period, courts considered a total of 2,346 cases concerning collaborative activity, resulting in 2,301 convictions (98.1%), 1 acquittal (0.04%), and termination of proceedings in 44 cases (1.88%). Such a structure of judicial outcomes is characteristic of offences against national security under conditions of martial law and reflects the general tendency toward a low acquittal rate in the criminal justice system of Ukraine.

The dynamics of the absolute number of convictions demonstrate consistent and significant growth between 2022 and 2024, unprecedented in pace—nearly a fivefold increase over two years. The practical stabilization of the indicator in 2025 (814 compared with 805 in 2024, an increase of only 1.1%) indicates the attainment of a certain plateau in the capacity of the judicial system to process this category of cases under the current operating model.

Of fundamental importance is the comparison between the number of convictions and the number of cases referred to court during the same reporting year. Evidently, beginning in 2025, courts were considering and concluding a substantial proportion of cases referred in previous years. This constitutes a classic manifestation of the temporal lag between the inflow of cases and their adjudication on the merits, characteristic of systems processing an accumulated caseload.

A comparison of the number of convicted persons with the initially registered proceedings under Article 111-1 CCU demonstrates that, over four years, 2,301 persons were convicted out of 11,192 registered proceedings, representing 20.6%. This progressive dynamic serves as a reminder that nearly eight out of ten registered proceedings do not result in a conviction. At the same time, the data in Figure 6 indicate that the judicial stage is the most predictable link in the criminal justice system's response to collaborative activity: cases reaching court end in conviction in 98.1% of instances, while the number of convictions demonstrates steady growth.

Implementation of Criminal Liability in Respect of Collaborators. The implementation of criminal liability encompasses the path from conviction to punishment and is decisive for assessing the effectiveness of the law. In Ukraine, this process is based on conviction and the imposition of punishment, which under criminal law may be actual (with execution of sentence) or nominal (with exemption from serving punishment). Statistical analysis of the relationship between these forms makes it possible to determine the factual nature and substance of liability imposed upon the offender.

An analysis of the data presented in Figure 7, reflecting the implementation of criminal liability for collaborative activity through the relationship between the number of convicted persons, the number of persons sentenced, and the number of persons exempted from punishment, makes it possible to move from a purely quantitative description of convictions to their relatively qualitative dimension—the actual substance of criminal liability imposed.

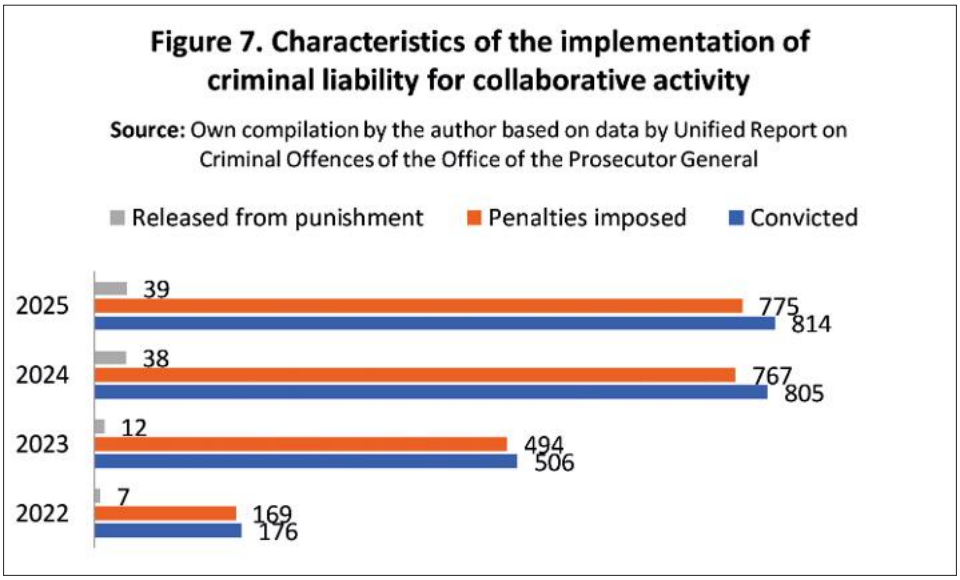

***Figure 7**. Characteristics of the implementation of criminal liability for collaborative activity*

Over the four-year period, out of 2,301 persons convicted under Article 111-1 CCU, punishment was imposed on 2,205 persons (95.8%), whereas 96 persons (4.2%) were exempted from punishment. Accordingly, the overwhelming majority of convictions result

in the actual imposition of punishment, while the practice of exemption remains relatively limited.

The dynamics of exemptions from punishment demonstrate a characteristic trajectory: 4.0% in 2022; 2.4% in 2023 (a decline of 1.6 percentage points); 4.7% in 2024 (an increase of 2.3 percentage points); and 4.8% in 2025 (practical stabilization, with growth of only 0.1 percentage points). In absolute terms, the number of exemptions increased at varying rates: from 7 in 2022 to 12 in 2023 (+71.4%), then to 38 in 2024 (+216.7%), and to 39 in 2025 (+2.6%). Stabilization in 2025 (39 versus 38 in 2024) corresponds with the general plateau reached in the number of convictions.

Particularly illustrative is the comparison of this indicator with the general practice of exemption from punishment within the criminal justice system of Ukraine. The total number of persons exempted from punishment for all criminal offences amounted to 21,077 in 2022, 28,892 in 2023, 22,228 in 2024, and 16,559 in 2025, demonstrating a stable downward trend: −23.1% in 2024 and −25.5% in 2025. By contrast, the number of collaborators exempted from punishment during the same period increased (from 7 to 39 persons, i.e., by a factor of 5.6), while their share in the total number of exemptions rose more than sevenfold—from 0.033% to 0.235%.

The implementation of criminal liability for collaborative activity is predominantly consistent: in 95.8% of cases, conviction results in the imposition of punishment. The stabilization of the share of exemptions at approximately 4.7–4.8% in 2024–2025 may reflect the emergence of a certain judicial standard regarding the application of relevant mitigating mechanisms; however, a full understanding of this tendency requires qualitative analysis of the grounds for exemption in specific cases.

Conclusions. The conducted study of the quantitative indicators of the application of criminal law measures for collaborative activity in Ukraine during 2022-2025 provides grounds for the formulation of the following conclusions.

1. Criminal liability for offences against the national security of Ukraine acquired genuine practical significance under conditions of full-scale armed aggression. Prior to 2022, criminal law provisions establishing liability for encroachments upon the foundations of national security performed predominantly a preventive function and were rarely applied in practice. The full-scale invasion created qualitatively new conditions for law enforcement, resulting in an unprecedented surge in the registration of relevant criminal offences.

2. The system of criminal law response to collaborative activity remains in a state of gradual but incomplete stabilization. The identified transition from the stage of mass initial registration to the stage of substantive implementation of criminal prosecution through convictions constitutes a positive tendency, indicating the overcoming of the institutional imbalance characteristic of the first months of the full-scale invasion. At the same time, the rate of transformation of registered proceedings into convictions remains relatively low: over four years, only 20.6% of the total number of registered proceedings resulted in convictions.

3. The effectiveness of criminal law counteraction to collaborative activity is uneven across different procedural stages. The principal bottleneck lies at the initial stage of criminal proceedings: only 38.1% of registered incidents are transformed into notices of suspicion. By contrast, the judicial stage is the most predictable and effective: 98.1% of cases reaching court result in convictions.

4. The progressive decline in the number of proceedings closed at the pre-trial investigation stage requires independent professional assessment. The reduction in

closures from 203 in 2022 to only 5 in 2025 (i.e., by a factor of 40.6), accompanied by an increase in the number of notices of suspicion, creates a growing asymmetry between these indicators. Such dynamics may indicate an orientation of investigative practice toward continuing proceedings under virtually any circumstances, thereby raising concerns regarding compliance with the principles of procedural economy and legality.

5. The practice of exempting collaborators from punishment is developing in a counter-trend to the general systemic tendency. Against the background of a consistent decline in the overall number of exemptions from punishment within the criminal justice system of Ukraine, the proportion of collaborators among persons exempted from punishment increased more than sevenfold—from 0.033% in 2022 to 0.235% in 2025.

6. The effectiveness of criminal law counteraction to collaborationism cannot be assessed exclusively through quantitative indicators. The analysis of statistical data reveals general tendencies and systemic disproportions; however, it does not answer the question of the soundness of specific decisions, whether at the pre-trial stage or during judicial proceedings. A comprehensive assessment of enforcement effectiveness requires the combination of quantitative analysis with qualitative examination of practice in individual cases.

The foregoing conclusions demonstrate that criminal law counteraction to collaborative activity in Ukraine remains in a state of dynamic formation of settled enforcement standards. Further enhancement of its effectiveness requires systematic improvement both of investigative practice—particularly in terms of the quality of initial registration and the substantiation of pre-trial decisions—and of judicial practice regarding the consistent application of criminal liability measures in proportion to the degree of social danger posed by the offence.

Abstract

The study examines the impact of Law No. 5/2026, which entered into force on 26 February 2026 and through which the Moldovan legislator substantially revised the Criminal Code to transpose Directive 2011/93/EU. The law introduced essential definitions, such as "material relating to the sexual abuse of a child" (Art. 1324) and "pornographic performance" (Art. 1325). Chapters IV and VII of the Special Part of the Criminal Code of the Republic of Moldova were supplemented with provisions concerning: coercing a child for sexual purposes (Art. 1721); inducing a person under 16 to witness sexual acts or sexual conduct (art. 2083); involving a child in pornographic performances (Art. 2084); and inducing or coercing a child into prostitution (Art. 2085). Amendments are also introduced in other provisions of the Criminal Code, including Art. 159, 160, 171, 172, 173-1751, 208, 2081, 2082, and others. The study seeks to explain the substantive criminallaw changes brought by Law No.5/2026 and to assess the extent to which these reforms bring domestic criminal law closer to European standards.

Keywords: material relating to the child sexual abuse, pornographic performance, prostitution, state of helplessness, abuse of authority.

PROTECȚIA PENALĂ A COPIILOR ÎMPOTRIVA ABUZULUI ȘI EXPLOATĂRII SEXUALE: EFECTELE LEGII NR. 5/2026

Abstract

Studiul examinează impactul Legii nr. 5/2026, intrată în vigoare la 26 februarie 2026, prin care legiuitorul moldovean a revizuit substanțial Codul penal pentru a transpune Directiva 2011/93/UE. Legea a introdus definiții esențiale, precum „material privind abuzul sexual asupra unui copil" (Art. 132/4) și „spectacol pornografic" (Art. 132/5). Capitolele IV și VII din partea specială a Codului penal al Republicii Moldova au fost completate cu articole privind: constrângerea unui copil în scopuri sexuale (Art. 172/1); determinarea persoanei care nu a atins vârsta de 16 ani să asiste la acte sexuale sau la acțiuni cu caracter sexual (Art. 208/3); participarea unui copil la spectacole pornografice (Art. 208/4); determinarea sau constrângerea copilului la practicarea prostituției (Art. 208/5). De asemenea, au fost operate amendamente în alte articole din Codul penal al Republicii Moldova, și anume – în art. 159, 160, 171, 172, 173-175/1, 208, 208/1, 208/2 etc. Studiul urmărește să explice ce remanieri de natură juridico-penală aduce Legea nr.5/2026 și în ce măsură acestea reușesc să apropie dreptul penal autohton de standardele europene.

Cuvinte-cheie: material privind abuzul sexual asupra copilului, spectacol pornographic, prostituție, stare de neputință, abuz de autoritate.

Introduction. On 26 February 2026, Law No.5 of 12 February 2026 concerning amendments to several normative acts (hereinafter "Law No.5/2026") entered into force. The adoption of such a law had been scheduled for June 2025 in the Rule of Law Roadmap (a benchmark in the Republic of Moldova's EU accession process), approved by Government Decision No.275 of 14 May 2025. The purpose of this initiative was to align national legislation "with EU standards on combating child sexual abuse, the sexual exploitation of children and child pornography (Directive 2011/93) (hereinafter "the EU Directive" – A.N.)" [1]. The objective of transposing this EU act is expressly stated in the preamble to Law No. 5/2026. This study seeks to highlight the main effects of the law in question and to clarify the extent to which it succeeds in harmonising European commitments with the requirements of the criminal legislative system of the Republic of Moldova.

Methods and materials applied. In this study, we examine how Law No.5/2026 may influence the interpretation and application of criminal law provisions. To identify these effects, we compare the law's provisions with other relevant norms of the Criminal Code of the Republic of Moldova (hereinafter "CC RM") to identify where dysfunctions or uncertainties may arise. We also consider the regulatory framework as a whole, to understand how these norms fit within the current functioning of the criminal legislative system of the Republic of Moldova. At the same time, we rely on logical reasoning to formulate clear conclusions regarding the practical impact of the new law.

Discussions and results obtained. **1**. Art. 159 CC RM has been supplemented with paragraph (1^1), which provides as follows: "*The termination of a pregnancy, by a doctor or by another medical worker, by any means, carried out without the consent of the pregnant woman*" [2]. Similarly Art. 160 CC RM has been supplemented with paragraph (2^1), which provides as follows: "*The actions set out in paragraphs (1) or (2), committed by a doctor or by another medical worker, without the person's consent*" [2].

These amendments, introduced by Law No.5/2026, depart from the objective of transposing the EU Directive, as they in fact pursue the implementation of Art. 39 of the Council of Europe Convention on preventing and combating violence against women and domestic violence (also known as the Istanbul Convention). In one of our earlier publications, we noted: "In the Criminal Code of the Republic of Moldova, Art. 39 of the Istanbul Convention corresponds to Art. 151 or 152 CC RM (with or without reference to Art. 27 CC RM). […] These provisions ensure adequate protection against forced abortion and forced sterilisation. There is no need to criminalise such acts at the level of *nomen juris*" [3]. We reiterate this thesis: the *nomen juris* criminalising does not, *per se*, amount to more effective criminalisation. This conclusion is grounded in the analysis that follows below.

Thus, before the entry into force of Law No.5/2026, the acts set out in Art. 159(1^1) and Art. 160(2^1) CC RM fell under Art. 151 or 152 CC RM (with or without reference to Art. 27 CC RM). The situation after the entry into force of the law is as follows: Art. 151 CC RM (with or without reference to Art. 27 CC RM) applies only to the termination of a pregnancy committed, without the victim's consent, by a person who does not possess the special status of doctor or medical worker; Art. 151 or 152 CC RM (with or without reference to Art. 27 CC RM) apply only to surgical sterilisation performed, without the victim's consent, by a person who does not possess the special status of doctor or medical worker.

If we compare the sanctions provided in Art. 159(1^1) CC RM and Art. 160(2^1) CC RM with those in Art. 151 or 152 CC RM (with or without reference to Art. 81(3) CC RM), we will find that situations may arise in which a doctor or medical worker is liable to a more lenient punishment than an unqualified perpetrator – a paradoxical outcome, given that a qualified subject would ordinarily be expected to face a more severe, not a more in-

dulgent, sanctioning regime. One might argue that such situations are acceptable, since a doctor or medical worker possesses greater training and diligence than other persons and, consequently, the risk to the victim's life would be lower. We consider such an approach to be overly simplistic.

First, Art. 159(1^1) and Art. 160(2^1) CC RM do not specify the medical specialty of the doctor or medical worker (a relevant gap: the law treats uniformly specialties with radically different levels of competence in obstetrics / gynaecology). For example, a medical worker in the field of psychiatry may qualify as a subject of the offences provided by these two provisions. We question whether any justification exists for this. Second – and more importantly – the acts set out in Art. 159(1^1) and Art. 160(2^1) CC RM may be committed: in the presence of medical contraindications for performing such a procedure; in unsanitary conditions; in non-specialised medical facilities, etc. When carried out under such circumstances, the termination of a pregnancy or the performance of surgical sterilisation poses an imminent risk to the victim's life, regardless of the status of the person who commits the act.

Nor can we overlook the following deficiency: the wording used in Art. 159(1^1) CC RM directly contradicts Art. 134^{15} CC RM, which expressly excludes doctors from the notion of "medical worker". Nevertheless, Art. 159(1^1) CC RM includes them, creating a rupture in legal logic and undermining the predictability of the provision. As for Art. 160 CC RM, it does not fall under Art. 134^{15} CC RM at all. This implicitly leads to qualifying a doctor as a medical worker solely for the offences provided in Art. 160 CC RM. The result is a definition applied selectively, without any intelligible criterion.

Accordingly, we propose the removal of paragraph (1^1) from Art. 159 CC RM and paragraph (2^1) from Art. 160 CC RM.

2. *The Criminal Code has been supplemented with article* 172^1, *entitled "coercion of a child for sexual purposes" [2]. The basic form of the offence consists of "coercing a child for the purpose of committing a sexual act or non-consensual sexual conduct in relation to a third party, where such acts do not meet the elements of child trafficking" [2].*

It cannot be argued that, before the entry into force of Law No.5/2026, the scenario described in Art. 172^1 CC RM fell entirely outside the scope of criminal law. We have repeatedly stated that rape or non-consensual sexual acts committed by two or more persons may be expressed, *inter alia*, in the commission of one of these offences "by a person who possesses the attributes of the perpetrator, through a person who does not possess those attributes" [4, p. 568; 5; 6]. Nevertheless, doubts persist regarding the applicability of the aforementioned aggravating circumstance where rape or non-consensual sexual acts are committed through a person (including a child aged 14 to 18) who is subjected to coercion within the meaning of Art. 39 CC RM. Furthermore, before the entry into force of Law No.5/2026, the coercion of a child to commit a sexual act or non-consensual sexual conduct against a third party required the act to be qualified as an attempt if the intended purpose was not achieved. Given the child status of the victim, such vulnerabilities in the criminal-law framework significantly reduced the level of protection against sexual abuse.

It should be noted that – both before and after the entry into force of Law No.5/2026 – Art. 206 CC RM applies only where the coercion of the child is accompanied either by the recruitment, transportation, transfer, harboring or receipt of the child, or by the giving or receiving of payments or benefits to obtain the consent of a person who exercises control over the child, for the purpose, *inter alia*, of commercial or non-commercial sexual exploitation. In cases involving the coercion of a child for the purpose of committing a sexual act or non-consensual sexual conduct in relation to a third party, the application

of Art. 206 CC RM would be unlawful. This constitutes an additional argument in favor of supplementing the Criminal Code with Article 172[1].

For all these reasons, we express our support for this addition inspired by Art. 3(6) of the EU Directive.

In order to ensure the uniform application of Art. 172[1] CC RM, we consider it necessary to formulate the following three clarifications:

1) The application of Art. 172[1] CC RM excludes the qualification of the act as rape or non-consensual sexual conduct committed by two or more persons let. d) of Art. 171(2) or let. d) of Art. 172(2) CC RM). This conclusion follows from Art. 116 CC RM;

2) A child aged between 14 and 18 is not held liable under Art. 171 or 172 CC RM only when the coercion exerted on them to commit a sexual act or non-consensual sexual conduct in relation to a third party meets the conditions laid down in Art. 39 CC RM. In the absence of these conditions, a child aged between 14 and 18 who is capable of directing their actions becomes liable under Art. 171 or 172 CC RM. Even in such a case, the person who coerces the child is liable under Art. 172[1] CC RM;

3) The subject of the offence provided in Art. 172[1] CC RM is a responsible natural person who, at the time of the act, has reached the age of 16. If the act described in this article is committed by a person aged between 14 and 16, the appropriate legal qualification is the one that applied before the entry into force of Law No.5/2026.

3. *It has become possible to aggravate criminal liability where the offences provided in Art. 159, 160, 171, 172 and 173 CC RM are committed "against a person in a state of helplessness resulting from advanced age, illness, disability or another factor"* [2].

This possibility was introduced through an amendment proposed by a member of the Parliament of the Republic of Moldova, supported by the following arguments: "The establishment of an aggravating circumstance concerning the exploitation of the victim's state of helplessness, resulting from age, illness, disability or another factor, is outlined in Directive 2011/93/EU, which obliges Member States to impose harsher penalties for acts committed against children in a situation of vulnerability" [7]. Indeed, point (ii) of Art. 3(5) of the EU Directive recommends the criminalization of "engaging in sexual activities with a child where [...] abuse is made of a particularly vulnerable situation of the child, in particular because of a mental or physical disability or a situation of dependence" [8]. It should be noted that the Moldovan legislator did not take the victim's age into account when transposing this provision into Art. 159, 160, 171, 172 and 173 CC RM. Moreover, the offences provided in Art. 159 and 160 CC RM, do not fall within the scope of the EU Directive. However, the aggravation of criminal liability where "the offence was committed against a person made vulnerable by particular circumstances" [9] is suggested by point c) of Art. 46 of the Istanbul Convention. From this perspective, the introduction of the analyzed aggravating circumstance is justified, irrespective of the victim's age.

The question is whether the introduction of this aggravating circumstance has or has not generated dysfunctions within the system of criminal law. This question arises in relation to the offences provided in Art. 171 and 172 CC RM (and not in relation to the offences provided in Art. 159, 160 and 173 CC RM).

Let us begin with the fact that, according to Art. 132[2](3) CC RM, "a sexual act or sexual conduct is deemed non-consensual when it is accompanied by physical or psychological coercion applied to the victim or to another person, or when advantage is taken of the person's inability to defend themselves or to express their will" [2]. Thus, taking advantage of the victim's inability to defend themselves or to express their will constitutes one of the alternative mandatory conditions for liability for rape or non-consensual sexual acts.

What is the difference between taking advantage "of the person's inability to defend themselves or to express their will" (Art. 132²(3) CC RM) and committing the offence "against a person in a state of helplessness resulting from advanced age, illness, disability or another factor" let. h) of Art. 171(2) and let. g) of Art. 172(2) CC RM)? [2] The difference between these two scenarios is merely formal, not substantive. This amounts to a breach of the rule laid down in let. d) of Art. 54(1) of Law No.100/2017, according to which, in the text of a draft normative act, "the same notions shall be expressed by the same terms" [10]. At first glance, this rule might appear to lack any practical value. But is that really the case?

Let. h) of Art. 171(2) CC RM provides for liability for rape (*i.e.*, a non-consensual sexual act) committed "against a person in a state of helplessness resulting from advanced age, illness, disability or another factor" [2]. The provision presupposes that, at the moment the sexual act is committed, the victim – being in a state of helplessness – is either physically or psychologically coerced, or advantage is taken of their inability to defend themselves or to express their will. We have already established above that the scenario of taking advantage "of the person's inability to defend themselves or to express their will" (art. 132²(3) CC RM) does not differ from the scenario of committing the offence "against a person in a state of helplessness resulting from advanced age, illness, disability or another factor" let. h) of Art. 171(2) CC RM) [2]. This means that, in accordance with Art. 3(2) CC RM, Art. 171(1) CC RM must be applied (and not let. h) of paragraph (2) of that article) where the sexual act is committed against a person in a state of helplessness resulting from advanced age, illness, disability or another factor. Thus, it follows that, in fact, let. h) of Art. 171(2) CC RM may be applied only when, at the moment the sexual act is committed, the victim in a state of helplessness is subjected to physical or psychological coercion. Similar conclusions apply to let. g) of Art. 172(2) CC RM.

Consequently, it may be stated that the Moldovan legislator has transposed, in an inefficient manner, the provisions of point (ii) of Art. 3(5) of the EU Directive and point c) of Art. 46 of the Istanbul Convention. What could the solution be? We consider that a revision of art. 132²(3) CC RM is necessary. To this end, we propose that the Art. 132²(3) CC RM be reformulated as follows: "A sexual act or sexual conduct shall be deemed non-consensual when it is either accompanied by physical or psychological coercion applied to the victim or to another person, or is committed against a person who is in a state of helplessness resulting from advanced age, illness, disability or another factor. A sexual act or sexual conduct committed against a person who is in a state of helplessness resulting from advanced age, illness, disability or another factor entails liability under let. h) of Art. 171(2) or let. g) of Art. 172(2) of the Code". In this way, it will be clear that, for the application of these provisions of the art. 171 and 172 CC RM, it is not mandatory for the victim to be subjected to physical or psychological coercion.

4. *It has become possible to aggravate criminal liability where the offences provided in Art. 171-175¹, 208¹ and 208³ CC RM are committed "through an abuse of a position of authority over the victim"* [2].

This possibility was introduced through an amendment proposed by a member of the Parliament of the Republic of Moldova. In support of his initiative, he invoked the following arguments: "Regarding [...] the circumstance in which the perpetrator abused his position of authority over the victim, we note that the draft law does not fully cover all situations involving the commission of the act by persons in a recognized position of trust, authority or influence over the child, as required by the Directive. In this context, we observe that national legislation already covers, through its current formulations, the

positions of trust and influence referred to in the Directive. Nevertheless, in order to expressly cover the scenario of abuse of a recognized position of authority, which may also exist outside the framework of protection, education or care relationships, it is necessary to introduce a new, general aggravating circumstance that distinctly reflects the abuse of authority" [7]. Indeed, point (i) of Art. 3(5) of the EU Directive recommends the criminalization of "engaging in sexual activities with a child where [...] abuse is made of a recognized position of trust, authority or influence over the child" [8]. It should be noted that the Moldovan legislator did not take the victim's age into account when transposing this provision into Art. 171, 172 and 173 CC RM.

But this is not the essential point. What draws our attention is that, in parallel with the aggravating circumstance "through an abuse of a position of authority over the victim" [2], Art. 171-175[1], 208[1] and 208[3] CC RM also specify the aggravating circumstance "against a person who is in the care, under the guardianship, under the protection, in the education or in the treatment of the perpetrator" [2]. It is true that the wording "through an abuse of a position of authority over the victim" in these articles covers a narrower sphere than the point (i) of Art. 3(5) of the EU Directive. This partial transposition was likely intended precisely to avoid overlaps between the two scenarios under comparison. Nevertheless, such overlaps cannot be entirely excluded. We refer, *e.g.*, to the situation in which the victim is under the perpetrator's protection, meaning that the victim "is lawfully deprived of liberty [...], and the person who committed the offence has the duty to guard and supervise them" [11, p. 83].

As a result, we recommend introducing amendments to Art. 171-175[1], 208[1] and 208[3] CC RM. In order to fully transpose the point (i) of Art. 3(5) of the EU Directive, in all these articles the phrase "through an abuse of a position of authority over the victim" [2], should be replaced with the expression "through an abuse of a position of trust, authority or influence over the victim" [8]. At the same time, to avoid regulatory duplication, the aggravating circumstance "against a person who is in the care, under the guardianship, under the protection, in the education or in the treatment of the perpetrator", should be removed from Art. 171-175[1], 208[1] and 208[3] CC RM.

5. *The term "debauchery" has been removed from Art. 208 CC RM [2]. At the same time, the Criminal Code has been supplemented with Article 208[5], which criminalizes the act of "inducing or coercing a child into practicing prostitution"* [2].

It should be emphasized that, before the entry into force of Law No.5/2026, "inducing minors to debauchery (that is, to the practice of prostitution), committed by a person who had reached the age of 18, entailed liability under Art. 208 CC RM" [11, p. 248]. Inducing minors to debauchery, when committed by a person aged between 16 and 18, entailed liability under Art. 220 CC RM.

We consider the removal of the term "debauchery" from art. 208(1) CC RM [2], to be justified, since this term – most likely meaning "prostitution" – was susceptible to an unfavorable extensive interpretation. In this context, the solution of criminalizing, in Art. 208[5] CC RM, the acts of inducing or, respectively, coercing a child into prostitution is a consistent solution, intended to compensate for the removal of the term "debauchery" [2] from Art. 208(1) CC RM. At the same time, the new article provides a more appropriate framework for transposing paragraphs (5) and (6) of Art. 4 of the EU Directive. Moreover, the differentiation of liability in the two paragraphs of Art. 208[5] CC RM is appropriate, being grounded in the distinct degree of social danger posed by the incriminated acts.

It should be noted that Art. 208[5] CC RM may be applied only "if the act does not meet the elements of child trafficking". Thus, let. a) of Art. 206(1) CC RM provides for liability

for "the recruitment [...] of a child for the purpose of [...] commercial or non-commercial sexual exploitation [...]" [2]. Conversely, Art. 208[5](2) CC RM must be applied where such an act does not involve the recruitment of the child and/or where the prostitution to which the child is coerced does not amount to exploitation.

We further note that the application of Art. 208[5](1) CC RM excludes the qualification of the act under Art. 220 CC RM. This conclusion follows from Art. 116 CC RM.

6. *The Criminal Code has been supplemented with Article 132[4], which defines the notion of material relating to the sexual abuse of a child.*

We support this addition. Before the entry into force of Law No.5/2026, a similar definition of the notion of "child pornography" was included directly in the provision of art. 208[1] CC RM [2]. The entry into force of that law had the effect of decongesting Art. 208[1] CC RM. Thus, in accordance with the rule laid down in let. d) of Art. 54(1) of Law No.100/2017 – according to which, in the text of a draft normative act, "a notion shall be expressed by the corresponding term, and its definition shall be avoided" [10] – the definition of the notion of "material relating to the sexual abuse of a child" [2] is provided not in the incriminating norm, but in a separate criminal provision.

As regards the replacement of the phrase "child pornography" with the lexical construction "material relating to the sexual abuse of a child" [2], this shift is recommended in the Terminology Guidelines for the Protection of Children from Sexual Exploitation and Sexual Abuse, developed in 2016 by the Interagency Working Group on Sexual Exploitation of Children (also known as the Luxembourg Guidelines). According to this document, "pornography is a term primarily used for adults engaging in consensual sexual acts distributed (often legally) to the general public for their sexual pleasure. Criticism of this term in relation to children comes from the fact that "pornography" is increasingly normalized and may (inadvertently or not) contribute to diminishing the gravity of, trivializing, or even legitimizing what is actually sexual abuse and/or sexual exploitation of children" [12]. It is therefore no coincidence that the European Parliament, in its Resolution of 11 March 2015 on child sexual abuse online, explicitly stated that "it is essential to use correct terminology for crimes against children, including the description of images of sexual abuse of children, and to use the appropriate term 'child sexual abuse material' rather than 'child pornography" [13].

Regarding the definition of the notion of material relating to the sexual abuse of a child, proposed for Art. 132[4] CC RM, it is inspired by the definition in let. (c) of Art. 2 of the EU Directive. This definition is clearer and more predictable than the descriptive provision that Art. 208[1] CC RM contained before the entry into force of Law No.5/2026.

It should be noted that Art. 132[4] CC RM does not incorporate the point (iii) of Art. 2(c) of the EU Directive, viewed considering Art. 5(7) of the same Directive. What is meant is the situation in which "a person appearing to be a child was in fact 18 years of age or older at the time of depiction" [8]. However, it must be emphasized that Art. 5(7) of the EU Directive is not mandatory. It is at the discretion of the Republic of Moldova to decide whether the analyzed provisions apply to cases involving child sexual abuse material.

In our view, the point (iii) of Art. 2(c) of the EU Directive, viewed considering Art. 5(7) of the EU Directive, should not be transposed into the Criminal Code of the Republic of Moldova. Our reservation concerns the phrase "a person appearing to be a child" [8]. First, in such a case, the offence is not directed against a minor victim. Yet only a minor can be a victim of the offences provided in Art. 208[1] CC RM. Second, the phrase "a person appearing to be a child" [8], is ambiguous. It is unclear whether the person depicted in the pornographic material appears to be a child because this is due to: (a) the anatomophysi-

ological characteristics of the adult in question; (b) the fact that the person is only slightly above the age of 18; or (c) the adult's simulation of minority or the artificial creation, by other means, of the appearance of minority. If the analyzed provisions of the EU Directive were to be transposed into domestic criminal law, there would be a risk of an unfavorable extensive interpretation of criminal law. We know that such interpretation constitutes a violation of Art. 7 of the European Convention on Human Rights. We take the view that the point (iii) of Art. 2(c) of the EU Directive (viewed considering Art. 5(7) of the EU Directive) could be transposed at a later stage within a different legislative proposal. Such amendments could eventually be incorporated into Chapter XI of the Special Part of the Criminal Code. In the same context, we consider that the unlawful circulation of material relating to sexual abuse in which the image of a child is entirely generated by artificial intelligence should also be criminalized.

7. *Art. 208[1] CC RM has been revised. Its previous title – "Child pornography" – has been replaced with the title "Circulation of material relating to the sexual abuse of a child" [2]. In addition, Art. 208[1] CC RM now contains four paragraphs instead of a single paragraph.*

We consider the reconfiguration of Art. 208[1] CC RM to be successful. The first two paragraphs of this article allow for an appropriate differentiation of the normative modalities of circulating material relating to the sexual abuse of a child, according to the degree of social danger posed by these modalities. The aggravating circumstances set out in Art. 208[1](3) CC RM likewise serves the purpose of a pertinent differentiation of criminal liability. Similarly, the inclusion of paragraph (4) in Art. 208[1] CC RM is appropriate. This paragraph is inspired by Art. 8(3) of the EU Directive, its purpose being to avoid the criminalization of situations without a real victim and without social danger, where such material is created or possessed between children exclusively for personal use.

8. *Art. 208[2] CC RM has been revised. This article, which criminalizes resorting to prostitution practiced by a child, now contains two paragraphs instead of a single paragraph.*

The amendment of Art. 208[2] CC RM was necessary, being inspired by Art. 4(7) of the EU Directive. Compared with Art. 208[2] CC RM in the version before the entry into force of Law No.5/2026, the current version of art. 208[2] CC RM: 1) has a broader scope, covering situations in which payment for sexual activities is made not only to the victim but also to a third party; 2) no longer makes liability conditional on the perpetrator's certainty regarding the victim's minority; 3) covers any form of remuneration or benefit granted to the victim, not only material advantages.

9. *The Criminal Code has been supplemented with Article 208[3], which, under the title "Inducing a person under the age of 16 to witness sexual acts or sexual conduct", establishes liability for two offences.*

The adoption of Art. 208[3] CC RM became necessary due to certain gaps generated by Law No.316/2022. Thus, before the entry into force of Law No.316/2022, the act criminalized in Art. 175 CC RM was described as follows: "perverse actions [...] consisting of exhibitionism, indecent touching, obscene or cynical discussions with the victim concerning sexual relations, inducing the victim to participate in or witness pornographic performances, providing the victim with pornographic materials, as well as other actions of a sexual nature" [2]. After the entry into force of Law No.316/2022, the phrase "consensual sexual conduct" [2] characterizes the harmful act provided in Art. 175 CC RM.

The phrase in question has the meaning established in Art. 132[2](2) CC RM. From this provision, three conditions emerge that the harmful act within the offence under art. 175 CC RM must meet: 1) it must involve obtaining sexual gratification – through direct contact or contact via an object – with the victim's body; 2) it must not constitute a sexual

act within the meaning of art. 132²(1) CC RM; 3) it must not fall under Art. 173 and 287 CC RM or Art. 354 of the Contravention Code. Therefore, the following cannot fall within the notion of "sexual conduct": knowingly inducing, for sexual purposes, a person under the age of 16 to witness sexual acts or sexual conduct, or to witness pornographic performances; obtaining direct or indirect profits from such activities; providing the victim with pornographic materials or material relating to the sexual abuse of a child; committing a sexual act or sexual conduct in the presence of a person under the age of 16. In such situations, Art. 206 CC RM likewise cannot be applied. This is because that article may be applied only where the minor victim is recruited, transported, transferred, harbored by the perpetrator, or where the perpetrator gives or receives payments or benefits to obtain the consent of a person who exercises control over the minor victim, for the purpose, *inter alia*, of commercial or non-commercial sexual exploitation.

We underline that Art. 208³ CC RM is modelled on art. 3(2)-(3) and Art. 4(2) of the EU Directive. The text of Art. 208³ CC RM is, for the most part, clear and foreseeable. Only paragraph (3) of this article raises reservations: "The consensual sexual act or consensual sexual conduct committed in the presence of a person who has not reached the age of 16" [2]. In the draft law approved at the Government meeting of 8 July 2024, this provision had a different content: "The sexual act or sexual conduct committed in the presence of a person who has not reached the age of 16" [14].

The question arises: how should rape or non-consensual sexual acts committed in the presence of a person under the age of 16 be qualified? The legislation in force does not reflect the serious psychological impact of exposing a minor to sexual violence. We consider that this gap may be addressed by supplementing Art. 171 and 172 CC RM with provisions under which liability would be aggravated if the offence is committed in the presence of a person who has not reached the age of 16.

10. The Criminal Code has been supplemented with article 208⁴, which, under the title "Participation of a child in pornographic performances", establishes liability for three offences. In the same context, the notion of a pornographic performance has been defined in Art. 132⁵ CC RM.

The provision of Art. 208⁴ CC RM is modeled on Art. 4(2)-(4) of the EU Directive. In turn, the definition of the notion of a pornographic performance is inspired by the definition in let. (e) of Art. 2 of the EU Directive. The adoption of Art. 208⁴ CC RM is justified by the essential distinction between material relating to the sexual abuse of a child (Art. 132⁴ CC RM), which concerns fixed visual representations, and a pornographic performance (Art. 132⁵ CC RM), which concerns live exposure, directed at an audience, of a child involved in explicit sexual behavior. Consequently, the separate criminalization of a child's participation in pornographic performances was indispensable to cover this autonomous form of sexual exploitation of children.

Conclusions. Law No.5/2026 marks an important step in strengthening the criminal protection of children and brings the normative framework of the Republic of Moldova closer to European standards. Although numerous amendments are necessary and well-founded, the analysis also reveals dysfunctions, overlaps, and risks of legislative incoherence. The effectiveness of the reform depends not only on expanding criminalisation, but also on the clarity, predictability, and efficiency of these provisions. The adjustments we propose in this study are essential for ensuring that the legislator's intention materialises into a functional, balanced criminal mechanism genuinely oriented toward the best interests of the child.

THE ROLE OF LEGAL EDUCATION IN CRIME PREVENTION: INTERDISCIPLINARY PERSPECTIVES AND PEDAGOGICAL STRATEGIES

Mihaela-Corina BUCUR,
Romanian Society of Victimology – Founding Member, Jurist, Authorized Mediator,
Fundeni Sanitary Post-Secondary School – Tenured Professor, 2nd Degree,

Romania
ORCID: 0000-0001-8904-0436

Abstract

Crime prevention represents a social objective of major complexity, requiring a proactive paradigm capable of merging rigorous legal expertise with modern pedagogical methodology, moving beyond the limits of a purely coercive model. The present study investigates the fundamental role of legal education, viewed not merely as a transfer of legislative information, but as a catalyst for forming authentic civic responsibility and for restructuring the attitudinal profile of youth in the face of antisocial behavioral temptations. The analysis focuses on the transition from the rote memorization of norms toward advanced experiential learning strategies, such as simulated trials (Moot Courts), mediation workshops, and real-case study analysis, which allow students to decode the internal mechanisms of justice and anticipate the legal, social, and personal consequences of their own actions. The paper examines best practice models that emphasize synergistic collaboration between teaching staff, magistrates, lawyers, and law enforcement representatives, demonstrating that direct dialogue succeeds in demystifying the judicial system and significantly reducing the incidence of phenomena such as vandalism, juvenile delinquency, or cyberbullying. Research results highlight that internalizing legal values through interactive and participatory methods contributes decisively to promoting a safe school climate and to crystallizing solid ethical discernment, capable of guiding the individual in moments of crisis or social pressure. This interdisciplinary synergy between the legal and educational environments constitutes the fundamental pillar of a consolidated rule of law, ensuring the premises for a stable and equitable society, in which respect for the law ceases to be dictated by the fear of sanction, becoming a civic responsibility assumed through education and profound understanding.

***Keywords:** civic responsibility, juvenile delinquency, legal literacy, restorative justice, experiential learning, culture of legality, bullying.*

ROLUL EDUCAȚIEI JURIDICE ÎN PREVENIREA CRIMINALITĂȚII: PERSPECTIVE INTERDISCIPLINARE ȘI STRATEGII PEDAGOGICE

Abstract

Prevenirea criminalității reprezintă un obiectiv social de o complexitate majoră, ce necesită o paradigmă proactivă capabilă să fuzioneze expertiza juridică riguroasă cu metodologia pedagogică modernă, depășind limitele modelului pur coercitiv. Studiul prezent investighează rolul fundamental al educației juridice, privită nu doar ca un transfer de informație legislativă, ci ca un catalizator pentru formarea responsabilității civice autentice și pentru restructurarea profilului atitudinal al tinerilor în fața tentațiilor comportamentale antisociale. Analiza se concentrează pe tranziția de la memorarea mecanică a normelor către strategii avansate de învățare experiențială, precum procesele simulate (Moot Courts), atelierele de mediere și analiza studiilor de caz reale, care permit elevilor să decodeze mecanismele interne ale justiției și să anticipeze consecințele juridice, sociale și personale ale propriilor acțiuni. Lucrarea examinează modele de bune practici ce pun accent pe colaborarea sinergică între cadrele didactice, magistrați, avocați și reprezentanți ai forțelor de ordine, demonstrând că dialogul direct reușește să demitizeze sistemul judiciar și să reducă semnificativ incidența fenomenelor precum vandalismul, delincvența infantilă sau cyberbullyingul. Rezultatele cercetării evidențiază faptul

că internalizarea valorilor legale prin metode interactive și participative contribuie decisiv la promovarea unui climat școlar sigur și la cristalizarea unui discernământ etic solid, capabil să ghideze individul în momente de criză sau presiune socială. Această sinergie interdisciplinară între mediul juridic și cel educațional constituie pilonul fundamental al unui stat de drept consolidat, asigurând premisele unei societăți stabile și echitabile, în care respectarea legii încetează să fie dictată de teama de sancțiune, devenind o responsabilitate civică asumată prin educație și înțelegere profundă.

Cuvinte-cheie: responsabilitate civică, delincvență juvenilă, alfabetizare juridică, justiție restaurativă, învățare experiențială, cultura legalității, bullying.

Introduction. Crime prevention in contemporary society has ceased to be the exclusive task of the state's coercive apparatus, structurally migrating toward a proactive model that emphasizes the early and holistic formation of the individual. This paradigm shift is not merely a pedagogical option but reflects the recognition of the intrinsic limitations of retributive justice. The classical model, focused primarily on punishing a deed already committed, often acts too late to repair the affected social fabric. Consequently, public policies are strategically shifting toward primary prevention mechanisms that directly target the roots of deviant behavior, acting upon psychosocial risk factors before they crystallize into illicit actions [1].

In this new conceptual framework, legal education undergoes a fundamental transformation: it is no longer viewed as a dry transfer of technical information or a simple listing of legal articles, but as a complex process of civic literacy. This process is considered the essential pillar for social stability and community cohesion. Beyond the abstract knowledge of the norm, civic literacy involves developing the capacity to navigate ethical dilemmas and understanding the spirit of the law as a guarantor of individual liberties, rather than just a limitation upon them [2].

The complexity of current criminal phenomena, marked by increased volatility and the accelerated transposition of social conflicts into the virtual space, mandates an urgent re-evaluation of the school's role as the primary vector for legal socialization. Digital reality has dissolved geographical barriers and created new risk zones: cybercrime—where minors can become perpetrators or victims with a single click; and hate speech and cyberbullying—which have become forms of aggression with devastating psychological impact, often perceived by youth as mere forms of informal interaction [3].

The need to adapt pedagogical strategies is critical. In the absence of a solid set of legal landmarks, the boundary between social interaction and aggression often becomes blurred for minors. Thus, legal education becomes a critical filter—a cognitive tool through which young people can correctly distinguish between the exercise of freedom of expression and the violation of another's fundamental rights [4].

From an interdisciplinary perspective, preventing crime through education requires the development of an authentic culture of legality. This implies a deep internalization of the values underlying the rule of law, so that compliance with the law is not the result of fear of sanction (a fragile, extrinsic conformity), but a conscious choice based on social responsibility and personal ethics. Recent research underscores a social security aspect: the absence of structured legal education among minors is directly correlated with increased vulnerability to manipulation, disinformation, and online radicalization. Without legal benchmarks, youth can be drawn into criminal networks or adopt extremist behaviors without realizing the legal gravity of their actions [5].

Therefore, the present work explores the necessity of integrating legal expertise into daily pedagogical practices, proposing a synergistic approach in which the student ceases to be a passive recipient of prohibitions. It proposes transforming the student into an active participant in their own civic formation, capable of understanding the social function of justice. The central objective of this study is to demonstrate that an early understanding of the mechanisms of justice and legal consequences represents the most efficient and sustainable tool for reducing juvenile delinquency rates in the long term, generating a positive impact on the entire social climate [6].

Methods and materials applied. The present research utilizes an exploratory qualitative methodology, grounded in a rigorous documentary analysis and a comparative study of best practice models implemented in European educational systems during the 2020-2025 chronological intervals. This methodological approach was selected to allow for an in-depth examination of pedagogical and legal mechanisms, facilitating the identification of critical variables that contribute directly to the success of primary prevention programs. By corroborating data extracted from various educational strategies and institutional reports, the study provides a multidimensional overview of how structured legal education influences socialization processes and shapes juvenile behavior within the school and community environment. The research design thus aims to extract efficiency indicators that can be adapted to the national context, demonstrating the direct correlation between the level of legal literacy among minors and the reduction in the incidence of antisocial acts, while providing the necessary foundation for proposing curricular reforms based on empirical evidence and the success of already validated external models.

Research materials. The documentary basis of this study was rigorously selected to ensure a multidimensional and integrated perspective on the contemporary educational and legal phenomenon. Given the interdisciplinary nature of the topic, the analyzed corpus of texts was not limited to the legal sphere but included official documents, empirical data, and cutting-edge pedagogical resources, structured as follows:

– *National Prevention Programs and Strategic Documents*: Priority was given to the examination of collaboration protocols and national strategies developed in partnership by the Ministry of Justice and the Ministry of Education. The analysis focused on pivotal documents, such as the "National School Environment Safety Strategy" and the architecture of non-formal programs like "School Otherwise" or "Green Week." Particular attention was paid to how the fundamental concepts of administrative and criminal liability are transposed and integrated into the mandatory and optional school curriculum. These documents do not merely represent administrative directives; they provide the normative and philosophical framework necessary for implementing legal education as a primary prevention mechanism. The objective of this framework is twofold: reducing the risk of victimization of minors and actively preventing the commission of antisocial acts through early awareness of the rigors of the law [7].

– *Statistical Reports and Crime Indicators*: To anchor the research in immediate social reality, complex statistical data regarding juvenile delinquency and the dynamics of bullying and cyberbullying incidents were utilized. The data were extracted from the annual reports of the General Inspectorate of the Romanian Police, child protection structures—the General Directorates for Social Assistance and Child Protection—and relevant non-governmental organizations for the period 2021-2024. Processing these figures allowed for a direct correlation between deficiencies in legal literacy and the frequency

of specific criminal typologies, such as cybercrime (illegal access to computer systems), assault and other violence, or crimes against property. This analysis highlighted the geographical and social critical points where pedagogical intervention is not only necessary but urgent to halt the escalation of deviant behaviors [8].

– *Methodological Guides and Curricular Resources*: The study included a critical analysis of civic education textbooks, specialized "Legal Education for Students" guides (such as those developed by professional associations in collaboration with magistrates), and auxiliary materials intended for the continuous training of teaching staff. Special attention was given to experiential learning strategies that propose a transition from theoretical memorization of the norm to its practical application. The analysis targeted the efficiency of using real case studies, scenarios based on age-appropriate jurisprudence, and role-play techniques. These resources are considered essential pillars for transposing abstract legal language into an accessible, playful, and relevant format for the youth world, thereby facilitating the internalization of norms as values of conduct and benchmarks of integrity, moving beyond the simplistic perception of the law as a sum of prohibitions [9].

This extensive and diversified documentary base ensures the internal validity of the research, providing both the theoretical foundation necessary for data interpretation and the indisputable empirical evidence of the need for structural reform in crime prevention strategies through the educational system.

Procedures and Pedagogical Interventions. The efficiency of the study was evaluated through the rigorous monitoring of three distinct types of pedagogical interventions, each strategically designed to activate different levels of legal consciousness: cognitive (understanding the norm), affective (internalization of values and empathy), and behavioral (applying the law in daily decisions). This tripartite approach ensures holistic learning, transforming the legal norm from an abstract concept, often perceived as external to the individual, into a practical and embraced reality.

Simulated method (Moot Courts): This procedure involved the symbolic and functional transposition of the courtroom directly into the educational space. Students were invited to take on active roles—judge, prosecutor, defense attorney, defendant, or witness—within cases adapted to their level of understanding but based on a real legal foundation. Beyond assimilating specialized legal terminology, the central objective was to develop empathy toward the act of justice and an understanding of the procedural rigor that guarantees human rights. Confronted with complex ethical dilemmas and the imperative need to base their decisions exclusively on material and testimonial evidence, the youth were able to assimilate the impartial and equitable character of the law. This method proved essential in correcting erroneous perceptions of justice (often confused with revenge or subjectivism), and in forming analytical thinking capable of evaluating facts from multiple and neutral perspectives [10].

Direct method (Expert Intervention): The study monitored the profound pedagogical impact of lectures and, especially, open dialogues held by magistrates, lawyers, and police officers within school premises. This method strategically aims to demystify the judicial system, offering youth a rare and valuable opportunity to interact with representatives of authority in a non-coercitive, support-based setting. The procedure facilitated the reduction of communication barriers and historical or social prejudices related to state institutions. Monitoring results indicate that the physical presence of an expert who explains the spirit of the law through real, concrete professional experiences has a much

stronger informational anchoring effect than the passive reading of a legislative text. Human interaction transforms the letter of the law into a set of living values intended to protect the community [11].

Digital and interactive method: Adaptation to the current technological context and the psychological profile of the "digital native" was achieved by integrating e-learning platforms, "serious games" applications, and interactive case studies. This procedure addresses the urgent need to educate youth regarding virtual risks—a field where legislation is often ignored by users. Interventions focused on phenomena such as cyberbullying, hate speech, intellectual property crimes, or the security of personal data. Through interactive simulations of online scenarios, students learned to precisely identify the critical threshold between a joke, an opinion, and a digital crime. Thus, a mechanism for legal self-protection and digital responsibility was developed in a space where youth erroneously feel protected by anonymity or the absence of physical barriers [12].

This strategic combination of procedures allowed for the observation that diversifying educational stimuli—from the quasi-theatrical experience of the simulated trial to the authority of direct dialogue and the interactivity of the digital environment—contributes to superior retention of legal information. Implicitly, this approach leads to a significant decrease in the predisposition toward antisocial behaviors, providing youth not only with knowledge but also with a solid set of civic competencies applicable in school, family, and extracurricular environments.

Discussions and results obtained. The integrated analysis of the collected data highlights that passive legal education, based exclusively on the rote memorization of school regulations or legal articles, has a minimal, almost negligible impact on the actual reduction of antisocial behavior among youth. This "magister-dixit" approach fails to produce an authentic change in mindset, as the student tends to perceive the law as an external, abstract, and often hostile entity, lacking relevance in their daily life.

In contrast, the research results demonstrate that active pedagogical strategies, which encourage critical thinking, debate, and ethical reflection on the norm, produce measurable and sustainable results in reducing school indiscipline, bullying, and acts of vandalism. The data indicate a direct correlation between the internalization of legal values through experiential exercises and an increase in the degree of voluntary compliance with community rules.

This fundamental distinction underscores the urgent need to transition from a purely informative model, centered on the simple storage of legal data, to a formative one, oriented toward character development and the formation of a solid civic consciousness in the prevention of juvenile delinquency. Thus, the success of the intervention is no longer evaluated by the volume of accumulated legislative knowledge, but by the maturation of the young person's moral discernment, who begins to understand the law not as an imminent punishment, but as a vital mechanism for protecting collective freedom and integrity.

Interdisciplinary Synergy and Evaluation of Consequences. The research results show that integrating a legal perspective into counseling and personal development classes significantly increases the capacity of young people to evaluate the long-term consequences of their actions. This interdisciplinary synergy addresses a major gap in traditional education: the fragmentation of knowledge. In the classical model, the law is presented abstractly, disconnected from the student's emotional reality. By correlating

law with psychology and ethics, the student ceases to perceive the law as a set of external and rigid prohibitions, transforming it into a framework for protecting their own integrity and that of those around them [13].

Correcting Erroneous Perceptions of Illicit Acts: Discussions with the target groups revealed a worrying fact: a large portion of young people associate the concept of "illegal" exclusively with violent crimes or those of extreme gravity (such as robbery or murder), ignoring or minimizing the legal repercussions of acts erroneously considered mere age-specific pranks. Frequently identified examples include the destruction of public property (vandalism), shoplifting, or, with an alarming frequency, cyberbullying. Interdisciplinary intervention allows for the dismantling of these myths, explaining that these actions, although perceived as simple social power plays, trigger concrete legal liabilities. Students were informed that their actions attract not only administrative sanctions but also the civil obligation to repair the damage and, in specific cases, a criminal record—a stigma with long-lasting effects [14].

Developing Emotional Intelligence and Anticipating Impact: The integrated approach facilitates the correlation of the legal norm with the development of emotional intelligence. Students thus receive the cognitive tools necessary to anticipate not only the state's coercive sanction (punishment) but also the devastating social and personal impact of their own delinquency. By using "victim perspective" techniques, young people are guided to visualize the suffering and trauma caused to others. This transposition exercise transforms empathy from an abstract feeling into a behavioral self-regulation mechanism. When young people understand the humanity of the victim, the moral barrier against committing an antisocial act is strengthened [15].

Therefore, the interdisciplinary approach transforms legal education from a simple law lesson into an authentic life lesson. It gives meaning to norms, anchoring them firmly in the emotional and social reality of young people and transforming the law from a threat into a set of internalized values.

Efficiency of Primary Prevention through Experiential Learning. One of the most relevant results of the study is related to the efficiency of immersive methods within primary prevention. Collected data indicate that youth who actively participate in simulations of real-life situations and mock trials (Moot Courts) show a 35% lower probability of becoming involved in violent conflicts or acts of aggression within the school and social environment. This significant decrease is not accidental, but the result of a profound process of reconfiguring the behavioral response to conflict, transforming a predisposition toward aggressiveness into civic competence [16].

Development of Alternative Dispute Resolution Skills: The primary explanation for this success lies in the fact that experiential learning directly develops alternative dispute resolution mechanisms. Within a simulated trial, the student is forced to step out of the comfortable role of a passive spectator and become an actor who must perform under pressure while respecting strict procedural rules. This experience acts as an exercise in mental discipline: instead of resorting to physical force or verbal intimidation to impose their point of view, the student learns that logical argument and evidence are the only validated tools in a rule of law. Thus, the simulated process becomes a practical metaphor for civilization [17].

From Impulsive Reaction to Logical Argumentation: Through repeated practice of negotiation and argumentation within simulations, young people tend to internalize these

strategies and apply them unconsciously in real-life interactions. Experiential learning creates genuine behavioral anchors. From a neuropsychological perspective, when a daily conflict arises, the trained student replaces the impulsive or violent reaction—coordinated by the amygdala through the archaic "fight or flight" response—with dialogue, analysis, and mediation, which are processes coordinated by the prefrontal cortex. The simulated litigation functions, therefore, as a training laboratory for impulse control and constructive anger management [18].

Impact on Group Cohesion and Tolerance: Immersive methods force young people to analyze a case from multiple points of view, often contrary to their own beliefs. For example, assuming the role of a defense attorney for a defendant with a difficult social history obliges the student to understand the human context behind an illicit act, without excusing it, but explaining it. This exchange of perspectives cultivates a cognitive tolerance that reduces the radicalization of opinions and diminishes aggression toward members of groups perceived as different. Results show that school environments that regularly practice legal simulations report an increased climate of safety, where the "law of the classroom" is no longer perceived as a constraint, but as a reflex of mutual respect [19].

Thus, experiential learning transforms primary prevention from an abstract pedagogical theory into a concrete life skill. It provides youth with a rational and legal alternative to violence, demonstrating that the power of argument is always superior to the argument of force.

Legal Education in the Face of New Forms of Cybercrime and Cyberbullying. A critical aspect highlighted by the present research is the imperative need to adapt legal education to the process of dematerializing juvenile delinquency. The results of the analysis indicate that the virtual environment generates a dangerous illusion of impunity and anonymity, which leads young people to adopt deviant behaviors that they would consider unacceptable in physical, face-to-face interactions. The collected data show that an overwhelming majority of minors do not realize the legal threshold at which a simple social interaction, a joke, or an offensive post transforms into cyberbullying, systematic harassment, or a serious breach of privacy—acts rigorously regulated and sanctioned by current criminal legislation.

Deconstructing the Myth of Virtual Anonymity: Pedagogical interventions focused on cybercrime have demonstrated that young people radically reconfigure their online conduct once they assimilate technical-legal concepts such as: the digital footprint, data traceability, and the technical capacity of authorities to identify perpetrators, regardless of the use of pseudonyms. Legal education does not function here merely as a warning; it provides an essential set of self-protection skills. The student ceases to be a vulnerable user and becomes a digital citizen capable of understanding that fundamental rights—such as the right to image and dignity—are just as protected in the virtual space as they are in the physical one [20].

Responsibility for Distributed Content and Digital Complicity: The study underscores the efficiency of digital simulations in which students are placed in the position of analyzing the legal consequences of distributing compromising materials (revenge porn, violent images) or propagating hate speech. This pedagogical method is vital for understanding the concept of shared legal liability. Young people learn that participating in a digital "media lynching" or simply "sharing" illicit content is not a neutral action but can attract

criminal or civil liability. This awareness acts as a braking mechanism for impulsivity, preventing accidental involvement in networks that propagate illegal content [21].

Impact on Digital Resilience and the Culture of Reporting: Research results confirm that students who benefit from specific modules on IT law exhibit a much higher degree of resilience against manipulation and social engineering. Moreover, they develop an increased openness toward reporting online abuse to teachers, parents, or authorities, overcoming the fear of digital retaliation. By transforming the law from an abstract barrier into a tool for personal safety, legal education succeeds in creating a more balanced virtual environment, where individual responsibility becomes the main barrier against the escalation of cybernetic conflicts [22].

Therefore, integrating this digital dimension into prevention strategies does not represent a mere curricular update, but a sine qua non condition for the safety of the current generation. It transforms the "lawless" space of the internet—as perceived by youth—into a territory governed by mutual respect and an awareness of legal consequences.

The Role of Authorities in Strengthening the Culture of Legality. Direct collaboration between teaching staff and legal professionals (magistrates, police officers, lawyers) has proven to be a determining factor in the success of prevention programs. This interaction transcends the simple transfer of technical expertise; it represents a fundamental reconfiguration of how young people perceive state authority and the social contract. Collected data suggest that the presence of experts in the classroom fulfills a dual and complementary pedagogical function, acting upon both the cognitive and attitudinal levels:

– *Legitimizing the Norm through Expert Guidance*: Legal professionals consolidate the authority and prestige of the law by providing it with meaning. When a magistrate or a lawyer explains the philosophical and social rationale behind a norm, it ceases to be perceived as an arbitrary or repressive rule imposed by the school system. Expert explanations provide the legal and jurisprudential context that traditional textbooks cannot cover, anchoring abstract concepts of "guilt," "foreseeability," or "liability" in real case studies. This anchoring in reality helps youth understand that the law is not an instrument of control, but a necessary social mechanism for protecting individual liberties [23].

– *Eroding the Communication and Human Gap*: The direct intervention of specialists significantly reduces the symbolic and psychological distance between the minor citizen and state institutions. For many young people, contact with authority (especially with the Police or the Court) often occurs at moments of crisis, conflict, or sanction, which generates a defensive perception. Preventive dialogue, conducted in a safe and neutral educational setting, promotes a climate of trust and transparency. This interaction radically transforms the archetype of the police officer or judge: from the image of a purely punitive agent, they become, in the eyes of youth, a guarantor of community safety and an accessible dialogue partner, capable of offering guidance, not just punishment [24].

– *Impact on Crime Reporting and Self-Protection*: A collateral result, yet one of vital importance for public safety, is the increased rate of reporting abuses. Youth who have interacted with legal professionals in a friendly and open environment develop enhanced resilience against victimization. They are much more likely to seek help from the authorities if they are witnesses to or victims of phenomena such as cyberbullying, physical aggression, or pressure from criminal groups. This paradigm shift indicates that young people are beginning to recognize authorities as a legitimate and protective support,

eliminating the "code of silence" that often fuels juvenile delinquency [25].

– *Behavioral Modeling through Moral Authority*: Beyond legal information, legal professionals serve as models of professional and civic conduct. Discussions regarding professional ethics and the consequences of legal decisions on human lives help students develop their own value systems. Thus, the culture of legality is consolidated not through coercion, but through the internalization of the values of the rule of law—a process facilitated by human interaction with those who apply and defend these values daily [26].

The presence of authorities in school is the missing link between the theory of citizenship and the practice of legality, transforming respect for the law from an abstract obligation into an assumed social responsibility.

The Educational Triad: The Role of the School-Family-Community Partnership in Consolidating the Culture of Legality. The long-term success of juvenile crime prevention programs does not depend exclusively on the quality of the pedagogical act in the classroom, but on the capacity to generate a synergy between the school, the family, and the local community. Research results indicate that the legal message transmitted in the school environment is much more easily internalized when it is supported and validated by the values promoted in the family environment. In the absence of this coherence, the young person may experience cognitive dissonance between the "law at school" and the practice in the private environment, a fact that weakens respect for the norm [27].

Involving the Family as a Preventive Partner: Data analysis underscores the importance of informing parents about the legal risks to which minors are exposed, especially in the sphere of expression-related offenses or cybercrimes. Programs that included legal counseling sessions for parents reported a decrease in permissive attitudes toward minor infractions, transforming the family from a risk factor (through neglect or ignorance) into a filter for active monitoring and ethical support [28].

The Community as a Space for Practicing Citizenship: Integrating local authorities and non-governmental organizations into the educational process provides youth with the opportunity to see the law in action. Legal volunteering projects or visits to public institutions allow for the transition from the abstract nature of the textbook to the concrete reality of community service. This institutional openness fosters a sense of belonging and responsibility toward the common good, reducing the desire for manifestation through acts of vandalism or antisocial behavior [29].

Sustainability through Convergent Messages: The results demonstrate that a culture of legality becomes resilient only when the legal norm is perceived as a shared community value. When the local police officer, the teacher, and the parent transmit a unified message about the consequences of actions and the importance of respecting others, the mechanism of juvenile behavioral self-regulation is strengthened, transforming legal compliance from an obligation into a natural social reflex [30].

Conclusions. The present research has demonstrated that the traditional approach to crime, based predominantly on punitive measures and post-factum interventions, is structurally insufficient in the absence of a solid educational foundation. Interdisciplinary collaboration between the legal and educational environments proves to be not just a pedagogical option, but an essential pillar in building effective strategies to prevent and combat juvenile delinquency.

The efficiency of the analyzed pedagogical interventions confirms that simple knowledge of the text of the law does not automatically generate compliance. A profound

understanding of the ethical and social foundations supporting the legal norm is imperative. Interactive strategies—such as simulated trials (Moot Courts) and direct partnerships with legal professionals—succeed in transforming legal abstraction into a moral compass for youth. Through this process, compliance with the law ceases to be perceived as an external constraint or a fear of punishment, becoming an act of responsibility assumed toward oneself and the community.

The study results confirm the hypothesis that the success of prevention is directly proportional to the degree of interactivity of the methods used and the level of institutional openness. The essence of these strategies lies not in the sterile accumulation of legislative information or the memorization of codes, but in the formation of solid civic discernment. This discernment functions as an ethical navigation system, providing young people with the capacity to navigate moments of crisis or group social pressure without transgressing the legal norm. An authentic culture of legality is not imposed by force but is built through participatory education, where the law is understood as the most effective tool for protecting individual freedom.

For these results to become sustainable, legal education must not be treated as an isolated or optional discipline, but as a transversal component of the pre-university formation process. Implementing these models at a systemic level requires a courageous political and educational vision that prioritizes the formation of civic character equally with academic performance. Only through this synergy can the premises of a rule of law consolidated through education be ensured, where cooperation between institutions replaces simple coercion.

In conclusion, investing in proactive pedagogical strategies represents the most efficient method of ensuring a safe social climate in the long term. The research results underscore that a legally informed youth is not just an individual who avoids criminal sanctions, but a responsible citizen, possessing critical discernment and a developed civic consciousness. They become capable of contributing actively to the stability, equity, and progress of society as a whole, transforming prevention into an engine for community development.

Abstract
This article examines the transformation of drug-related crime in the context of rapid digitalization and contemporary security challenges. The study emphasizes that illicit drug trafficking has increasingly shifted from the physical environment to the digital sphere, where encrypted communications, cryptocurrencies, anonymization technologies, and online platforms are actively used to coordinate criminal activities and conceal illegal operations. Particular attention is paid to the situation in Ukraine, where martial law and the full-scale armed aggression by Russia have intensified existing trends in the digitalization of drug-related crime and increased its connection with hybrid threats to national security. The article argues that traditional operational and investigative approaches are no longer sufficient under such conditions and highlights the need to modernize law enforcement practices through the use of digital forensics, OSINT tools, blockchain analytics, and enhanced international cooperation. The relevance of the research is supported by current international data and the growing necessity to harmonize national investigative methods with European Union standards.
Keywords: drug crime, digitalization, digital evidence, OSINT, martial law.

COMBATEREA CRIMINALITĂȚII LEGATE DE DROGURI ÎN CONTEXTUL DIGITALIZĂRII ȘI AL LEGII MARȚIALE: PROVOCĂRI PRIVIND DOCUMENTAREA ȘI PERSPECTIVE DE ÎMBUNĂTĂȚIRE

Abstract
Prezentul articol examinează transformarea criminalității legate de droguri în contextul digitalizării rapide și al provocărilor contemporane de securitate. Studiul evidențiază faptul că traficul ilicit de droguri s-a transferat tot mai mult din mediul fizic în spațiul digital, unde comunicațiile criptate, criptomonedele, tehnologiile de anonimizare și platformele online sunt utilizate activ pentru coordonarea activităților infracționale și disimularea operațiunilor ilegale.
O atenție deosebită este acordată situației din Ucraina, unde legea marțială și agresiunea armată pe scară largă a Rusiei au intensificat tendințele existente de digitalizare a criminalității legate de droguri și au amplificat conexiunea acesteia cu amenințările hibride la adresa securității naționale. Articolul susține că abordările operaționale și investigative tradiționale nu mai sunt suficiente în asemenea condiții și subliniază

necesitatea modernizării practicilor organelor de aplicare a legii prin utilizarea criminalisticii digitale, a instrumentelor OSINT, a analizei blockchain și a consolidării cooperării internaționale.

Relevanța cercetării este confirmată de datele internaționale actuale și de necesitatea tot mai accentuată de armonizare a metodelor naționale de investigare cu standardele Uniunii Europene.

Cuvinte-cheie: infracțiuni privind drogurile, digitalizare, probe digitale, OSINT, lege marțială.

Introduction. The fight against drug-related crime today takes place in a different reality than it did just a few years ago. Whereas previously such activities were concentrated primarily in the physical world, an increasingly significant portion of them is now shifting to the digital realm. It is there that communication between participants in criminal schemes takes place, along with the coordination of illegal activities, the search for clients, financial transactions, and the concealment of traces of unlawful activity. As a result, the drug trade is taking on new characteristics: it is becoming technologically more sophisticated, more covert, and significantly less dependent on a specific territory.

These changes are not accidental. They have been driven by globalization, the rapid development of information and communication technologies, the proliferation of digital platforms, and the emergence of decentralized financial instruments. All of this has created favorable conditions for the emergence of a new model of illicit drug trafficking—one that is flexible, adaptive, and capable of rapidly changing its modus operandi in response to law enforcement actions.

For Ukraine, this problem is particularly acute, as the imposition of martial law did not create it anew but sharply intensified existing trends toward the digitalization of drug-related crime. Full-scale armed aggression by Russia has not only altered the security environment as a whole but has also significantly impacted the crime situation. The war has transformed the routes used to transport illicit substances, complicated control over certain territories, and opened up additional opportunities for criminal networks to be exploited within broader mechanisms of destructive influence. Under such conditions, certain segments of the drug trade can be viewed not only as a source of criminal profit but also as an element of hybrid threats.

Some analytical reports suggest that certain drug trafficking groups may be used by hostile intelligence services to destabilize the situation in rear regions, gather intelligence, and finance subversive activities. This significantly increases both criminal and security risks. Consequently, the challenge of combating drug-related crime extends beyond a purely law enforcement response and is increasingly intertwined with national security issues.

Under these circumstances, the traditional model of operational and investigative activities, which for a long time focused primarily on detecting and documenting criminal behavior in the physical environment, is no longer always sufficiently effective.

This is particularly evident in a context where the modern illicit drug trade is increasingly shifting to the digital space. It is there that it operates according to different algorithms: communication between participants takes place via encrypted messengers, financial transactions are conducted using cryptocurrencies and anonymization tools, and a significant portion of the evidence exists only in electronic form.

Communication between participants takes place via encrypted messaging apps, financial transactions are conducted using cryptocurrencies and anonymization tools, and a significant portion of the information that may be of evidentiary value exists only in electronic form.

This is precisely why the law enforcement system faces not merely a need for tech-

nical improvements, but a necessity to fundamentally rethink its approaches to documenting and proving drug-related crimes. In essence, this involves changing the very logic of identifying, recording, and procedurally utilizing information generated in the digital realm.

In this regard, the implementation of the latest operational and investigative measures—based on the analysis of digital traces, the use of automated information processing tools, the application of OSINT tools, blockchain analytics, and the monitoring of digital communications—as well as the strengthening of international coordination in the fight against drug-related crime, takes on particular significance.

The relevance of this research is also confirmed by current international data.

According to the 2024 World Drug Report, the number of drug users worldwide has reached 292 million, and synthetic drug markets demonstrate a high level of resilience and the ability to quickly adapt to law enforcement pressure. For Ukraine, which is steadily integrating into the European security space, it is particularly important to align national investigative approaches with the methodological standards of the European Union, as reflected in the reports of relevant EU institutions.

Analysis of recent research and publications applied. The issue of combating drug-related crime and improving investigative techniques has long occupied a prominent place in Ukrainian criminal law and forensic science; however, it is taking on new significance today due to the digitalization of the drug market and changes in the methods used to detect and document such crimes. This is entirely natural, as the illicit drug trade remains one of the areas where criminal practices evolve faster than established approaches to their detection and documentation.

Academic works focus both on the general principles of investigating crimes related to the illicit drug trade and on specific procedural and tactical aspects of applying operational-investigative measures and covert investigative (search) actions [6]. At the same time, the rapid digitization of criminal activity has significantly altered the very nature of drug-related crime. This is precisely why some of the previously formulated provisions today require not a formal repetition, but a careful review that takes into account new methods of communication, concealment, and the shift of criminal activity to the online environment. In this context, works devoted to digital evidence, the functioning of criminal activity in cyberspace, and the application of covert measures in the context of the technological transformation of crime take on particular significance.

Some studies are devoted not only to documenting drug-related crimes but also to issues of regional drug crime prevention, which allows for a broader assessment of the organizational and criminological aspects of this problem [7].

The use of digital technologies in criminal proceedings has been examined in the works of V. V. Cherney, S. S. Chernyavsky, O. Yu. Tatarov, M. A. Pogoretsky, and other scholars [4; 6]. These studies formulate important theoretical propositions regarding the impact of information and communication technologies on criminal proceedings, outline approaches to the collection and evaluation of digital information, and draw attention to the risks of human rights violations during the application of the latest technical means. At the same time, such studies are largely of a general theoretical nature and only partially take into account the specifics of drug-related crimes committed in the digital environment, where the level of latency is traditionally particularly high.

The works of O. A. Samoilenko, which focus on the analysis of criminal activity in cyberspace and the use of specialized knowledge in investigating crimes committed using telecommunications technologies, play a significant role in this field. The author convinc-

ingly demonstrates that modern forms of criminal activity, including those related to the illicit trafficking of narcotics, are increasingly taking on the characteristics of cybercrime. This, in turn, requires investigators to possess not only proper procedural training but also a sufficient level of IT competence. At the same time, relevant studies focus primarily on issues related to the initiation of criminal proceedings and the use of specialized knowledge, while the problem of their systematic integration with covert investigative (search) activities, the collection of digital traces, the use of OSINT tools, and the documentation of online communications has not been fully explored [8].

A significant contribution to the development of tactics for covert investigative (search) activities has been made in the works of A. V. Shevchyshen. These works provide a detailed examination of issues of evidence in criminal proceedings involving the use of information and telecommunications technologies. Such research has important methodological significance for understanding the nature of digital evidence. However, even these do not fully cover the specifics of using such evidence specifically in criminal proceedings concerning the illegal trafficking of narcotic drugs [12]. Some dissertation studies also address the specifics of conducting covert investigative (search) operations against individuals who use the Internet to sell drugs and propose algorithms for so-called virtual undercover purchases. However, in most cases, these approaches have not yet been integrated into a unified system with modern technical means for recording digital traces.

Alongside purely academic works, sources of an applied nature also deserve special attention. These include, in particular, analytical materials from the Molfar agency and reports from units of the Ukrainian Cyber Police. Their value lies primarily in the fact that they demonstrate the practical potential of OSINT tools and blockchain analytics for establishing links between participants in criminal activity, as well as for tracking the movement of funds in the cryptocurrency environment, although such materials alone do not yet guarantee their direct use as evidence. At the same time, such approaches are largely described within the framework of analytical or intelligence work. Consequently, their transformation into full-fledged and admissible evidence is possible only subject to proper procedural documentation, verification, and subsequent evaluation within the context of criminal proceedings.

Reports from UNODC, EUDA, and Europol also provide a solid empirical foundation for understanding current trends in illicit drug trafficking. These materials reflect global trends in the development of drug markets, changes in logistics routes, the expansion of distribution methods, and the active use of digital platforms for trading in drugs and precursors. However, such sources are primarily descriptive and statistical in nature. They provide valuable material for assessing the scale and directions of drug crime transformation, but do not directly offer procedural or forensic algorithms suitable for national law enforcement practice.

Thus, an analysis of academic and applied sources suggests that existing research focuses primarily either on general issues of cybercrime or on specific procedural aspects of obtaining information from electronic communications networks. This gap has not only theoretical but also direct practical significance, as it complicates the development of effective algorithms for documentation and evidence gathering in modern criminal proceedings involving drug-related crimes. Instead, the issue of the comprehensive use of the latest technical tools — OSINT tools, blockchain transaction analysis, and unmanned aerial vehicles — in conjunction with covert investigative (search) operations specifically in criminal proceedings involving drug offenses remains insufficiently covered in domes-

tic academic literature.

This is precisely what necessitates the development of a comprehensive vision for algorithms governing next-generation operational and investigative measures. Such algorithms must be adapted to the digital nature of the modern drug trade, the requirements of Ukraine's criminal procedural legislation, and the specificities of law enforcement under martial law. This, in fact, constitutes the research rationale and objective of this article.

The purpose of the article is to determine the effectiveness and legal basis for the use of the latest operational and investigative measures in documenting drug crimes involving the use of internet technologies, as well as to propose scientifically grounded directions for improving Ukraine's criminal procedural and special legislation.

Discussions and results obtained. Modern documentation of drug crimes is increasingly linked to the need to transfer a significant portion of operational and investigative activities to the digital space. It is precisely to the online environment that communication between participants in criminal schemes, financial transactions, and the coordination of illegal activities are now shifting. While direct observation, physical surveillance and recording of actions in the real world were once of key importance, this is no longer sufficient. A significant body of information that has evidentiary or investigative value is generated precisely in the digital environment. Therefore, one of the first and most important areas of focus is the use of open-source intelligence (OSINT) in combination with other technical means.

The internal structure of the drug trade itself has also changed significantly. The classic pyramid model, in which all levels were more or less directly subordinate to a single central authority, has gradually given way to decentralized networked ecosystems. This transformation is driven by criminal organizations' desire to reduce the risk of exposure, make individual elements of the scheme interchangeable, and increase the overall resilience of the illicit business to interference by law enforcement agencies.

This is manifested primarily in the internal division of roles: within this new model, functions are distributed as clearly as possible among participants, and individual links are often isolated from one another. The administrator (Master/Shop) typically coordinates the store's operations, manages financial flows, and organizes wholesale purchases, often operating from outside Ukraine. The operator, who usually works remotely, maintains contact with customers, processes requests, and coordinates couriers' activities. The person responsible for packaging large batches and transferring them to the direct executors effectively serves as an intermediate warehouse (Master-Cladman). The courier (Cladman) receives the so-called "master stash," distributes small doses to hiding places, records their locations using geotagged photos, and transmits this information via a bot. In this scheme, the buyer acts as the end consumer, who effectively pays for the coordinates of the hiding place.

A distinctive feature of this system is the high turnover of personnel, particularly among couriers. Such individuals are often recruited online with promises of quick money, but in reality remain the most vulnerable and least protected link in the entire scheme. For the organizers, they are, in essence, a disposable resource that can be easily replaced in the event of exposure or arrest.

The modern distribution algorithm is based on two principles: the anonymity of participants and the absence of direct physical contact between them. This is precisely why contactless distribution has become the dominant model of retail drug trafficking today. Telegram bots and channels occupy a central place in this system, having effectively

become one of the main digital platforms for such activities in Ukraine. They are used to accept orders, verify payments, send coordinates for "stashes," and assist the customer at every stage of the illegal transaction. Researchers at Kharkiv National University of Internal Affairs note that advertising for such resources is disseminated, in particular, through graffiti on buildings and spam emails [13]. For the wholesale segment, as well as for the trafficking of precursors, platforms on the Tor (The Onion Router) network are additionally used, specifically DarkNet Marketplaces (DNM), access to which requires special software and significantly complicates monitoring by law enforcement agencies.

The financial aspect has also shifted almost entirely to the digital environment. Bitcoin, Litecoin, and anonymous tools such as Monero are used for transactions. The combination of cryptocurrencies with "mixing" services creates a false sense of complete invulnerability and impunity among those involved in criminal activity [12].

Under these conditions, detecting and identifying the administrators and couriers of drug shops requires not only traditional approaches but also a complex combination of technical, analytical, and procedural tools. The following sections will discuss several key areas of this combination, including digital footprint analysis, the use of technical radio surveillance tools, traffic correlation analysis, and blockchain analytics. One of the core areas is digital footprint analysis. This involves, in particular, the automated collection of photographs of hiding places posted in car-selling bots, the subsequent examination of their metadata (EXIF), and the determination of possible GPS coordinates and technical specifications of the device used to take the photograph. Although most modern messaging apps delete some of this data during transmission, in some cases links to the original files may be stored on external hosting services. This opens up additional opportunities for locating the courier's area of operation.

Another area involves the use of technical radio surveillance tools. Once typical routes or locations where a "stash point" operates have been identified, tools can be used to capture the unique identifiers of mobile devices appearing in a specific area at a specific time. This approach makes it possible to narrow down the circle of individuals potentially involved in creating or maintaining stash points.

To de-anonymize administrators who do not directly handle the goods, other methods for determining digital activity parameters may be used in practice. This includes identifying real IP addresses, browser technical characteristics, and specific digital profile indicators that allow for the identification of an individual or at least significantly narrowing the search scope.

Identifying buyers requires special attention. In this case, correlation analysis of traffic becomes crucial, where the user's activity time in the Telegram bot is correlated with subscriber connection data within a specific base station. If timestamps show a consistent match, this may indicate a high probability of a specific individual's involvement. Payment chains are also analyzed: transaction IDs in the bot are cross-referenced with phone numbers, bank cards, or other details used to top up accounts or crypto wallets.

Another equally important area is combating the use of cryptocurrencies as a payment method. Despite the widespread belief among criminals that transactions in Bitcoin (BTC), Monero (XMR), or USDT are completely anonymous, blockchain technology generally functions as a public ledger. This is precisely what allows blockchain analytics tools to be used to track the movement of assets from the buyer's or merchant's wallet to the ultimate beneficiary, particularly through entry and exit points into the fiat system (fiat on/off ramps) on centralized exchanges that adhere to KYC procedures [5].

The conditions of war have further altered the nature of this problem. In the current

situation, the drug trade may pose not only a criminal law threat but also a security threat. A telling example in this context is the criminal organization "Khimprom," which, according to investigations, built an extensive distribution network for synthetic drugs and employed methods typical of closed security agencies: strict secrecy, polygraph testing of members, tight internal control, and violent mechanisms of punishment for violations of established rules.

Some analytical sources also point to a likely connection between such structures and Russian intelligence agencies. In such a case, drug trafficking may be used not only to generate profit but also to finance elements of hybrid influence, recruit addicted individuals, or destabilize specific communities, including those critical to the state's defense capabilities. This is precisely why countering such activities increasingly requires combining traditional law enforcement tools with a counterintelligence perspective on the situation.

The response to the digitalization of crime has been the integration of new technological solutions into investigative practice. Open-source intelligence (OSINT) makes it possible to identify digital traces of individuals involved in criminal activity, establish their connections, analyze communication channels, and uncover the operational schemes of online stores. The Supreme Court of Ukraine and the international community recognize the significance of such data provided it is properly documented in court proceedings [9]. In this context, the capabilities of private analytical agencies, particularly Molfar, are of practical interest, as they demonstrate the effectiveness of specialized software in collecting and analyzing digital information.

Social analysis makes it possible to identify links between social media accounts, usernames, email addresses, and other digital identifiers. Platforms such as Dataminr allow for real-time tracking of events and the identification of new trends in drug trafficking. In turn, certain artificial intelligence tools, such as Read Their Lips or AI Image Enlarger, can be used for additional analysis of surveillance camera footage if it captures individuals involved in creating or maintaining stashes [10].

An important example of the practical application of digital analytics is the collaboration between the Ukrainian Cyberpolice and Crystal Blockchain. Thanks to address monitoring and clustering tools, law enforcement agencies were able to identify a significant number of cases in which cryptocurrency was used as a means of payment [3]. Methodologically, this is based on tracking the flow of transactions from a drug store's crypto wallet to regulated exchanges that verify their customers. The information obtained in this way can be used to identify the actual owner of the assets.

Changes in the nature of crime naturally influence the transformation of operational and investigative measures. Technological development requires the adaptation of procedural algorithms to new methods of distribution, storage, and transportation of narcotics. This is particularly evident in situations where a significant portion of the traffic has shifted to the postal sector—via services such as "Nova Poshta," "Ukrposhta," "Meest," and other operators. Under such conditions, the classic controlled delivery provided for in Article 271 of the Criminal Procedure Code of Ukraine takes on new practical forms.

Its implementation begins with the identification of a suspicious shipment based on operational intelligence or risk profiling. This is followed by procedural formalities: the prosecutor issues a decision to monitor the commission of a crime, clearly defining the form of such monitoring. The next step involves coordination with the postal operator's security service, with whose participation the contents of the shipment may be inspected without damaging the packaging or with subsequent restoration of the packaging. If nec-

essary, the narcotic substance is replaced with a dummy—either completely or partially. A GPS tracker may be placed inside the shipment to track the package's movement in real time, and, if technically feasible, audio or video recording devices may be used to capture the moment the package is opened.

During the implementation of such a measure, surveillance is conducted regarding the actual receipt of the shipment. If the package is retrieved via a parcel locker, the moment of entering the access code and removing the contents is recorded. It is only after the actual receipt of the package that the individual may be detained, as this episode is crucial for proving intent to illegally acquire narcotic drugs.

The collection of information from electronic communication networks (Article 263 of the Criminal Procedure Code of Ukraine) also plays a critically important role in documenting the activities of online stores. At the same time, the use of end-to-end encryption shifts the focus from the direct interception of message content to the analysis of metadata—that is, information regarding time, duration, routing, and other traffic parameters.

The practical implementation of such a measure involves, first and foremost, identifying the target: determining the IMEI code of the mobile device, the IP address, or another unique user identifier within the messaging app. Following this, a ruling from an investigating judge of the appellate court authorizing the conduct of the special investigative measure is obtained in accordance with the procedure established by law. The technical aspect of the measure is carried out in cooperation with mobile network operators and internet service providers. If it is impossible to decrypt the data stream, the mechanisms provided for in Article 264 of the Criminal Procedure Code of Ukraine may be used, namely, the extraction of information from electronic information systems by accessing the suspect's device directly. Further analysis allows for the creation of connection graphs, the determination of the geolocation of network connections, and the correlation of periods of digital activity with the time of creating "bookmarks".

Compliance with procedural deadlines is no less important. A report on the results of such a special investigative measure must be drawn up within 24 hours after the measure is terminated, and its total duration may not exceed six months [1].

Although the CPC of Ukraine does not explicitly define "virtual purchase" as a separate type of operation, in practice and doctrine it is usually considered a form of operational purchase within the scope of Article 271 of the CPC of Ukraine. In this scenario, a fictitious buyer account is created on Telegram with a corresponding activity history, after which contact is initiated with a bot or store operator. Continuous screen recording from the moment of logging into the messenger until receiving the coordinates or a photograph of the hiding place is of particular importance. Next, the transfer of funds or cryptocurrency to the specified wallet is recorded, with mandatory preservation of the transaction hash (TXID) and supporting data confirming the payment.

The next step involves traveling to the location based on the received coordinates, seizing the substance, conducting initial testing, and ordering a chemical analysis. The advantage of this approach is that it allows for documenting the fact of the sale without directly exposing undercover agents, while simultaneously laying the groundwork for further tracking of the funds' movement.

At the same time, the technical effectiveness of such tools does not automatically imply the procedural admissibility of the results obtained. Nevertheless, the admissibility of digital evidence remains one of the most complex issues. Judicial practice highlights several particularly sensitive points. First, when seizing correspondence, a conflict arises between the traditional understanding of correspondence as physical letters and modern

electronic correspondence. The European Court of Human Rights in the case of "Klass and Others v. Germany," like national courts, emphasizes the need for a clear distinction between these concepts to ensure adequate protection of privacy.

Second, OSINT findings must be properly incorporated into criminal proceedings through procedural channels, primarily via an inspection report. Screenshots alone, without preserved digital signatures, metadata, or other indicators of integrity, may be deemed inadmissible as evidence.

Third, during test purchases, elements of incitement must be strictly avoided. The sales initiative must originate from the seller themselves, for example in the form of a public offer via a bot, rather than being artificially created by law enforcement.

The use of unmanned aerial vehicles (UAVs) plays a distinct role in the system of new measures. In cases where contactless sales occur in hard-to-reach areas—such as forest park zones, on the outskirts of settlements, or in other locations where the presence of operatives could disrupt the operation—remote surveillance becomes particularly valuable.

UAVs equipped with high-resolution optical systems and thermal imagers allow for real-time recording of the creation of "stashes" or the moment they are retrieved by buyers. Provided they are properly documented, such video materials may be attached as appendices to the investigative report—for example, regarding surveillance of a person or location—and acquire significant evidentiary value [11].

At the same time, the introduction of the latest technologies inevitably gives rise to a number of legal conflicts. One of the key issues concerns the admissibility of evidence obtained using specialized software, particularly for blockchain analysis, or OSINT tools, which are not explicitly provided for in the current Code of Criminal Procedure of Ukraine.

There is no consensus among scholars regarding the legal nature of information obtained from open sources. Thus, V.G. Khakhanovsky believes that monitoring freely accessible internet resources does not in itself restrict an individual's rights and therefore may be conducted without a ruling by an investigating judge and admitted into proceedings as a document [10]. In contrast, V.V. Shendryk emphasizes that digital evidence, given its vulnerability to modification and the specific nature of how it is obtained, requires stricter procedural safeguards, and the uncontrolled accumulation of even publicly available data about an individual may constitute an intrusion into their private life [13].

The lack of clear legislative regulation of the procedure for using digital evidence—electronic traces, log files, transaction hash sums—often leads courts to side with the defense and deem such information inadmissible due to doubts regarding its authenticity, integrity, and proper procedural documentation. This, in turn, necessitates a clearer legislative definition of the procedures for collecting, recording, and procedurally using digital evidence in criminal proceedings.

Conclusions. The study provides grounds for asserting that the digitization of illicit drug trafficking and the conditions of martial law have significantly altered not only the methods used to commit drug-related crimes, but also the very logic of their detection, documentation, and prosecution. Contactless sales, the use of encrypted messengers, cryptocurrencies, electronic platforms, and anonymization tools are gradually shifting a significant portion of criminal activity into the digital environment. In this situation, traditional approaches, designed primarily to record behavior in physical space, no longer ensure adequate effectiveness.

These changes leave no room for delay. The success of an investigation increasingly

depends not on the formal accumulation of a large volume of materials, but on the timely, accurate, and procedurally flawless initial recording of information. That is why the analysis of digital traces, the use of OSINT tools, blockchain analytics, traffic correlation analysis, as well as the latest formats of covert investigative (search) operations should be viewed not as an auxiliary element, but as one of the key conditions for effectively countering the modern drug trade. This approach makes it possible to more thoroughly identify the roles of individual participants in criminal schemes, track financial flows, and promptly document the connections between organizers, operators, and executors.

At the same time, the study identified a number of fundamental problems and procedural conflicts. First and foremost, this concerns the lack of sufficiently clear legislative regulation regarding the status of digital evidence, as well as the procedures for its collection, recording, preservation, and verification. A separate issue remains the lack of uniformity in approaches to evaluating the results of OSINT, blockchain analytics, data extraction from electronic communication networks, virtual undercover operations, and other modern documentation tools. Equally pressing is the question of the limits of permissible interference in an individual's private life, especially when dealing with electronic correspondence, metadata, digital records, and technical identifiers. All of this creates a situation in which even substantively valuable information may lose its evidentiary value due to procedural flaws in its collection or documentation.

Practice shows that several issues remain the most vulnerable: breaches of the continuity of digital information storage, improper documentation of the origin of electronic data, the lack of proper recording of technical copying parameters, as well as the substitution of procedural formalities with mere accumulation of screenshots or analytical reports. A separate conflict arises from the fact that criminal procedural law does not contain sufficiently clear provisions regarding the use of certain specialized software tools, while actual law enforcement practice has long been utilizing instruments that go beyond the traditional model of evidence.

Under these circumstances, it is appropriate to discuss the need for systematic improvements to Ukraine's criminal procedural and specialized legislation. First and foremost, the very concept of electronic (digital) evidence and its place in the evidentiary system requires legal clarification. It seems logical to amend the Criminal Procedure Code of Ukraine to establish general requirements for the collection, copying, hashing, storage, and verification of electronic data, as well as to define the procedural rules for using information obtained from open sources, blockchain systems, and electronic communication networks. Separate regulation is also required for the practice of conducting virtual operational purchases, electronic controlled delivery, and the documentation of cryptocurrency transactions.

Equally important is the improvement of the provisions of the Criminal Procedure Code of Ukraine governing covert investigative (search) actions. In this context, it is advisable to clarify the procedure for obtaining, recording, and evaluating metadata of electronic communications, accessing digital devices, as well as using technical means designed to detect and document digital traces. In parallel, it is worth developing departmental guidelines on working with specialized software, conducting blockchain analysis, documenting OSINT results, and ensuring an appropriate chain of custody for digital information. It is also important to provide for the more active involvement of information technology specialists in the early stages of pre-trial investigation.

The international aspect is of particular importance. Since the modern digital drug trade frequently utilizes foreign platforms, cryptocurrency exchanges, communication

channels, and other elements of transnational infrastructure, effective investigation is impossible without timely international legal assistance and coordination with the competent authorities of other states. In such proceedings, it is particularly important to identify and document the foreign element from the very beginning to ensure the evidentiary integrity of the data during its collection, transmission, and subsequent use in criminal proceedings.

In summary, it is advisable to highlight three interrelated areas for further improving the practice of combating drug-related crime: first, the development of a standardized algorithm for investigative and procedural actions in the digital environment; second, the unification of rules for working with electronic evidence, cryptocurrency transactions, and digital communications; third, the clarification of procedural grounds for applying the latest documentation tools while ensuring an appropriate balance between the interests of criminal justice and human rights guarantees. At the same time, these proposals should not be considered final. The complexity and dynamic nature of modern drug-related crime require further scholarly analysis, coordination of approaches between practitioners and scholars, and the development of solutions that will be effective not only in theory but also in actual criminal proceedings.

Abstract

The adoption of Law No.249/2025 on the national security of the Republic of Moldova marks an important stage in the reconfiguration of the national security architecture, through the explicit integration of the field of public order and safety. In this context, special investigative activity, regulated by Law No.59/2012, gains increased relevance, extending beyond the traditional sphere of crime prevention and increasingly intersecting with the logic of national security.

The study examines the place and role of this type of activity within the new institutional and normative framework, highlighting the tensions generated by the coexistence of multiple legal regimes governing special investigations: extraprocedural crime prevention and public order enforcement, criminal proceedings, and intelligence and counterintelligence activities carried out by the Security and Intelligence Service. Although recent reforms suggest a tendency toward institutional integration, the analysis reveals the existence of systemic inconsistencies at the level of legal instruments, stemming from the absence of a coherent conceptual model regarding the use and evidentiary valorization of results obtained through intrusive measures.

The research demonstrates that, despite efforts to align with European standards, the Republic of Moldova risks developing a formal national security architecture insufficiently supported by effective operational instruments, particularly in the field of public order. This vulnerability arises from the fact that special investigative activity, as a primary tool for knowledge and anticipation, is subject to excessive procedural requirements more specific to the evidentiary phase than to the intelligence-gathering stage, thereby limiting its preventive effectiveness.

Keywords: ***national security, special investigative activity, resilience, criminal intelligence, evidence, Law No. 249/2025, normative incoherence.***

ROLUL ACTIVITĂȚII SPECIALE DE INVESTIGAȚII ÎN ARHITECTURA SECURITĂȚII NAȚIONALE A REPUBLICII MOLDOVA: ÎNTRE DEZIDERATUL REZILIENȚEI ȘI DISFUNCȚIONALITATEA MECANISMULUI INVESTIGATIV

Abstract

Adoptarea Legii nr.249/2025 privind securitatea națională a Republicii Moldova marchează o etapă importantă în reconfigurarea arhitecturii securității naționale, prin integrarea explicită a domeniului ordinii și securității publice. În acest context, activitatea specială de investigații, reglementată prin Legea nr.59/2012, capătă o relevanță sporită, depășind sfera tradițională a prevenirii criminalității și intersectându-se tot mai mult cu logica securității naționale.

Studiul analizează locul și rolul acestui gen de activitate în noua arhitectură instituțională și normativă, evidențiind tensiunile generate de coexistența mai multor regimuri juridice de reglementare a investigațiilor speciale: prevenirea extraprocesuală a criminalității și asigurarea ordinii publice, procesul penal și activitatea informativă și contrainformativă desfășurată de Serviciul de Informații și Securitate. Deși reformele recente sugerează o tendință de integrare la nivel instituțional, analiza pune în evidență existența unor incoerențe sistemice la nivelul instrumentelor juridice, determinate de lipsa unui model conceptual unitar privind utilizarea și valorificarea rezultatelor măsurilor intruzive.

Cercetarea demonstrează că, în pofida eforturilor de aliniere la standardele europene, Republica Moldova riscă să dezvolte o arhitectură formală de securitate națională insuficient susținută de instrumente operative funcționale, în special pe segmentul ordinii publice. Această vulnerabilitate derivă din faptul că activitatea specială de investigații, ca principal instrument de cunoaștere și anticipare, este supusă unor exigențe procedurale excesive, specifice mai degrabă fazei probatorii decât celei de colectare a informațiilor, ceea ce limitează eficiența sa preventivă.

Cuvinte-cheie: securitate națională, activitate specială de investigații, reziliență, intelligence criminal, probațiune, Legea 249/2025, incoerență normativă.

Introduction. Recent transformations of the normative framework in the field of national security of the Republic of Moldova reflect a significant reconfiguration of the architecture of this sector, driven by the need to adapt to new risks and to the requirements of European integration. The adoption of Law No.249/2025 on the national security of the Republic of Moldova [11], establishes an expanded vision of national security, integrating, alongside state security and national defence, the domain of public order and public safety.

In this context, special investigative activity, regulated by Law No.59/2012 [10], gains increased relevance, being the main operational-investigative instrument of the authorities responsible for preventing and combating risks to public order (Art. 2 letter d)). However, the integration of this type of activity into the national security architecture is not accompanied by a clear correlation at the level of legal instruments in the field of public order, which generates uncertainties regarding its role and limits in achieving national security objectives.

Despite the central role that special investigative activity should play in ensuring national security within the public order segment, official data for the years 2024-2025 reveal the profoundly limited nature of the practical applicability of this legal instrument. Although a certain level of activity outside criminal proceedings is observed, it is almost exclusively dominated by non-essential measures, such as information gathering, while intrusive measures, essential for the realization of the investigative function, have a marginal or even negligible share.

This situation indicates the existence of systemic dysfunctions, generated by the accumulation of high normative requirements, which lead not only to the restriction of

the use of special investigative instruments, but also to their transformation into a predominantly informational mechanism, lacking real operational effectiveness. Under these circumstances, the imbalance between the need to ensure safeguards against abuses and the imperative of effective investigative intervention becomes evident.

In these conditions, a tension emerges between the formal role assigned to special investigative activity within the national security architecture and its actual functionality. While the strategic framework invokes the strengthening of prevention and early response capacities, the legal regime applicable to this instrument risks generating an implementation blockage, limiting its use in practice.

Starting from these premises, the article aims to analyse the normative framework relevant to the national security of the Republic of Moldova, in order to determine the place and role of special investigative activity within this architecture, as well as to assess its functionality in the context of the new security paradigm. In this regard, the study seeks to highlight the conceptual and legislative inconsistencies that affect the integration of this instrument at the practical level, to evaluate the impact of the dysfunctions of the normative framework on the fulfilment of the State's preventive function, and to outline directions for recalibrating the regulation, with a view to ensuring a functional balance between the protection of fundamental rights and the effectiveness of public order enforcement mechanisms.

In this context, the study proceeds from the hypothesis of the existence of a structural imbalance between the strategic level of national security regulation and the operational level of legal instruments, which tends to maintain and obscure the dysfunctional character of special investigative activity within the new architecture of national security.

Methods and materials applied. The methodology of the study includes traditional research methods: logical and grammatical interpretation, analysis and synthesis, deduction and induction, observation and comparison. Based on the analysis of relevant materials (national and foreign legislation, specialised literature, explanatory notes and opinions on draft laws, court decisions and recommendations, as well as other relevant materials), the corresponding conclusions and proposals are formulated.

I. The Normative Architecture of National Security. 1.1. The Context of Reform and the Evolution of the Concept of National Security. The reform of the normative framework in the field of national security of the Republic of Moldova, initiated in recent years, reflects a paradigm shift driven both by the evolution of the security environment and by the need to align with European standards in the governance of the security sector [12]. A central role in this transformation is played by the National Security Strategy of the Republic of Moldova 2023 [16], which proposes an integrated approach to security, based on prevention, institutional resilience, and interinstitutional coordination.

Within this logic, national security is reconfigured in a more functionally oriented manner, placing increased emphasis on risk prevention, the strengthening of institutional resilience, and the integrated management of threats. Although the previous normative framework also enshrined an extended vision of national security [3], including the security of the state, society, and citizens [4], recent reforms aim to transform this vision into a coherent operational model capable of ensuring the anticipation and proactive management of risks.

This orientation is also confirmed at the level of legislative substantiation, where the need to overcome a fragmented and reactive approach to security is emphasized, in favour of an integrated and systemic architecture, based on the clear delimitation of competences and the strengthening of interinstitutional coordination mechanisms [12].

At the normative level, this vision is enshrined through Law No. 249/2025 on the national security of the Republic of Moldova, which establishes national security architecture structured around three main components: state security, national defence, and public order and public safety [11, Art.3 para. (10)]. The explicit integration of the domain of public order and public safety into this architecture reflects the recognition that threats to security do not manifest exclusively at the strategic or military level, but also at the level of the day-to-day functioning of society, including through crime, social instability, or other forms of internal risk.

In this context, public order and public safety acquire a strategic dimension, going beyond the traditional framework of law enforcement activities and becoming an essential component of national security. Such an evolution necessarily entails the use of effective instruments for the prevention and anticipation of risks, capable of enabling early intervention before threats materialise.

However, the analysis of the normative framework reveals that this integration is carried out predominantly at the conceptual and institutional levels, without being accompanied by a corresponding correlation at the level of the legal instruments used to achieve these objectives. In particular, in the field of public order and public safety, the regulation is limited to identifying the competent authorities [11, Art.10], without explicitly reflecting the legal instruments through which these powers are exercised.

By contrast, in the area of state security, the legislator establishes a clearer correlation between the institutional mission and the instruments employed, expressly providing for the possibility of resorting to coercive measures, under the conditions of the law [11, Art. 8]. This difference in regulation highlights the existence of a non-uniform normative treatment, in which the integration of operational instruments is carried out selectively, only within certain components of national security.

Thus, a dissociation emerges between the declared intention of the legislator to build an integrated and coherent national security system and the normative solutions effectively adopted, which do not ensure a uniform integration of legal instruments across all relevant domains. This dysfunction is liable to affect the coherence and effectiveness of the system, insofar as the conceptual expansion of national security is not matched by a corresponding operational capacity.

1.2. The Place of Special Investigative Activity in the National Security Architecture. Although, at a declarative level, Law No.249/2025 establishes an integrated model of national security, a substantive analysis of operational mechanisms reveals a peripheral positioning of the special investigative activity regulated by Law No.59/2012. In the current configuration, this instrument no longer appears as a transversal pillar, but rather as a specialised one, whose effectiveness is conditioned by a "segregation of legal regimes" of investigation.

This fragmentation becomes visible through the emergence of multi-layered security architecture. On the one hand, intelligence and counterintelligence activity regulated by Law No.179/2023 is oriented towards a logic of strategic intelligence, adapted to threats against the state. On the other hand, the segment of public order and public safety (served by Law No.59/2012) remains closely tied to judicial rigor, which, although providing strong safeguards against abuses, may limit the speed of response at the stage of anticipation.

The complexity of this transition process is also reflected in the strategic analyses of the period. For example, the Independent Report on Security Sector Governance (PISA, 2024) [1] provides a valuable overview of institutional reforms and the missions of law en-

forcement authorities, emphasizing the democratization and efficiency of structures. The fact that such reference documents focus predominantly on the strategic vision, and the general framework of functioning of the Police or other services underlines precisely the technical and highly specialized nature of special investigative activity, which requires a distinct approach. At a time when legislation was undergoing profound transformations—through the clear delimitation of intelligence activity from public order activity—analytical efforts naturally focused on the "major reform" of the sector, leaving the refinement of operational instruments to legal doctrine.

A dysfunction that deserves attention within this architecture lies in the interpretation of Art. 20 para. (11) of Law No.59/2012, concerning the obligation to terminate the measure at the moment when the preparation of an offence is detected. This provision may generate a moment of informational discontinuity. During the interval required for the transition from the regime of Law No.59/2012 to that of the Criminal Procedure Code, a monitoring gap may occur precisely at the critical stage of the materialization of the risk.

Thus, the place of special investigative activity in the new architecture is one that calls for recalibration. Although it is a vital instrument for resilience, its current configuration as a "preliminary stage" of criminal proceedings, coupled with admissibility restrictions (Art. 93 para. 4 CCP), may explain the reluctance in its practical use, as illustrated by the absence of reported measures in 2024-2025.

II. The Functionality of Special Investigative Activity and the Challenges of the Normative Framework. 2.1. The Relevance of Special Investigative Activity in the New National Security Paradigm and the Issue of Its Effectiveness. The adoption of Law No.249/2025 on the national security of the Republic of Moldova marks a particularly important moment for the positioning of special investigative activity within the national security architecture. While following the 2023 reform this instrument was decoupled from the dimension of state security and predominantly reoriented towards the field of public order, the new law reintroduces, at least implicitly, its relevance for the achievement of the national security interest. Within this logic, special investigative activity can no longer be regarded as a mere auxiliary or pre-criminal procedural mechanism, but rather as an essential instrument for knowledge, prevention, and anticipation of risks to national security, particularly in the segment of public order and public safety.

This normative repositioning inevitably entails a reassessment of the conditions under which this instrument operates, from the perspective of its effectiveness. Insofar as national security is conceived, within the current strategic framework, as a continuous process of risk prevention and management, the efficiency of operational mechanisms becomes a determining factor in achieving the objectives established by the legislator.

However, official data for the years 2024-2025 indicate not so much the absence [14], but rather the evident dysfunctionality of special investigative activity in its current form [15]. At a general level, in 2025, a total of 5,220 special investigative measures were carried out outside criminal proceedings, an increase compared to 2024 (4,465), which might, at first glance, suggest a strengthening of investigative activity.

An analysis of the structure of these measures, however, reveals a profoundly unbalanced configuration, characterized by the overwhelming predominance of the measure of information gathering across all subjects involved in special investigative activity. Thus, in the case of the Ministry of Internal Affairs, this measure accounts for over 98% of the total measures authorized by the heads of specialized subdivisions (3,383 out of 3,446), a trend that is also observed at the level of other authorities, such as the National Administration

of Penitentiaries or the National Anticorruption Center.

At the same time, the gap between preventive activity and criminal prosecution is highlighted by the contrast between the authorization regimes. While within criminal proceedings (under the Code of Criminal Procedure), in 2025, a total of 8,249 measures were authorized by prosecutors and investigating judges, outside criminal proceedings (under Law No. 59/2012), measures authorized by the investigating judge were ordered in only 16 cases, exclusively at the level of the Ministry of Internal Affairs. Moreover, measures authorized by the prosecutor outside criminal proceedings are entirely absent across all subjects. This striking disproportion highlights the exceptional—or even non-existent—character of the use of intrusive investigative instruments outside criminal proceedings.

Compared to 2024, there is thus a numerical increase in special investigative measures; however, this evolution does not reflect a diversification of the instruments used, but, on the contrary, an accentuation of the predominantly informational character of the activity, to the detriment of its operational dimension, which is essential for the fulfilment of the State's preventive function. Under these conditions, special investigative activity fails to achieve its specific purpose of preventing and anticipating risks, being, in fact, reduced to a limited informational instrument, lacking the capacity to intervene effectively in the dynamics of phenomena affecting public order and national security.

Such a situation cannot be qualified as a mere statistical indicator, but rather reflects a structural problem of the normative framework, in which the legal instrument intended for risk prevention is diverted from its essential function and integrated into a formal logic devoid of real practical effectiveness [5]. Consequently, a normative paradox emerges: on the one hand, the recently adopted strategic and legislative framework amplifies the importance of prevention and early intervention in the field of national security; on the other hand, the main instrument intended to achieve these objectives proves to be non-functional in practice. This dissonance raises fundamental questions regarding the adequacy of the normative framework to the real needs of the security system.

The legislator's attempts to remedy the situation, including through subsequent interventions in the normative framework, confirm that the 2023 reform generated effects that go beyond the initial intentions. In particular, one can observe the tendency to introduce high standards of protection of fundamental rights, inspired by the case-law of the European Court of Human Rights, without sufficient correlation with the specificity of the preventive phase and with the need to ensure the effectiveness of practical activity. In this regard, through the amendments brought to Law No.59/2012, the legislator intervened selectively in the normative framework, extending the scope of special investigative measures authorized by the investigating judge. Thus, by Law No.100 of 13 June 2025, two new letters were introduced to para. (3) of the Art. 27, concerning: (c) the detection and prevention of electoral fraud or illegal interference in the electoral process; (d) the detection and prevention of organized crime, acts of corruption and related offences, money laundering, and the financing of terrorism. These interventions confirm the attempt to recalibrate the normative framework in order to strengthen the preventive role of special investigative activity.

Under these conditions, the analysis of special investigative activity cannot be limited to the formal dimension of its regulation, but must also include an assessment of its functionality and of its impact on the achievement of national security. The dysfunctionality of this instrument affects not only the efficiency of crime prevention activities, but also has direct implications for the State's capacity to anticipate and manage risks to national security.

Therefore, the issue can no longer be reduced to a simple inefficiency of application, but reveals the existence of a structural dysfunction of the normative framework, which affects the real capacity of special investigative activity to contribute to the fulfilment of the State's preventive function. In this context, it becomes necessary to analyse the normative causes that have generated this situation, in order to identify directions for recalibrating the investigative mechanism.

2.2. The Causes of the Dysfunctionality of Special Investigative Activity. The dysfunctionality of special investigative activity, empirically evidenced by the structure and distribution of measures carried out outside criminal proceedings, is not accidental in nature, but results from a set of normative choices adopted within the 2023 reform. Although these interventions aimed at strengthening the guarantees of fundamental rights, they directly affected the functionality of the investigative mechanism, generating an imbalance between the informational and the operational dimensions of special investigative activity.

A first determining factor is the excessively restrictive configuration of the principle of proportionality, enshrined as an autonomous principle of special investigative activity, which has contributed to its predominantly informational orientation and to limiting the use of operational instruments. As demonstrated in the specialised literature, this legislative option not only introduced a criterion with insufficiently defined normative content, but also decisively influenced the entire regulatory framework, legitimising a series of additional restrictions which, cumulatively, have affected the functional balance of the investigative mechanism [6]. Instead of functioning as an instrument for balancing competing interests, proportionality has, in practice, become an additional filter of formal validation, with a discouraging effect on the initiation of measures.

A second essential element is represented by the regime governing the grounds for ordering special investigative measures, which does not correspond to the preventive logic of this type of activity [8, p. 357]. Conditioning interference on the existence of indications of an imminent danger or on a threshold close to the standard of reasonable suspicion creates a structural tension between the anticipatory nature of the activity and the requirements imposed by law. Consequently, the legal instrument becomes difficult to use precisely in the early stages, where intervention would be most effective.

According to the Art. 19 para. (1) point 1) letter (a) of Law No.59/2012, "*the grounds for ordering special investigative measures are substantiated indications suggesting suspicions regarding an imminent danger of harm against the person, public health, property, public order and public safety*". This legal formulation reveals the orientation of the normative framework towards situations of immediate risk, which raises issues of compatibility with the predominantly anticipatory and gradual nature of the phenomena targeted in the practice of special investigative activity. The use of the phrase "substantiated indications" is not accidental and does not equate either with mere operational information or with evidence in the procedural sense. The legislator operates here with an intermediate standard of knowledge, sufficient to justify limited interferences with fundamental rights, but insufficient to trigger the mechanisms of criminal proceedings. This solution is consistent with the preventive and security-oriented nature of special investigative activity carried out outside criminal proceedings.

In the specialised literature, this type of intermediate evidentiary standard is explained in opposition to the notion of "*reasonable suspicion*", it being emphasised that it may include informational elements which, although they do not reach the level of certainty or plausibility required for initiating criminal prosecution, nevertheless indicate

the existence of a real risk [13]. Thus, it has been shown that simple anonymous information, data resulting from general risk analyses, or even rumours regarding the preparation of serious acts may not meet the criterion of reasonable suspicion, yet may constitute sufficient indications to trigger preventive investigative measures. In the same sense, it is not necessary for such indications to be fully concrete or individualized, it being sufficient that the totality of known facts and circumstances indicate the possibility of the commission—present or future—of serious unlawful acts [17, p. 84].

Another major factor of dysfunctionality is the impossibility of evidentiary use of the results obtained under Law No.59/2012 [9]. The rigid separation between the preventive phase and criminal proceedings has generated what has been described in doctrine as a "structural rupture" between operational activity and judicial activity [7]. Under these conditions, special investigative measures lose their practical purpose, being reduced to a limited informational role, without the possibility of contributing to the administration of justice. In this regard, through the amendments made in 2023 to the Criminal Procedure Code, the legislator expressly enshrined the limitation of the evidentiary use of the results of special investigative activity. Thus, according to Art.93 para. (4) CPC [2], "*the factual data obtained through special investigative activity may be admitted as evidence only in cases where they have been administered within criminal proceedings and verified through the means provided in para.* (2), *in accordance with the provisions of procedural law...*". This normative solution, in principle, excludes the use as evidence of results obtained outside criminal proceedings, reinforcing the separation between the preventive and the judicial dimensions of special investigative activity.

To the aforementioned factors is added the institution of notification of the targeted person, which, although justified from the perspective of safeguarding fundamental rights, may generate significant practical risks and an effect of institutional self-censorship. In the absence of clear mechanisms for protecting ongoing activities or of exceptions adapted to the specific nature of preventive activities, this obligation may discourage the use of special investigative measures in sensitive situations.

The legal regime of notifying the person subjected to special investigative measures is regulated in detail by Art. 22 para. (9)-(10) and Art. 22^1 of Law No.59/2012. According to these provisions, the prosecutor is obliged to inform the targeted person in writing, within no more than 15 days from the verification of the legality of the measure, the person subsequently having the right to access the documents related to the ordering, authorization, and execution of the measure. Notification may be postponed only under strictly limited conditions, such as the existence of a risk to life or health, the necessity to continue other special investigative measures, or the imminent initiation of criminal proceedings, for determined periods and under the control of the prosecutor. This regulation establishes a mechanism of post factum transparency which, although justified from the perspective of the protection of fundamental rights, may generate operational risks and a discouraging effect on the use of special investigative measures.

Considered individually, these elements may be justified by the need to align with European standards in the field of human rights protection. However, viewed as a whole, they generate a cumulative effect that exceeds the intended purpose, leading to overregulation capable of affecting the functional balance of the system. Instead of strengthening the effectiveness of prevention mechanisms, the current normative framework risks transforming special investigative activity into an instrument that is difficult to use and, consequently, marginalised in practice.

Under these conditions, the dysfunctionality of special investigative activity cannot

be explained by a single factor, but rather by the interaction between multiple normative choices which, although coherent from a formal perspective, fail to ensure an adequate balance between the protection of fundamental rights and the necessity of guaranteeing national security.

Thus, the issue is no longer whether the normative framework provides sufficient safeguards, but whether it still allows, in practice, the exercise of the State's preventive function.

2.3. Directions for Normative Recalibration of Special Investigative Activity. The dysfunctions highlighted above cannot be remedied through isolated interventions or marginal adjustments, but require a fundamental reconsideration of the normative architecture of special investigative activity. The problem does not lie in the absence of legal safeguards, but in the manner in which they have been configured, generating a structural imbalance between the protection of fundamental rights and the functionality of prevention mechanisms.

In this context, a first direction of recalibration concerns the reconsideration of the status of the principle of proportionality. Its enshrinement as an autonomous principle, distinct from the respect for fundamental rights and freedoms, has proven not only redundant, but also liable to generate normative uncertainty. Within the logic of the European Convention on Human Rights, proportionality does not operate as an independent criterion, but as an intrinsic condition of the lawfulness of interference. Its artificial separation within Law No.59/2012 has led to an unjustified duplication of the control filter and to an accentuation of the defensive character of the regulation. A return to integrating proportionality within the principle of respect for fundamental rights would contribute to restoring the axiological coherence of the system.

At the same time, a reconfiguration of the grounds for ordering special investigative measures is required, which, in their current form, are anchored in a logic of reactive intervention centred on the notion of "*imminent danger*". This approach is difficult to reconcile with the preventive nature of special investigative activity, which, by definition, targets criminal processes in formation or latent manifestation. Maintaining a legal threshold close to the standard of reasonable suspicion limits the use of measures precisely in those early stages where their effectiveness is greatest. Therefore, the grounds for ordering should be recalibrated in accordance with the specific nature of this activity, through the establishment of a distinct evidentiary standard adapted to the anticipatory character of intervention.

Another essential direction concerns the legal regime of the results of special investigative activity. The rigid separation between the preventive and the criminal procedural dimensions has led to a paradoxical situation in which the State authorizes significant interferences with fundamental rights, but, in principle, excludes the use of the results obtained within criminal proceedings. In the absence of a coherent mechanism of valorisation, special investigative activity loses its practical purpose, being reduced to a limited informational role. In this regard, it is necessary to establish legal solutions that would allow the controlled integration of such results into criminal proceedings, with due respect for procedural safeguards and conventional standards.

In the same vein, the regime of notification of the targeted person requires careful reassessment. Although this institution responds to legitimate requirements of protecting fundamental rights and ensuring post factum transparency, the rigid manner in which it is regulated may generate significant risks in practice. The strict limitation of the grounds for postponement and the obligation to inform within a relatively short time

frame may compromise ongoing investigative activities or create an effect of institutional self-censorship. A more flexible regulation, allowing adaptation to the specific circumstances of individual cases, would contribute to maintaining a functional balance between transparency and effectiveness.

Considered cumulatively, these elements do not represent mere imperfections of the regulation, but rather express a fundamental problem of the normative architecture. The current configuration of the principle of proportionality, of the grounds for ordering measures, of the regime governing the use of results, and of the notification mechanism reflects the same legislative option, oriented towards emphasising the defensive dimension of regulation, to the detriment of its operational functionality.

At the systemic level, this option is reflected in the manner in which the separation is configured between special investigative activity carried out outside criminal proceedings and that conducted within them. In itself, the distinction between a preventive regime, oriented towards knowledge and anticipation of risks, and a procedural regime, oriented towards the administration of evidence, is compatible with European models and corresponds to different purposes.

However, dysfunctions arise insofar as the preventive regime is subjected to requirements comparable to, or even more restrictive than, those applicable within criminal proceedings, which runs counter to its functional logic. Instead of providing a flexible framework adapted to early intervention, special investigative activity regulated by Law No.59/2012 is configured in a predominantly defensive manner, which discourages its use in practice.

Under these conditions, the direction of reform does not consist in a formal reunification of the two regimes, but in a recalibration of the relationship between them, by ensuring a functional balance that would allow preventive activity to operate on the basis of standards adapted to its nature, without compromising the fundamental guarantees of the rule of law.

In the absence of such recalibration, special investigative activity risks remaining a sophisticated normative instrument, but devoid of practical effectiveness, incapable of responding to the real requirements of national security in a democratic society.

Conclusions. The analysis conducted confirms the hypothesis of the study: despite the conceptual reconfiguration of national security through Law No.249/2025, the integration of special investigative activity within this architecture remains incomplete, being marked by systemic inconsistencies and a structural imbalance between the strategic and the operational levels of regulation.

The new national security paradigm, grounded in prevention and resilience, presupposes the existence of effective operational mechanisms capable of ensuring the anticipation and early management of risks. However, the normative framework applicable to special investigative activity is not configured to genuinely support this function, which generates dissociation between the declarative level of security policies and the actual capacity for intervention.

In this context, the identified structural imbalance does not directly generate the dysfunctionality of special investigative activity, but rather contributes to maintaining and relegating its non-functional character to the background. Thus, a pre-existing problem at the level of the normative framework is integrated into a strategic architecture that does not correct it, but, on the contrary, diminishes its visibility and systemic relevance.

This conclusion is also supported by the empirical data analysed, which show that special investigative activity is not absent, but operates in an unbalanced manner, dom-

inated by predominantly informational measures and practically devoid of the use of effective investigative instruments outside criminal proceedings. Under these conditions, special investigative activity risks being marginalised, losing its role as an instrument for the prevention and anticipation of risks in the field of public order and public safety.

Therefore, the major risk lies not only in the existence of normative dysfunctions, but in the fact that these are absorbed into a national security architecture which, in the segment of public order and public safety, remains predominantly declarative and unsupported by functional operational instruments.

Under these circumstances, the recalibration of the normative framework of special investigative activity represents a structural necessity, with a view to restoring a functional balance between the protection of fundamental rights and the effectiveness of prevention mechanisms. This implies not only punctual adjustments, but a reconsideration of the manner in which legal instruments are integrated into the national security architecture, so that they no longer conceal existing dysfunctions, but effectively contribute to their correction.

THE REGULATION AND INVESTIGATION OF THE OFFENSE OF SEXUAL ACTS WITH A MINOR

Mihai-Alexandru STANCIU,
PhD, University Lecturer,
Faculty of Law and Administrative Sciences,
"Ovidius" University of Constanta, Romania,
Chief Prosecutor, Prosecutor's Office, Constanta District Court,
Romania
ORCID: 0009-0009-4953-7275

Abstract
This paper set out to analyze the evolution of the Romanian legislative framework regarding the criminalization of the offense of sexual acts with a minor, starting from the regulation under the former Criminal Code up to the latest substantive amendments introduced not only by the adoption of the new Criminal Code, but especially more recently, which led to a complete reconfiguration of the criminalization and of the way in which the state has understood to relate to such particularly serious acts. At the same time, the paper aims to highlight the need for the widespread adoption of techniques for interviewing minors, the provision of special rooms adapted for carrying out activities involving minors, as well as special measures for investigating such acts, without which holding those responsible criminally liable remains difficult to achieve, especially because in many cases the reporting of the acts to the criminal investigation authorities does not occur immediately after their commission, which makes the gathering of solid evidence difficult.
Keywords: NICHD-r Protocol, interviewing minor victims, age of sexual consent.

REGLEMENTAREA ȘI INVESTIGAREA INFRACȚIUNILOR CONTRA LIBERTĂȚII ȘI INTEGRITĂȚII SEXUALE A MINORILOR

Abstract
Lucrarea și-a propus o analiză a evoluției cadrului legislativ românesc privind incriminarea infracțiunilor contra libertății și integrității sexuale a minorilor în general și a celei de act sexual cu un minor în special, pornind de la reglementarea din vechiul Cod penal și până la ultimile modificări de substanță operate nu doar prin adoptarea noului Cod penal, dar mai ales recent, ceea ce a condus la o reconfigurare totală a incriminării și a modului în care statul a înțeles să se raporteze la astfel de fapte deosebit de grave. Totodată, lucrarea urmărește să scoată în evidență necesitatea adoptării pe scară largă a unor tehnici de audiere a minorilor, a dotării cu încăperi speciale adaptate pentru desfășurarea activităților cu minorii, dar și a unor măsuri speciale de investigare a unor astfel de fapte, fără de care tragerea la răspundere penală a celor vinovați de comiterea lor rămâne dificil de atins, în special din cauza faptului că în multe dintre cazuri sesizarea organelor de urmărire penală nu survine imediat după comiterea faptelor, ceea ce face ca strângerea unor probe solide să fie greu de înfăptuit.
Cuvinte-cheie: protocol NICHD–r, audiere victime minore, vârsta consimțământului sexual.

Introduction. Part of the offenses against the person regulated by the Criminal Code [1], offenses against sexual freedom and integrity in general, and those directed against minors in particular, which will be the focus of this analysis, have over time displayed a

particular characteristic through the gravity of their consequences for victims, especially on a psychological level.

The challenges in preventing and combating such acts have consisted, first of all, in finding a regulatory approach that responds as concretely as possible to the need to protect minor victims, including from the perspective of determining the age from which it may be presumed that a minor can express valid consent to engage in sexual activities, and secondly in identifying investigation and research methods capable of leading to the formulation of a solid criminal accusation and ultimately to the conviction of those who committed such acts.

Throughout the period of application of the former Criminal Code [2], from 1968 to 2014, the regulation of these offenses benefited from stability which, however, proved to be far too rigid in relation to the evolution of society, to which it could no longer offer adequate legal protection. By adopting the new Criminal Code in 2009 [1], effective from 1 February 2014, the aim was to align Romanian legislation with the international norms and standards existing in this field, something that was not fully achieved from the outset and which, also taking into account the existing social realities, required successive legislative amendments.

Methods and materials applied. Because of the complexity of analyzing all offenses against sexual freedom and integrity in this paper, we will focus our attention on the offense of sexual acts with a minor and on the offense of sexual corruption of minors, which we will present from the comparative perspective of the legislative amendments that occurred over time and of the implications these amendments brought, such as the decriminalization of certain acts, the tightening of the sanctioning regime, or the regulation of new grounds for non-punishment.

The offense of sexual acts with a minor was regulated by the former Criminal Code under Article 198, which criminalized, in its basic form, any sexual act with a minor under the age of 15. If the minor was between 15 and 18 years old, the act constituted an offense only if the active subject had the status of guardian, curator, supervisor, caretaker, attending physician, teacher, or educator and used that status, or if he abused the victim's trust or his authority or influence, the penalty provided by law being imprisonment from 3 to 10 years. In addition to the basic form, the law also provided for certain aggravated forms. It is important to mention that the law required the minor to have expressed consent to participate in sexual activities, consent considered perfectly valid as long as the minor had reached the age of 15, the age from which the minor was considered sufficiently physically and mentally developed to begin sexual life. If the minor had not reached this age, the act constituted the offense of sexual acts with a minor, and if the minor's consent did not exist or if the minor was too young to be considered capable of validly expressing consent, matters established in relation to his or her level of physical and mental development, the act was classified and punished more severely, as the offense of rape.

On 17 December 2011, Directive 2011/93/EU of the European Parliament and of the Council of 13 December 2011 on combating the sexual abuse and sexual exploitation of children and child pornography, replacing Council Framework Decision 2004/68/JHA on combating the sexual exploitation of children and child pornography, was published in the Official Journal of the European Union, with a transposition deadline for Member States of 18 December 2013.

The purpose of that normative act was to establish minimum rules concerning the definition of criminal offenses and sanctions in the area of sexual abuse and sexual exploitation of children, child pornography, and the solicitation of children for sexual pur-

poses, and it introduced provisions intended to ensure better prevention of such offenses and better protection of their victims [3, Art.1]. The Directive established that "child" means any person below the age of 18 years, and that "age of sexual consent" means the age below which, in accordance with national law, it is prohibited to engage in sexual activities with a child [3, Art.2]. In practice, it left Member States a margin of appreciation in determining the age from which minors may consent to sexual activities. At the same time, it left to Member States the decision whether to criminalize consensual sexual activities between persons close in age and in psychological and physical development or maturity, insofar as the acts involved no abuse [3, Art.8].

By adopting the new Criminal Code [1], a series of important changes were introduced in the regulation of the offense of sexual acts with a minor. First, a distinction was made between sexual acts involving sexual intercourse, oral or anal sexual acts, or any other acts of vaginal or anal penetration, which constitute the offense of sexual acts with a minor [1, Art. 220], and those consisting in committing against a minor, or causing the minor to endure or perform, any other sexual act than those mentioned, which constitute the offense of sexual corruption of minors [1, Art. 221]. Previously, any act of a sexual nature committed with a minor, under the conditions of the law, fell under the scope of the same offense. Secondly, the conditions under which acts in the first category constituted an offense were fundamentally changed, in the sense that the act committed with a minor aged between 13 and 15 constituted an offense punishable by imprisonment from 1 to 5 years (basic form), as did the act committed with a minor under 13, punishable by imprisonment from 2 to 7 years (aggravated form), in both cases provided that the age difference exceeded 3 years. If the act was committed by an adult who abused his authority or influence over the victim, and the minor was between 13 and 18 years old, irrespective of the age difference between them, the act constituted an offense punishable by imprisonment from 2 to 7 years. The new regulation also provided for a number of other aggravated forms. It must be emphasized that the legislator maintained the age of 15 as the age of sexual consent. As regards acts in the second category, classified under the offense of sexual corruption of minors, they fell under the scope of the offense only if committed with a minor under the age of 13, provided that the age difference exceeded 3 years, and were punishable by imprisonment from 1 to 5 years. Besides the basic form, the law also provided for a series of aggravated forms.

A first amendment after the adoption of the new Criminal Code occurred in 2016 [4] and sought to limit criminalization, where the act was committed by an adult with a minor, only to situations in which the minor was aged between 15 and 18 years old (not 13-18 as previously) and if it occurred in one of the following circumstances:

1. The minor is a family member of the adult;

2. The minor is in the care, protection, education, custody, or treatment of the offender, or the offender abused his recognized position of trust or authority over the minor, or the particularly vulnerable situation of the latter, as a result of a mental or physical disability or a state of dependency;

3. The act endangered the life of the minor; 4. the act was committed for the purpose of producing pornographic materials. The condition that the adult should have abused his authority or influence over the victim was removed. Minor changes were also made regarding the offense of sexual corruption of minors.

The second legislative amendment, more substantial, occurred at the end of 2020 [5]. The most important change being the increase of the age of sexual consent from 15 to 16 years. Amendments were made in respect of both offenses: sexual acts with a minor

and sexual corruption of minors. Thus, in the case of the offense of sexual acts with a minor, the basic form was amended so that the act constituted an offense if committed with a minor aged between 14 and 16 years (not 13-15 as previously) and remained punishable by the same sentence of 1 to 5 years' imprisonment, while the aggravated form was amended so that the act was committed with a minor under the age of 14 (not 13 as previously) and was punishable with the same special minimum of 2 years' imprisonment but with a higher special maximum of 9 years (previously 7 years), in both cases provided that the age difference exceeded 3 years. In the other aggravated form, where the act was committed by an adult against a minor, the special maximum was also increased from 7 to 9 years, and the circumstances in which the act committed by the adult could constitute an offense were amended. At the same time, other aggravated forms were provided, punishable by imprisonment of up to 10 or 12 years, which, however, due to the multitude of regulated circumstances of commission, some of them very specific, risk making their practical application cumbersome. With regard to the offense of sexual corruption of minors, the amendments were also substantial, the age threshold of the minor for the act to constitute an offense being increased from 13 to 14 years, and a series of aggravated forms were also regulated.

Certainly the most important amendments occurred during 2023, through the adoption of Law no. 217/2023 [6], which amended and supplemented a series of normative acts, entering into force, as regards the amendments made to the Criminal Code and the Criminal Procedure Code, at the beginning of the following year. Because certain amendments were found by practitioners to raise problems of interpretation and application during the same year, before their announced entry into force, a new law was adopted [7], which removed the criticized deficiencies, at least in part.

These two laws rewrote, according to a new conception, the way in which offenses against the sexual freedom and integrity of minors are regulated, by repealing the offense of sexual acts with a minor, provided under Article 220 of the Criminal Code, and introducing two new offenses: rape committed against a minor, provided under Article 218^1 of the Criminal Code, and sexual assault committed against a minor, provided under Article 219^1 of the Criminal Code.

The essence of these new regulations is that the law presumes in all cases that a minor under the age of 16 cannot express valid consent to engage in sexual intercourse or other sexual acts with an adult, even in the absence of coercion, deprivation of the ability to defend oneself or to express one's will, or exploitation of such a state, as long as the age difference between the adult and the minor is greater than 5 years.

Otherwise, but strictly in situations where no coercion is used, no deprivation of the ability to defend oneself or to express one's will occurs, and no exploitation of such a state is involved, the ground for non-punishment provided by law applies and, although the act constitutes an offense, the offender's criminal liability cannot be engaged. It is therefore considered that in all cases where the minor has not reached the age of 16, his or her consent to participate in sexual activities cannot be regarded as validly expressed in relation to his or her level of mental and physical development, and the act constitutes an offense in all cases, but the bringing of the adult offender to criminal liability depends on whether or not the legal ground for non-punishment regarding the age difference applies.

Where the minor is aged between 16 and 18, the act constitutes an offense when committed by an adult, but only under certain circumstances that give the act an aggravated character, such as where the minor is a family member of the adult, or the minor is in the care, protection, education, custody, or treatment of the offender, or where the act

resulted in bodily injury or endangered the life of the minor in any way.

If the offender is a minor, the act constitutes an offense only when the minor victim is under the age of 14, provided, however, that the age difference between the minors is greater than 5 years, otherwise the ground for non-punishment applies. In practice, it appears that in this variant, in order for the minor offender's criminal liability to be engaged, the injured minor can never be between 13 and 14 years old, because the offender would have to be over 18 years of age and therefore could no longer be considered a minor.

An original and debatable manner of regulating the sanctioning treatment consists of the provision in Article 218[1] para. 11, which stipulates that the act is punished "according to the provisions of Article 114", yet a reading of the referenced provisions shows that they concern the general consequences of the criminal liability of minors. According to the philosophy of the current Criminal Code, it is clear that only educational measures, whether custodial or non-custodial, may be applied to minors, so their application by the court should not raise practical problems. It is, however, difficult to understand why, in the case of the aggravated form of the same offense, which involves on the part of the minor offender acts of coercion, deprivation of the victim's ability to defend herself or himself or to express her or his will, or exploitation of such a state, the law provides that it shall be punished with imprisonment from 3 to 10 years and the prohibition of certain rights. It is obvious that an offender who was a minor at the time of the act cannot be sentenced to a punishment, even if the law provides for one. The court will have to sanction the minor under the general conditions governing the criminal liability of minors, by applying an educational measure. Yet, given that the aggravated form concerns strictly cases in which the act is committed by a minor, the real intention of the legislator in providing for punishments cannot be inferred.

Otherwise, the classic distinction between the offense of rape and that of sexual assault is maintained, in the sense that the former concerns strictly sexual intercourse, oral or anal sexual acts, as well as any other acts of vaginal or anal penetration, while the latter concerns any act of a sexual nature, except for those that form part of the material element of the offense of rape.

A desire of the legislator to strongly discourage such acts can be observed through the increase of the penalty limits for offenses of this kind, imprisonment penalties ranging from 7 to 12 years when there is no coercion and from 8 to 15 years when coercion or other methods of overcoming the victim's consent are used.

The legislator's intention to adopt as comprehensive a criminal regulation as possible for offenses affecting the sexual freedom and integrity of minors, with a severe sanctioning regime intended to deter, is commendable, but I consider that the legislative manner, characterized by frequent changes of conception, by the gradual amendment and addition of new aggravated forms intended to punish different behaviors, outcomes produced, or purposes pursued in the commission of the acts, certainly makes the entire regulation difficult to correlate and apply in practice, sometimes even leading to situations of inequity between similar cases. One may imagine, for example, the situation in which the minor victim is 15 years and 11 months old, and the adult offender with whom he or she engages in sexual intercourse is 20 years and 11 months old. In this case, the ground for non-punishment applies because the age difference between the two does not exceed 5 years. However, if the adult is 20 years, 11 months, and 1 day old, he will no longer benefit from the ground for non-punishment and will be liable to imprisonment from 7 to 12 years and the prohibition of certain rights. Of course, for criminal liability to arise it is required that the adult offender knew the age of the minor, because subjectively the act must be

committed with intent, but even so, the practical application of the legal provisions, in borderline situations, may be quite difficult.

Discussions and results obtained. In this section we will address the issue of evidence in offenses against the sexual freedom and integrity of minors. In matters of evidence, the Criminal Procedure Code refers strictly to the procedure to be followed for the administration of each piece of evidence within the criminal trial, for the purpose of obtaining means of evidence on the basis of which the legal truth may be established, with the aim that it be as close as possible to the factual truth. With a few exceptions[1], however, it does not provide the directions to be followed by judicial authorities in gathering evidence and discovering the truth, but it categorically imposes evidentiary standards that must be met for the adoption of procedural measures, such as the initiation of criminal proceedings against a defendant, the indictment, or the conviction of guilty persons. Judicial authorities are therefore obliged to make every effort to identify all relevant and useful evidence that could be administered in the case and to reach the standards required in order to formulate a criminal accusation. In all cases, in the absence of solid evidence, if after the exhaustion of the evidentiary proceedings there remains doubt as to whether the suspect or defendant committed the act, such doubt will benefit that person and will be interpreted in his favor, leading to a decision of dismissal or acquittal. Following numerous discussions and lectures, certain methodologies have emerged in practice to support those investigating different types of offenses, intended to help apply, as uniformly as possible, investigative tactics which, in difficult or complex cases, have led to the best results.

In the matter of the offenses covered by this paper, the evidentiary process is certainly particularly difficult because in most cases they are committed without any persons present other than the perpetrator and the injured person, so that in the absence of direct and solid evidence, the evidentiary standard required by law for obtaining convictions cannot be met. Added to this is the fact that the injured persons are minors, sometimes of a very young age and with a low level of psychosocial development, which raises serious questions regarding their understanding and narration of the truth in a criminal investigation.

In recent years, in prosecutor's offices in Romania, a protocol for interviewing minor victims called the Revised NICHD Protocol (NICHD-r), developed by the U.S. National Institute of Child Health and Human Development [8], has increasingly been implemented. It represents a standardized method for interviewing child victims or witnesses, a scientifically grounded instrument considered the "gold standard" in interviewing children.

Certainly, it does not provide a "magic solution" for discovering the truth, but it offers multiple benefits compared with a classic interview, such as increasing the quality of statements by maximizing narrative and spontaneous information and reducing memory distortions, reducing children's suggestibility by limiting the interviewer's intervention in their answers and preventing contamination of the statement, protecting children during the interview by creating a safe, predictable, and non-threatening setting and by reducing the risk of retraumatization, standardizing interviews by ensuring a uniform procedure regardless of the interviewer and increasing the comparability and professionalism of interviews, but especially improving evidentiary value by obtaining legally reliable infor-

[1] For example, according to Art. 184 para. (1) of the C.P.P., in the case of crimes committed by minors between the ages of 14 and 16, in the case of the killing or injury of a newborn child or fetus by the mother, as well as when the criminal investigation body or the court has a doubt about the discernment of the suspect or defendant at the time of committing the crime that is the subject of the accusation, a forensic psychiatric examination is ordered.

mation, increasing the credibility of testimony, and increasing the chances of detecting false statements.

It is structured into several phases beginning with the introduction, followed by the pre-substantive phase, the substantive phase, and the conclusion.

In the introductory phase, the first contact between the interviewer and the child takes place, on which occasion the interviewer introduces himself or herself and explains his or her role to the child and presents the room in which they are located, including by showing the recording cameras, while the child's physical and emotional state is observed.

In the pre-substantive phase, a relationship of trust is built and the child's ability to narrate is trained. The protocol provides the manner of approach for several situations possible in practice, including, for example, the situation where the child does not respond or shows non-verbal signs of avoidance or resistance. The child is invited to recount, in turn, a pleasant event and an unpleasant event that happened at kindergarten or at school, unrelated to the reported incident, with the emphasis on what the child felt on those occasions and what thoughts or emotions he or she had. Next, the aim is to understand and practice the rules of the interview by presenting the concepts of "I don't understand," "I don't know," "wrong," and "correct." Before the interview, a recent, positive, meaningful event, chronologically close to the alleged abuse and in which the child participated actively, will be identified.

In the substantive phase, the actual recounting of the reported incident takes place and the aim is to obtain all information relevant to the case. The questions asked by the interviewer seek to detect and manage forms of reluctance and resistance and to explore as much as possible the situation of abuse. Breaks are permitted when needed.

It is recommended that the interview take place in a specially adapted and arranged room so that minors may feel in their own environment, equipped with furniture and walls painted in warm, welcoming colors, preferably with a small play area or a table for coloring and drawing. It is mandatory that only the child and the interviewer be present in the room, so in order to ensure compliance with criminal procedural requirements that impose the presence of a legal representative, a representative of public child protection services, lawyers, or other persons whom the law permits to attend the interview, they should attend from an adjacent room with direct view through a one-way mirror or via audio-video transmission systems.

Of course, the child's statement alone will in most cases not be sufficient to charge and convict the sexual abuser, especially when the latter chooses not to give a statement or even denies committing the acts, but it substantially increases the chances that the statement obtained through the child's free narration, with minimal elements of suggestion, may be corroborated with other evidence, even indirect, which together may form the conviction that the act exists, constitutes an offense, and was committed by the person under investigation.

We will next present Case M.V. from the practice of the Prosecutor's Office attached to the Constanta District Court in order to highlight the importance of using the NICHD-r protocol in such cases.

Top of Form Thus, on 01.11.2023, the mother of the minor A.C., aged 11, notified the police that during the period 2019-2021, her daughter, who was in the care of her grandmother, was "caressed and touched in the intimate area, at night", by M.C., the grandmother's cohabitant. During the period 2019-2021, both of the girl's parents were abroad. The girl's grandmother had died prior to the police notification.

The mother submits to the case file a screenshot representing a written conversa-

tion between her daughter and grandmother on 23.10.2023, from which it results that the girl told her grandmother about what happened, but that she did not tell her at the time because she was afraid of upsetting her grandmother or getting kicked out of the house.

The minor was examined by a forensic doctor and it was concluded that she had a compliant hymen, which allows for sexual intercourse without tearing, and no changes were found at the level of the anal canal and orifice.

From the investigations and from the hearing of several witnesses, close to the family, it emerged that the grandmother, born in 1959, had a poor state of health and had been moving with difficulty for several years, while M.V., born in the same year, had a good state of health, and the relationship between the two began 10 years ago. M.V. had no home or job, the material means of existence being provided by A.C.'s parents, who sent them money from abroad.

It was established that M.V. was very close to A.C. and spent a lot of time with her, accompanied her to and from school, singing lessons, competitions (both in her hometown and in other towns in the country, where they sometimes spent several days). M.V. and A.C.'s grandmother slept in different rooms, and A.C. sometimes slept with M.V. So, A.C. told several people about the sexual abuse committed against her by M.V. in October 2023, shortly before the police were notified.

The investigations also revealed that M.V. had been definitively convicted twice for committing rape crimes, the first time in 1978, when he was 19 years old – an act committed together with two other defendants on two women, and the second time in 1986, when he was 27 years old – an act committed on his wife's sister, aged 16, with whom he lived. A.C.'s family members were not aware of these convictions.

Minor A.C. was questioned by the prosecutor according to the NICHD protocol, on which occasion she reported that in the summer of 2019, when she was 7 years old, she slept with "Papu", because she was afraid to sleep alone. He stroked her back, as he usually did, because she couldn't fall asleep otherwise, then he undressed her and touched her "in the small thing" and "in the big thing", after which "something strange, thick, like human skin entered the big thing". She didn't move and pretended to be asleep. He didn't say anything, but she heard him breathing strangely, trembling, and felt him shaking, then he dressed her and they slept. Minor A.C. also stated that events like the one described above had happened "7 or 10 times a month", because sometimes she slept with "Papu", sometimes with her grandmother. One evening "Papu put where the boys do their small thing where she does her small thing", she felt "human skin, a little wet", he moved back and forth for 5 minutes and felt a little pain. Then he went to the bathroom, from where she heard him "do Ah, as if something hurt him". The last event of this kind happened "like the first time", when she was 9 years old, during 2020, in the living room of the apartment where they lived

A.C. also stated that later, after she turned 9, she asked some schoolmates what the word "sex" meant. After the discussion with her classmates, she began to understand what she had watched one evening with "Papu" on TV. When she was invited by the prosecutor to say more about what she had seen on TV, she wrote the word "pornography" on a sheet of paper. She did not understand at the time what that film represented or what "Papu" was doing to her at night. After she began to understand, she no longer wanted to sleep with M.V. and then decided to tell her grandmother, and then her mother.

The psychological expert report of the injured person A.C. concluded that she presents a symptomatology that is usually associated with prolonged and repeated traumatic experiences of sexual assault, physical violence, emotional abuse and neglect. The injured

person was exposed to pornographic films for a period of time, the meaning of which she only realized before the disclosure. The statement given by the injured person has sufficient quality to argue that the statements are possibly true, based on a real experience and that it is unlikely that she could produce this statement without having actually experienced these experiences.

At the same time, it concluded that no external influences on her or suggestions from other sources were identified. At the reported time of the onset of the sexual abuse, the minor was not aware of what was happening. In the case of the injured person, there can be no question of consent to the facts investigated. The injured person needs long-term psychotherapy, as a result of the acts of sexual abuse to which she was exposed.

The defendant M.V. fled immediately after the funeral of A.C.'s grandmother, where he learned that the girl had revealed the episodes of abuse, taking with him a gold chain belonging to the girl. He was found two weeks later, while making plans to leave the country. He stated that the injured person's father would try to get revenge on M.V.'s daughter, through him, for a 10-year-old dispute. He could not explain why A.C. stated that he had sexually abused her. He refused to be tested by a polygraph, stating that he had "been tested before".

The forensic psychiatric report of M.V. concluded that he was very cautious and vigilant in terms of "disclosing" his own identity and was diagnosed with a mixed personality disorder (paranoid, antisocial and dependent), without any evidence of deviant sexual behavior, a tendency to obtain sexual satisfaction from relationships with minors without their consent, or psychosomatic disorders of a pedophile and/or sexual abuser.

The defendant M.V. was sent to trial, in a state of preventive arrest, for committing the crimes of aggravated and continued rape, continued sexual corruption of minors, ill-treatment of a minor and theft. He was sentenced in the first instance to 15 years in prison, a solution that remained final after the appeal. It is noted that the only direct evidence in this case consisted of the statement of the minor injured person who freely related, in his own words, what he experienced and was able to perceive in relation to his age and psychosocial development.

Conclusions. A constant concern of the Romanian legislator is observed to prevent and combat as efficiently as possible crimes against sexual freedom and integrity, especially those concerning minors, through the legislative amendments brought and which aimed to align Romanian legislation with international standards in the matter, with an emphasis on a harsh sanctioning regime, intended to deter. It is noteworthy that the legislator's option towards an extensive, broad legislation, which would differentiate from the point of view of abstract danger, the different circumstances of committing the acts. However, it cannot be overlooked that such amendments operate far too often, which can create confusion both among those called upon to apply the law, and among its recipients. In addition to the difficulties related to a legislative framework in a continuous state of evolution, investigative bodies are called upon to identify the best methods of investigation and evidence collection, in an area where the utmost caution must be taken into account precisely those whom the state must protect, namely minor victims.

THE UNDERGROUND OF INSECURITY: TUNNELS AND HYBRID WARFARE ON THE EASTERN BORDER OF THE EUROPEAN UNION

Lucian Gabriel PEREȘ,
PhD, Associate Professor,
Border Police Department,
"Alexandru Ioan Cuza" Police Academy,
Bucharest, Romania
ORCID: 0009-0004-5307-6727

Abstract

The article studies the evolution of the crisis at the Polish-Belarusian border, marking a transition from ground-level irregular migration to the sophisticated use of underground tunnels as instruments of hybrid aggression. The research argues that these underground infrastructures represent a new stage in "Gray Zone" warfare, where the tunnel is no longer a simple escape route for migrants but a strategic tool for penetration and sabotage sponsored by hostile states and organized crime.

The study analyzes the dynamic interplay between the Polish "Smart Border" defenses – characterized by the integration of seismic sensors, thermal imaging, and AI-driven data fusion – and the high adaptability of hostile state actors. By using a hybrid methodological approach, combining technical infrastructure analysis with geopolitical strategy, the paper demonstrates how the underground has become a critical front for European security. The findings suggest that while technological advancements have significantly enhanced detection capabilities "at any depth," the primary challenge remains the economic and logistical exhaustion of the target state.

The article concludes that the "Underground of Insecurity" dictates a collective European response, shifting the focus from static physical barriers to dynamic, intelligent surveillance ecosystems capable of defending the territorial and political integrity of the European Union in the 21st century.

Keywords: border security, Poland-Belarus border, migration pressure, external border, underground tunnels, Artificial Intelligence, data fusion, strategic penetration, hybrid conflict.

SUBTERANUL INSECURITĂȚII: TUNELURILE ȘI RĂZBOIUL HYBRID LA GRANIȚA ESTICĂ A UNIUNII EUROPENE

Abstract

Articolul examinează evoluția crizei de la granița polono-belarusă, marcând o tranziție de la migrația neregulamentară la nivelul solului, la utilizarea sofisticată a tunelurilor subterane ca instrumente de agresiune hibridă. Cercetarea susține că aceste infrastructuri subterane reprezintă o nouă etapă în războiul din „Zona Gri", unde tunelul nu mai este o simplă rută de evadare pentru migranți, ci un instrument strategic pentru penetrare și sabotajul sponsorizate de state ostile și crima organizată.

Studiul analizează interacțiunea dinamică dintre apărarea „frontierei inteligente" poloneze – caracterizată prin integrarea senzorilor seismici, a imagisticii termice și a fuziunii datelor bazate pe inteligență artificială – și adaptabilitatea ridicată a actorilor statali ostili. Prin utilizarea unei abordări metodologice hibride, combinând analiza infrastructurii tehnice cu strategia geopolitică, lucrarea demonstrează modul în care subteranul a devenit un front critic pentru securitatea europeană.

Concluziile sugerează faptul că, deși progresele tehnologice au îmbunătățit semnificativ capacitățile de detectare „la orice adâncime", principala provocare rămâne epuizarea economică și logistică a statului țintă. Articolul concluzionează că „Subteranul insecurității" necesită un răspuns european colectiv, mutând accentul de la barierele fizice statice la ecosisteme de supraveghere dinamice și inteligente, capabile să apere integritatea teritorială și politică a Uniunii Europene în secolul XXI.

Cuvinte-cheie: securitatea frontierelor, frontiera Polonia-Belarus, presiune migratorie, tuneluri subterane, inteligență artificială, fuziunea datelor, penetrare strategică, conflict hibrid.

Introduction. **Political and Strategic Impact**. The technological evolution of aerial survillance systems has shifted the center of gravity of tactical invisibility to the underground. In the context of hybrid actions, underground infrastructure is no longer just a defensive refuge, but is actively integrated into asymmetric destabilization strategies. This reconfiguration of the battlespace transforms the underground into an operational domain where threats can be projected beyond visible demarcation lines, eroding predictability and classical territorial security.

The use of the underground tunnel as a tool of migratory pressure and sabotage marks a new stage of hybrid conflict. Although defensive technology has evolved rapidly, transforming the border into a "smart" one, the challenge remains constant due to the adaptability of the state actors involved, increasingly aggressive. According to recent communications related to the digitalization of NATO borders and the strengthened cooperation between NATO and the European Union (EU), the message is quite clear: *any incursion, regardless of depth, will be detected by the fusion of artificial intelligence data and the strengthened military presence*.

The tunnel was not designed as an escape route for migrants, but as a strategic penetration tool for the state that is tackling a hybrid aggression. The European Union and its member states spend significant amounts of money on securing external borders. However, studying the dynamics at the Polish-Belarusian border, moving from simple fences to underground infrastructure and purpose-built tunnels, goes beyond the scope of border security. This becomes an essential case study for European security in the 21st century, and member states need to be aware of the issue as a whole.

Research on this topic highlights the tension between a state's need to protect its territorial integrity and its international obligations regarding asylum and respect for human rights. Politically, the discovery of the use of tunnels justified exceptional measures such as a state of emergency and press restrictions, which set a precedent for how democracies can manage hybrid crises. Press restrictions were justified on the grounds of preserving "state secrets" – the argument being that publishing certain details could help organized crime networks or the actors involved.

A question arises in this context: *where does the right of the state to guard its border end and where do the fundamental rights of "migrants" begin*? The balance is difficult to balance. On the one hand, we have the duty of governments to maintain the rule of law and, on the other hand, the moral and legal obligation of a state to offer a form of protection to foreigners coming to the border, thus generating a turning point that tested the image of Poland and the European Union in relation to the democratic values assumed through the community acquis.

This type of situation has forced the European Union to decide whether or not to finance the construction of physical barriers (fences and anti-tunnel sensors) from common budgets, a subject that has divided the approaches of European states. The initial investments were made by the states directly confronted with this crisis, in this case Poland, Latvia and Lithuania, which built their border fences from their own budgets.

For example, for the Eastern Shield Project (Polish: Tarcza Wschód), Poland initially invested from its own resources (around 2.3-2.5 billion euros approved for the period 2024-2028), then managed to obtain European Funds through the SAFE Program (English: Security Action for Europe), around 43 billion euros.

Although not a direct "funding" in money, there have also been contributions in the form of resources and expertise from allies such as Germany and the Baltic States cooperating together in the "Baltic Defense Line" Project, allowing joint procurement of sur-

veillance equipment, which lowers the unit price of Artificial Intelligence (AI) technologies and sensors. Partial co-financing in terms of logistical infrastructure and interoperability is ensured by NATO.

It should be noted that migrants are transformed into "weapons" changing the classic definition of political and military aggression which defines aggression as an *external, visible and, most of the time, military act* [1].

From the strategic point of view, the external border of the European Union has become a testing ground for Gray Zone Warfare. This is a conceptual space located between traditional peace and conventional war. It is a type of conflict in which an aggressor state attempts to gain strategic advantages without triggering a direct military response (such as activating NATO's Article 5). According to the reference author Michael J. Mazarr, in his work "*Mastering the Gray Zone: Understanding a Changing Era of Conflict*", published by the U.S. Army War College Press in 2015, for a conflict to be considered "in the gray zone", it must tick three essential elements:

- Ambiguity, that is, the aggressor acts in such a way that he can deny involvement or claim that his actions are of a different nature (for example, about the migration crisis in the area, Belarus claims that it is a "spontaneous humanitarian problem", not a planned operation);

- The actions must be below the threshold of armed conflict, that is, aggressive enough to destabilize the target, but not so violent as to justify an invasion or a retaliatory bombing;

- The use of non-military instruments, that is, the use of economic pressure, cyber attacks, disinformation and, in this case, instrumentalized migration.

The tunnels are not just access routes for migrants, they can represent a tactical vulnerability through which saboteurs or undercover special forces can infiltrate. The Polish strategy shows a shift from "many soldiers" to "many sensors".

The strategic impact is that a state can now monitor hundreds of kilometers with reduced personnel, but becomes vulnerable to cyber-attacks and jamming. Iplementing of AI and autonomous drones is intended to send a strategic message to Minsk and Moscow: "*Any infiltration attempt is visible in real time*".

Purpose of the research. The chosen theme has a multidimensional significance, transforming a topical geopolitical topic into an academic analysis with major strategic implications.

The research highlights how authoritarian regimes on the external border of the European Union use asymmetric solutions, forcing EU member states to incur immense logistical costs.

Thus, an interested third state can use cheap labor to dig a tunnel, forcing the EU to invest billions in seismic sensors and AI, generating an economic and technological imbalance. The study provides a framework for understanding how NATO and the European Union must adapt their „shield" to respond to threats that do not involve tanks, but clandestine engineering.

By emphasizing that "*Member States must be aware of the issue as a whole*", the research takes on a warning role that must be taken into account. A tunnel under the external border is a security issue for all EU Member States, because once it enters the area of free movement, the "strategic penetration" is complete.

European solidarity is necessary at this time, because we are living in modern times with new concepts about how to carry out an aggression against a state and, implicitly, a union of states.

Methods and materials applied. The research is based on conceptual analysis and documentary synthesis, using the following specific methods and applied materials:

– *Case study*: focusing on the Polish-Belarusian border segment (especially the Białowieża Forest area) as a „laboratory" of new underground infiltration tactics;

– *Comparative analysis*: considering the evolution of the effectiveness of physical barriers (the 5.5 m fence) versus electronic barriers (Eastern Shield) in detecting subversive activities as well as changes in terminology, from "humanitarian crisis" to "hybrid aggression";

– *Examination of official press releases* from NATO, FRONTEX and especially the Polish Ministry of the Interior as well as information from the international press with references to these events, corroborated with reports from the Polish State Border Guard (Straż Graniczna) and statistics on crossing attempts, locations of discovered tunnels and materials used for their construction.

Specific Challenges in the Context of Hybrid Warfare. Considering the reports of specialized structures and the media [2], starting with the second half of 2025 and accelerating in the first months of 2026, it is observed that the security architecture of NATO's eastern flank has been forced to respond to a new dimension of hybrid threats that we have called – *the underground infiltration infrastructure*. If in previous years the migratory pressure orchestrated by the Moscow-Minsk axis manifested itself on the surface, the new discoveries indicate a shift towards bypassing engineering methods, designed to circumvent the physical and electronic barriers implemented by the European Union states at the external border.

The dynamics on the border between Belarus and Poland have evolved from a humanitarian and political crisis into a veritable technological and tactical "war of attrition". What began in 2021 as an illegal border crossing has today turned into an extremely sophisticated game of "cat and mouse".

At first, the main tactic was direct assault, meaning large groups of migrants, sometimes directed by Belarusian security forces, would try to pass through the wooded areas and swamps of the Białowieża Forest, located on the border between Poland and Belarus. The area is also a UNESCO site of inestimable ecological value.

The method used was to cut the barbed wire barriers. Poland urgently sent army forces to the border along with border guards and they responded by building a 5,5 meter-high steel fence, equipped with motion sensors and thermal imaging cameras (a real electronic barrier). This structure radically changed the way migrants infiltrated.

The tactics used to cross the fence were improvised ladders or "bridges", hydraulic jacks or various cutting tools, but also distraction: large groups simulated a crossing at one point to attract Polish patrols, while small groups discreetly passed through another place. As border surveillance with drones and surface sensors proved to be effective measures, another method was thought of – the underground method.

Initially, attempts were reported to dig small holes under the foundation of the fence, especially in areas where the soil allowed, then attempts were reported to pass through water discharge pipes or through riverbeds (in the Bug River area, for example, which is the border between Belarus and Poland for a section of 178 km), where the physical fence is more difficult to maintain [3].

This is not just about migration, but a hybrid conflict where technology plays a crucial role. Both sides use drones. Belarus uses them to monitor the activity of Polish patrols, and the Polish authorities to detect groups of migrants approaching the fence.

At the same time, there are reports of the use of lasers or bright lights by the Bela-

rusian side to blind Polish surveillance cameras during crossing attempts.

Since 2021, the situation has become extremely tense at the border, with Poland declaring border restriction zones to limit access by people who could help with the logistics of infiltration.

According to reports from Polish Border Guards in the Podlaskie region, four tunnels dug under the border with Belarus were identified during 2025. The most complex of these, discovered in December 2025 near the border town of Narewka, had alarming technical characteristics: a height of 1.5 meters and a total length of 60 meters (50 meters on the Belarusian side and 10 meters on the Polish side), being reinforced with concrete structures [4].

In a single incident, documented in December 2025, approximately 180 migrants (mostly from Afghanistan and Pakistan) used such a tunnel to enter Poland near the town of Narewka in a densely forested area [5]. Most of those who crossed were apprehended immediately after emerging on Polish territory, thanks to seismic and acoustic detection systems that alerted law enforcement.

The investigations, as reported by several publications (*The Telegraph*, *Washington Times*, *EU Today*, *Dailly Express US*, *WP Wiadomosci*), suggest the involvement of specialists recruited from the Middle East, as it was found that they used tactical expertise similar to the underground networks used by terrorist groups [6], and the only groups in the Middle East capable of building such tunnels are: Hamas in the Gaza Strip, Islamic Jihad, Hezbollah in Lebanon, some factions in Kurdistan and, possibly, the Islamic State. This method allows the transit of large groups of people (up to 180 migrants in a single incident), testing the detection capacity of the systems implemented at the external border of the European Union.

In 2024, the Rzeczpospolita newspaper reported on the extradition of a 33-year-old Ahmad Ali from Germany to Poland. The Syrian was the head of a large group involved in the illegal transportation of migrants from Belarus to Europe. According to intelligence services, part of the profits was transferred via cryptocurrencies to terrorist organizations such as Hezbollah and Islamic Jihad.

This tactic, according to the same publications, is considered by Warsaw and the leaders of the European Union as an escalation of the hybrid war orchestrated by the Kremlin with the help of the puppet state Belarus. The goal is to destabilize Europe through migratory pressure, forcing member states to allocate massive resources to secure the borders, which has already happened.

In response to this escalation, Poland and the Baltic states initiated the "East Shield" project in 2024 [7], a massive investment that transforms the border into a digital defense ecosystem. The system is no longer limited to above-ground barriers, but implements state-of-the-art technologies and is considered the largest operation to fortify NATO's eastern flank since 1945.

It is not just a „fence" stretching along 700 km of the Polish border, but an integrated "system-of-systems", where technology plays the main role. To detect underground activities (such as tunneling) and other incursions, Poland is implementing a mix of technologies that work in layers:

1. Advanced Seismic and Acoustic Monitoring. The use of geophones (a device built on the principle of a seismograph, which receives sound waves that propagate in the superficial layers of the earth's crust) and Artificial Intelligence algorithms to distinguish between ambient noise and vibrations specific to excavations. Without them, the massive flow of data from the over 2,500 sensors and thousands of cameras would be impossible

to manage by human operators. The border is therefore equipped with a dense network of buried sensors: microphones and geophones that capture ground vibrations. Digging a tunnel, no matter how silent it may be, generates specific frequencies that are captured by these seismic sensors.

The major challenge, however, is separating natural "noise" (animals, nearby heavy traffic, geological phenomena, etc.) from human activity. This is where AI comes in with filtering algorithms that recognize the sound signature of digging equipment and immediately alert the command center when it detects such an anomaly.

2. Ground Penetrating Radar (GPR) Imaging and Radar Technologies. In addition to sensors, monitoring is also done through active technologies, such as constant scanning of the subsoil to identify density anomalies and artificial cavities. Mobile or fixed detection units can scan the subsoil to identify "voids" or anomalies in soil density. This is the standard technology used to see what is at depth without the need for excavation. Thermal and infrared cameras monitor at the surface, being essential to identify „exits" or logistical movements (transport of excavated soil to the surface, specific equipment, etc.) that are necessary for tunnel construction.

3. Using Artificial Intelligence. However, the most important component is not the sensor itself, but the data analysis center. All data from drones (which constantly patrol), radars, cameras and seismic sensors are sent in real time to regional operational centers. Artificial Intelligence overlays the data. If a seismic sensor detects a vibration and a drone detects unusual movement of people or vehicles in the same area, the system automatically marks the location as a "critical incident", minimizing the reaction time of border guards.

One counter-AI method used by the Belarusian side is to create interference. By causing repetitive noises or simulated movements in different places, they try to "saturate" the algorithm, hoping that it will classify the real infiltration activity as a system error or a natural event [8].

4. Physical Fortifications and Countermobility. The Eastern Shield project is not only based on technology, but also on physical blockade through anti-tank ditches and „dragon's teeth". These are part of the infrastructure that can stop any incursion (whether human or vehicle) through suitable areas of passage, where the probability of being detected by sensors is low.

Although the technology used in projects to secure the European external border is state-of-the-art, the challenge remains the size (hundreds of kilometers of border) and the fact that the tunnels can be dug at varying depths depending on the consistency of the soil. However, through this system, Poland is transforming the border into a „smart" area, where any excavation becomes, from a technical point of view, extremely risky and easy to locate for intervention teams.

The collaboration between Poland and the Baltic states has evolved from simple diplomatic agreements to an integrated military strategy, known as The Baltic Defence Line, which represents a coordinated effort to transform the eastern border of the European Union into an impenetrable barrier. Here are the main pillars of this collaboration:

– Strengthening the defense of the Suwałki Corridor, considered by some analysts to be a critical point, i.e. a vulnerable area for NATO. Poland and Lithuania are working most closely to secure this area, a strip of land of about 100 km located along the border between these EU states and separating the Russian exclave of Kaliningrad from Belarus. Its strategic importance is vital: it is the only land link connecting the Baltic States (Estonia, Latvia, Lithuania) with the rest of NATO allies in Europe;

– Joint planning through which the two countries have signed rapid intervention protocols. In the event of aggression, Polish and Lithuanian forces act as a single unit under NATO command, eliminating bureaucratic delays;

– Constantly conducting simulation military exercises called „Dragon", together with other NATO allies. These exercises test the ability to quickly block Russia's access to Kaliningrad through this corridor.

Estonia, Latvia and Lithuania also agreed in January 2024 to sign a major Regional Security Agreement (Baltic Shield), with accelerated implementation in 2024-2025, through which they committed to building a network of over 600 concrete bunkers along their borders with Russia (excluding Kaliningrad) and Belarus. The design of the bunkers and anti-tank ditches is standardized. This allows the equipment and troops of the states involved, as well as NATO allies, to use the Baltic infrastructure at any time without logistical adaptations. In addition, networks of secure depots (so-called „support parks") have been built that are pre-positioned close to the border to ensure immediate resistance [9].

The Polish model of a „smart border" has also been adopted by the Baltic states. Seismic sensors in Estonia and acoustic detection systems in Poland are connected to a regional command center. If a suspicious sound of digging is detected in Latvia, the information is instantly shared with the entire eastern flank. Furthermore, bridges and border roads are prepared with "mining chambers" (in the form of ready-made niches for explosives) that can be quickly blown up in the event of an invasion.

Recently, according to the European Commission's European Drone Defence Initiative (EDDI) documents, the four countries, together with Norway and Finland, announced the creation of a constant surveillance system with drones. They patrol 24/7, using AI to identify any changes in the ground topography that could indicate a new tunnel or a buildup of troops. The critical moment was the fall of 2025 (especially the repeated incursions of Russian drones into Polish airspace), which demonstrated that traditional defense methods (fighter jets, fixed radars) are ineffective and extremely expensive to intercept swarms of small, cheap and difficult to detect drones.

The system is designed as a layered defense network, not as a continuous physical barrier and contains: Integration of advanced radars, acoustic sensors, infrared cameras and radio frequency detection systems, capable of identifying small objects at low altitudes. use some systems such as MEROPS (tested in Poland and Romania), which use smaller, faster and autonomous interceptor drones to neutralize enemy drones and the use of automated systems designed to process data in real time and provide a reaction time much shorter than that of a human. MEROPS systems (short for Multi-Sensor Electronic Response and Operation Platform System) are an advanced class of platform designed for anti-drone combat (C-UAS - Counter Unmanned Aerial Systems), developed to manage low-altitude threats, specific to border areas or hybrid conflict zones [10].

However, the final decision to neutralize „human in the loop" remains a fundamental safety requirement. The term comes from the English language: human-in-the-loop and represents a fundamental principle of ethics and safety in the use of autonomous systems, artificial intelligence and advanced military technologies. The decision to apply force or to physically neutralize the target is made by a human.

A key element is the integration of the national systems of each participating country into a "common situational awareness picture", based on the risk analysis model, so that the alert received by one of the states is immediately visible to the others. Poland plays the role of an „operational hub" in this digital interoperability system.

Conclusions. The study of the phenomenon of infiltration through tunnels on the

Polish-Belarusian border reveals that we are witnessing a fundamental change in the nature of modern conflicts. We are dealing with a redefinition of the border in the "hybrid era", and from the analysis of the data, some pertinent observations can be drawn.

We can say that the tunnel is no longer a simple escape route for migrants, but has become a precision weapon in the arsenal of hybrid warfare. If the fence is a symbol of political resilience, the tunnel is proof of the adaptability of the aggressor, demonstrating that any static barrier can be circumvented by exploiting the "*third dimension*" – the underground.

This dynamic reveals an asymmetric efficiency ratio: while a third country can mobilize human resources at low cost for the execution of tunnels, the European Union is forced to allocate vast financial resources for the implementation of advanced monitoring systems (seismic sensors, Artificial Intelligence algorithms, etc.). This phenomenon generates a systemic imbalance, forcing defensive structures to internalize high costs to counter rudimentary but effective infiltration methods.

The Polish experience confirms that a secure border in the 21st century is no longer based on the number of troops deployed in the area, but on the capacity to process information. Detection of underground activities is impossible without the fusion of data (seismic, thermal and acoustic) through Artificial Intelligence. This "invisible barrier" is the only viable response to an enemy operating below the threshold of conventional armed conflict. We are witnessing the transformation of border security from the concept of a "fortress" to a "smart shield".

The strategy of aggressive state actors aims, indirectly, to generate economic pressure on the European Union. By forcing member states to allocate significant financial resources for the development and implementation of technologies for detecting and countering underground activities, aggressors can contribute to the erosion of budgetary balances and the amplification of internal political tensions within the community bloc, without resorting to the direct use of classical military force.

In this context, securing the "underground of insecurity" cannot be considered exclusively a national issue of Poland or the Baltic states. Once completed, a cross-border tunnel could become an access point to the entire Schengen area. Therefore, funding research and development of advanced surveillance and intelligent monitoring technologies must constitute a collective priority for the European Union and NATO, going beyond the level of political discourse and becoming a security imperative based on technical capabilities and institutional cooperation.

The case of the tunnels on the EU's eastern border shows us that security can no longer be guaranteed only by classic fortifications (fences, barbed wire). The challenge of the future lies in the ability of Member States to maintain the protection of territorial integrity without sacrificing the humanistic and democratic foundation that defines the European Union. Border security is, in essence, a balancing act between the force necessary for defense and the values that this force must protect.

If democracy loses its own identity in order to survive a crisis, the success of security becomes a defeat of the values that the state was founded to defend. In the near future, the "tunnel war" is likely to expand to the use of underground micro-drones or robotic digging systems, which will require a constant update of detection algorithms. The article emphasizes that, in the face of an adversary „digging" at the foundation of European security, technological vigilance and European strategic unity are the only guarantees of our integrity.

The "underground of insecurity" requires a collective European response, shifting

the emphasis from static physical barriers to dynamic and intelligent surveillance systems, capable of defending the territorial and political integrity of the European Union in the 21st century.

PREVENTING INTENTIONAL HOMICIDES UNDER EXTRAORDINARY LEGAL REGIMES: CURRENT STATUS AND TRENDS IN UKRAINE

Maryna MESNIANKINA,
University Lecturer,
Department of Criminal Law Disciplines, Institute of Law and Security,
Odessa State University of Internal Affairs,
Ukraine
ORCID: 0009-0008-0177-6886

Abstract

The article provides a comprehensive analysis of the quantitative and qualitative parameters of intentional homicides in Ukraine under conditions of transformation of the criminogenic situation caused by the implementation of special legal regimes. The study examines the level, dynamics, intensity, structure, and territorial distribution of intentional homicides, as well as the peculiarities of procedural response to these criminal offenses.

It is established that during 2018–2021 there was a steady downward trend in the number of intentional homicides, which changed dramatically starting from 2022 with a sharp increase. A two-phase development model is substantiated: a period of stabilization followed by a multiple and systemic growth of indicators. The analysis of intensity coefficients confirms a significant rise in violent crime rates during the wartime period.

Particular attention is paid to structural changes, including the increase in the share of intentional homicides in the overall structure of crime and crimes against life and health. A significant imbalance between the growth in registered offenses and the decline in the effectiveness of procedural response has been identified, manifested in a reduction in the proportion of notices of suspicion and indictments.

The spatial characteristics of intentional homicides are also revealed, including the formation of high-risk regions under the influence of wartime factors, as well as the identification of typical locations at the micro level, where the residential sector remains dominant.

Keywords: intentional homicide, violent crime, criminogenic situation, crime dynamics, crime intensity, territorial distribution, procedural response.

PREVENIREA OMORURILOR INTENȚIONATE ÎN CADUL REGIMURILOR JURIDICE EXTRAORDINARE: STAREA ACTUALĂ ȘI TENDINȚELE ÎN UCRAINA

Abstract

Articolul oferă o analiză cuprinzătoare a parametrilor cantitativi și calitativi ai omuciderilor intenționate în Ucraina în condițiile transformării situației criminogene, cauzate de implementarea regimurilor juridice speciale. Studiul examinează nivelul, dinamica, intensitatea, structura și distribuția teritorială a omuciderilor intenționate, precum și particularitățile reacției procesuale la aceste infracțiuni.

Se constată că, în perioada 2018–2021, s-a înregistrat o tendință constantă de scădere a numărului de omucideri intenționate, care s-a modificat radical începând cu anul 2022 printr-o creștere bruscă. Este fundamentat un model de dezvoltare în două faze: o perioadă de stabilizare urmată de o creștere multiplă și sistemică a indicatorilor. Analiza coeficienților de intensitate confirmă o majorare semnificativă a nivelului criminalității violente în perioada războiului.

O atenție deosebită este acordată schimbărilor structurale, inclusiv creșterii ponderii omuciderilor intenționate în structura generală a criminalității și a infracțiunilor contra vieții și sănătății. A fost identificat un dezechilibru semnificativ între creșterea numărului de infracțiuni înregistrate și diminuarea eficienței reacției procesuale, manifestat prin reducerea proporției notificărilor de suspiciune și a rechizitoriilor înaintate în instanță.

De asemenea, sunt evidențiate caracteristicile spațiale ale omuciderilor intenționate, inclusiv formarea unor regiuni cu risc ridicat sub influența factorilor de război, precum și identificarea locațiilor tipice la nivel micro, unde sectorul rezidențial rămâne predominant.

Cuvinte-cheie: omucidere intenționată, criminalitate violentă, situație criminogenă, dinamica criminalității, intensitatea criminalității, distribuție teritorială, reacție procesuală.

Introduction. Intentional murders are among the most socially dangerous criminal offenses, as they directly encroach on the highest social value – human life. Their quantitative and qualitative characteristics are important indicators of the state of the criminogenic situation in the state, the level of social tension, as well as the effectiveness of the criminal justice system. The study of these indicators acquires particular significance in the conditions of special legal regimes, when under the influence of military, political and socio-economic factors both the general processes of social development and the mechanisms of law enforcement change.

Criminal offenses against the life of a person pose a direct threat to the security of all spheres of society, negatively affect the state of law and order, demographic processes, socio-cultural development and economic stability of the state, and also significantly increase the level of public anxiety and distrust of government institutions. The current stage is characterized not only by the general increase in the number of such crimes, but also by the complication of their criminological structure: the share of especially serious manifestations of violence is increasing, the practice of using weapons is expanding, the capabilities of modern technologies and technical means are used more often during the preparation or commission of crimes [1, p. 137]. It should be noted separately the strengthening of tendencies towards regional differentiation of crime, the formation of local centers of its concentration, as well as the "relocation" of individual criminal practices between different territories, which indicates the adaptive and transformative nature of modern violent crime.

Such a complication of the criminogenic situation necessitates an in-depth scientific analysis of intentional homicides not only as a separate category of criminal offenses, but as a socially dangerous phenomenon that reflects the general state of public security and the level of the state's ability to respond to the challenges of a special period.

Analysis of statistical data of the Prosecutor General's Office of Ukraine on intentional homicides for the period 2018-2025 allows us to distinguish a clear two-phase model of the development of violent crime. In the pre-war period, from 2018 to 2021, there was a stable trend towards a decrease in the number of registered intentional murders. If we conditionally accept the indicator of 2018, when 5,557 cases were recorded, as the base value of 100%, then in 2019 this indicator decreased to 98.3%, in 2020 – to 68.6%, and in 2021– to 58.1%. Such dynamics indicate a gradual but consistent reduction in violent attacks on life, which indicates the stabilization of the criminogenic situation in the pre-war period and the effectiveness of preventive, law enforcement and socio-legal mechanisms that operated in the state. Overall, over four years, there has been a reduction of over 41% compared to the base year 2018, reflecting a systemic trend towards a decrease in the intensity of violent crime [2; 3; 4; 5; 6, p. 96] (Fig. 1).

Radical changes in the crime situation occurred in 2022. Compared to 2021, when 3,230 cases were registered, the number of intentional murders increased to 22,083, that is, almost 6.8 times. Such a sharp jump indicates the influence of external and internal factors, in particular, the destabilization of the social situation, military actions, and violations of traditional social and legal control mechanisms. The increase in the number

of intentional murders in 2022 has the character of a crisis turning point, when ordinary social and legal regulators do not provide effective containment of violence, and the intensity of conflicts at the social level increases significantly [7; 8; 9; 10] (Fig. 1).

In the following years, the number of intentional homicides continued to increase, but without the characteristic shock jump of 2022. In 2023, 36,667 cases were registered, which is 66% more than in the previous year. In 2024, there was an increase of 42.4% – to 52,197 cases, and in 2025 – by 14% (59,497 cases). Such dynamics indicate the formation of a phase of inertial growth of violent crime: the indicators continue to increase, but the growth rate is gradually decreasing, which may indicate a certain stabilization of the new criminogenic reality caused by military and social factors [7; 8; 9; 10] (Fig. 1).

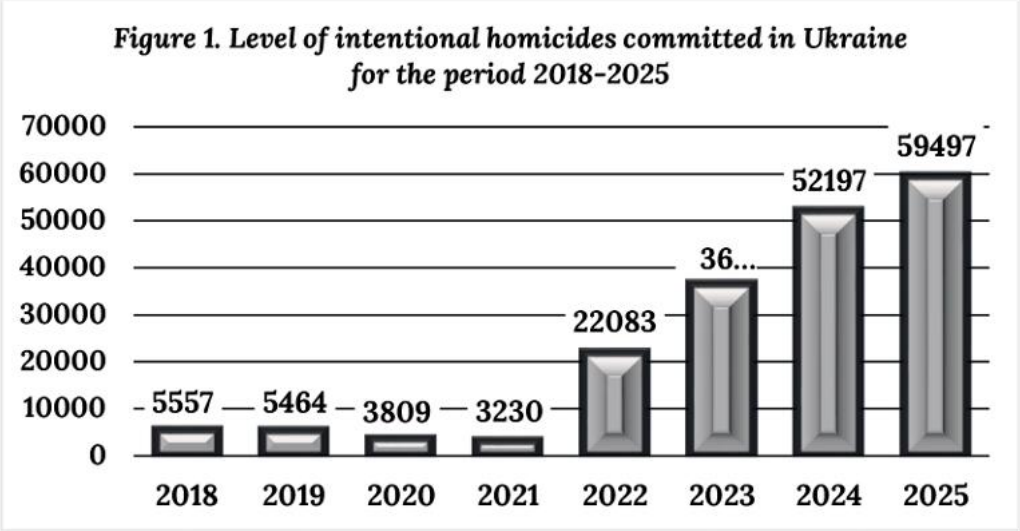

Figure 1. Level of intentional homicides committed in Ukraine for the period 2018-2025

Thus, analyzing the statistics for 2018-2025, we can state the presence of two fundamentally different stages of the development of intentional homicides in Ukraine. The first stage (2018-2021) was characterized by a gradual decrease in the level of violent attacks, reflecting the pre-war stability and effectiveness of the criminal prevention system. The second stage (from 2022) is a sharp, multiple growth, which forms a stable phase of inertial escalation of violence. Such a development model is systemic in nature and requires a differentiated approach to organizing preventive measures, strengthening criminal law response and regional adaptation of security policy, since the growth of violence is manifested unevenly both in terms of territorial and socio-demographic distribution.

The intensity coefficient of intentional homicides (per 100 thousand population) clearly illustrates the sharp transformation of the criminogenic situation in Ukraine. If in 2018 this indicator was 13.1, and by the end of the pre-war period in 2021 it decreased to 7.7, then in 2022 it sharply increased to 53.5. Further dynamics showed a steady growth: in 2023 – 89.4, in 2024 – 128.3, and in 2025 – 147 [2; 7; 8; 9; 10]. Thus, during the period of hostilities, the intensity of intentional homicides increased almost 19 times compared to the minimum pre-war level, which indicates the systemic nature of violent crime and a significant increase in risks to the social security of the population. Such a sharp escalation shows not only a quantitative increase in crime, but also the need to adapt preventive response strategies, strengthen law enforcement mechanisms, and enhance social stabilization in high-risk regions.

Structural indicators of intentional homicides have undergone a radical transformation during the period under study. The share of these crimes in the overall structure of criminal offenses against life and health has increased from approximately 14% in 2018 to almost 70% in 2025, which indicates a significant increase in their criminological significance. In the total mass of all criminal offenses, the share of intentional homicides has increased from about 1% to almost 10%, demonstrating not only quantitative growth, but also a qualitative restructuring of the criminal structure of society [2; 10]. Such dynamics indicate a concentration of the most serious encroachments on life and health, which directly affects social security, the effectiveness of law enforcement activities and the formation of preventive response strategies.

If we consider in detail the internal structure of criminal offenses against life and health in 2025, it is distributed as follows. The leader in prevalence remains intentional murders – 59,497 cases, which is 69.5% of the entire category. In second place in terms of share are intentional bodily harm of minor severity – 15,898 cases (18.5%). Next are beatings and torture – 2,334 cases (2.7%), as well as intentional bodily harm of moderate severity – 2,027 cases (2.4%), combined with cases of domestic violence – 2,030 cases (2.4%). In the last place in terms of prevalence are intentional grievous bodily harm – 1,322 cases (1.5%), while other crimes against life and health make up approximately 3% of the total [10].

Therefore, the dominance of intentional homicides combined with a high level of minor bodily injuries indicates the concentrated criminological danger of these categories and emphasizes the need for a differentiated approach by law enforcement agencies to the prevention and detection of crimes against the life and health of the population.

The internal structure of intentional homicides in Ukraine in 2025 indicates a clear concentration of criminal danger in certain types of crimes. The largest share is made up of murders against two or more people, of which 3,527 cases (6%) were recorded. This type of crime is characterized by high social danger, because several victims suffer in one situation, which complicates the disclosure and increases the resonance of such crimes. Less numerous, but socially significant, are the cases of murders of young children and pregnant women, as well as crimes committed with particular cruelty. Although their number is small, these categories are characterized by a high level of moral and criminal danger and cause significant public resonance [11, p.11]. All other motives and circumstances of murders, including selfish, hooligan, official, contract, or group, occur singly and do not constitute a systemic threat, but their study is also important for a comprehensive understanding of the criminal situation.

Thus, the structure of intentional homicides in 2025 indicates the dominance of group attacks and crimes of high social harm, while other types of crimes are episodic in nature. This configuration emphasizes the need for a differentiated approach by law enforcement agencies, which allows for more effective concentration of resources on the most dangerous categories of crimes and the development of targeted preventive measures.

At the same time, the indicators of procedural response have the opposite dynamics. If in the pre-war period, reports of suspicion accounted for 24-38% of registered cases, then after 2022 their share decreased to 5%, and in 2025 to 1.5%. The share of indictments accordingly decreased from 15-24% to 1% [7; 10]. Such a gap between the scale of the growth of violent crimes and the capabilities of criminal justice indicates a systemic imbalance, which has several consequences. First, the limited procedural response reduces the preventive effectiveness of law enforcement agencies, creating conditions

for further escalation of the criminogenic situation. Second, the disproportion in law enforcement increases social anxiety, undermines citizens' trust in government institutions, and reduces the public legitimacy of the justice system. Third, the presence of significant regional inequality in procedural activity forms "territories of increased risk", where the lack of an effective response can contribute to the concentration of violence and complicate control over the criminogenic situation [12, p.126].

The highest level of intensity of reports of suspicion is concentrated in relatively safe regions, where the law enforcement system retains the ability to actively respond to procedural issues. In particular, the leading positions are occupied by Zakarpattia (19%), Vinnytsia (18%), Volyn (15%) and Zhytomyr (14%) regions. Rivne (13%), Kropyvnytskyi (11.7%), Cherkasy (11.5%), Lviv (11.4%), Poltava (10.6%) and Kyiv (10.1%) regions, which indicates a relatively stable level of procedural activity in these territories [10].

The group of regions with an average level of procedural activity is formed by Mykolaiv (9.8%), Ternopil (9.3%), Khmelnytskyi (8%), Odesa (6.3%), Kyiv city (5.1%), Chernihiv (5%) and Chernivtsi (4.1%) regions. In Dnipropetrovsk region, this indicator is somewhat lower and amounts to 4%, which may reflect an increased burden on the law enforcement system [10].

At the same time, in regions that directly border the combat zone or are under constant security pressure, a critical decrease in the share of reports of suspicion is recorded. The lowest values are characteristic of Sumy (0.5%), Zaporizhia (0.7%), Kharkiv (1.4%) and Kherson (2.1%) regions, which indicates a significant limitation of the possibilities of effective pre-trial investigation [10].

A similar pattern is observed in the referral of indictments to court. The highest level of this procedural stage was recorded in Zakarpattia (12.8%), Vinnytsia (12.6%), Zhytomyr (9.6%), Volyn (8.8%) and Rivne (8%) regions. At the same time, moderate indicators are characteristic of Lviv (7.7%), Poltava (7.5%), Kropyvnytskyi (6.8%), Kyiv (6.1%), Mykolaiv (5.9%) and Khmelnytskyi (5.8%) regions [10].

In contrast, in the frontline territories, there is an almost critical drop in the level of judicial referral of criminal proceedings: in Zaporizhia region it is only 0.2%, in Sumy region – 0.3%, in Kharkiv region – 1%, in Kherson region – 1.3%. This situation reflects the objective difficulties of the functioning of the justice system under military stress [10].

Thus, the regional analysis demonstrates a clearly expressed asymmetry of the criminal procedural response, which was formed under martial law. While the rear regions retain relative stability and the ability to ensure the proper level of investigation, the front-line regions are faced with a significant narrowing of procedural opportunities. This leads to the formation of territorial zones of increased procedural risk and complicates the implementation of the principle of the inevitability of criminal liability for intentional murder.

The geography of intentional homicides in Ukraine during the period of special legal regimes is characterized by clear territorial polarization. The most criminogenically tense situation is observed in regions that are in the zone of active hostilities or are under constant security pressure. In 2025, the leading positions in the number of registered intentional homicides were occupied by Kharkiv (6624), Sumy (6426) and Zaporizhia (5054) regions. A significant indicator was also recorded in Dnipropetrovsk region (3125). The combination of these regions forms a conditional "zone of increased risk", where the factors of militarization of space, population displacement, destruction of infrastructure and weakening of traditional social ties are combined. Areas with significant but less concentrated criminal activity include Kherson Oblast (1073) and Kyiv City (1049). In these cases,

both military and urbanization determinants of violent crime are combined. The group of regions with relatively moderate intensity is formed by Odesa (826), Chernihiv (747), Kyiv (446), Zhytomyr (354), Mykolaiv (305), Chernivtsi (300), Lviv (297), Kropyvnytskyi (281), Poltava (254), Cherkasy (250), Khmelnytskyi (224) and Vinnytsia (206) regions. These territories are characterized by the absence of a systemic peak load, although individual local foci of criminogenic tension are still recorded. The lowest rates were found in relatively rear western regions – Volyn (137), Ternopil (118), Zakarpattia (109), Ivano-Frankivsk (107) regions. In Rivne region, the number of cases was about 150 [10]. These territories demonstrate a relative stability of the criminogenic situation, which is explained by the remoteness from the active zone of hostilities and lower industrial concentration.

Along with macro-regional analysis, the study of the spatial localization of crimes at the micro-level is of fundamental importance [13, p.102-103]. This involves establishing typical locations for intentional homicides, which allows for the identification of situational patterns of violent behavior. The dominant environment for the implementation of intentional attacks on life remains the residential sector. Most such crimes occur in apartments and private houses. This indicates the prevalence of interpersonal conflicts that arise in a closed space between individuals connected by family or long-term social ties. Public space is the second most common. Streets, courtyards and other open locations become places for situational conflicts, which are often impulsive in nature. A specific segment of places where intentional murders are committed is also formed by entertainment infrastructure facilities. – cafes, bars, nightclubs and other leisure establishments. Although the frequency of such crimes in these locations is relatively low compared to the residential sector or open public spaces, it is here that there is an increased conflict-generating potential [13; 14, p.46; 19; 20; 21; 22; 23; 24].

Analysis of seasonal variability in intentional homicides in 2025 demonstrates a distinct uneven distribution of criminal activity throughout the calendar year. The generalization of monthly statistical data allowed us to systematize them by season and determine the contribution of each season to the overall crime structure.

At the beginning of the year, an increased level of violent attacks is recorded: in January, 5,891 cases were registered (9.9% of the annual volume), which indicates one of the local maxima. In February, a significant decline is observed to 3,772 cases (6.3%), after which in March there is a slight increase to 3,852 (6.5%). With the onset of spring, activity gradually increases: in April, 4,943 cases (8.3%) were recorded, in May – 4,839 (8.1%). In June, a certain decrease is noted to 4,641 (7.8%), but already in July the highest monthly figure is reached – 6,001 cases (10.1%). In August, the level remains stably high – 5,447 (9.2%), after which in September there is a decline to 4,536 (7.6%). In the autumn period, there is a rise again: in October – 5209 (8.8%), in November – 4859 (8.2%), and in December the figure increases to 5507 cases (9.3%) [10].

The generalized seasonal distribution shows that in winter (December–February) 15,170 intentional murders were recorded, which is about 25.5% of the annual volume. The spring period (March-May) is characterized by 13,634 cases (22.9%). The highest level of criminal activity falls on summer (June-August) – 16,089 cases (27%), which forms a seasonal peak. In autumn (September-November) 14,604 cases (24.6%) were registered.

Thus, the seasonal dynamics have a wave-like character with a clearly pronounced maximum in the summer months and a relative decrease in the spring period. The revealed pattern can be explained by the influence of seasonal criminogenic factors, in particular, the intensification of social interaction in the warm season, the increase in the intensity of interpersonal contacts and, as a result, the increase in the likelihood of conflicts

that can escalate into violent actions.

The conditions of operation of special legal regimes affect the distribution of intentional homicides by day of the week. Taking into account the calendar ratio of working (5) and weekend (2) days, working days account for about 68% of the possible time intervals for committing crimes, and weekends – approximately 32%. This statistical advantage is due to the greater number of working days, but criminological analysis should take into account not only the calendar structure, but also the level of social activity and the nature of interpersonal contacts on different days of the week [16, p.49].

Analysis of the time of commission of intentional murders allows to reveal patterns of concentration of crimes during the day and their connection with social activity of the population. In the morning period (06:00-12:00) about 10-12% of cases, mostly of a domestic nature, occur in private premises and are associated with situational conflicts. The daytime period (12:00-18:00) covers 15-18% of crimes; at this time the share of murders in public spaces increases - on the streets, in transport, in workplaces - due to more active social contacts. The highest peak falls on the evening (18:00-00:00) 35-40%, when crimes often occur in public places, catering and entertainment establishments, often under the influence of alcohol and emotional escalation. At night (00:00-06:00) 30-35% of cases are recorded, mostly in the private sector, on the streets and transport hubs, where sudden conflicts, reduced social control and limited presence of witnesses create favorable conditions for the commission of a crime. In general, the evening-night period is critical for violent activity, which justifies the need to concentrate preventive measures at this time [17, p.8].

The methods of committing intentional murders remain a key element of their criminological characteristics, as they reflect the mechanism of implementation of criminal intent, the level of preparation of the criminal and the degree of social danger. The most common are murders using cold weapons – knives and other piercing-cutting objects. Such crimes are mostly of a domestic or situational-conflict nature, are committed without careful preparation and are often associated with alcohol intoxication. A significant proportion are intentional murders using firearms, the availability of which during wartime increases the risk of this particular method increasing. Such crimes are often characterized by high social danger and preliminary planning. Other methods, such as inflicting multiple bodily injuries, strangulation or mechanical impact, are characterized by high emotional tension and a close personal connection between the perpetrator and the victim. Isolated cases include the use of explosive devices or arson, which require advanced training and are aimed at covering up the crime or creating public resonance. [15, p.49; 18, p.864].

Thus, the analysis of the methods and timing of committing intentional murders under special legal regimes shows a combination of traditional domestic conflict mechanisms with new risks caused by the militarization of the social environment and increased aggressiveness of the population.

Conclusions. In conclusion, we note that the analysis of intentional homicides in Ukraine for the period 2018-2025 indicates a fundamentally two-phase development of violent crime: pre-war stability and a gradual decrease in the level of crimes (2018 - 2021) were replaced by a sudden, multiple increase in the war period (from 2022), which formed a stable phase of inertial escalation. A significant increase in the intensity and severity of crimes, their concentration in front-line regions, uneven procedural response, as well as seasonal and daily patterns emphasize a deep security crisis that goes beyond the boundaries of a criminological problem and has a systemic social character.

Along with traditional domestic conflict motives, the role of new risks is growing, caused by the militarization of the social environment, the spread of modern technologies, and the availability of weapons, which increases the social danger of these crimes. This indicates the need for a comprehensive approach to preventive policy, differentiated response by law enforcement agencies, and strengthening regional security.

Therefore, intentional homicides under special legal regimes are not only a critical indicator of the criminal threat, but also a key indicator of social instability, which requires a systematic, strategic, and scientifically sound approach to protecting the population and ensuring the effectiveness of criminal justice.

TACTICAL AND LEGAL CHALLENGES IN "SKY ECC" AND "ENCROCHAT" TYPE MISSIONS: THE IMPACT OF COMMUNICATIONS DECRYPTION ON DRUG TRAFFICKING CASES IN ROMANIA

George ȚICAL,
PhD, University Professor,

ORCID: 0000-0002-6123-6821

Abstract

This scientific paper analyzes the fundamental paradigm shifts in the architecture of European security, caused by the collapse of the "digital fortresses" EncroChat and Sky ECC. In a 21st century defined by technological convergence, cross-border organized crime groups have adopted military-grade encryption as their main tool for evading the law, generating a false sense of invulnerability. The paper explores how Romanian law enforcement authorities, in close coordination with partners through Europol and Eurojust channels, managed to transform the "data flood" resulting from decryptions into an unprecedented evidentiary asset.

From a tactical perspective, the investigation focuses on the complex process of "humanizing bits", namely on the methodologies for assigning digital identity by corroborating metadata with operational reality on the ground. The need for a "cognitive re-equipment" of investigative officers, who must operate today at the intersection of Big Data analysis and traditional police tactics, is analyzed.

From a legal perspective, the paper addresses the procedural "carnage" in Romanian courts, where the validity of evidence obtained through the European Investigation Order (EIO) is tested under the pressure of exceptions regarding the loyalty of the administration of evidence and jurisdictional sovereignty. The impact of the CJEU case law on the admissibility of such data is analyzed, highlighting the risk of "digital impunity" in the absence of a harmonized legislative framework. In conclusion, the paper proposes a proactive vision of "21st century police", where the success of missions depends on the capacity of the judiciary to integrate technological innovation without sacrificing the fundamental guarantees of the rule of law.

Keywords: Sky ECC/EncroChat, E-evidence, cross-border organized crime, European investigation order, digital attribution, evidence loyalty, ognitive retooling.

PROVOCĂRI TACTICE ȘI JURIDICE ÎN MISIUNILE DE TIP "SKY ECC" ȘI „ENCROCHAT": IMPACTUL DECRIPTĂRII COMUNICAȚIILOR ASUPRA CAZUISTICII DE TRAFIC DE DROGURI DIN ROMÂNIA

Abstract

Prezenta comunicare științifică analizează mutațiile fundamentale de paradigmă în arhitectura securității europene, provocate de prăbușirea „fortărețelor digitale" EncroChat și Sky ECC. Într-un secol XXI definit de convergența tehnologică, grupările de criminalitate organizată transfrontalieră au adoptat criptarea de nivel militar ca principal instrument de eludare a legii, generând o falsă senzație de invulnerabilitate. Lucrarea explorează modul în care autoritățile de aplicare a legii din România, în strânsă coordonare cu partenerii prin canalele Europol și Eurojust, au reușit să transforme „potopul de date" rezultat din decriptări într-un activ probatoriu fără precedent.

Sub aspect tactic, investigația se concentrează pe procesul complex de „umanizare a biților", respectiv pe metodologiile de atribuire a identității digitale prin coroborarea metadatelor cu realitatea operativă din teren.

Este analizată necesitatea unei „reechipări cognitive" a ofițerilor de investigații, care trebuie să opereze astăzi la intersecția dintre analiza Big Data și tactica polițienească tradițională.

Din perspectivă juridică, lucrarea abordează „măcelul" procedural din instanțele românești, unde validitatea probelor obținute prin Ordinul European de Anchetă (OEA) este testată sub presiunea excepțiilor privind loialitatea administrării probelor și suveranitatea jurisdicțională. Se analizează impactul jurisprudenței CJUE asupra admisibilității acestor date, subliniind riscul unei „impunități digitale" în absența unui cadru legislativ armonizat. În concluzie, lucrarea propune o viziune proactivă asupra „poliției secolului XXI", unde succesul misiunilor depinde de capacitatea sistemului judiciar de a integra inovația tehnologică fără a sacrifica garanțiile fundamentale ale statului de drept.

Cuvinte-cheie: Sky ECC/EncroChat, probe electronice, criminalitate organizată transfrontalieră, ordin european de anchetă (OEA), atribuire digitală, loialitatea probei, reechipare cognitivă.

Introduction. When "fortresses" become aquariums. The research theme starts from the obvious reality of recent years: communication has become increasingly digital, and organized crime groups have started to use increasingly sophisticated encryption systems to hide their activity. In this context, operations such as Sky ECC and EncroChat have radically changed the way in which authorities understand and investigate these networks, giving them access to an impressive volume of data that until recently seemed inaccessible, especially in drug trafficking cases. At the same time, this evolution has gone hand in hand with the intensification of judicial cooperation at European level, but also with the increasingly clear need to adapt legislation and judicial practice to new technological realities.

In this context, the present research aims to analyze how the decryption of these communications influences both the efficiency of investigations and the admissibility of evidence in drug trafficking cases in Romania. The main interest is directed towards the concrete difficulties generated by the management of very large volumes of digital data, but also towards the legal uncertainties that arise when this data is used as evidence, especially in relation to the requirements of a fair trial.

The analysis is based on the idea that access to communications previously considered impossible to penetrate represents a major advantage in combating organized crime, as it allows for the detailed reconstruction of criminal activity. At the same time, it starts from the premise that the lack of clear and uniform rules regarding the use of this evidence, especially in a cross-border context, can create real difficulties regarding its admissibility before the courts.

In this sense, the research aims to highlight both the tactical and legal implications of the use of data obtained by decrypting encrypted communications in drug trafficking cases in Romania. It also analyzes the concrete way in which information from the Sky ECC and EncroChat platforms is integrated into the investigation activity, as well as the way in which the existing legal framework responds to the challenges raised by these types of evidence.

Methods and materials applied. The research is based on an interdisciplinary approach, located at the intersection of criminal law, criminology and the analysis of phenomena generated by the digitalization of investigations, having a predominantly qualitative character. The approach is based on the documentary analysis of the specialized literature, the European and national regulatory framework, as well as relevant documents in the field, complemented by the legal analysis of the norms and jurisprudential guidelines regarding electronic evidence. At the same time, elements of comparative analysis and case study are utilized, by reporting on the Sky ECC and EncroChat operations, in order to highlight the tactical and legal implications of using these data in the criminal process.

In order to render the reality on the ground as faithfully as possible, the language used integrates, in places, elements of police slang. This stylistic option does not affect the scientific rigor of the approach, but contributes to the authentic illustration of the operative mechanisms and the professional culture specific to the analyzed environment, while facilitating the concrete understanding of the described phenomena.

Let's face it, because we don't have time to waste on euphemisms: for a long time, the smart guys in big crime lived with the warm and fuzzy feeling of *digital invisibility*. They thought they were immutable, hidden behind toys worth thousands of euros that guaranteed them that no structure, no matter how well-equipped, would ever read their "*recipes*" for success. We're talking about EncroChat or Sky ECC, which weren't just miserable chat apps for expensive phones, but true virtual fortresses. A kind of bit-by-bit *safe houses*, where Balkan routes were cut, prices per kilogram were negotiated and sentences were handed down with unbelievable audacity. Honestly? They were convinced they were untouchable.

But, surprise. Trouble in their encrypted paradise. When these code walls collapsed, we found ourselves with a mountain of data. A deluge, nothing more. Romania, located right at the "*high gate*" of Europe in the security area, had to learn on the fly how to process this mammoth evidence without stumbling into procedural "bumps". Basically, the way in which DIICOT and DCCO officers now manage drug trafficking cases has changed radically. We are no longer talking about classic "stories" from the trail or "*arrows*" caught on the street corner. We are talking about massive data flows that give you the entire network architecture.

This is what the specialized literature already calls a new type of systemic protection, because, as mentioned in The Invisible Shield, modern public safety depends on our ability to transform "*raw data into information shields capable of anticipating the adversary's movements*" [1, p. 17]. Basically, we have gone from hunting people to hunting bits.

It is a new paradigm. A brutally direct one. It is no longer just about catching the criminal, but about the police's ability to adapt to "*new challenges in a world where classic missions collide head-on with digital reality*" [3, p. 112].

Today we are not talking about dusty theory. We are talking about how we have managed to break the myth of their invulnerability and, above all, about the legal thresholds that we keep bumping into in court when we bring this "exotic" evidence to the table. In this context, "*the integration of Big Data analysis in the fight against crime is no longer a technological luxury, but a strategic necessity for institutional survival*" [2, p. 38].

It is a game of technological checkmate. And the stakes are huge: either we learn to speak the language of this data, or we remain with binoculars in hand while the networks rebrand before our eyes.

Anatomy of the operations: how the Hexagon servers ended up in our indictments. Let's be realistic: what happened with EncroChat and Sky ECC was not a simple "*interception*" of a dozen, but a veritable magnitude 9 earthquake in the communications infrastructure of organized crime. We are not talking about a surveillance warrant placed on a miserable cartel phone number, but a total technical immersion in servers located in French and Dutch jurisdiction. In essence, the authorities there "*injected*" a code that turned their "*secure*" phones into the most effective wiretapping microphones in history. It was, if you will, a digital Trojan horse of epic proportions, a show of force that confirms Europol's vision that "*organised crime groups are exploiting cutting-edge technologies to secure their communications, forcing law enforcement agencies to adopt innovative solutions to access data*" [7, p. 42].

But how does this data end up on the desk of a DCCO officer in Bucharest? This is where the magic of the European Investigation Order (EIO) comes in. No more dead times, no more piles of files tied with string that circulate at snail's pace through ministries within the framework of classic letters rogatory. Now we are talking about a direct flow, a kind of judicial fast-track through Eurojust. However, here comes the first tactical "*bug*": we receive the data, but we receive it in the form of massive, raw digital packages, often without an instruction manual. This is exactly what the European Commission has emphasized in its communications on security: "*access to electronic evidence is essential in around 85% of criminal investigations, but their complexity requires unprecedented cross-border cooperation*" [4, p. 2].

It is not as if you listen to a magnetic tape and conscientiously write down what "Don" X says to "Arrow" Y. This is *Big Data* in its purest and most aggressive form. You get millions of lines of code, encrypted messages, pictures of "cargo" freshly unloaded at the port of Constanta and GPS locations thrown together in a file that seems indecipherable at first glance. Thus, "*the ability to extract actionable intelligence from heterogeneous databases is now the front line in national security, where algorithms must overcome human limitations in processing massive information flows*" [2, p. 42]. Without serious analysis software and without officers who know how to "*read*" between the bits, you are like a blind man holding a map written in Braille, but who has never learned the alphabet.

And there is something else that costs money and time. Let us not forget that these international operations have pushed the limits of police cooperation as we have known it for decades. In the paper Police in the 21st century: current missions and changing challenges, presented in Vienna, it is clearly discussed that "*cross-border missions are no longer limited to joint patrols or post-factum information exchange, but to the fusion of data streams in real time, creating a hybrid investigative space*" [3, p. 114]. That is, when a "*city boy*" from Romania sent a picture of a stack of euros to a partner in Rotterdam via Sky ECC, we saw the picture almost at the same time as the recipient. This simultaneity has changed the rules of the game: we have moved from retrospective investigation (what happened?) to predictive investigation (what is going to happen?).

But wait, this is where the legal "*clunk*" that gives us the biggest headaches in courtrooms comes in: the loyalty of the evidence. How do we prove to a panel of judges that the data package that left a server in France is identical, bit by bit, to the one that ended up in the file at the Bucharest Court? If we don't have a solid and indisputable digital chain of custody, the luxury lawyers, paid with big money from traffic fees, are just waiting to destroy all our months of work on the grounds of data manipulation or lack of technical transparency. It is a minefield where, as stated in The Invisible Shield: The Science Behind Public Safety, "*the invisible shield of technology must be doubled by surgical procedural rigor, otherwise innovation becomes vulnerable to the rigors of the rule of law*" [1, p. 21]. This concern is also reflected in the monitoring reports of the EU Council, which emphasize the need for "*common standards for the admission of digital evidence obtained through special investigative techniques*" to avoid invalidating complex cases.

Moreover, operating with this data involves close collaboration between organized crime units and *digital forensics experts*. You can no longer work "*in isolation*". According to recent studies in the Annals Series on Military Sciences, "*the convergence of cyber-intelligence and classical criminal investigation requires a cognitive re-equipment of personnel, who must master both field tactics and the subtleties of complex data analysis*" [2, p. 48]. In Romania, this meant the creation of analysis cells where the case officer sits shoulder to shoulder with the IT specialist to piece together the puzzle, while respecting the Euro-

pean Directive on data protection for judicial purposes (Directive 2016/680). An often ignored but crucial aspect is that of assigning digital identity. In the Sky ECC environment, no one logs in with the name on the bulletin board, true. We were dealing with "*handles*" like *Shadow99* or *The King*. Our tactical work was to "*humanize*" these IDs. How? Through *cross-platform* corroboration. If Shadow99 was boasting about a new car, we had to find that car in real traffic in Bucharest, using LPR (License Plate Recognition) systems. If he sent a picture of a barbecue in the yard, we had to identify the location through OSINT (Open Source Intelligence) analysis. This "*digital ant work*" is what turns a simple chat into evidence that sends someone behind bars for 15 years. **Europol** calls this process *Targeting the Top*, emphasizing that decrypting messages is only the first step, the real victory being linking the fingerprint to the individual through traditional corroborated evidence.

In conclusion, the anatomy of these operations shows us that the future of security no longer lies only in "*muscle*", but in the ability to navigate this digital ocean. We had the data. We had the technology from external partners. But now we are in the process of polishing the legislation and internal procedures so that this "*digital flood*" does not unnecessarily spill into the court archives, but produces definitive convictions. The stakes? It's simple: to show them that, no matter how expensive their encrypted phone is, the law enforcement branch now has a digital "*upgrade*" that can no longer be ignored.

Tactical Challenges: From Anonymous ID to Real Handcuffs. Here is the operational "*slaughter*". If in the first phase we were happy like children that we had the data, in the second we realized that we had in our arms a ball of digital threads so tangled that it would have taken us three lifetimes to untangle it manually. Why? Because no self-respecting trafficker would put his ID picture as his avatar or sign himself "*Popescu Ion, high-risk dealer*".

Let's get to the "*heart of the problem*", where the bits hit the metal bars of the cell and where the months of work of the DCCO officers turns into hard years of prison, or, if we make a mistake, into a beautiful ranking.

The first tactical situation that had to be solved was when the "*Pandora's box*" called Sky ECC was opened, which was the assignment. You find yourself in front of your monitor with a handle like "*DarkKnight_RO*" or "*ElPadrino_Bucuresti*" who discusses with disarming ease about "*20 pieces of white*" that need to end up in a mall parking lot in Sector 3. Who is the character behind the avatar? This is where what we call in operational jargon "*humanization of bits*" comes into play. In the Romanian police environment, we quickly learned that a mountain of bits is not worth a penny if you can't tightly link them to a CNP (Personal Numeric Code), a person, and a physical address. As masterfully emphasized in The Invisible Shield: The Science Behind Public Safety, "*the science of modern public safety no longer resides in the brute force of intervention, but in the fine ability to map the volatile digital footprint over the often brutal physical reality of the suspect*" [1, p. 19].

How was this feat achieved? Through corroborations that would make even the most experienced old-fashioned detective sweat through his shirt. If DarkKnight sent a picture of a barbecue in the yard of an "*anonymous*" villa to the chat group, the analysis officers would immediately enter Google Earth, check the shapes of the roofs, the angle of the shadows and the surrounding vegetation until they found the exact location. If he boasted of a limited edition watch worth 50 thousand euros, we would immediately scan the social media pages of the suspect's entourage until we found the same bracelet sparkling on someone's wrist in a club in Mamaia. This is exactly the process described at the Vienna Conference: "*the 21st century police no longer only hunt individuals in the flesh, but process complex patterns of digital life to materialize the physical presence of the criminal*

in the judicial space" [3, p. 115].

The second big challenge, which gave logistical nightmares, was *the industrial volume of data*. Manually processing hundreds of thousands of messages, thousands of photos and audio files in a timely manner, before the "*goods*" leave the warehouse or the money is laundered through eight tax havens, is simply extreme sport. Here, the "*modern scientific method*" written about in the Annals Series on Military Sciences (2025) has practically become our new operational bible. We were forced to resort to Machine Learning algorithms to filter keywords and generate real-time connection graphs. You no longer have the luxury of reading the entire stream of cancans between traffickers; you have the machine tell you who communicates with whom most often, who gives the orders and who is the vital "*node*" of the network that needs to be cut first. According to the study Artificial intelligence and big data analysis, "*the fusion of the cold logic of the algorithm and the tactical intuition, the field "smell" of the case officer, represents the only real barrier to the metastatic expansion of cross-border criminal networks*" [2, p. 45].

And let's not forget the famous *cryptolanguage*. No one is so naive as to write "cocaine" or "*heroin*" in a chat, even an encrypted one. They use a hybrid slang, a digital bird language where the goods are "*snow*", "*t-shirts*", "*girls*", "*spare parts*" or "*paint*". Our tactics had to make a giant leap to decrypt not only the bits, but also the hidden meaning of this jargon that changes faster than iOS updates. Europol, in its strategic reports, sharply warned that "*the linguistic and tactical adaptability of organized crime groups represents the most effective countermeasure against automated surveillance systems, making human expertise in interpreting the cultural and criminal context indispensable*" [7, p. 95].

But the great tactical victory of the Romanian system in recent years has been its *operational simultaneity*. Thanks to access to this data through the secure channels of Europol and Eurojust, it was possible to carry out "*mirror*" raids with partners in Spain, the Netherlands or Germany. By the time the "*goods*" were unloaded in a clandestine warehouse in Ilfov, the police were already at the gate, because we had read the message with the exact location while the leader of the network was typing it relaxedly from a beach in Dubai. It is that technological "*checkmate*" that I mentioned in the introduction. However, the risk is proportionate: a single second of inattention, a leak of information or a misinterpretation of a metaphorical context in a message and all the surveillance work of months can be lost, leaving us with an empty file.

This is where the role of the European Commission comes in, which, through its recent directives on cybersecurity and electronic evidence, puts enormous pressure on us to maintain a fine balance. "*Technology is an incredible force multiplier, but it remains a sterile tool if it is not backed by a procedural rigor that guarantees that the truth extracted from the bits is identical to the legal truth recognized by the court*" [5, p. 12].

Basically, we have witnessed a professional mutation: the transition from the classic police officer, "*with the sole of his shoe worn out in the neighborhood*", to the police analyst, a hybrid who must master the Criminal Procedure Code to perfection, but also have notions of Python, metadata analysis and a lot, a lot of criminal psychology applied in the virtual environment. In Romania, our elite units, such as DCCO, have understood that "*cognitive retooling*" is not just a conference slogan, but a matter of professional life and death.

The ultimate tactical challenge, however, remains *the integrity of the digital chain of custody*. When you handcuff a drug kingpin based on messages extracted from a server in France, you have to be prepared to answer a thousand technical questions: How was the copy made? Who had access to it? Was any bit altered during the transfer through

the OAS? As stated in the Annals Series on Military Sciences, "*modern security is no longer played out only on the street, but also in the cloud, where state sovereignty is tested by encryption protocols and multiple jurisdictions*" [2, p. 50].

In conclusion, we have managed to break the mirror in which they admired themselves as intangible. But the tactical battle is far from being won definitively. Criminals are already migrating to other, even more obscure and sophisticated platforms. And those on the front lines must be ready to start all over again, with the same resources, but with a much more technologically "*reequipped*" mind. The stakes? Let's not let the "*invisible shield*" of the law becomes a mere decoration on the wall of an outdated institution.

Legal challenges: the courtroom carnage. Let's move on to the "*barrage of fire*", where bits turn into years of prison or resounding acquittals. If at Operative we managed to "*humanize*" the bits, in front of the court we hit a much higher wall – *admissibility*. Here, the fight is no longer fought with masked men and battering rams, but with commas, procedures and international treaties. Let's not fool ourselves: the top lawyers for the traffickers no longer dispute the fact that their client wrote those compromising messages. That would be ridiculous. They attack the "kitchen" through which those messages reached the Romanian judge's table.

The first and hardest legal battle is fought over *the concept of loyalty in the administration of evidence*. Lawyers are jumping up and down: "*Judge, how do we know that the server in France has not been manipulated? Where is the interception warrant issued by a Romanian judge for this Romanian citizen, on Romanian territory?*" It is a dilemma of digital sovereignty that gives chills to the judicial system. At this point, we must call on the "*heavy artillery*" of European cooperation. As the European Commission points out, "*electronic evidence has a volatile and cross-border volatile nature, which makes classic mutual legal assistance often ineffective, requiring direct mutual recognition mechanisms, such as the European Investigation Order*" [4, p. 3]. But wait, the battle is just beginning. In Romania, we are bumping into the "*elephant in the room*": the decisions of the Constitutional Court regarding interceptions and their legality. Lawyers frequently invoke the fact that the evidence from Sky ECC or EncroChat is, in fact, "*state hacking*". They claim that the French authorities hacked an IT system without respecting the procedural guarantees of the Romanian Code of Criminal Procedure. Here, we come up with the counter-argument offered by Europol and Eurojust, which clearly state that these operations were carried out under the jurisdiction and authorization of the magistrates of the states where the servers were located (France and the Netherlands). The principle is simple, but difficult for the defense to "*swallow*": if the evidence was legally obtained in the issuing state, it is admissible in the executing state (Romania), according to the principle of mutual recognition that underlies the single European judicial area.

However, our courts are cautious. And they have reason to be. As mentioned in The Invisible Shield: The Science Behind Public Safety, "*the technological shield of public safety cannot operate in a legal vacuum; it must be doubled by a procedural transparency that ensures that the right to a fair trial is not sacrificed on the altar of technological efficiency*" [1, p. 23]. In other words, it is not enough to have evidence; you must demonstrate that the digital chain of custody is intact. Any suspicion that the data was altered during transfer through Europol servers or when downloaded to DIICOT databases can lead to the exclusion of evidence. It is an "*all or nothing*" game.

Another major legal challenge is *the right to confrontation*. How can a defendant challenge the digital "*witness*"? In the case of an undercover witness, you can hear him (even with a distorted voice). But how do you "*hear*" a decryption algorithm or metadata

analysis software? This issue of the technological "*black box*" is intensely debated in Police in the 21st century: current missions and changing challenges, where it is shown that "*the major challenge of modern justice is to translate the technical complexity of cyber-interception into an intelligible legal language that allows the real exercise of the right of defense*" [3, p. 116].

Moreover, we are faced with the interpretation of the decisions of the Court of Justice of the European Union (CJEU). Recently, in famous cases, the CJEU began to set strict limits on the generalized and undifferentiated storage of traffic data. Lawyers immediately take advantage: "*This data was collected "in bulk", targeting thousands of users, not just my client. It is illegal mass surveillance!*". We must demonstrate that the interception targeted a specific criminal infrastructure (EncroChat being practically a service dedicated to criminals), not the general population. This is exactly what the study Artificial intelligence and big data analysis in crime prevention and combat supports: "*the difference between illegal surveillance and elite investigation lies in the proportionality of the measure and the specificity of the digital target*" [2, p. 49].

In Romania, the battle is also fought over *technical expertise*. Often, judges request computer forensic expertise to confirm that the extracted messages are real. But who does the expertise? Our specialists from the specialized laboratory. The lawyers say: "*Well, wait, the laboratory is still at the Police/Romanian Intelligence Service, it's not independent!*" And so we enter a spiral of appeals that can block a file for years. Here, "*cognitive retooling*" must also be applied to magistrates. The 21st century judge must understand what a hash is, how end-to-end encryption works, and why a digital copy is as "*original*" as the source. Without this legal-technical literacy, we risk throwing the best evidence in the trash due to a simple misunderstanding of the phenomenon.

The stakes are indeed huge. If this evidence falls en masse, organized crime receives a "*free pass*" in the digital space. As Europol warned in its reports, "*failure to ensure a sustainable legal framework for electronic evidence will lead to a dangerous digital impunity, where criminal groups will always be one step ahead of the law*" [5, p. 7].

In conclusion, the legal challenges in Romania on the Sky ECC/EncroChat files are the ultimate stress test for our justice system. It's not just about "*catching the thieves*", but about how we adapt fundamental concepts of law (born in the age of paper and eyewitness testimony) to the brutal reality of servers thousands of miles away and billions of encrypted messages. We must be surgeons of the law, operating with precision, because any procedural error means a "*shark*" back at large, richer and more convinced than ever that his technology is, indeed, an invisible shield.

Conclusions and perspectives. The future is no longer written with ink, but with bits. We have reached the finish line of this analysis, but in the field, the battle is only now heating up. Let's draw the curtain on this complex landscape and see what we are left with (...in our pockets) after the digital "*storm*" caused by Sky ECC and EncroChat.

Let's be realistic: the era in which the "*bad guys*" slept peacefully on encrypted down pillows is more or less over. But make no mistake, organized crime is not sitting around crying for servers in France. They are rebranding, migrating to new and more obscure platforms, to even deeper "*darknets*". However, the lesson learned by us, those in the public order and national security system in Romania, is a vital one.

The first big conclusion? *International cooperation is no longer a diplomatic "fad", but our operational oxygen*. Without Europol, Eurojust and the European Investigation Order, we would be left looking at blocked phones like expensive bricks. As the European Commission points out, "*in an interconnected world, the security of a Member State depends*

directly on the speed with which electronic evidence circulates between jurisdictions" [5, p. 15]. Romania has shown that it can play in the big leagues, but we must maintain this digital "*guerrilla*" agility.

The second conclusion, perhaps the hardest for us, is the need for a *total cognitive retooling*. It is no longer enough to have "*muscle*" and know how to put on the handcuffs. The DCCO police officer or the DIICOT prosecutor of the 21st century must be half data analyst, half field tactician. According to the study Artificial intelligence and big data analysis, "*the fusion of the cold logic of the algorithm and the tactical intuition of the officer is the only real barrier to the expansion of criminal networks*" [2, p. 45]. If we do not invest heavily in training, we risk having state-of-the-art machines but not knowing how to get them out of the parking lot.

From a legal perspective, the "*carnage*" in the courtrooms has shown us that we need a *clearer legislative framework*. We cannot leave the admissibility of billions of euros of evidence to the mercy of dusty procedural interpretations, conceived in the era of the typewriter. We must clearly define in the Code of Criminal Procedure the status of this data extracted from external servers. As stated in The Invisible Shield, "*the technological shield of public safety remains a mere museum piece if it is not doubled by a procedural rigor that ensures that digital truth is also legal truth recognized by the court*" [1, p. 25].

And what comes next? The prospects are challenging. We are heading towards an era of *Predictive Policing*. We no longer want to just catch traffickers after the goods have hit the streets; we want to be there when the first order is typed. But be careful! In the pursuit of efficiency, we must not fall into the other extreme. "*21st Century police missions must navigate the thin line between necessary surveillance and respect for fundamental rights, in a fragile democratic balance*" [3, p. 117].

Ultimately, *the stakes of this game of technological* "*checkmate*" *are the very safety of our communities*. We have managed to break their myth of invulnerability, but the fight continues. We must remain curious, remain technical and, above all, remain united under the same "*umbrella*" of European security.

Abstract
Modern methodological approaches to anticipating criminal phenomena rely on prospective studies, trend analysis, and early-warning mechanisms to understand and forecast developments in security and crime. These methods integrate scenario analysis, risk indicator assessment, and studies on conflict dynamics, offering a comprehensive perspective on possible future developments. In security studies, such approaches are essential for the early identification of crises and for supporting strategic decision-making under conditions of uncertainty. In Romania, these tools are applied within analysis and early warning centres, where trends are monitored and scenarios are developed for possible evolutions in crime and conflict, enabling rapid and adaptive responses from authorities, as well as the development of preventive public policies aimed at reducing vulnerabilities and strengthening regional and international security in the long term. These methodological approaches contribute to the consolidation of a culture of foresight, support interdisciplinary research, and provide a useful framework for developing innovative crime prevention strategies in the context of current global challenges and for enhancing a more robust and sustainable international security environment.
Keywords: prospective studies, algorithms, anticipation, risk factors, criminality.

ABORDĂRI METODOLOGICE MODERNE ÎN ANTICIPAREA FENOMENELOR INFRACȚIONALE

Abstract
Abordările metodologice moderne în anticiparea fenomenelor infracționale se bazează pe utilizarea studiilor prospective, a analizei de tendințe și a mecanismelor de avertizare timpurie, pentru a înțelege și a anticipa evoluțiile din domeniul securității și criminalității. Aceste metode integrează analiza de scenarii, evaluarea indicatorilor de risc și studiile privind dinamica conflictelor, oferind o perspectivă complexă asupra posibilelor evoluții viitoare. În contextul studiilor de securitate, aceste abordări sunt esențiale pentru identificarea timpurie a crizelor și pentru fundamentarea deciziilor strategice în situații de incertitudine. În România, astfel de instrumente sunt aplicate în cadrul centrelor de analiză și avertizare timpurie, unde sunt monitorizate tendințele și sunt elaborate scenarii pentru posibile evoluții ale criminalității și conflictelor, facilitând reacții rapide și adaptate ale autorităților, dar și dezvoltarea unor politici publice preventive, orientate spre reducerea vulnerabilităților și consolidarea securității regionale și internaționale pe termen lung. Aceste abordări metodologice contribuie la consolidarea unei culturi a anticipării, sprijină cercetarea interdisciplinară și oferă un cadru util pentru dezvoltarea de strategii inovatoare de prevenire a criminalității în situația provocărilor actuale globale și pentru o securitate internațională sporită și durabilă.
Cuvinte-cheie: studii prospective, algoritmi, anticipare, factori de risc, criminalitate.

Introduction. Prospective studies – scientific investigations utilising preliminary analysis techniques to examine possible future scenarios – are among the most innovative methods of modern research. This preventive approach transforms the social paradigm from one primarily focused on confronting crisis situations to one more centred on anticipating them. It essentially represents a future-oriented time perspective. The main advantages of prospective studies, compared to retrospective ones, lie in reducing selection errors (biases) and preparing for vulnerability situations, characterised by two defining elements: adaptation to them and even the possibility of influencing their evolution. Predictive mechanisms guide decision-makers in developing strategies to manage vulnerability situations.

Adapting to risks entails establishing proactive measures after identifying and evaluating predictions, scenarios, forecasts, and early warning operations. Decisions are no longer based solely on the past and present. Thanks to prospective studies, which are grounded in rigorous simulations of the future, responses to threats are informed [1, pp. 43-46].

Regarding the capacity to influence the dynamics of crisis situations, the following question arises: Can future developments be steered by current actions? Can advantageous alternatives be favoured? Can unfavourable outcomes be avoided? Can certain exposures be eliminated? In this context, prospective studies become the most attractive tool for countering global instability [2, p. 32]. They assist both in understanding perspectives and in creating the conditions necessary for things to happen differently – safer, more sustainable, and more efficient. Preventing antisocial acts transforms from a defensive concept into an active tool for optimising the future.

There is no doubt that developing prospective studies requires working with a series of well-defined, thoroughly grounded concepts and methodologies [2, p. 32] to generate accurate, functional forecasts for coherent, valid, and justified decision-making. Among these are qualitative analysis (which can capture cultural and social nuances influencing human behaviour and encourage the development of effective community intervention strategies) and quantitative analysis (through which forecasts and statistics can be generated and future trends established) [3, pp. 102-104]. Combining these methods ensures a comprehensive and detailed perspective on the factors affecting public safety.

Real innovation is not merely the analysis of behaviours or phenomena over time, but how the information obtained transforms into a mechanism capable of adapting to and actively influencing the observed reality. Compared to the classic linear model, which involves collecting data, analysing it, and publishing results, the progressive model is circular and dynamic, based on continual iterations and adjustments. In fact, risk is no longer treated as a fixed function but rather as an active, evolving process that depends on interactions among various factors. Thus, we are talking about complex phenomena monitored through modern systemic methods, adapted and valuable in their role as decision-making support.

This study aims to answer the question: to what extent do modern predictive methods effectively contribute to optimising public safety decisions, considering their methodological and ethical limits?

Methods and materials applied. This scientific article falls within the category of theoretical research, based on an in-depth analysis of specialised literature and relevant concepts to anticipate criminal phenomena. The paper adopts a theoretical-analytical approach, focusing on interpreting, correlating, and critically evaluating the specialised literature to outline a coherent perspective on the predictive mechanisms used in public

security. Critical analysis played an essential role, examining the main contributions from the fields of criminology, prospective studies, and prevention-oriented analyses. This method allowed not only the synthesis of established viewpoints but also the highlighting of the limitations and challenges associated with new paradigms, particularly regarding the use of data-driven tools and probabilistic models. The endeavour sought to strike a balance between presenting the advantages of these approaches and emphasising the risks of their uncritical application.

Logical analysis was also a central element of the research, facilitating the organisation of ideas and the construction of explanatory relationships between the concepts used. By relating to risk factors and facilitating conditions, probabilistic connections were highlighted, avoiding deterministic interpretations. This manner of structuring the argumentation clarified how certain variables could influence the occurrence of criminal behaviours without rendering them absolute causes.

To systematise the content more effectively, classification was also utilised to order information according to criteria relevant to the analysed field, delineating categories of factors involved in the dynamics of the criminal phenomenon, as well as the main types of methodological approaches identified in the specialised literature. This organisation contributed to enhancing the clarity of the exposition and facilitating the following of the argumentative thread.

Regarding the materials used, the research is based solely on documentary sources, specifically scientific works, specialised studies, and relevant bibliographic references. Additionally, a conceptual analysis was conducted of various tools and techniques for crime anticipation, such as forecasting, scenario planning, and predictive models, without directly applying them to concrete data. References to these tools served an illustrative and explanatory role, contributing to an understanding of their use in practice. By combining these methods, the study offers an integrated approach to the theme under examination, emphasising conceptual rigour and argumentative coherence. The undertaken endeavour aims to highlight the main directions of evolution in anticipating criminal phenomena while maintaining a clear boundary between theoretical analysis and potential practical applications.

The paper's contribution lies in the critical integration of predictive models with ethical and institutional dimensions, proposing a balanced perspective on the use of algorithms in crime prevention. Complementing the theoretical-analytical endeavour, the research highlights the need to integrate future empirical approaches that test predictive models in concrete institutional contexts. Such a direction would allow for comparative evaluations of the performance of various analytical tools, as well as the validation of their relevance concerning the specificities of national public order and public safety systems.

Discussions and results obtained. **1. *Forecasting as a Tool for Grounding Managerial Decisions***. Identifying trends, risks, and strategies to counter vulnerabilities, and quantifying security impacts are the prerogative of management structures. The responsibility of the leadership system is materialised in the obligation of decision-makers to undertake concrete measures aimed at protecting and strengthening the organisation's interests, but also concerns social commitment, meaning the collective well-being of society. Planning, as a function of the managerial process, entails an overall vision that must also account for various strategic forecasts [4, pp. 135-137]. It is worth mentioning here that forecasts – tools for knowledge and diachronic investigation – extract and interpret development trends and trajectories of processes, states of affairs, or events [5, pp. 53-57].

By using forecasts, decision-makers evaluate future directions regarding qualitative

and quantitative components specific to the activity domain. As a coherent set of analytical approaches through which managers integrate existing dynamics, identify regularities, and formulate anticipations regarding the phenomena and processes likely to manifest within a determined time horizon. Generally, projections cover several years and are approximate, serving as a foundation for establishing strategic objectives and guiding institutional-level decisions. These studies require articulating a well-defined methodological framework in which statistical analysis, predictive modelling, scenario techniques, and historical trend evaluations are used in concert to construct credible representations of the evolution of criminality. Such an approach involves leveraging longitudinal data series, socio-economic indicators, and institutional variables that correlate with risk factors identified in the specialised literature to formulate hypotheses about criminal dynamics.

Anticipating criminal phenomena has evolved from simple intuitions to a discipline based on probabilistic determinism. Simply put, while the future cannot be predicted with mathematical certainty, it is known that crime does not appear out of nowhere; rather, it follows certain complex causal patterns. To decipher these mechanisms, analysis is no longer limited to descriptive statistics; instead, advanced instruments such as multivariate regression models, Bayesian networks, which allow updating probabilities when new data emerge, machine learning algorithms, and simulations are used to analyse the relationship between multiple independent variables and one or more outcomes. These technologies help to see beyond raw numbers and understand how criminal behaviour propagates within social dynamics.

An essential element of modern research is the development of alternative scenarios. The question arises: what would happen if certain variables were to change? This analysis examines how modifications to the legislative framework, economic fluctuations, or technological advancements could influence patterns of criminality. This method allows decision-makers to test the system's effectiveness before an actual crisis occurs, identifying vulnerabilities that require proactive intervention. For these projections to be genuinely credible, a rigorous methodology for triangulating data is necessary, meaning a strategy for information validation. Official police statistics are necessary but are often supplemented by victimisation surveys, qualitative studies, and open-source intelligence analyses. This diversified approach provides a much more faithful image of reality on the ground. Simultaneously, predictive models undergo continuous calibration to verify that results remain stable and precise under varying social conditions.

Anticipation is a decisional phenomenon, not merely an analytical one. Beyond the theoretical component, the goal is pragmatic – optimising public policies and resources. In a world where institutions have limited logistical resources, predictive analysis indicates the areas or social groups at high risk of victimisation [6, pp. 172-174]. Thus, preventive strategies can be grounded in empirical evidence rather than assumptions.

2. Data-Based Anticipation Models and Their Impact on Institutional Decision-Making. In preventing risk situations, prospective studies are fundamental. They allow the identification of vulnerability factors and are sine qua non tools for developing prophylactic strategies. A significant advantage of these studies is that, in the digital age, they operate on vast data flows, paving the way for predictive prevention through algorithms that can detect threats and identify much more effective solutions than traditional analysis. It is crucial to mention that operational formulas must be explainable and auditable. Algorithms cannot be used without a solid ethical framework.

The use of algorithmic systems and massive data volumes has radically changed how social reality is understood and managed. Currently, information no longer circu-

lates freely; rather, it is filtered by digital infrastructures that priorities data according to often invisible logics for the ordinary user. This change brings significant advantages in knowledge accumulation but also creates new areas of uncertainty, especially where access to data is unequal or where interpretive models reach their limits. Decisions based on Big Data generate intense debates in contemporary discourse. On the one hand, these technologies are appreciated for their efficiency in identifying repetitive patterns and formulating precise predictions. On the other hand, there is a real risk of adopting and amplifying existing human errors or biases within society [7, p. 180].

In this context, recent research highlights the phenomenon of algorithmic bias, in which predictive models can reproduce or even amplify existing structural inequalities in society. Empirical analyses have demonstrated that certain risk assessment systems used in criminal justice can yield discriminatory results based on indirect socio-demographic variables [8]. These findings underscore the necessity for rigorous validation and audit mechanisms, as well as constant human oversight in the decision-making process [9].

In international literature, the development of the concept of predictive policing reflects an increasingly pronounced orientation toward utilizing statistical models and algorithms to anticipate crime [10]. These systems use historical data and contextual variables to estimate the probability of criminal offences occurring in specific areas or time periods, thereby optimising resource allocation within institutions. Studies conducted in this field highlight both the efficiency of these tools in reducing certain types of criminality and their limitations, particularly regarding dependence on data quality and the risk of perpetuating existing inequalities [11, pp. 85–90].

Regarding forecasting criminality, there is a noticeable shift from classical forecasting methods to much more complex probabilistic models. Anticipation is no longer limited to the simple extension of past trends; it now involves machine learning techniques capable of capturing invisible relationships among economic, demographic, and social behaviour. These approaches enable the construction of much more robust evolutionary scenarios, based on a combination of quantitative data and contextual analyses. However, the performance of these models depends entirely on the quality of the information input into the system: incomplete data or measurement errors can lead to distorted conclusions that, once translated into administrative decisions, can have significant consequences [12, pp. 17-19]. For this reason, the continuous calibration and verification of models are essential to maintaining the credibility of prospective analyses.

A major challenge is the tendency of institutions to shift part of the decision-making responsibility onto algorithms. Although applications that estimate the risk of recidivism or the probability of committing offences provide valuable analytical support, they raise serious transparency issues and require rigorous controls over automatically generated decisions to ensure accountability in decision-making.

Methodologically, modern crime research requires interdisciplinary effort. Sociology, criminology, psychology, and data science jointly contribute to understanding the multiple causes of antisocial acts. This correlation of perspectives provides a much stronger basis for public policies, enabling the adoption of informed and strategic measures. The development of digital technologies has also opened new avenues for information collection, including through the analysis of online environments, these sources providing relevant insights into social interactions and preferences in real-time. However, their use in prospective studies demands heightened attention to personal data protection, as the line between useful analysis and intrusive surveillance becomes increasingly difficult to delineate. In practice, these modern methods enable a shift from delayed reactions to a

preventive strategy grounded in clear evidence. The early identification of new operational methods or criminal tendencies aids in optimising resources and swiftly adjusting interventions.

Openness to information and communication technology forms the foundation for the proper functioning of the current social framework [13, p. 145]. However, technologies meant to protect us can simultaneously become sources of vulnerability at both the individual and community levels. The digitisation process, especially through massive data volumes and artificial intelligence, has profoundly transformed the very meaning of knowledge, how it is used, and access to it [7, p. 202]. Using algorithms to anticipate human behaviour necessitates profound reflection on the balance between security and freedom. In the absence of clear regulations, technology can undermine fundamental rights. Therefore, integrating predictive analysis into studies of criminality must be accompanied by a high degree of ethical responsibility, ensuring that the effectiveness of interventions does not contravene the principles of the rule of law.

3. Scientific Grounding of Institutional Intervention. Grounding the decision-making process on empirical evidence marks a departure from administrative models based on intuition or the simple reproduction of institutional routines that no longer correspond to contemporary social realities. This approach transforms public safety management into a precise activity, in which every adopted measure must be based on rigorous data analysis and a deep understanding of the mechanisms that generate criminality. In an age of complexity, an institution's success depends on its ability to process vast amounts of information to identify vulnerabilities that superficial analyses might overlook.

The efficiency of this model is reflected, first and foremost, in how resources are managed [5, pp. 58-59], considering that the workforce and allocated budgets are always limited relative to the scale of antisocial phenomena. Instead of distributing staff uniformly and often inefficiently across the entire area of competence, managers can now focus their efforts on areas where risk models indicate a higher probability of incidents. This specialisation of intervention enables a strategic presence in the field, where preventive actions are calibrated to the specifics of each area or exposed social group. The result is an optimisation of operational costs and an increase in the state's relevance in addressing citizens' needs.

In addition to logistical aspects, evidence-based architecture introduces a rigorous performance evaluation system that obligates institutions to maintain constant professional integrity. Any implemented strategy is subject to real-time monitoring to verify whether theoretical projections are confirmed in practice. When figures indicate a discrepancy between proposed objectives and obtained results, the managerial system has a duty to intervene promptly to adjust the working parameters. This dynamic of continuous learning eliminates the risk of investing time and resources in outdated methods, instead providing the opportunity to multiply tactics that lead to a real reduction in victimisation rates.

Integrating scientific research into the decision-making process also provides a safeguard against subjective errors and biases that can distort human judgment. When a decision is supported by logical arguments and demonstrated correlations between socio-economic factors and criminal behaviours, the degree of error significantly decreases. This methodological rigour provides the necessary support for sustainable public policies that can withstand the test of time and produce profound transformations in the community's safety structure.

We emphasise the importance of legitimacy that the use of data brings in the pub-

lic space. Transparency regarding how administrative decisions are made, explained through objective analyses, contributes to rebuilding the trust bond between citizens and the authority. In a democratic environment, the state's power to intervene preventively must always be justified by clear evidence demonstrating the utility and necessity of each measure. Thus, public safety evolves toward a stage of professional maturity, where data science and ethical responsibility unite to protect both social order and individual fundamental rights.

4. Explanatory Models and Analytical Tools in Criminality Anticipation. Surveying the specialised literature, there is a transition from traditional explanatory models, centred on retrospective analysis, to thinking frameworks oriented toward prediction and prevention. Thus, classical criminology theories, based on the relationship between the individual and the social environment [14, pp. 71-73], are now complemented by interdisciplinary approaches that integrate statistical tools, digital technologies, and algorithmic models. This paradigm shift reflects methodological evolution and adaptation to the increasing complexity of criminal phenomena.

Conceptually, anticipating criminality involves identifying patterns in the manifestation of antisocial behaviours and correlating them with a series of determining factors that can be grouped into several relevant categories: individual factors (behavioural predispositions or personal history), social factors (family environment, level of social integration, group influence), and contextual factors (spatial characteristics or situational opportunities). Such a classification allows for both a nuanced understanding of the phenomenon and the structuring of analytical models capable of capturing the interdependencies among the variable elements.

Methodologically, modern approaches to anticipation stand out for their use of various tools that go beyond descriptive analysis. Data-based predictive models leverage large volumes of information to identify iterative schemes and estimate the probability of criminal offences occurring under specific conditions. These are complemented by behavioural analysis techniques aimed at identifying early indicators of deviance and by spatio-temporal models that enable the mapping of criminal risk.

Compared to traditional approaches, these methods offer several clear advantages, including the ability to handle a larger number of variables and the ability to generate prospective scenarios. However, they are not without limitations. Dependence on data quality, the risk of algorithmic bias, and the difficulty of integrating qualitative dimensions of human behaviour pose major challenges that warrant critical evaluation of the generated results. Comparative analysis of different models is very important to avoid overestimating predictive capacity and to maintain a balance between rigour and interpretive caution. Furthermore, anticipation mechanisms can be understood in terms of the causal relationships between risk factors and criminal manifestations. It can thus be observed that certain conditions, such as social marginalisation or negative peer influences, do not directly cause the commission of a criminal act but rather increase the likelihood of its occurrence [15, pp. 23-25]. Therefore, anticipation does not operate with certainties but rather with probabilistic estimates based on observable correlations and trends. This perspective aids in formulating coherent explanatory chains where the triggering factors are correlated with facilitating situations and potential behavioural outcomes.

From an applied perspective, integrating these methodological approaches yields more effective prevention strategies [16, p. 451]. By identifying risk areas and vulnerable categories, responsible institutions can intervene more effectively, optimising resource allocation and reducing the incidence of criminal activity. Additionally, the use of pre-

dictive models necessitates clear ethical and legal frameworks governing the collection, processing, and utilisation of information.

From a legal standpoint, the use of predictive tools in public safety must be analysed in light of European standards on data protection and fundamental rights. The General Data Protection Regulation (GDPR) and the case law of the Court of Justice of the European Union impose clear limits on the automated processing of data and decision-making based solely on algorithms [17, pp. 17-19]. Consequently, any crime anticipation system must respect the principles of proportionality, transparency, and accountability to avoid unjustified intrusions into privacy and other fundamental rights [18, pp. 17-19].

Conclusions. The evolution of contemporary society, marked by accelerated digitisation, increased mobility, and diversification of social risks, necessitates a reconsideration of the procedures through which the criminal phenomenon is understood and managed. Prospective studies are mechanisms capable of identifying favourable conditions and potential trajectories of deviant behaviour in advance. They are increasingly used in decision-making processes for crime prevention and resource management, providing additional benchmarks by organising and interpreting large volumes of data into an operationally usable form. These tools are utilised within broader decision-making mechanisms, where the final interpretation remains essential for directing interventions.

Anticipating criminal phenomena results from a gradual rapprochement between two analytical approaches that have evolved separately: on the one hand, classical explanations from criminology, focused on understanding the causes of crime, and on the other hand, recent approaches oriented towards identifying patterns and trends in the phenomenon. This merging results in a shift in perspective, placing emphasis on both explaining events that have already occurred and on how they can be understood in terms of probability and development over time; predictions are, in fact, an extension of criminological understanding rather than a break from it. The criminal phenomenon is undoubtedly a dynamic process that changes in response to numerous factors acting simultaneously and interdependently. Instead of simple causality, a complex structure of influences emerges, in which individual, social, and contextual elements overlap and mutually enhance one another [19, p. 239].

Risk factors can be better understood when grouped into three main levels: individual, social, and contextual. The individual level addresses personal characteristics and specific behaviours, the social level encompasses relational and group influences, and the contextual level reflects the economic, institutional, and environmental conditions under which social activity occurs. The importance of this framework lies in how these levels interact to create favourable or unfavourable conditions for the manifestation of criminal behaviour.

Finally, it is pertinent to note that data-driven predictive models impose a series of constraints, primarily related to the quality of the information used and its interpretation. The results obtained depend directly on the consistency of the input data, and any imbalances or errors can significantly affect the conclusions. For this reason, employing these models necessitates constant reference to critical analysis and human validation, ensuring that the results are understood in their real context and not treated as absolute truths. Yet complex decisions always entail estimating what is to come. Most solutions, whether significant or minor, are predictions about the future.

From a practical perspective, the results of the analysis support the need to strengthen the institutional framework by systematically integrating predictive tools into public safety decision-making, accompanied by the development of clear mechanisms for au-

diting and controlling the algorithms used. Furthermore, it is essential to develop public policies to standardise data use and increase decision-making transparency, to mitigate risks associated with algorithmic bias and promote the critical use of predictive models. At the same time, investments in interdisciplinary professional training for personnel at responsible institutions are vital to effectively capitalising on these tools.

Regarding future research directions, there is a clear need to develop empirical studies to test the effectiveness of predictive models in concrete institutional contexts, as well as to explore the impact of using artificial intelligence on fundamental rights in the process of anticipating and preventing criminality.

Therefore, the contribution of this study lies in highlighting the necessity for an integrated approach that combines the analytical rigour of predictive models with the ethical and legal demands specific to the rule of law. Anticipating criminal phenomena cannot be reduced to a mere technological issue; it must be understood as a complex process at the intersection of data, decision-making, and institutional responsibility. This perspective opens new avenues for research aimed at evaluating the real impact of these tools on the efficiency of public policies and the protection of fundamental rights.

CRIMINAL DENUNCIATION AS A CRIMINAL POLICY INSTRUMENT IN COMBATING DRUG TRAFFICKING: ANALYSIS OF ROMANIAN REGULATION AND COMPARATIVE LAW BENCHMARKS

Vasile COMAN,
PhD Candidate,
Faculty of Law, Babeș-Bolyai University, Romania,
Judge, Cluj Court of Appeal – Criminal and Juvenile Division, Romania
ORCID: 0009-0006-9225-2310

Abstract

The study examines the role of the criminal denunciation as an instrument of criminal policy in combating drug trafficking, with a particular emphasis on the legal mechanisms that incentivize the cooperation of individuals involved in criminal activities with judicial authorities. The research analyzes the regulatory framework under Romanian law, as established by Law No. 143/2000 on the prevention and combating of illicit drug trafficking and consumption, focusing on the institution of special grounds for non-punishment, respectively for the mitigation of the applicable penalty for the individual who reports the offense and contributes to the identification of other participants in the crime [5, Art. 14-15].

The analysis includes an interpretation of the legal provision in national case law, highlighting the manner in which Romanian courts have applied the statutory conditions concerning the timing of the denunciation, the effective nature of cooperation with judicial authorities, and its impact on the determination of criminal liability. At the same time, the study advances a comparative law perspective by relating the Romanian regulatory framework to legislative solutions existing in other European legal systems, where analogous institutions are designed to facilitate the detection and dismantling of organized crime networks.

Through this approach, the paper seeks to highlight the effectiveness and the inherent limitations of criminal denunciation as a legal mechanism aimed at combating and dismantling drug trafficking networks, as well as to identify potential directions for interpretative development and legislative reform within the framework of contemporary criminal policy.

Keywords: criminal denunciation, drug trafficking, Law No. 143/2000, grounds for non-punishment, reduction of penalty, case law, comparative law.

DENUNȚUL PENAL CA INSTRUMENT DE POLITICĂ PENALĂ ÎN COMBATEREA TRAFICULUI DE DROGURI: ANALIZA REGLEMENTĂRII ROMÂNE ȘI REPERE DE DREPT COMPARAT

Abstract

Studiul analizează rolul denunțului penal ca instrument de politică penală în combaterea traficului de droguri, cu accent pe mecanismele juridice care stimulează cooperarea persoanelor implicate în activități infracționale cu autoritățile judiciare. Cercetarea examinează reglementarea din dreptul român prevăzută de Legea nr. 143/2000 privind prevenirea și combaterea traficului și consumului ilicit de droguri, cu accent pe instituția cauzei speciale de nepedepsire, respectiv de reducere a pedepsei aplicabile persoanei care denunță fapta și contribuie la identificarea altor participanți la infracțiune [5, art. 14-15].

Analiza include interpretarea normei în jurisprudența națională, evidențiind modul în care instanțele române au aplicat condițiile legale referitoare la momentul formulării denunțului, caracterul efectiv al cooperării cu organele judiciare și impactul acesteia asupra stabilirii răspunderii penale. Totodată, studiul propune o perspectivă de drept comparat, prin raportarea reglementării române la soluții legislative existente în alte

sisteme juridice europene, unde instituții similare urmăresc facilitarea descoperirii și destructurării rețelelor de criminalitate organizată.

Prin această abordare, lucrarea își propune să evidențieze eficiența și limitele denunțului penal ca mecanism juridic destinat combaterii și destructurării rețelelor destinate traficului de droguri, precum și să identifice posibile direcții de interpretare și dezvoltare legislativă în contextul politicilor penale contemporane.

Cuvinte-cheie: denunț penal, trafic de droguri, Legea nr. 143/2000, cauză de nepedepsire, reducere a pedepsei, jurisprudență, drept comparat.

Introduction. When it comes to the detection of drug-related offenses, an examination of criminal case law in Romania reveals a fact that is difficult to disregard: the majority of reports originate from denunciations made by individuals already involved in the commission of offenses within this sphere and, almost improperly, from ex officio notifications by the criminal investigation authorities.

Limiting the analysis to the subject matter of the present study, namely, criminal denunciation as a lever of control for the detection, sanctioning, and, ultimately, the combating of the phenomenon associated with drug distribution within society, its utility as a reporting mechanism, expressly enshrined in the provisions of the Romanian Code of Criminal Procedure (Article 290), becomes readily apparent (Article 290(1) of the Code of Criminal Procedure provides that a denunciation constitutes the notification made by a natural or legal person regarding the commission of a criminal offense). At the same time, it will be demonstrated that, within the framework of special legislation governing the drug regime, denunciation acquires multiple legal valences, depending on the timing of its submission and its impact on the substantiation of the reported offenses, the fulfillment of certain statutory conditions being required.

From the perspective of traditional ethics (honor, loyalty), denunciation signifies the betrayal of a close associate (co-perpetrator, accomplice), that is, the breach of a "pact", at least implicit, of solidarity.

The notion that the State "rewards betrayal" has been subject to criticism since the adoption of Romania's first modern Criminal Code in 1865. Under the regime of the 1865 Criminal Code, denunciation was regulated as an absolutory excuse from punishment (a ground for non-punishment), in the interest of society's objective of identifying offenders. However, legal doctrine justifiably argued that "this exemption from punishment is immoral, as it grants such a significant reward to a person who, in addition to the offense itself, of which he is equally guilty as the others, adds betrayal, thereby revealing an even greater degree of perversity".

At the same time, another effect closely aligned with the purpose of the regulation was acknowledged, namely that, in such circumstances, "offenders will find it more difficult to secure accomplices with whom to organize conspiracies (...), as they will fear one another" [1, p.168].

Criminal Denunciation. Valences in the Light of Law No.143/2000 on the Prevention and Combating of Illicit Drug Trafficking and Consumption. The principal special statute governing the repression of drug trafficking (lato sensu) in Romania is Law No. 143/2000 on the prevention and combating of illicit drug trafficking and consumption [5]. The legal framework in the field of prohibited substances is further complemented by Law No. 194/2011 on combating operations involving products susceptible to having psychoactive effects, other than those regulated by the normative acts in force [6].

Thus, in the context of drug-related offenses, criminal denunciation may serve a dual function, namely as a ground for non-punishment or as a ground for the mitigation

of the penalty, a system that is likewise encountered in other European criminal legislations concerning the prohibition of drug trafficking.

a) Criminal Denunciation: Ground for Non-Punishment.

According to Article 14 of Law No. 143/2000, a person who has committed one of the offenses provided for in Articles 2-9 shall not be punished if, prior to the initiation of criminal proceedings, they report to the authorities their participation in the commission of the offense, thereby contributing to the identification and the bringing to criminal liability of the perpetrator or of the other participants.

Article 14 of Law No. 143/2000 establishes a special ground for non-punishment, affording the individual who has participated in the commission of the offenses provided for in Articles 2-9 the possibility of avoiding criminal liability if they report to the authorities their own involvement prior to the initiation of criminal proceedings (self-denunciation). This measure is aimed both at encouraging cooperation with investigative authorities and at dismantling drug trafficking networks, while recognizing the social value of the contribution made to the identification and prosecution of other participants.

The denunciation must be made prior to the initiation of criminal proceedings, thereby demonstrating the initiative and good faith of the person involved. Although the legislator does not distinguish between proceedings initiated *in rem* (with respect to the act) and those initiated *in personam* (with respect to a person), it is generally accepted that the relevant temporal threshold is the reporting of the offense before the commencement of criminal proceedings *in personam* against at least one individual in relation to the reported act.

In case law, there is divergence as to whether the reporting individual may benefit from the ground for non-punishment in situations where they are not part of a plurality of offenders, namely where they acted as the sole perpetrator of the offense committed.

Thus, in a case from the jurisprudence of the Cluj Court of Appeal, it was held, by majority opinion (2 to 1), that a self-denunciation concerning the reporting individual's own conduct cannot be excluded from the scope of application of this legal provision [9]. More recently, the issue has been settled – albeit only with reference to the offense provided for in Article 2 of Law No. 143/2000 – by Decision No. 30 of 10 February 2026 of the High Court of Cassation and Justice (Panel for the Resolution of Questions of Law), which established that "this special ground for non-punishment provided for in Article 14 of Law No. 143/2000 on the prevention and combating of illicit drug trafficking and consumption, as republished, is not applicable to a reporting individual who is the sole perpetrator of the offense committed and provided for in Article 2 of the same law". For the same reasons, we consider that this decision is likewise applicable to the other offenses referred to in Article 14.

With regard to the legal nature of the provisions of Article 14 of Law No. 143/2000, the reasoning of Decision No. 30 of 10 February 2026 of the High Court of Cassation and Justice (Panel for the Resolution of Questions of Law) affirmed their character as a special statutory ground for non-punishment, of a personal nature, which entails an active conduct on the part of the reporting individual in relation to the substantiation of the criminal participation of other persons in the same reported offense.

b) Criminal Denunciation: Ground for the Reduction of Penalties.

According to Article 15 of Law No. 143/2000, a person who has committed one of the offenses provided for in Articles 2-9 and who, during the criminal investigation, reports and facilitates the identification and the bringing to criminal liability of other individuals who have committed drug-related offenses shall benefit from a reduction by one half of

the statutory limits of the penalty prescribed by law.

The essence of this provision lies in the recognition and encouragement of the defendant's cooperation with the criminal investigation authorities, through the reporting and facilitation of the identification of other individuals involved in offenses of this category. This provision constitutes a form of mitigation of criminal liability, intended to support the efficiency of investigations in the field of drug trafficking, and represents a continuation of the rationale underlying Article 14 of Law No. 143/2000, albeit with a more limited impact, given the procedural stage at which it intervenes, in relation to the efforts already undertaken by the judicial authorities, which have been previously seized in connection with an offense committed by the reporting individual within the same sphere of criminality.

According to case law, the conduct manifested during the criminal proceedings, as reflected in the provisions of Article 15 of Law No. 143/2000, constitutes a particular application of the general criterion for the individualization of punishment provided for in Article 74(1)(f), second thesis, of the Criminal Code, within a specific case [8]. This self-interested conduct of the individual is rewarded by the reduction by one half of the statutory limits of punishment for the commission of certain offenses exhaustively enumerated by Law No. 143/2000, which implicitly, and, as a rule, effectively, entails the real possibility of imposing a more lenient sentence on the person who, during the criminal investigation phase, chooses to provide statements and to facilitate the identification and the bringing to criminal liability of other individuals who have committed drug-related offenses. Consequently, such an attitude, oriented toward the establishment of the truth from the very outset of the criminal proceedings, is valorized in light of the importance of the prompt identification of persons who have committed criminal acts.

The conduct consisting in reporting and facilitating the identification and the bringing to criminal liability of other individuals who have committed drug-related offenses is, however, distinct from the mere acknowledgment of one's own act; the former is aimed at bringing to the attention of the criminal investigation authorities the identity of other participants in the commission of that offense or of other offenses. As will be further demonstrated, the essential requirement is that such information be of a novel character.

In other words, the judicial authorities must not have previously been aware, by any means, of the identity and activities of the reported individuals [9], nor must they have already initiated criminal proceedings against them.

For instance, it has been held that, with regard to the defendant H.'s request to have the denunciation made against P. taken into account, the court considered that the first-instance court had carried out a proper assessment of the conditions required for the applicability of Article 15 of Law No. 143/2000 (similar conditions being also required under Article 19 of Law No. 682/2002), and correctly concluded that this legal institution could not operate in favor of the defendant. The fact that defendant H. had been mentioned as a witness in criminal case no. x/117/2023 (in which P. had been indicted) was not sufficient, given that investigative activities had already been initiated in that case at the time the denunciation was made, and the reported individual was already under the scrutiny of the criminal investigation authorities (as also indicated in the communication issued by DIICOT – Cluj Territorial Service). Consequently, the defendant's contribution in the aforementioned criminal case could not justify the application of any ground for sentence reduction, although it would be taken into account in the individualized assessment of the sentence in relation to the defendant's personal circumstances [10].

Similarly, in another case, it was held that, with respect to the denunciation made by

defendant R., although the reported individual had been indicted, the information provided by the defendant did not facilitate the bringing to criminal liability of that individual, since the reported person already had the status of a defendant in another case [11].

In essence, for the provisions of Article 15 of Law No.143/2000 to be applicable, the following cumulative conditions must be satisfied:

1) The information brought to the attention of the judicial authorities must, in principle, take the form of a denunciation, within the meaning of Article 290(1) of the Code of Criminal Procedure, and must concern specific individuals with respect to whom the judicial authorities do not already have knowledge of their involvement in drug-related criminal activities.

It is particularly necessary to identify a specific individual (by full name) whose prosecution is sought for "drug-related" offenses, accompanied by a description of the acts, even in general terms. At the time of the denunciation, the person concerned must not have already been reported by another individual within the same case or be otherwise known to be involved in the same criminal activity; otherwise, the judicial authorities would already be aware of both the offense and the perpetrator, thereby eliminating the rationale underlying the support afforded to criminal justice, which forms the basis of the ground for sentence reduction.

Thus, it has been held, for example, that defendant B. made no reference to co-defendant X (the reported individual) in his statement as a suspect, entirely omitting the episode concerning the transfer of a quantity of 400 grams of cannabis to the co-defendant. In his statement as a defendant, he later described this episode, specifying (accurately) that X. had been a client identified by A. However, at the time of B.'s statement as a defendant, co-defendant X. had already been reported by A., such that B.'s statement cannot be equated with a denunciation, even though it contributed to X.'s being held criminally liable [12].

In order to meet the requirements of a valid denunciation, the notification cannot be of a generic nature; in some cases, even the indication of a nickname is insufficient if it is not accompanied by additional identifying data. For instance, it has been held that the provisions of Article 15 of Law No. 143/2000 were not applicable because, during the hearing concerning the application of these provisions, the defendant failed to provide further information within the meaning required by Article 15, stating that, since he had ceased involvement with drugs, he was no longer able to supply such data. Moreover, the individuals to whom the defendant referred by nicknames (Gonti, Sanyi, Sapi) in the statement given on 9 August 2015 did not meet the conditions of a denunciation under Article 290 of the Code of Criminal Procedure, nor did they allow for the identification of those persons, whom he described as friends but claimed to know only by their nicknames [13].

Moreover, in order to produce the intended effects, the denunciation must comply with the formal requirements prescribed by the Code of Criminal Procedure (essentially corresponding to those required for a prior complaint as a means of seising the criminal investigation authorities, as reflected in Article 290(2)), most often taking written form. Thus, it was correctly held that, with regard to defendant S., although he submitted a denunciation addressed to DIICOT – Cluj Territorial Service on 17 June 2024 (therefore during the trial stage in the present case), it was returned to him due to non-compliance with the requirements set out in Articles 289(2) and 290 of the Code of Criminal Procedure, and the defendant failed to remedy those deficiencies. Consequently, none of the three grounds for sentence reduction were applicable to him [16].

Similarly, the provisions of Article 15 of Law No.143/2000 do not require that the

information provided be the sole or essential basis for the subsequent initiation of criminal proceedings against the reported individuals. In this regard, it has been held that the applicability of Article 15 does not presuppose that the incriminating evidence (i.e., the essential or decisive evidence) be furnished by the reporting individual. Accordingly, the fact that the prosecution has gathered and administered additional evidence in support of the charges, which subsequently served as the basis for initiating criminal proceedings, cannot lead to the conclusion that this special ground for sentence reduction is inapplicable [17].

2) The denunciation must be made during the criminal investigation directed against the reporting individual, within the context of a specific criminal case.

In order to benefit from the provisions of the legal text, the self-interested denunciation must be made between the moment of the initiation of criminal proceedings (at least *in rem*) and the resolution of the case by the prosecutor. For example, it has been held that, pursuant to Article 15 of Law No.143/2000, the ground for sentence reduction becomes applicable only if the denunciation is made during the criminal investigation; in the case at hand, those provisions were deemed inapplicable to the defendant, given that the denunciation was made after the issuance of the act seising the court, thus after the completion of the criminal investigation [Cluj Court of Appeal, Criminal and Juvenile Division, Criminal Decision No. 1162/A of 16 October 2020, unpublished].

3) The reporting individual must facilitate the identification and the bringing to criminal liability of the person(s) reported, who are alleged to have committed drug-related offenses.

Facilitating the bringing to criminal liability does not necessarily entail the indictment or referral to trial of the person reported by the author of the denunciation (although this typically occurs and confirms the credibility of the denunciation), nor does it imply any relaxation of, or exemption from, the obligation of the criminal investigation authorities to conduct the investigation where the information provided is conclusive, in light of Article 7 of the Code of Criminal Procedure concerning the principle of the mandatory initiation and exercise of criminal proceedings, particularly since the offenses provided for by Law No. 143/2000 are prosecuted *ex officio*.

In this regard, it has been correctly held that, although Article 15 of Law No. 143/2000 does not require a specific procedural outcome of the information provided (a matter which depends, in the first instance, on the subsequent conduct of the investigative authorities), nevertheless, the passivity of the criminal investigation bodies must be unequivocal, and the data supplied by the reporting individual, together with their subsequent actions, must be capable of facilitating the identification and the bringing to criminal liability of persons committing drug-related offenses, in order for the applicability of the legal benefit invoked by the defense to be considered [14].

Similarly, we consider that the scope of this concept also encompasses the reporting of offenses under Law No. 194/2011 on combating operations involving products susceptible to having psychoactive effects, other than those regulated by the normative acts in force, particularly in light of the legislator's recent tendency to reclassify certain "ethnobotanical" substances, due to their effects and prevalence in social practice, as drugs in the strict sense of Law No. 143/2000. Most recently, this development was implemented through Law No. 30/2025 amending and supplementing Annex Tables I-III to Law No. 143/2000, whereby, as of 29 March 2025, substances containing 2-MMC (2-Methylmethcathinone) and/or 2-CMC (2-Chloromethcathinone) have been classified as high-risk drugs, whereas they had previously been regarded as "psychoactive substances" within

the meaning of Law No. 194/2011.

4) The denunciation need not be exclusive in relation to the reported criminal activity; it may be made even after the initiation of criminal proceedings against the reported individual, provided that it concerns new material acts committed by that person.

In practice, prosecutorial units have argued that the denunciation must have an exclusive character with regard to the criminal activity attributed to the reported individual, an approach not endorsed by the courts. Thus, effect has been given to the provisions of Article 15 of Law No. 143/2000 even where the denunciation concerned and facilitated the bringing to criminal liability of the reported person for new material acts forming part of a continued offense, through the extension of the criminal investigation, although proceedings had already been initiated prior to the denunciation. In this regard, it was held that the argument advanced by DIICOT – Cluj Territorial Office, namely that Article 15 would not be applicable because criminal investigations against the reported individual P. were already underway at the time the defendant was heard, could not be upheld, insofar as the criminal activity described by the defendant did not form the subject matter of the investigation at the time of his questioning as a suspect. Moreover, the representative of the prosecution confirmed, at a hearing, that following the defendant's statement, the criminal investigation was extended in respect of P. to include additional acts of drug trafficking committed in relation to the defendant, which had been brought to the attention of the judicial authorities by the latter [21].

The denunciation, and, consequently, the applicability of the provisions of Article 15 of Law No. 143/2000, is, in any event, of a personal nature and is limited to the conduct adopted by the offender during the criminal investigation within a specific criminal proceeding, and not, in general terms, to all subsequent cases in which the offender may have the status of defendant. In such other cases, however, the defendant may rely separately on another mitigating ground, namely the provisions of Law No. 682/2002. In other words, a denunciation has a "single effect" and cannot be invoked in other criminal proceedings concerning the same defendant, even where such proceedings are pending before different judicial authorities. Conversely, the joinder of cases involving concurrent offenses committed by the same defendant may, in principle, lead to an extension of the effect of the analyzed ground for sentence reduction, even where the offenses are committed in ideal concurrence.

Thus, the making of a denunciation by the defendant's spouse or by a person close to them cannot inure to the benefit of the defendant, since, according to the general provisions set out in Article 290 of the Code of Criminal Procedure, a denunciation may be made only personally, its effects not being "transferable." For example, it was held that the defendant did not personally submit a denunciation, the information having been conveyed by the defense counsel as originating from the defendant's spouse. Even accepting that the information provided by the spouse originated from the defendant, who was involved in activities relating to the trafficking of prohibited substances, this contribution was taken into account only in determining the quantum of the penalty [18]. This case-law solution should, however, be approached with caution, since, in the case of defendants held in pre-trial detention, the drafting and submission of a formally compliant denunciation to the attention of the criminal investigation authorities may prove more difficult; consequently, the assistance of a third party close to the defendant should not, in principle, constitute an impediment to the application of the provisions of Article 15 of Law No. 143/2000.

If the denunciation is made after the completion of the criminal investigation di-

rected against the reporting individual, potentially even after their referral to trial, the ground for sentence reduction cannot be applied; however, such proactive conduct may, where appropriate, be taken into account under the provisions of Law No. 682/2002. In case law, it has been noted, in general terms, that the ground provided for in Article 15 of Law No. 143/2000 is subject to similar conditions as that provided for in Article 19 of Law No. 682/2002, with the following distinctions: the former becomes applicable only if the denunciation is made during the criminal investigation; moreover, the denunciation must concern individuals who have committed drug-related offenses, whereas Article 19 of Law No. 682/2002 requires the commission of a serious offense, as legally defined by Article 2(1)(h) of the same law [15]. Thus, it was held in a given case that the indictment was issued on 30 May 2023, at which point the criminal investigation had concluded, while the information concerning the possible commission of drug trafficking offenses was transmitted to the criminal investigation authorities in July 2023 (according to the prosecution's communication), therefore not during the course of the criminal investigation [18].

In any event, in order to benefit from the aforementioned legal provisions, the denunciation must, in all cases, be of a voluntary nature. In this regard, with reference to Article 19 of Law No. 682/2002, the relevant case law of the High Court of Cassation and Justice has established that it is necessary for both the denunciation and the facilitation of bringing other persons to criminal liability to occur during the criminal investigation, to take the form of a voluntary denunciation, and to be made in the course of the criminal investigation conducted against the reporting individual. In the case at hand, these conditions were not fulfilled, since the defendant, caught *in flagrante delicto* by the police, at a time when criminal proceedings had not yet been initiated, identified another individual, C., as the person from whom he had obtained the drugs, thereby attempting to justify their possession [19].

From a procedural standpoint, it should be noted that, at the level of case law aimed at ensuring uniform interpretation, the High Court of Cassation and Justice has held that, in the absence of an express legal regulation concerning the status of the reporting individual, a person who notifies the judicial authorities by way of a denunciation does not participate in the criminal proceedings in the capacity of a "denouncer" *per se*, but rather as a person who has knowledge of facts or factual circumstances relevant to establishing the existence or non-existence of an offense, identifying the perpetrator, and clarifying the circumstances necessary for the fair resolution of the case, thereby contributing to the ascertainment of the truth in criminal proceedings. In other words, the individual who seises the judicial authorities through a denunciation participates in the criminal proceedings thus initiated in the capacity of a witness, with all the rights and obligations provided by law. Any potential benefit that the reporting individual may obtain from the perspective of criminal liability does not affect their procedural status, but rather has consequences exclusively for the probative value of their statement, which remains subject, like any other item of evidence, to the free assessment of the judicial authorities [20].

Criminal Denunciation in Drug-Related Matters: Comparative Law Perspectives. In the criminal law of the Republic of Moldova, it is noted that Article 217(5) of the Criminal Code, concerning the unlawful circulation of narcotic drugs, psychotropic substances, or their analogues without the purpose of distribution, provides that a person who has committed the acts stipulated in Articles 217 or 217[1] shall be exempt from criminal liability if they have actively contributed to the detection or counteraction of offenses related to the illicit circulation of such substances. This contribution may take various forms, including self-denunciation, the voluntary surrender of narcotic drugs, psychotropic substances

or their analogues, the indication of the source from which these substances were obtained, the disclosure of individuals who participated in the commission of the offense, or the identification of monetary assets, property, or proceeds derived from the offense. However, the seizure of such substances at the time of the person's apprehension, or during investigative measures undertaken for their detection and confiscation, cannot be regarded as voluntary surrender.

It may be observed that the legislator of the Republic of Moldova adopts a notably lenient approach, regulating a single ground that excludes criminal liability for certain offenses relating to drug circulation, which consolidates all forms of conduct that, under Romanian criminal law, are valorized through the mechanisms of non-punishment and sentence reduction, while having a mandatory character for judicial authorities. According to legal doctrine, the provisions of Article 217(5) of the Criminal Code represent a special modality of exemption from criminal liability in the field of drug circulation, introduced in 2005, also referred to as a legal mechanism of "incentive-protection" for individuals cooperating with criminal investigation authorities [2, p. 123-129], where the conditions for the application of this mixed ground for excluding criminal liability are also examined.

This is not the case in French criminal law, where the legislator adopts a more reserved stance with regard to explicitly rewarding denunciation. Thus, in matters of drug trafficking (*trafic de stupéfiants*), denunciation or cooperation does not automatically give rise to a reduction of the penalty expressly provided by law, as in Romania; rather, it is assessed indirectly by the judge as a factor in the individualization of punishment, namely as a potential mitigating circumstance (reflecting cooperative conduct with the authorities). The use of specific mitigating circumstances with variable sentence-reducing effects, granted in exchange for the provision of truthful and verifiable information capable of clarifying the investigated facts or enabling the identification of those responsible, is also encountered in certain Latin legal systems, such as Chile [3, p. 211], Colombia (where the compensatory reduction may reach up to three quarters of the sentence), Argentina, and Peru. Within these legal systems, individuals who cooperate in the investigation of drug trafficking offenses may benefit from exemption, reduction, or suspension of penalties, as measures aimed at preventing and combating such criminal activities.

Returning to French legislation, it is noted that Article 222-43 of the French Penal Code provides that the term of imprisonment to which the perpetrator or accomplice of the offenses set out in Articles 222-35 to 222-39 of the Code is subject shall be reduced by two thirds if, after notifying the administrative or judicial authorities, they have made it possible to put an end to the criminal acts or, as the case may be, to identify the other perpetrators. In the case provided for in Article 222-34, the sentence of life imprisonment is reduced to twenty years' imprisonment.

Moreover, pursuant to Article 222-43-1 of the French Penal Code, any person who intends to commit one of the offenses provided for in this section shall be exempt from punishment if, after notifying the administrative or judicial authorities, they have made it possible to prevent the commission of the offense and, where applicable, to identify the other perpetrators or accomplices.

In Italian criminal law, the cornerstone is Presidential Decree No.309/1990 of 9 October 1990, which constitutes the consolidated legislative framework governing narcotic drugs and psychotropic substances. Article 73(7) regulates the institution of cooperation (*collaborazione / del confidente*), according to which the penalty is reduced (generally by up to one half) for individuals who concretely assist the authorities in preventing further

consequences of the offense, identifying or apprehending other participants, or uncovering criminal resources or networks. This institution is frequently applied in judicial practice and has a long-standing tradition rooted in efforts to combat the criminal activities of Italian mafia organizations—among which drug trafficking has been a prominent component—and it closely resembles the institution of the *pentito* (repentant collaborator with justice in organized crime cases). In this context, Giovanni Falcone was arguably one of the most prominent advocates of the procedural utility of cooperating witnesses and of the necessity for adequate legislation capable of effectively protecting those who collaborate from severe reprisals (often physical elimination) by members of the criminal organizations they expose.

Similar to Romanian criminal law, Spanish criminal law provides for a ground for the reduction of penalties for individuals who cooperate with judicial authorities in the sphere of drug-related offenses. Thus, Article 376 of the Spanish Penal Code stipulates that, in the cases provided for in Articles 361-372 of the Code, judges or courts, stating their reasons in the judgment, may impose a penalty one or two degrees lower than that prescribed by law for the respective offense, provided that the individual has voluntarily abandoned their criminal activities and has actively cooperated with the authorities or their agents. Such cooperation may consist in preventing the commission of the offense, obtaining decisive evidence for the identification or apprehension of other perpetrators, or hindering the operation or development of the organizations or associations to which the individual belonged or with which they collaborated.

Furthermore, in a specific context concerning dependent users, pursuant to Article 376(2) of the Spanish Penal Code, in the cases provided for in Articles 368-372, judges or courts may impose a penalty one or two degrees lower on an offender who, being drug-dependent at the time of committing the offense, sufficiently demonstrates that they have successfully completed a rehabilitation program, provided that the quantity of toxic drugs, narcotic substances, or psychotropic substances involved was not of considerable magnitude or of extreme gravity.

A similar mechanism for rewarding bona fide cooperation in matters of drug trafficking or unlawful possession—extending even to complete exemption from punishment—also exists in the criminal law of Hungary and Russia, where the interested individual discloses the offense or contributes to the establishment of evidence concerning both the act and the involvement of other participants.

Conclusions. In conclusion, the analysis of the institution of criminal denunciation in the field of drug-related offenses highlights its essential role as an instrument of criminal policy aimed at enhancing the efficiency of the detection, mapping, and dismantling of criminal networks. Far from representing merely an ethically questionable manifestation, denunciation acquires, within the current normative framework, a pragmatic function subordinated to the general societal interest in combating serious crime. In this sense, the dual regulation established by Law No. 143/2000—as a mechanism of non-punishment (criminal immunity) or of sentence reduction—reflects a clear legislative choice to incentivize early and effective cooperation with judicial authorities, depending on the timing and the concrete utility of the information provided.

At the same time, recent case law, including the interventions of the High Court of Cassation and Justice, contributes to shaping the interpretative benchmarks necessary for the coherent application of these provisions, particularly with regard to the conditions for their applicability and the limits of the benefits granted to reporting individuals. A tendency may be observed toward a more nuanced assessment of the criteria relating

to the useful, novel, and effective character of the denunciation, as well as a rigorous distinction between the mere acknowledgment of one's own conduct and genuine cooperation aimed at bringing other participants to criminal liability. In this context, denunciation is not assessed in a purely formal manner, but rather in light of its actual contribution to the ascertainment of the truth, requiring a concrete analysis in each individual case in order to prevent the distortion of the institution's purpose.

From a comparative perspective, the legislative solutions examined confirm the existence of a broader European trend toward encouraging offenders' cooperation with authorities, albeit through varying regulatory techniques and degrees of intensity. While some systems, such as the Romanian or Spanish ones, expressly enshrine grounds for sentence reduction or non-punishment, others, such as French law, leave a broader margin of appreciation to the judge, whereas models such as those of Republic of Moldova or Italy incorporate more extensive mechanisms for incentivizing cooperation. Within this landscape, the Romanian regulatory framework appears to be a balanced one, albeit not devoid of practical difficulties, which calls for a careful application and, potentially, for legislative refinement, in line with the evolving dynamics of criminal phenomena and the requirements of a fair criminal process.

In essence, the regulation of compensatory mechanisms for cooperation with judicial authorities has emerged as a response of the legal system to the need to overcome, first and foremost, the difficulties encountered in the judicial repression of certain criminal organizations, whose defining characteristics (secrecy, opacity, and the use of force) have long challenged, and continue to challenge, traditional investigative tools. Indirectly, such mechanisms encourage disengagement from the criminal path [4, p. 8-9], the reporting individual providing judicial authorities with indispensable insider information that contributes to the detection and prosecution of key actors within the criminal drug milieu, thereby enhancing the effectiveness of efforts to combat the phenomenon through the mechanisms of criminal justice.

Abstract

The work provides a comprehensive analysis of the tactical and psychological aspects of the police officer's crisis communication in the conditions of modern social dynamics. The essence of crisis communication as a specific form of interpersonal interaction, characterized by high emotional tension and confrontation of the interests of the parties, is revealed. Based on the analysis of the professional activity of law enforcement officers, it is substantiated that the success of solving critical situations directly depends on the communicative lability of the police officer and his ability to quickly adapt behavior strategies in accordance with the opponent's actions.

Particular attention is paid to the systematization of verbal and non-verbal techniques of psychological influence. The mechanisms of reflective and non-reflective listening are analyzed, as well as specific psychological techniques, including self-disclosure, empathy, and emotional mirroring, which contribute to reducing psychological resistance and establishing psychological contact. It is demonstrated that adherence to professional and ethical standards at the initial stage of interaction constitutes a fundamental prerequisite for building trust and ensuring the de-escalation of conflict situations.

The study focuses on the specifics of police interaction with individuals who have combat experience. Communication algorithms are proposed, based on the principles of cautious respect, consideration of post-traumatic conditions, and rejection of an authoritarian communication style. It is argued that the use of empathetic support methods and rational argumentation serves as a key factor in preventing violence and ensuring public safety. The findings have practical significance for improving the professional training of police officers and increasing the effectiveness of their activities in extreme conditions.

Keywords: crisis communication, policing, de-escalation of conflict, psychological contact, psychological techniques, interaction with veterans.

TEHNICI PSIHOLOGICE DE COMUNICARE ÎN CRIZĂ ÎNTRE POLIȚIE ȘI VETERAN ÎN CONDIȚII DE LEGE MARȚIALĂ

Abstract

Lucrarea oferă o analiză cuprinzătoare a aspectelor tactice și psihologice ale comunicării de criză a polițistului în condițiile dinamicii sociale moderne. Este evidențiată esența comunicării de criză ca formă spe-

cifică de interacțiune interpersonală, caracterizată prin tensiune emoțională ridicată și confruntarea intereselor părților implicate. Pe baza analizei activității profesionale a organelor de aplicare a legii, se argumentează că succesul soluționării situațiilor critice depinde în mod direct de flexibilitatea comunicativă a polițistului și de capacitatea acestuia de a adapta rapid strategiile comportamentale în funcție de acțiunile interlocutorului/oponentului.

O atenție deosebită este acordată sistematizării tehnicilor verbale și nonverbale de influență psihologică. Sunt analizate mecanismele ascultării reflective și non-reflective, precum și tehnici psihologice specifice, inclusiv autodivulgarea, empatia și oglindirea emoțională, care contribuie la reducerea rezistenței psihologice și la stabilirea contactului psihologic. Se demonstrează că respectarea standardelor profesionale și etice în etapa inițială a interacțiunii constituie o premisă fundamentală pentru construirea încrederii și asigurarea dezescaladării situațiilor conflictuale.

Studiul se concentrează asupra particularităților interacțiunii poliției cu persoanele care au experiență de luptă. Sunt propuse algoritmi de comunicare bazați pe principiile respectului prudent, luării în considerare a stărilor post-traumatice și respingerii unui stil autoritar de comunicare. Se argumentează că utilizarea metodelor de sprijin empatic și a argumentării raționale reprezintă un factor-cheie în prevenirea violenței și asigurarea siguranței publice. Rezultatele cercetării au semnificație practică pentru îmbunătățirea pregătirii profesionale a polițiștilor și creșterea eficienței activității acestora în condiții extreme.

Cuvinte-cheie: comunicare de criză, activitate polițienească, dezescaladarea conflictului, contact psihologic, tehnici psihologice, interacțiunea cu veteranii.

Introduction. In the modern conditions of the transformation of the law enforcement system and the growth of social tension, the communicative competence of a policeman goes beyond purely official etiquette, becoming a strategic tool for ensuring public safety. Crisis communication in police activities is defined as a specific form of interaction in extreme or conflict conditions, where time pressure, high emotional tension and the opposite interests of the parties create risks of escalation of violence.

The relevance of the study is due to the need to move from traditionally authoritarian methods of conflict management to scientifically based psychological techniques of dialogue. Of particular importance is the ability of the policeman to combine verbal and non-verbal means of influence to establish psychological contact, which is a basic condition for achieving trust on the part of citizens. In this context, a critically important aspect of professional activity is the development and implementation of algorithms for interaction with certain categories of persons, in particular veterans and combatants. The specificity of their psycho-emotional state, formed by combat experience, requires law enforcement officers not only to know legal norms, but also to possess the skills of empathic listening, recognition of psychological triggers and the use of de-escalation techniques that allow minimizing the risks of conflicts in the rear regions

The conceptualization of crisis communication in police activity involves considering this phenomenon as a dynamic system of interaction in conditions of acute confrontation between the goals, interests and value positions of the parties.

The development of psychological technologies for working with veterans is based on the principles of humanistic psychology (C. Rogers), nonviolent communication (M. Rosenberg) [3], as well as on the scientific research of W.T. Coombs, S. Holladay, R. Heath [4], and E. James in the field of crisis communication. When developing recommendations on crisis communication for police officers, the research of Ukrainian scholars was taken into account [2].

A characteristic feature of such a process is intense interpersonal interaction, where each subject's behavioral strategies are forced to adapt to the opponent's actions in real time. Under these circumstances, the communicative liability of the policeman becomes decisive, which is manifested in the ability to effectively interact with representatives of various social groups, apply active listening techniques and transform the conflict poten-

tial of the situation into a constructive dialogue. The effectiveness of a law enforcement officer under such conditions is determined not only by the reasonableness of his position, but also by the ability to form an attraction and establish stable trust, which is a basic preposition for the successful de-escalation of the crisis.

At the same time, the manner of communication is influenced by the environment, well-being, features of the communicative situation, etc. However, despite the situation, the policeman must follow certain rules of communication when communicating, namely: equality, benevolence, impartiality, the ability to listen to another person and understand him, tact and mutual respect.

The policeman must start crisis communication with citizens with a greeting, refraining from shaking hands and must introduce himself, name the position, special rank, surname, briefly inform the purpose and reason for the application, at the citizen's request to present an official certificate/token. In the course of his official duties, he must refrain from any action that could degrade his dignity, cause doubt about his impartiality or undermine his authority.

In communication, the policeman must be tactful, educated and friendly, express demands and/or remarks in a calm, correct, convincing form, not show superiority, not use threats, irony, jargon, familiar tone. If necessary, calmly, without irritation, repeat and clarify the content of what was said or legal requirements, listen to the person's explanations or questions carefully, without interrupting, showing kindness and respect to the opponent (interlocutor).

At the initial stage, the communication technique includes such elements as the corresponding facial expression, pose, choice of initial words and tone of expression, movements and gestures, actions that attract the attention of another participant of the communication, aimed in advance at his adjustment, at a certain perception of the information transmitted to the police. Therefore, it is important to pay attention to non-verbal communication and use means of its influence when communicating.

Communicative interaction of people, including a policeman, with a citizen occurs mainly in verbal (verbal) form, through emotional-positive influence (encouragement) and emotional-negative influence (punishment). Without the application of the communicative categories «approval» or «disapproval», joint communication is impossible.

An act of verbal communication is a dialogue consisting of speaking and listening. Generally speaking, dialogue is a form of productive, conflict-free and constructive communication designed to clarify what is happening during a crisis, and to understand the issue and the problem that needs to be resolved.

In a conversation, it is essential for the police officer to be understood by the other person involved, and for the police officer to listen to and understand the other person.

The best way to achieve this is through non-reflective listening. The essence of this type of dialogue lies in the police officer not interrupting the other person speaking – this is known as conditionally passive listening. In particular, neutral words such as 'yes', 'I see' and 'that's interesting' help to keep the conversation going and ease tension.

Another method is reflective listening. This involves the police officer establishing a dialogue with the other party to ensure that the information has been correctly understood. In other words, it requires the police officer to listen carefully in order to ascertain the true meaning of the communication;

In a conversation, it is essential that the police officer is understood by the other person involved, and that the police officer listens to and understands the other person.

The key to effective dialogue lies in the following: do not rush to judgement, but

strive to understand the nature of the crisis, its causes and possible solutions; take into account both verbal and non-verbal cues (posture, breathing, eye contact, head and hand movements, tone of voice, rate of speech, rhythm, etc.).

Tactical and psychological techniques during crisis communication aimed at exerting psychological influence and altering the behaviour of the communication participant (in accordance with the logic of crisis communication, the tactical techniques used are applied consistently or variably, depending on the crisis situation and the dynamics of its development; they can and must be adapted as necessary, some techniques may be abandoned, others replaced, but deviation from the stated goals and objectives of crisis communication is unacceptable) [1]:

– *Self-disclosure*: is the most effective technique, based on the principle that candid information shared by a participant in crisis communication (the offender) about themselves can help the police officer establish a connection and build a rapport with them. People open up more readily and candidly to those they know better. In a free-flowing conversation, one can discuss one's own interests and feelings, and sometimes even aspects of one's professional or personal life. Self-disclosure, in addition to its effectiveness and speed, proves useful as an information tactic; that is, a frank conversation elicits openness in the interlocutor;

– *Empathy*: one should demonstrate a high degree of empathy in response to the words and actions of the person involved in the crisis communication. One of the most effective ways of building a rapport with the person involved in the crisis communication (the offender) is the ability to show them that the police officer is capable of putting themselves in their shoes for a moment and seeing the crisis situation (incident) through their eyes. An important aspect of empathy is that, during crisis communication, the police officer demonstrates their understanding of the views of the crisis communication participant (the offender) to that very participant (the offender). Empathy can manifest itself: in agreement – one should demonstrate agreement with the participant in the crisis communication (the offender) regarding those points that reflect the fairness of their demands, and persuade them to refrain from committing unlawful acts; reflecting feelings – focusing on the words and actions of the crisis communication participant (offender), using language that this participant understands, and helping them to think through thoughts and feelings they are at least aware of to some extent;

– The use of so-called '*warmth*' is effective in building mutual understanding and trust, achieved through the voice, genuine interest, and the police officer's active demonstration of an attempt to understand the party involved in the crisis communication (the offender), their concern, and their belief in reaching a mutually acceptable solution in the crisis situation;

– The "*stalling*" or "*waiting*" technique – used to delay the course of crisis communication in order to ascertain necessary information about the party involved in the crisis (the offender), to clarify the crisis situation, and to formulate the appropriate response, etc. To gather information, it is advisable for the police officer to use open-ended questions that require a long, detailed answer. For example: "What has happened here?", "What do you mean when you say...?", "How, in your opinion, can we resolve this issue and reach an agreement?", "How do you view your actions and what do you propose...?". Thanks to such questions, the participant in the crisis communication can explain their position and provide the police officer with a significant amount of information. Furthermore, the more attentively the police officer listens to the participant in the crisis communication (the offender), the more open and detailed the latter's answers will be; the police officer should also make

such comments or suggestions that demonstrate their interest in what the participant in the crisis communication (the offender) is saying. If circumstances permit, the police officer should demonstrate their interest in continuing the dialogue through gestures, facial expressions, eye contact, etc. Under no circumstances should they interrupt the offender, even if the police officer is certain that they are lying. Once they have finished speaking, you should calmly ask if they wish to add anything or if there is anything troubling them, and it is advisable to encourage them to respond with phrases such as "Please continue" or "And what happened next...?" or "What do you think should be done...?" During the conversation, it is important for the police officer to use paraphrasing, i.e. repeating to the participant in the crisis communication their own statements in different words, the meaning of which they have already conveyed to the police officer. This method of presenting the information received also demonstrates interest, attention and understanding of what the person involved in the crisis communication (the offender) is trying to say, as well as encouraging them to provide the necessary information;

– *Reflecting feelings*: the police officer focuses on conveying to the person involved in the crisis communication that they understand their feelings, and on paying attention to their emotional state, etc. When using this technique, it is important to pay attention not only to what the person involved in the crisis communication is saying, but also to how they say it (volume, speed, intonation, etc.);

– *Confrontation*: a clash or opposition of views, principles, etc.; a technique based on differences and contradictions, which involves clarifying information received from a participant in crisis communication (the offender). By pointing out contradictions in their statements, it is easier for the police officer to ask them appropriate questions to continue the communication;

– *An assessment technique* based on the police officer's consideration of the individual's mental state and personal characteristics, and which also demonstrates a certain degree of empathy (an understanding of another person's relationships, feelings and mental states in the form of shared experience);

– *Detailing the problem*: it is helpful to break down a problematic communication situation with a person into sub-problems and try to resolve each one separately. Examining the individual parts and details of the main problem helps to clarify it and, ultimately, to resolve it;

– *Diagnostic issues*: asking the individual a series of questions to ascertain their level of understanding of the crisis situation, their attitude towards the police officer's instructions, and to reveal their personal qualities (such as responsibility, decisiveness, independence, etc.);

– *Demonstrating the benefits and advantages*: a tactic typically used to bring unlawful conduct to an end by showing the offender the benefits and advantages of complying with the police's lawful demands;

– *The development of dependency*: personal (psychological) dependency arises when a police officer makes legitimate demands of an offender and creates in the offender the impression that only the police officer, as a person, can help them resolve the crisis with dignity;

– *Demonstrating the wrongfulness of actions*: a technique based on a police officer's reasoned demonstration that the offender's chosen objective is false and contrived, thereby hindering the effective resolution of a crisis situation.

The strategy for crisis communication with different groups of citizens has two aspects:

1) A police officer must be able to control their emotions so that their actions do not lead to a conflict (or exacerbate a crisis situation) when communicating with another party involved in the crisis, and if a conflict (or crisis situation) has already arisen, they must choose the most appropriate course of action, enabling them to maintain their composure and not lose their temper;

2) The police officer must exert such influence over the other party involved in the crisis communication (the offender) as would help to restore that person to a normal (mentally stable) state, defuse the conflict and carry out the assigned task in accordance with the police officer's powers.

The main argumentation techniques aimed at convincing a member of the public of the necessity and correctness of actions during communication, and at establishing a relationship of trust between the police officer and the other party involved in crisis communication, are:

– *Emotional persuasion*: the use of emotional imagery, feelings and the officer's own experience. The essence of this technique lies in creating an emotional scenario with the member of the public in the leading role. Whilst in this fantasy, the citizen tries on the feelings of the other side (the other party involved in the crisis situation), putting themselves in their shoes ("Imagine yourself in the shoes of…", "Would you like to see such consequences for yourself?");

– *Rational persuasion*: the use of facts and arguments to change someone's position. The essence of this technique lies in presenting facts and arguments that help to gain consent and win the citizen over to one's side. The citizen weighs up the arguments and sides with the police officer. Explaining the link between the police officer's actions and the benefits for the citizen ("What I am doing – How will this help you?"), as well as explaining the link between the citizen's actions and the consequences they will face ("If you do…, you will face the following consequences…");

– *Engaging in cooperation*: persuading someone by involving them in the action on one's side. Instead of confrontation, the member of the public becomes the police officer's ally ("I (the police) need your help…", "Give me some advice – what would you do if you were in my position?").

During crisis communication, it is important to establish a relationship of trust with the individual. The following factors help to foster a relationship of trust between a police officer and another party involved in crisis communication when communicating:

1) Demonstrating personal professional qualities: conducting effective preventive discussions; helping to resolve minor issues faced by members of the public (family conflicts, minor disputes); reducing crime rates in the area;

2) Demonstrating personal moral and ethical qualities: honesty and integrity; willingness to help; willingness to work for the community; no desire to participate in corrupt schemes;

3) Demonstrating the benefits of cooperation with the police: participation in various community events (open sessions, educational sessions, safety classes, etc.); reporting to the community in the manner prescribed by regulatory and legal acts; demonstrating the mutual benefits of cooperation;

4) Non-verbal demonstration: a sincere and open attitude when communicating; open gestures, showing open hands; absence of non-verbal barriers between the citizen and the police officer; confident behaviour, tone of voice, emotional contagion (expression); demonstration of equality in communication; respect for the citizen's personal space; a smile (friendly facial expressions); empathy (shared feeling);

5) Verbal techniques: listening attentively without interruptions; a genuine interest in understanding the citizen's goals and way of life; demonstrating attention to the citizen's words and feelings; using emotional support techniques where appropriate; clear and understandable instructions, requests and questions during communication; creating an informal yet professional atmosphere during communication; having a sense of humour and demonstrating linguistic resourcefulness.

To ensure effective, conflict-free communication, a protocol for police officers' interactions with veterans and combatants has been developed and recommended for use. In such situations, military personnel are guided by the rules of conduct in combat. The issue of trust is of paramount importance to them. Many military personnel may display more aggressive behaviour; irritation arises in communication and the level of conflict increases. Reactions are often extremely intense, manifesting as aggression and attempts to keep the interlocutor under control. Often, their behaviour and communication are marked by unwarranted wariness, suspicion, anxiety, and a refusal to accept the police officer's instructions. Therefore, to establish contact and trust, police officers must follow the following recommendations when communicating with serving military personnel or veterans:

1) *Greeting*: greet the person in a friendly manner, introduce yourself, and clearly explain the basis and reason for your visit. It is preferable for a police officer with combat experience (if available) to initiate communication with the serviceman;

2) *General attitude*: cautious respect (express respect for the soldier's experience and contribution to the defence of Ukraine's territorial integrity and sovereignty);

3) *Active listening*: listen without interrupting and give him or them the opportunity to express their thoughts and feelings;

4) *Reflecting feelings*: acknowledge their emotions using phrases such as: 'I understand that this is difficult' (it is preferable for such phrases to be spoken by a police officer who has also taken part in combat operations);

5) *Sensitivity*: be attentive to the soldiers' emotions and take potential triggers into account. Do not use expressions such as: «War is hell», «Yes, I understand» and so on during communication;

6) *Restraint*: avoid imposing your own opinion, respect their experiences, and control your own emotional state. Avoid sudden movements and a loud tone of voice (the service member may be suffering from concussion). Where possible, avoid threats, orders, an authoritarian style of communication, and the use of force against the person you are speaking to. Maintain social distancing whilst communicating;

7) You should have a range of responses ready in case of provocative questions from a citizen (serviceman) who has returned from a combat zone ("Why are you here and not at the front?"), for example:

– the need to maintain order behind the front lines;

– the need to uphold the rule of law, so that families are not afraid to return home in the evening or walk the streets of the city;

– each of us is in uniform, wears epaulettes and carries out our orders. You carry out the orders of your superiors. I also have my superiors, and I also carry out their orders;

8) *Identifying needs*: ask what is troubling the service member and what their needs are;

9) *Attitude towards the situation*: ask open-ended questions to find out more about the service member's perspective;

10) *Providing support* (as appropriate). Offering help: suggest possible solutions or

resources that might be useful;

11) *Informing about rights*: explain what rights and options servicemen have, if appropriate;

12) *Concluding the conversation*. Summarising: summarise what has been discussed and determine the next steps regarding the situation. Thanking: express gratitude for their openness and willingness to communicate;

13) *Personal safety during communication*. Maintain social distancing whilst communicating. Your partner should adopt an observer's position – in the event of aggressive behaviors by the person you are speaking to (the service member) – and warn you of the danger in good time (bear in mind that the person you are speaking to may be carrying a weapon or explosives). If the situation escalates, call a patrol police crew for assistance and report the escalation of the crisis to your immediate supervisor.

Conclusions. Based on the analysis of the tactical and psychological aspects of crisis communication in police work, it can be argued that the effectiveness of de-escalating conflict situations is determined by the integrated use of verbal techniques and non-verbal tools. Establishing a stable psychological rapport at the initial stage through strict adherence to deontological norms – in particular, proper identification, tact and maintaining professional distance – serves as a fundamental prerequisite for minimizing resistance and building trust in law enforcement officers.

At the same time, the use of specific techniques, such as self-disclosure, empathy and mirroring emotions, enables the police officer to transform communication from a tool of coercion into a tool for managing the offender's psychological and emotional state. This helps to uncover the opponent's position and obtain the relevant information needed to resolve the crisis constructively. The success of crisis interaction depends directly on the police officer's ability to swiftly adjust their methods of influence – from active reflective listening to techniques for stalling, confrontation or elaborating on the problem – depending on the dynamics of the situation and the personal characteristics of the individual. In this context, every tactical manoeuvre is subordinated to the single goal of stabilising the mental state of those involved and bringing unlawful actions to an end.

A particularly critical aspect is the approach to communicating with individuals who have combat experience, which requires a specific framework of trust based on the principle of cautious respect and a deep understanding of post-traumatic triggers. Moving away from an authoritarian style in favors of empathetic support and rational argumentation is a key factor in preventing conflicts in the civilian environment and maintaining the authority of law enforcement agencies.

Abstract

In the context of money laundering, the recovery of criminal assets is a key component of modern frameworks for preventing and combating financial crime. Effective recovery measures prevent criminals from profiting from illicit gains and strengthen public confidence in the legal system and financial institutions.

This paper examines contemporary mechanisms for identifying, freezing, seizing, and confiscating assets derived from predicate offenses and money laundering operations. It addresses both traditional measures, such as seizure and restraining orders, as well as modern approaches, including provisional freezing, international cooperation, and the role of authorities in early interventions.

The paper also discusses legal and operational challenges, such as complex transnational networks, the risk of rapid asset dissipation, and the need to balance efficiency with procedural safeguards. The study emphasizes the need for a comprehensive, flexible, and well-regulated set of measures to prevent criminals from profiting from illegal activities while ensuring compliance with national and international law.

Keywords: money laundering, criminal asset recovery, freezing, seizure, confiscation.

RECUPERAREA BUNURILOR INFRACȚIONALE ÎN CAUZELE DE SPĂLARE A BANILOR: EVOLUȚII ȘI PROVOCĂRI CONTEMPORANE

Abstract

Recuperarea bunurilor infracționale în contextul spălării a banilor reprezintă un element esențial al cadrului modern de prevenire și combatere a criminalității financiare. Măsurile eficiente de recuperare nu doar că împiedică infractorii să beneficieze de câștiguri ilicite, dar consolidează și încrederea publică în sistemul juridic și în instituțiile financiare.

Lucrarea analizează mecanismele contemporane de identificare, înghețare, sechestrare și confiscare a bunurilor provenite din infracțiuni predicat și din operațiuni de spălare a banilor. Sunt abordate atât măsurile tradiționale, precum ordinele de sechestru sau restricție, cât și metodele moderne, inclusiv înghețarea provizorie, cooperarea internațională și rolul autorităților în intervențiile timpurii.

De asemenea, sunt discutate provocările juridice și operaționale, cum ar fi rețelele transnaționale complexe, riscul de dizipare rapidă a activelor și necesitatea de a echilibra eficiența cu respectarea drepturilor procesuale. Studiul evidențiază că un ansamblu cuprinzător, flexibil și bine reglementat de măsuri este esențial pentru prevenirea profitului din infracțiuni și pentru respectarea legislației naționale și internaționale.

Cuvinte-cheie: spălarea banilor, recuperarea bunurilor infracționale, înghețarea, sechestrul, confiscarea.

Introduction. The crime of money laundering poses a major threat to economic stability and the integrity of the global financial system. In this context, the recovery of proceeds of crime becomes an essential tool in preventing and combating financial crime, serving to deprive offenders of illicit gains and restore the rule of law. The effectiveness of asset recovery mechanisms is closely linked to the existence of a clear, coherent regulatory framework that is consistently enforced by the competent authorities.

The topic addressed in this research is of particular relevance, given the complexity and dynamics of the phenomenon of money laundering, as well as the practical difficulties associated with identifying, tracing, and confiscating the proceeds of crime. At the same time, the accelerated digitization of financial services and the expanding use of virtual assets (cryptocurrencies, digital tokens, DeFi platforms) have led to significant changes in how money laundering offenses are committed. These developments pose additional challenges in the process of identifying, tracing, and recovering criminal assets, particularly given the relative anonymity, decentralization, and cross-border nature of transactions conducted in the digital environment.

The study contributes to the development of public policies in this area by providing theoretical and practical guidelines for improving mechanisms for the recovery of illicit assets. At the same time, this research takes on increased importance in the context of the Republic of Moldova's integration into the European Union, particularly in light of the new European regulations in the 2024 AML (Anti-Money Laundering) Package, which impose advanced standards regarding the confiscation and administration of assets derived from criminal activity.

Methods and materials applied. The methodology used in this study combines methods specific to legal science, adapted to the analysis of mechanisms for the recovery of criminal assets in money laundering cases. Thus, the logical analysis method enabled the substantiation of the legal framework applicable to asset freezing and confiscation measures; the comparative method facilitated the examination of national regulations in relation to European and international standards, highlighting convergences, differences, and evolving trends; and the classification method contributed to the systematization of recovery measures (identification, freezing, seizure, confiscation), based on their nature and purpose, as well as their impact on combating criminal activity.

As part of the assessment of the national system for preventing and combating money laundering, in relation to Recommendation 4 (Confiscation and provisional measures) of the Financial Action Task Force (FATF), the competent authorities were encouraged to strengthen their capacity to identify, freeze, and confiscate the proceeds of crime [1]. In this regard, the Republic of Moldova was prompted to adopt legislative and institutional measures designed to facilitate the recovery of illegally obtained assets and prevent their integration into the legal economic circuit.

At the same time, it is imperative to establish an effective mechanism for the administration and utilization of confiscated assets, in accordance with international standards, which ensures not only the preservation of the economic value of frozen assets but also their use in a transparent, responsible, and public-interest-oriented manner.

In this context, the Republic of Moldova's recent legislative initiatives mark a significant shift from a traditional model—focused exclusively on confiscation as a punitive measure—toward an integrated model for the recovery and reuse of assets derived from criminal activity. The draft law on the use of funds and assets confiscated from criminal activities introduces a regulatory framework that explicitly governs the use of these assets, emphasizing their utilization for social, educational, and institutional strengthening purposes.

Thus, the proposed mechanism [2] establishes clear procedures for the administration, record-keeping, and allocation of confiscated assets, including through the creation of structures or commissions responsible for evaluating requests for use and monitoring how these assets are utilized. Such an approach contributes to increasing transparency and reducing the risks of inefficient or abusive management of confiscated assets, a problem frequently highlighted in international evaluations.

Furthermore, the new regulatory framework promotes the principle of the social reuse of the proceeds of crime, established in European case law and practice, according to which confiscated assets must be reintegrated into the legal economy for the benefit of society. This involves directing resources toward funding public interest projects, supporting civil society organizations, and strengthening the capacities of institutions involved in preventing and combating crime.

Regarding judicial practice, there is a noticeable trend toward strengthening the application of mechanisms for the recovery of criminal assets, with national courts gradually moving toward a more rigorous regime aligned with international standards. According to the conclusions of the National Risk Assessment Report on Money Laundering and Terrorist Financing (NRA), approved on December 9, 2025 [3], improvements have been noted in the implementation of preventive and punitive measures, including in the area of confiscation. However, difficulties persist regarding the uniform application of these measures and the efficiency of the process for recovering illicit assets.

Thus, case law in the Republic of Moldova highlights both progress and limitations in the application of confiscation, including extended confiscation. In some cases, courts have ordered firm measures to freeze and confiscate assets derived from money laundering activities; however, these procedures have often been hampered by difficulties in identifying the beneficial owners, the transnational nature of financial transactions, and the complexity of the evidence. These obstacles affect not only the duration of the proceedings but also the ultimate effectiveness of asset recovery.

An analysis of judicial practice, combined with an assessment of existing institutional mechanisms, reveals significant gaps in the enforcement of measures to recover criminal assets. In this context, it is necessary to strengthen institutional capacities, simplify procedures, and intensify international cooperation in order to accelerate the confiscation process and increase the effectiveness of anti-money laundering efforts.

Despite the legislative progress made, the effectiveness of mechanisms for the recovery of criminal assets in the Republic of Moldova remains contingent on how these instruments are applied in practice. In this regard, it is essential not only to analyse the regulatory framework but also to conduct a comparative assessment of national practices against international models, in order to identify existing gaps and establish the direction for reform.

Looking ahead, future developments will aim at a thorough harmonization of national legislation with the European Union acquis, as well as the strengthening of control mechanisms over financial entities. In particular, a revision of the legal framework for the recovery of criminal assets is envisaged, in line with the objectives set out in the National Accession Program for the period 2025–2029 [4].

Discussions and results obtained. Within the international framework for preventing and combating money laundering, the FATF expressly emphasizes the need for competent authorities to have a wide range of legal tools at their disposal for the freezing of criminal assets. These range from temporary, less intrusive measures to permanent provisional measures, with the selection to be made based on the specific circumstances

of each case. Such a flexible approach is essential to ensuring the effectiveness of the process of recovering proceeds of crime [5].

Precautionary measures, also referred to in international practice as provisional measures, are legal instruments through which competent authorities seek to prevent the risk of loss, disposal, or concealment of assets suspected of being derived from criminal activities. They are eminently preventive in nature, intended to preserve the assets until the conclusion of criminal proceedings, so that, in the event of a conviction or forfeiture order, the effective recovery of the value of the assets is possible.

Under national law, these measures are governed by the Criminal Procedure Code and consist primarily of the seizure of movable and immovable property. Their purpose is to prevent the concealment, damage, disposal, or removal of property subject to special or extended forfeiture, as well as to ensure the enforcement of fines or the compensation for damages caused by the offense. It is important to emphasize that precautionary measures are not reparatory in nature and do not permanently affect property rights, but merely temporarily restrict the exercise of such rights until the final resolution of the case.

A key factor in the application of these measures is the timing of their imposition. Premature imposition may compromise the effectiveness of the investigation by alerting the persons concerned and facilitating the concealment of assets, while delay may lead to their loss. In practice, the measures are frequently ordered at key stages of the criminal investigation, such as during searches, wiretaps, or arrests, to maximize operational efficiency.

For the imposition of protective measures, certain fundamental conditions must be met: the existence of a reasonable risk that the assets will be concealed or disposed of, and the fact that the assets are subject to forfeiture or may be used to secure the financial obligations arising from the offense. Furthermore, legal doctrine emphasizes the importance of respecting the principle of proportionality, which requires that the measure be limited to the estimated value of the damage and not impose an excessive restriction on the right to property. Failure to comply with this principle may lead to unjustified interference, especially in situations where the measures are maintained for extended periods or target assets whose value significantly exceeds the estimated damage [6].

The application of precautionary measures in a transnational context raises numerous difficulties, stemming from the lack of a unified regulatory framework, differences between national legal systems, and limitations on judicial review. These issues are also illustrated in the case law of the European Court of Human Rights, including in the case of Amerisoc Center S.R.L. v. Luxembourg [7], where it was found that international cooperation mechanisms may affect fundamental rights when judicial review is insufficient. The court emphasized the need to ensure a genuine balance between the effectiveness of combating financial crime and the protection of property rights, as well as the importance of having effective avenues for challenging the measures ordered.

A central tool in the process of recovering criminal assets is the freezing of funds, which aims to temporarily block suspicious assets to prevent their transfer or concealment. Although it produces effects similar to seizure, freezing is distinguished by its legal nature, being, as a rule, an administrative or operational measure of an urgent and temporary nature, often applicable without a prior criminal conviction.

In practice, the distinction between freezing and seizure is not always clear, and these measures are sometimes confused. However, the fundamental difference lies in the fact that freezing aims to immediately block suspicious transactions and is ordered

by administrative or financial entities, whereas seizure is a criminal procedural measure ordered by judicial authorities, with the aim of ensuring confiscation or compensation for damages.

The national legal framework defines freezing as the process of rendering criminal assets unavailable, which in itself entails the temporary prohibition of the transfer, destruction, conversion, disposal, or removal of criminal assets for the purpose of their recovery or the temporary assumption of administration or control over those assets [8].

At the international level, the freezing of assets is established as a priority measure in the FATF Recommendations, which require states to adopt effective mechanisms for identifying, freezing, and confiscating the proceeds of crime—including without a prior criminal conviction—in order to prevent the concealment and transfer of illicit funds. Furthermore, the European Union's regulatory framework promotes the use of freezing as an autonomous tool, distinct from criminal seizure, with an emphasis on speed and cross-border cooperation.

In the context of virtual assets, the application of freezing and seizure measures presents distinct challenges. Unlike traditional bank funds, cryptocurrencies are stored in digital wallets controlled by private keys, making it impossible to freeze them without actual access to those keys. Furthermore, the use of decentralized platforms and "mixing" or "tumbling" services hinders the traceability of funds and reduces the effectiveness of traditional freezing measures. Under these circumstances, the regulation and supervision of virtual asset service providers (VASPs) and the ability to utilize blockchain analysis tools become essential.

The comparative analysis highlights relevant practices: in France, financial authorities may order the immediate freezing of suspicious transactions; in Italy, asset freezing is used extensively in the fight against organized crime, including without a prior conviction; in Germany, financial institutions have strict obligations to suspend suspicious transactions; and in the United Kingdom, rapid administrative mechanisms allow for the freezing of funds based on reasonable suspicion, although this practice raises issues regarding proportionality.

Despite its effectiveness, the application of asset freezing poses significant challenges, such as confusion regarding the applicable legal regimes, the excessive duration of the measures, difficulties with international recognition, and the impact on the rights of bona fide third parties. In this context, European case law emphasizes the need to respect essential safeguards: legality, proportionality, and the existence of effective judicial review.

In conclusion, asset freezing and precautionary measures are indispensable tools for the recovery of criminal assets in money laundering cases. Their effectiveness, however, depends on a clear delineation of legal regimes, proportional application, and the strengthening of international cooperation mechanisms, with a view to ensuring a balance between the need to combat financial crime and respect for fundamental rights.

In continuing the analysis of mechanisms for the recovery of criminal assets, security measures in criminal matters play a central role, consisting primarily of special forfeiture and extended forfeiture. Their purpose is to eliminate the social danger posed by assets derived from illicit activities, as well as to prevent their reuse for criminal purposes, particularly in the context of money laundering.

From a doctrinal perspective, confiscation is characterized as a sui generis criminal law sanction with a pronounced preventive nature. As Bogdan Camelia emphasizes, this measure is not fully equivalent to a criminal penalty, as it does not aim to punish the

offender but rather to eliminate the illicitly obtained financial advantage. Consequently, confiscation is not absolutely contingent upon the imposition of a penalty and does not fully fall under the principle of the personal nature of criminal liability, as it may also affect third parties under certain conditions provided by law [9].

In the context of money laundering, confiscation takes on strategic importance, as the primary purpose of this offense is to integrate criminal proceeds into the legal economic circuit. Thus, depriving the offender of the benefits obtained becomes essential for the effectiveness of criminal policies. In this context, several forms of confiscation can be distinguished:

– *Special confiscation*, which targets property used to commit the crime, property intended for its commission, or property resulting directly from criminal activity. In money laundering cases, this is frequently applied to sums of money, bank accounts, or property acquired with illicit funds;

– *Extended confiscation*, which allows for the confiscation of additional assets, characteristic of certain categories of crimes and subject to specific conditions established in the Criminal Code. This form is particularly relevant in complex money laundering cases, where the trail of funds is difficult to prove directly;

– *Non-conviction-based confiscation*, applicable in exceptional situations, such as the death of the defendant, flight from prosecution, or the impossibility of holding the defendant criminally liable. This form reflects modern trends toward streamlining asset recovery but raises sensitive issues regarding respect for fundamental rights.

An emerging challenge in the enforcement of asset forfeiture measures is the recovery of virtual assets. Their technological characteristics—pseudonymity, high mobility, and the ability to be transferred instantly across jurisdictions—create significant difficulties in establishing a link between the asset and criminal activity, as well as in the effective enforcement of asset forfeiture measures. In practice, these difficulties are amplified by the use of non-custodial wallets, decentralized finance (DeFi) protocols, and anonymization technologies, which can hinder the identification of the assets' beneficial owner. Under these circumstances, confiscation becomes dependent not only on traditional legal instruments but also on the technical capabilities of authorities to conduct blockchain analysis and cooperate with specialized private entities.

At the European Union level, the new regulatory framework on asset recovery, established by Directive (EU) 2024/1260, marks a significant step in the harmonization of national laws. The directive establishes minimum rules regarding the identification, tracing, freezing, confiscation, and management of criminal assets, strengthening cooperation among Member States and enhancing the effectiveness of asset recovery mechanisms. Furthermore, the directive emphasizes the efficient administration of frozen assets to prevent their depreciation until their final disposal.

A distinct and relevant model for comparative analysis is the civil forfeiture mechanism, established in the legal system of the United States of America. Unlike the continental European model, where confiscation is, in principle, contingent upon a criminal conviction, this mechanism allows for the confiscation of assets through independent civil proceedings directed against the property (in rem), rather than against the individual.

Thus, authorities may order the forfeiture of assets suspected of deriving from criminal activities, including money laundering, without the need to establish a person's criminal guilt. This approach facilitates the recovery of assets in situations where the perpetrators cannot be identified, are deceased, or evade criminal prosecution, thereby contributing to the increased effectiveness of mechanisms to combat financial crime.

However, *civil forfeiture* [10] is subject to substantial criticism, particularly from the perspective of the protection of fundamental rights. The lower standard of proof and the possibility of reversing the burden of proof can lead to situations where property owners are required to demonstrate the lawful nature of their assets. For this reason, legal doctrine emphasizes the need to establish adequate procedural safeguards to prevent potential abuses and ensure respect for property rights.

Compared to the approach promoted at the European Union level, where confiscation without conviction is permitted under strict conditions and accompanied by robust procedural safeguards, the American model is characterized by greater flexibility, but also by increased risks regarding the balance between efficiency and the protection of individual rights.

In a European comparative context, a diversity of approaches is observed in the application of forfeiture in money laundering cases.

In Italy, forfeiture is used extensively in the fight against organized crime, including through preventive forfeiture mechanisms, applicable even in the absence of a criminal conviction, where the illicit origin of the assets is reasonably demonstrated.

In France, authorities have effective confiscation tools, supported by advanced asset management mechanisms, which contribute to increasing the asset recovery rate.

In Germany, the reform of confiscation legislation has strengthened the possibility of extended confiscation and simplified procedures for recovering criminal assets.

In the United Kingdom, civil recovery mechanisms allow for the confiscation of assets based on the civil standard of proof, which facilitates asset recovery in complex money laundering cases but raises concerns regarding procedural safeguards.

Despite the progress made, the application of confiscation in money laundering cases faces multiple challenges. These include the difficulty of proving the link between assets and criminal activity, the use of unregulated structures and intermediaries to conceal ownership, as well as the transnational nature of financial flows. These difficulties are exacerbated in cases involving virtual assets, where the trail of funds can be fragmented through multiple rapid transactions conducted on platforms located in different jurisdictions or even within decentralized ecosystems lacking an identifiable legal entity. In such situations, identifying the beneficial owner and proving the illicit origin of the funds become considerably more complex. Furthermore, issues arise regarding the protection of property rights and the rights of bona fide third parties, which necessitates rigorous scrutiny of the proportionality of the measures ordered.

An analysis of national practice reveals significant difficulties in investigating and concluding money laundering cases, particularly in situations where the predicate offense is not identified or cannot be proven with sufficient clarity. Under these circumstances, only a small number of cases reach the courts, and the proportion of criminal assets that are actually subject to confiscation proceedings remains limited.

The results of national money laundering risk assessments highlight that one of the main difficulties in combating money laundering is identifying and proving the predicate offense. In the absence of establishing the illicit source of the funds, the criminal prosecution process is often hampered, which affects both the prosecution rate and the effectiveness of measures to recover criminal assets.

This approach indirectly reflects a limited capacity to investigate money laundering independently, as well as difficulties in criminalizing acts committed by third parties who are not directly involved in the commission of the predicate offense. Consequently, the effectiveness of confiscation mechanisms is compromised, as the absence of a conviction

or clarification of the origin of the assets reduces the possibility of applying asset recovery measures.

In this context, there is a clear need to strengthen institutional capacities and develop evidentiary mechanisms tailored to the specific nature of money laundering offenses, including in cases where such offenses are investigated independently. Such an approach would contribute to increasing the efficiency of the process of recovering criminal assets and to aligning national practice with international standards in this area.

Specifically, in the case of the Republic of Moldova, strengthening the regulatory and institutional framework regarding confiscation is a priority in the context of alignment with European and international standards. The effective implementation of confiscation mechanisms, including extended ones, as well as the development of institutional capacities to identify and administer criminal assets, are essential for increasing the effectiveness of the fight against money laundering.

In conclusion, confiscation is a fundamental tool in the process of recovering criminal assets, playing a decisive role in deterring and combating money laundering. Its effectiveness depends on the existence of a coherent legal framework, the uniform application of rules, and the balance between the need to protect the public interest and respect for fundamental rights.

In the same vein, given the transnational nature of money laundering, the recovery of assets used in or derived from this crime cannot be effectively achieved without robust, flexible, and results-oriented international cooperation. In this regard, international standards, particularly those promoted by the FATF, highlight the need to develop cooperation mechanisms that go beyond excessive formalism and allow for rapid intervention to prevent the removal or concealment of assets.

Thus, the effectiveness of asset recovery depends directly on the ability of states to act on the basis of the principle of reciprocity, to initiate proactive exchanges of information, and to use the most appropriate legal and operational tools depending on the specifics of each case. In particular, informal cooperation—based on the operational exchange of information between competent authorities, such as law enforcement agencies, financial intelligence units, and judicial authorities—plays a decisive role in the early stages of investigations, contributing to the rapid identification and location of criminal assets.

In the case of virtual assets, international cooperation takes on an additional dimension, requiring not only collaboration among authorities but also the involvement of virtual asset service providers, exchange platforms, and other digital intermediaries. The lack of uniform global regulations and differences in approach across jurisdictions can create loopholes that criminals exploit to conceal and transfer assets.

At the same time, the use of specialized international networks [11], such as those of the Criminal Assets Recovery Agency, as well as the involvement of existing global cooperation mechanisms, facilitates the exchange of information and increases the success rate of asset recovery proceedings. Practical experience shows that leveraging informal channels before initiating formal mutual legal assistance procedures helps in drafting better-founded and more effective requests.

On the other hand, formal cooperation remains indispensable, as it is necessary to establish clear, swift, and efficient procedures for the execution of mutual legal assistance requests, including regarding the recognition and enforcement of provisional measures and confiscation orders. In this context, it is essential that states have legal mechanisms in place to allow for the enforcement of foreign judgments without the need to fully repeat the proceedings on the merits, limiting review to issues of legality, respect for the

right to a fair trial, and the enforceability of such judgments.

In conclusion, strengthening international cooperation—both formal and informal—is an essential prerequisite for improving the efficiency of asset recovery in money laundering cases. An integrated approach, based on flexibility, foresight, and inter-agency coordination, is essential to prevent jurisdictions from being used as safe havens for illicit assets and to ensure an effective global response to financial crime.

Beyond the stages of identification, freezing, and confiscation, the true effectiveness of mechanisms for recovering criminal assets in money laundering cases is reflected in how these assets are managed, realized, and reintegrated into the legal economy. In this regard, international standards emphasize the need to establish effective mechanisms for managing frozen, seized, or confiscated assets throughout the proceedings, so that their value is preserved and utilized appropriately.

The administration of frozen assets must be carried out based on transparent criteria and through specialized structures or authorized professionals, to prevent their depreciation and ensure their effective utilization. In the context of money laundering, where assets can take various forms (financial funds, movable or immovable property, equity interests), flexibility in management and disposal strategies becomes essential.

At the same time, the use of confiscated assets must be guided by the principles of transparency, accountability, and the public interest. Allocating these assets to fund law enforcement agencies, the justice system, or social programs contributes not only to strengthening institutional capacity but also to increasing public confidence in the effectiveness of mechanisms for combating financial crime. In this regard, confiscation should not be viewed as a revenue-generating tool, but rather as a mechanism for restoring social balance and eliminating the economic benefits of crime.

At the international level, the final stage of asset recovery frequently involves the return or sharing of confiscated assets among the states involved in investigating and resolving the case. This requires not only the existence of appropriate legal mechanisms but also effective cooperation between jurisdictions, including through the conclusion of bilateral or multilateral agreements. In the context of money laundering, where financial flows cross multiple jurisdictions, such cooperation is indispensable for ensuring the efficient and equitable recovery of assets.

Last but not least, preserving the value of assets throughout the proceedings is an essential prerequisite for effective recovery. This requires the adoption of appropriate interim management measures, including the timely disposal of perishable or depreciating assets, as well as the efficient management of complex assets.

Conclusions. The research highlights that the recovery of criminal assets in money laundering cases is an essential pillar of modern policies to combat financial crime, going beyond a strictly punitive dimension and integrating into a comprehensive approach focused on prevention, efficiency, and the restoration of social balance.

The study emphasizes that the recovery of criminal assets is an essential element of combating money laundering, but the effectiveness of this process depends not only on the regulatory framework but especially on its practical implementation. In the case of the Republic of Moldova, the analysis demonstrates the existence of a legal framework that is relatively aligned with international standards, but also significant gaps at the institutional, operational, and judicial levels.

Above all, it has been found that the effectiveness of asset recovery mechanisms depends crucially on the existence of a coherent regulatory framework, aligned with international and European standards, as well as on the institutional capacity to implement

it. Recent developments, including those resulting from the AML 2024 Package [12], confirm the trend toward strengthening legal instruments for the identification, freezing, and confiscation of assets derived from criminal activity.

At the same time, the analysis highlights the importance of precautionary measures and asset freezing mechanisms as indispensable preventive tools for preserving the value of assets until the conclusion of judicial proceedings. Their application, however, must be carried out in strict compliance with the principles of legality and proportionality to avoid unjustified interference with property rights.

Furthermore, confiscation—in all its forms, including extended confiscation and confiscation without conviction—emerges as a strategic tool in combating money laundering, serving to eliminate the economic benefit of the crime. At the same time, comparative analysis demonstrates the existence of various models at the international level, each characterized by a different balance between efficiency and the protection of fundamental rights.

A key finding highlighted by the study is the transnational nature of money laundering, which calls for enhanced international cooperation, both through formal mechanisms and informal channels. The effectiveness of asset recovery is closely linked to the speed of information exchange, coordination between jurisdictions, and the ability to avoid fragmented procedures.

Furthermore, the research underscores that the final stage of asset recovery—the administration, disposal, and use of confiscated assets—is essential to ensuring the real impact of these mechanisms. The implementation of transparent and efficient asset management systems helps preserve their value and direct them toward public interest purposes, thereby strengthening public confidence in the justice system.

Regarding the Republic of Moldova, the results of the analysis indicate significant progress in aligning the regulatory framework with international standards; however, challenges remain regarding the uniform application of legislation, the identification of criminal assets, and the efficiency of recovery procedures. In this context, it is necessary to strengthen institutional capacities, develop appropriate evidentiary tools, and deepen international cooperation.

In particular, the research highlights that technological developments and the increasingly widespread use of virtual assets require a continuous adaptation of mechanisms for the recovery of criminal assets. The integration of digital analysis tools, the development of technical expertise among authorities, and the strengthening of the regulatory framework applicable to virtual asset service providers are becoming essential conditions for maintaining the effectiveness of the system for preventing and combating money laundering in the digital age.

Ultimately, the recovery of criminal assets in money laundering cases must be approached as an integrated process that combines legal, institutional, and operational dimensions. Only through such an approach, based on regulatory consistency, international cooperation, and respect for fundamental rights, can the real effectiveness of the fight against money laundering and the strengthening of the rule of law be ensured.

THE USE OF SPECIAL KNOWLEDGE IN CRIMINAL PROCESS: PRACTICAL NEEDS AND SOLUTIONS

Ion COVALCIUC,
PhD, Associate Professor,
"Ştefan cel Mare" Academy of the Ministry of Internal Affairs,
Chief Prosecutor, Balti Municipality Prosecutor's Office,
Republic of Moldova
ORCID: 0000-0003-0692-8988

Abstract

Celerity represents one of the sine qua non conditions for the successful achievement of the purpose of the criminal process, as formulated in Art. 1 para. (2) of the CPP RM (Criminal Procedure Code of the Republic of Moldova). The purpose aims at protecting the person, society, and the state from crimes, as well as protecting the person and society from the illegal acts of persons with positions of responsibility in their activity related to the investigation of alleged or committed crimes, so that any person who has committed a crime is punished according to their guilt, and no innocent person is held criminally liable and convicted. Equipping the judicial bodies with more investigative tools evidently represents an efficient means in favor of the celerity of investigations.

In addition, remedying the legislative inconsistencies regarding the administration of special knowledge in the criminal process, as well as transforming this process into an effective tool for administering evidence in the criminal process, would represent an important step in this regard.

Keywords: criminal proceedings, criminal procedural law, medico-legal finding, expertise, technical-scientific finding.

UTILIZAREA CUNOȘTINȚELOR SPECIALE ÎN PROCESUL PENAL: NECESITĂȚI PRACTICE ȘI SOLUȚII

Abstract

Celeritatea reprezintă una dintre condițiile sine qua non pentru realizarea cu succes a scopului procesului penal, așa cum acesta este formulat în Art. 1 alin. (2) din CPP RM. Scopul vizează protejarea persoanei, societății și statului de infracțiuni, precum și protejarea persoanei și societății de faptele ilegale ale persoanelor cu funcții de răspundere în activitatea lor legată de cercetarea infracțiunilor presupuse sau săvârșite, astfel încât orice persoană care a săvârșit o infracțiune să fie pedepsită potrivit vinovăției sale, iar nicio persoană nevinovată să nu fie trasă la răspundere penală și condamnată. Dotarea organelor judiciare cu mai multe instrumente investigative reprezintă, evident, un mijloc eficient în favoarea celerității investigațiilor.

În plus, remedierea inadvertențelor legislative privind administrarea cunoștințelor speciale în procesul penal, dar și transformarea acestui proces în un instrument efectiv de administrare a probelor în procesul penal, ar reprezenta un pas important în acest sens.

Cuvinte-cheie: proces penal, lege procesual penală, constatare medico-legală, expertiză, constatare tehnico-științifică.

Introduction. In accordance with the provisions of Art. 2 of the CPC RM[1], the criminal process is regulated by the provisions of the Constitution of the Republic of Moldova, by the international treaties to which the Republic of Moldova is a party, and respective-

[1] Hereinafter the Criminal Procedure Code (CPC), Law of the Republic of Moldova No.122 of 14.03.2003 In: Official Monitor No.248-251/447 of 07.06.2003.

ly by the Criminal Procedure Code. As provided in Art. 1 para. (1) CPC RM, the criminal process represents the activity of the criminal investigation bodies and courts with the participation of the parties in the process and other persons, carried out in accordance with the provisions of the Criminal Procedure Code. The respective provisions indicate without the possibility of interpretation that legality is one of the basic principles of the criminal process, a principle expressly mentioned by the legislator in Art. 7 of the CPC RM. But beyond the indisputably positive aspects of the principle of legality, what we would like to draw attention to within this scientific endeavor relates to the possibility of using special knowledge in the criminal process, and a more applied way of using the principle of legality, so that it does not represent excessive formalism in the investigation process and, instead of contributing to the expeditious resolution of the criminal case, leads to the delay of investigations.

Methods and materials applied. Theoretical and normative material, and last but not least, relevant national and international jurisprudence were used in drafting the article. Also, during the study, several methods of scientific investigation specific to theory were applied, such as: the logical method, the comparative analysis method, the analytical method, etc. Last but not least, the empirical method was used selectively to determine the impact of the use of specialized knowledge in the criminal process on the celerity of investigations.

Purpose of the research. The analysis of the relevant criminal procedural normative framework and domestic jurisprudence in criminal matters, the way in which the criminal procedural law is understood and applied by the judicial bodies, especially the instruments applied by the legislator to include the procedural legal norms from other laws in the Criminal Procedure Code.

Discussions and results obtained. The evolution of the technological process in the recent period naturally cannot go unnoticed by criminal elements, and besides the fact that science provides criminal investigation bodies with new technical means intended for a more effective administration of evidence in the criminal process, it must also respond to the increasingly sophisticated methods used by criminals. Thus, if some time ago, the statement of the author N. Reabchin, that the specificity of papillary traces consists in the fact that they point directly to the "owner", who touched the object, meaning they indicate the specific person. The discovery of other traceological traces – footwear marks, means of transport, also requires the establishment of the person who used them. In the case of papillary traces, the directness logically results from their uniqueness – out of all the people on earth, there are not and have never been two persons with the same papillary traces [1, p.495]. At present, the situation can be totally different. For "if, aside from criminal technologies, the criminal, even using footwear, means of transport, or anything else to commit the crime, still has to be present at the place where the criminal act is committed, even if we were to admit that the traces at the scene are created only by mediate objects, the situation changes radically in the case of using informational technologies, technologies for which we could unhesitatingly affirm that there is no dimension of space, and not only that, but also of borders, domicile, etc. In the same register, for example, if the classic methods of distributing drugs, especially to end consumers, involved interaction in a certain environment, usually disapproved of by society on the one hand and under the scrutiny of law enforcement agencies on the other hand, and consequently recruiting potential clients being a challenge, then the new informational technologies, especially new communication applications, allow unnoticed access even in the safest environments from a social point of view" [2, p.140].

In another train of thought, the classic methods of committing even common law crimes have suffered lately as a result of the technologization of society, such as, for example, thefts committed through informational technologies, drug sales through mobile applications, as well as the speed with which new psychoactive substances appear on the market.

These being just a few of the contemporary objective conditions that involve the large-scale use of special knowledge in the criminal process, solving the tasks of the criminal process being practically impossible without this knowledge.

A brief historical foray into the matter denotes that, in fact, the problem of using special knowledge in the criminal process is not a new one, the demand for it increasing proportionally to the evolution of society and respectively to the evolution of the criminal phenomenon. Thus, some time ago, one of the founders of criminology, Hans Gross, mentioned "that I do not by any means pursue the goal of freeing the investigating judge, to a greater or lesser extent, from the support of competent persons: nothing could be more harmful than for the investigating judge not to know where the limits of his knowledge end; in this case, he would fall into an uninterrupted series of errors. But, if it is inconceivable that the investigating judge be as well informed in specialized matters as authorized experts, on the other hand, it is legitimate to demand that he knows in which situations he must resort to the help of specialists, whom exactly to choose, and what questions to ask" [3, p.3].

The need to use special knowledge in the criminal process was noticed with the formalization, or in other words, providing a scientific character to criminal investigations. At the same time, the way in which special knowledge is administered in the criminal process represents, in our opinion, the "cornerstone", as it can serve as an effective tool in investigating crimes where the circumstances of the case require it, or it can become a problem in itself when the administration of special knowledge in the criminal process is excessively formalized. In this sense, the author Packer H.L. highlighted:

a) *The Due Process Model*, when the basic priority lies in the adequate protection of the rights and freedoms of the person, a protection ensured by granting a maximum number of criminal procedural guarantees to the person defending themselves in the criminal process;

b) *The Crime Control Model*, when the focus is placed on protecting society and its members (real or potential victims) from crimes, and which allows, in order to achieve maximum effectiveness in combating crime, a substantial restriction of the rights and freedoms of the person.

Based on this conception, recognized as conceptual today, it can be stated that the basic elements, which are in continuous competition in criminal procedural policy, are, on the one hand, the full protection of human rights, and on the other hand, the fight against crime. The merit of author Packer H.L. is to be recognized in the fact that he demonstrated the impossibility of establishing a monopoly in this fight. The respective elements, although they are in a natural competition, constantly interact at the same time, determining each criminal procedural system to be in an eternal search for the balance needed by society [4, p. 57].

But, beyond the need to ensure that the rights and freedoms of the participants in the criminal process are not unjustifiably restricted, the average duration of the evidentiary procedures through which special knowledge is used in the criminal process of over a year [5], when it comes to expertise, and somewhat less, depending on the knowledge requested, when it comes to technical-scientific or medico-legal findings, certainly can-

not contribute to the celerity of investigations.

Although at first glance the stated problem does not have a legal character, according to criminal procedural provisions, as evidence in the criminal process, factual elements established including through the following means are admitted:

- The judicial expertise report;
- Technical-scientific and medico-legal findings.

What we will analyze next relates to the way in which, at present, the administration of certain evidence through the respective means is regulated, the interference between them, their impact, as well as their integration into the criminal procedural evidence.

With reference to the technical-scientific or medico-legal finding, Art. 139 para. (1) of the CPC RM provides for the possibility of ordering it in the event that there is a danger of the disappearance of some evidence or the modification of some factual situations and it is necessary to urgently explain some facts or circumstances of the case, the competence to order it belonging to the prosecutor, the criminal investigation body, the ascertaining body, or the court, which can use the knowledge of a specialist for this purpose.

While according to the provisions of Art. 142 para. (1) of the CPC RM, the judicial expertise is ordered in cases where specialized knowledge in the field of science, technique, art, craft, or other fields is necessary to establish, clarify, or evaluate circumstances that may have evidentiary importance for the criminal case. And according to the provisions of Art. 6 para. (1) point 12/1 of the Criminal Procedure Code, judicial expertise is understood as the scientific-practical research activity carried out within the criminal process, with the aim of finding the truth by conducting methodical research, with the application of special knowledge and technical-scientific procedures to formulate reasoned conclusions regarding certain facts, circumstances, material objects, phenomena and processes, the human body and psyche, which can serve as evidence in a judicial process.

The comparative analysis of the stated texts of law highlights, on the one hand, the legislator's option to include both the expertise report and the technical-scientific and medico-legal findings among the means of evidence in the criminal process, means whose list, as it results from the criminal procedural legislation, is a restrictive one [6, p.449], and on the other hand, that essentially the respective means of evidence do not differ, even if the legislator chose to define them differently. The differences between the expertise and the finding being rather related to the subjects, the conditions for ordering them, the people involved, etc. [7, p.65].

But, according to the provisions of Art. 6 point 12) of the CPC RM, a judicial expert is a qualified person who is authorized, according to the law, to perform expertise and formulate conclusions in the specialty in which they are authorized, regarding certain facts, circumstances, material objects, phenomena and processes, the human organism and psyche, and who is included in the State Register of Judicial Experts. So it is obvious that the institution takes on a profoundly formal character, as long as, besides qualifications, the person must be legally authorized to perform expertise, moreover, they must be registered, including in the State Register of Judicial Experts.

At first glance, the situation seems to be simpler in the case of specialists who, according to Art. 6 point 43) of the CPC RM, is – the person who thoroughly knows a discipline or a certain problem and is involved in the criminal process, in the manner provided by law, to contribute to establishing the truth. Thus, if the expert's involvement in the criminal process, besides the need to solve certain problems requiring special knowledge in certain fields, it is also necessary for the expert to meet some formal criteria. Furthermore, the recommendation of the Supreme Court of Justice No.38 of 2013, referring to

the provisions of Art.142-153 of the Criminal Procedure Code, suggests that an expertise cannot be ordered and performed until the start of the criminal investigation [8].

The mentioned aspects surely cannot contribute to the celerity of the investigations, and the deadlines for performing some categories of expertise only complicate this matter even further.

Consequently, what would be possible to achieve under the current criminal procedural framework, in order to avoid possible delays of the investigations where the need to use special knowledge arises within the criminal process, would be resorting to technical-scientific or medico-legal findings. Or, in other words, resorting to the knowledge of the specialist instead of calling upon the involvement of an expert.

At the same time, the respective solution cannot be used every time the need to use special knowledge arises in the criminal process. In this sense, the criminal procedural law expressly provides for situations in which the use of the specialist's knowledge instead of the expert's is not possible. For example, according to the provisions of Art. 143 para. (1) of the CPC RM, the expertise is ordered and performed, obligatorily, for the ascertainment of:

1. The cause of death;
2. The degree of severity and the character of bodily injuries;
3. The mental and physical state of the suspect, accused, defendant – in cases where doubts arise regarding their state of sanity or their ability to independently defend their legitimate rights and interests in the criminal process;

3/1. The mental and physical state of the person about whom it is claimed that acts of torture, inhuman or degrading treatments were committed;

4. The age of the suspect, accused, defendant, or injured party – in cases where this circumstance has importance for the criminal case, and the documents confirming the age are missing or present doubt;

4/1. The health condition of the suspect, accused, or defendant deprived of liberty – in cases of the presence of some indications of contracting a serious illness;

5. The mental or physical state of the injured party, the witness if doubts arise regarding their ability to correctly perceive the circumstances that are important for the criminal case and to make statements about them, if these statements will later be placed, exclusively or mainly, at the base of the decision in the given case.

From what has been mentioned, it certainly results that the legislator has conditioned the possibility of ascertaining the circumstances mentioned above, exclusively through a single evidentiary procedure – the expertise.

Furthermore, according to Art. 143 para. (1) point 6) of the CPC RM, the expertise is also mandatory in other cases when the truth cannot be established through other evidence. But, in our view, the respective provision does not exclude the possibility of using the knowledge of a specialist in the respective situations, the expertise becoming mandatory only subsidiarily, when other evidentiary procedures are inefficient. In another train of thought, according to Art. 97 of the CPC RM, in the criminal process, the following circumstances are ascertained through certain means of evidence:

1. The cause of death – through the medico-legal expertise report;
2. The existence, character, and degree of bodily injuries in criminal cases – through the medico-legal expertise report;
3. The incapacity of the person, at the time of committing the prejudicial act, to realize their actions or inactions or to direct them as a result of a mental illness or a temporary mental disorder, another health disorder, or debility – through the psychiatric

expertise report;

3/1. The contraction by the suspect, accused, or defendant of a serious illness that prevents the execution of the sentence – through the conclusions of the Consultative Medical Council of the National Administration of Penitentiaries or, as the case may be, through the judicial expertise report;

4. The incapacity of the witness to perceive and reproduce the circumstances, which are to be ascertained in the criminal case, as a result of a mental illness, a temporary mental disorder, another health disorder, or debility – through the psychiatric expertise report;

5. The attainment by the injured party, suspect, accused, defendant of a certain age, if this has importance in the case – through an age certificate, and in case of age-related incapacity – through the medico-legal or psychiatric expertise report.

The comparative analysis of the mentioned provisions denotes that even if there are certain differences, according to the criminal procedural provisions, the expertise is mandatory in the mentioned situations.

At the same time, the way in which the technical-scientific or medico-legal finding is ordered, as opposed to the expertise, denotes that the former practically do not involve the participation of the parties in this process. From the provisions of Art. 140 para. (1) of the CPC RM, the criminal investigation body, the prosecutor, the ascertaining body, or the court that orders the technical-scientific finding establishes its object, formulates the questions to be answered, and establishes the term in which the work will be performed. And according to the provisions of Art. 141 para. (1/1) of the CPC RM, the criminal investigation body, the prosecutor, the ascertaining body, or the court informs the parties that they have the right to get acquainted with the technical-scientific or medico-legal finding report, drafting a protocol in case of exercising this right.

In opposition to the aforementioned, the expertise implies not only the possibility of appointment on the initiative and at the expense of the parties according to the provisions of Art. 142 para. (2) of the CPC RM, but also their active participation in the process of appointing and performing the expertise.

Similarly, according to the provisions of Art. 144 para. (4) of the CPC RM, the suspect, the accused, or the injured party may request the criminal investigation body or, as the case may be, the prosecutor to order the performance of the judicial expertise. And the refusal to order the performance of the judicial expertise can be challenged in the manner established by the present Criminal Procedure Code.

According to the provisions of Art. 145 para. (1) of the CPC RM, the criminal investigation body, the prosecutor, or the court, in the event that it orders the performance of the judicial expertise, informs the parties in writing about the object of the judicial expertise and the questions to which the expert must give answers and explains to the parties that they have the right to make observations regarding these questions and to request their modification or completion, as well as the right to request the appointment of one expert recommended by each of them to participate in the performance of the judicial expertise.

Similarly, according to the provisions of Art. 151 para. (7) of the CPP RM, the judicial expertise report or the declaration of the judicial expert regarding the impossibility of presenting some conclusions, as well as the protocol of the expert's hearing, are communicated to the parties immediately, but no later than 3 working days from their receipt by the criminal investigation body, the prosecutor, or the court, and it is explained to them in writing that they have the right to give explanations, to make objections, as well as to request the submission of additional questions to the expert, the performance of a judicial expertise.

In another context, although apparently the mentioned evidentiary procedures are different, including from the perspective of the parties' participation, according to the provisions of Art. 139 para. (2) of the CPC RM, the technical-scientific and medico-legal findings can only be performed by a judicial expert registered in the State Register of Judicial Experts. Thus, on the one hand, when regulating the finding, the legislator operates with the notion of specialist (Art. 139 para. (1), 140 para. (2) of the CPC RM), and according to the provisions of Art. 87 para. (1) of the CPC RM, the specialist is the person called upon to participate in performing a procedural act in the cases provided by this Criminal Procedure Code, who is not interested in the results of the criminal process. The request of the criminal investigation body, the prosecutor, the ascertaining body, or the court regarding the calling of the specialist is mandatory for the manager of the enterprise, institution, or organization where the specialist works. On the other hand, however, the legislator conditions the performance of the finding by a judicial expert registered in the State Register of Judicial Experts according to the provisions of Art. 139 para. (2) of the CPP RM. Consequently, the difference between the mentioned evidentiary procedures becomes mostly formal, and the possibility of the judicial body to solve the problem of using special knowledge in the criminal process, by resorting to specialists from different fields without any formal criteria, is annihilated.

Moreover, the very difference between finding and expertise, as initially outlined by the legislator, also becomes difficult to apply; regardless of whether we are in the presence of a danger of the disappearance of some evidence or the modification of some factual situations for which an urgent explanation of some facts or circumstances of the case is necessary, the functional competence of solving these situations belongs to the expert. According to the provisions of Art. 139 para. (2) of the CPC RM, the technical-scientific and medico-legal finding can also be performed by a judicial expert registered in the State Register of Judicial Experts. In other words, regardless of the form of administering special knowledge in the criminal process, expertise or finding, the only subject through whom the evidentiary procedure can be carried out is the expert. The problem becomes all the more complicated as, regardless of the form, the research is carried out by the same subject, and as we mentioned above, the average term for performing expertise is one to the detriment of the celerity of investigations.

In another train of thought, the question arises about the rationale of using two forms of administering special knowledge from the same subject. The question is all the more current as, according to Art. 141 para. (2) of the CPC RM, if it is found that the technical-scientific or medico-legal report is incomplete or its conclusions are not accurate, the performance of a judicial expertise is ordered, both activities being performed by the person with the same abilities – the expert.

The respective legislative provisions are to be considered by relating them to the provisions of Art. 89 para. (1) point 5) of the CPC RM, according to which, a person cannot take part in the process as an expert if they have participated as a specialist in this process, except for the cases of participation of the forensic doctor in the external examination of the corpse and the cases of participation of subject matter specialists in the investigation of explosions and the dismantling of explosive devices.

In fact, the respective approach departs from the initial approach in this matter which provided that the technical-scientific finding is usually performed by specialists working in the criminal investigation body. It can also be performed by specialists working within other bodies, as well as by other specialists.

Last but not least, although the criminal procedural legislation provides for the pos-

sibility of the participation in the criminal process of both the expert and the specialist, as different subjects, and according to the provisions of Art. 87 para. (1) of the CPC RM, the specialist is the person called upon to participate in performing a procedural act in the cases provided by the Criminal Procedure Code, who is not interested in the results of the criminal process. The request of the criminal investigation body, the prosecutor, the ascertaining body, or the court regarding the calling of the specialist is mandatory for the manager of the enterprise, institution, or organization where the specialist works. And according to para. (5) point 6) of the same article, the specialist is obliged to make conclusions of technical-scientific or medico-legal finding. The legislator, as we mentioned above, expressly provided according to the provisions of Art. 139 para. (2) of the CPC RM, the possibility of performing the finding only by the expert.

Conclusions. Reiterating what is mentioned in Art. 1 para. (1) of the CPC RM, according to which the criminal process represents the activity of the criminal investigation bodies and courts with the participation of the parties in the process and other persons, carried out in accordance with the provisions of the Criminal Procedure Code. Activity which according to the provisions of para. (2) of the same article has the purpose of protecting the person, society, and the state from crimes, as well as protecting the person and society from the illegal acts of persons with positions of responsibility in their activity related to the investigation of alleged or committed crimes, so that any person who has committed a crime is punished according to their guilt and no innocent person is held criminally liable and convicted.

We consider it necessary to mention that achieving the purpose of the criminal process would be, if not impossible, then at least difficult to achieve in the absence of legislative provisions that would allow the use of multiple investigative tools, including alternative ones, for administering evidence in the criminal process.

At the same time, it is obvious that the purpose of the criminal process can be achieved also to the extent that the criminal procedural legislation favors the celerity of the investigations, a celerity that can certainly be much more easily achieved when inconsistencies such as those mentioned above are remedied.

CRIME IN THE CONTEXT OF ARMED CONFLICT: A SOCIOLOGICAL ANALYSIS OF CHANGES IN THE STRUCTURE OF CRIMINAL OFFENSES

Oleksandra PTASHNYK,
PhD Candidate, Associate Professor,
Acting Head, Department of Law,
Academician I.M. Lutskyi, King Danylo University,
Ivano-Frankivsk, Ukraine
ORCID: 0000-0002-1529-2443

Abstract

This article presents a comprehensive sociological analysis of how crime has changed in Ukraine during the Russian Federation's full-scale armed aggression. Using statistical data from the Office of the Prosecutor General (2021-2025), it examines shifts in the structure of criminal offenses. The author finds that the war has strongly triggered "social anomie" and led to a sharp increase in serious and especially serious crime, such as war crimes, crimes against national security, and violations of military discipline.

The study highlights specific sociological factors contributing to rising crime rates, including: economic deprivation, mass victimization, and psychological trauma (PTSD). It also focuses on the aggressor's "criminal activism", which includes identocidal and urbicidal acts. The paper explores how organized crime adapts to martial law by shifting to digital methods and corrupting the distribution of humanitarian resource.

The increase in military offenses among the Defense Forces reflects psycho-emotional exhaustion, which calls for new social support models, not only more repressive measures. The conclusions emphasize the need to adopt transitional justice, an approach that balances the punishment of offenders with the reintegration of people from de-occupied territories. After the war, new problems, such as proliferation of illegal weapons and violent behavior, will require a scientifically grounded strategy for society's rehabilitation.

Keywords: martial law, crime structure, sociology of deviance, social anomie, criminal actionism, war crimes, transitional justice, national security, collaboration, identicide.

CRIMINALITATEA ÎN CONTEXTUL CONFLICTELOR ARMATE: O ANALIZĂ SOCIOLOGICĂ A SCHIMBĂRILOR ÎN STRUCTURA INFRACȚIUNILOR PENALE

Abstract

Articolul prezintă o analiză sociologică comprehensivă a transformărilor criminalității în Ucraina în perioada agresiunii armate la scară largă a Federației Ruse. Utilizând date statistice ale Oficiului Procurorului General (2021-2025), studiul examinează modificările survenite în structura infracționalității. Autorul susține că războiul a intensificat semnificativ „anomia socială" și a determinat o creștere accentuată a infracțiunilor grave și deosebit de grave, precum crimele de război, infracțiunile contra securității naționale și încălcările disciplinei militare.

Studiul evidențiază factorii sociologici specifici care contribuie la creșterea ratei criminalității, inclusiv deprivarea economică, victimizarea în masă și trauma psihologică (PTSD). De asemenea, acesta se concentrează asupra „activismului criminal" al agresorului, care include acte de identocid și urbicid. Articolul analizează modul în care criminalitatea organizată se adaptează regimului legii marțiale prin trecerea la metode digitale și coruperea procesului de distribuire a resurselor umanitare.

Creșterea infracțiunilor militare în rândul Forțelor de Apărare reflectă epuizarea psiho-emoțională, ceea ce impune dezvoltarea unor noi modele de sprijin social, și nu doar aplicarea unor măsuri represive suplimentare. Concluziile subliniază necesitatea adoptării justiției tranzitorii — o abordare care echilibrează sancționarea infractorilor cu reintegrarea persoanelor din teritoriile deocupate. După război, noi provocări, precum proliferarea armelor ilegale și comportamentul violent, vor necesita o strategie fundamentată științific pentru reabilitarea societății.

Cuvinte-cheie: lege marțială, structura criminalității, sociologia devianței, anomie socială, activism criminal, crime de război, justiție tranzitorie, securitate națională, colaborare, identocid.

Introduction. The full-scale war launched by the Russian Federation against Ukraine has become not only a challenge to national security but also a powerful catalyst for fundamental changes in all social systems, particularly in the sphere of law and order. The armed conflict has transformed the nature of social danger, giving rise to new forms of crime and altering traditional forms of criminal activity. A sociological analysis of these processes reveals not only statistical trends but also profound shifts in social psychology, moral values, and mechanisms of social control. Research into these processes is critically important for developing transitional justice strategies and stabilizing the rule of law in the post-war period.

The object of the study is the state and structure of crime in Ukraine under martial law. The subject of the study is the sociological patterns of changes in types of offenses caused by the armed conflict.

The aim of the article is to conduct a comprehensive sociological analysis of the quantitative and qualitative transformations of crime in Ukraine during 2021-2025, to identify the key determinants of the criminalization of social relations, and to substantiate new models for combating crime in wartime conditions.

Methods and materials applied. The study's methods are based on sociological theories of anomie (É. Durkheim, R. Merton), the concept of "criminal actionism" (Y. Orlov), and statistical analysis of data from the Office of the Prosecutor General of Ukraine. It uses an interdisciplinary approach combining a criminological perspective with psychoanalytic analysis of collective trauma and resentment.

Discussions and results obtained. Academic research on crime in armed conflict has a solid theoretical foundation, but there is an urgent need to rethink approaches for modern warfare. Scholars such as O.M. Bandurka, V.V. Holina, Y.V. Baulin, V.M. Kuts, O.M. Dzhuzha, and A.P. Zakaliuk contributed to these foundations. However, most studies focused on crime prevention during normal (peacetime) conditions.

Contemporary researchers note that war has changed how academics approach their work and exposed problems in crime-prevention institutions. M.I. Kharvoniuk [8] observes that, recently, studies on the state of crime in Ukraine are rare. Many authors focus only on certain crimes, such as organized crime, corruption, or war crimes. Since 2020, general crime statistics have received little attention.

Researchers (O. M. Yurchenko, V. L. Grokholskyi, and others) focus on the evolution of this phenomenon and its ability to fill a "governance vacuum" amid the weakening of state institutions. At the same time, a comprehensive theoretical assessment of organized crime, specifically as a systemic threat under martial law and in the context of hybrid challenges, remains underdeveloped.

S.M. Alfiorov, V.S. Batyrhareieva, B.M. Holovkin, and others have addressed the criminological characteristics of theft and robbery. However, science now faces a new problem – the development of an effective mechanism to prevent property crimes committed specifically during wartime.

Although attention to crime committed by military personnel is growing, specialized monographic studies devoted exclusively to this type of crime in the context of full-scale aggression are limited.

Y.V. Orlov [3] holds a special place in the current literature. The author suggests using a "criminological lens" to explain aggression as "criminal performance" (actionism). He also analyzes Russian fascism with psychoanalytic methods, exploring collective trauma and resentment in war crimes.

Sources urge in-depth study of these areas: how to support transitional justice sci-

entifically; how to design wartime anti-crime strategies; analysis of identocide (destroying national identity) and urbicide as forms of the aggressor's crime; and how to align national laws (especially Article 438 Criminal Code of Ukraine) with the Rome Statute of the ICC.

Academic debate is now shifting. It moves from listing facts toward a systematic understanding of disorder in the anti-crime system. The search for new models to keep the rule of law is ongoing.

A full analysis shows that the crime situation has worsened a lot. There is a roughly 11% increase in reported crime. This needs closer study, since the data comes with fewer statistical sources (due to territory occupation) and mass emigration of over 7 million people.

Statistical reports from the Office of the Prosecutor General [5] from 2021 to 2025 allow a detailed analysis of crime trends in Ukraine. The full-scale invasion in 2022 marked a turning point in crime structure. Since 2021, registered offenses have risen sharply: from 321,443 in 2021 to 608,101 in 2025. The main changes were linked to martial law, which led to a spike in certain crime categories.

According to official data from the Office of the Prosecutor General [5], the crimes whose numbers have increased significantly are:

1. *Crimes against peace, the security of humanity, and the international legal order*: This is the category with the most explosive growth due to the mass registration of war crimes (Art. 438 of the Criminal Code of Ukraine). The number rose from 253 in 2021 to 62,128 in 2022 and remains at a high level (over 56,000 in 2025). The main increase comes from Article 438 (violations of the laws and customs of war), under which there were only 172 cases in 2021, while during the war, the figure ranges from 26,000 to 60,000 annually.

2. *War crimes*: A steady and significant annual increase is observed: 3,037 (2021) → 11,596 (2022) → 14,820 (2023) → 16,820 (2024) → 17,385 (2025).

3. *Crimes against national security*: Rose sharply in 2022 (17,422 cases) compared to 520 in 2021. Treason (Art. 111) rose from 208 in 2021 to 1,957 in 2022, staying above 1,000 per year later. Massive collaboration cases (Art. 111-1) started in 2022: 5,851 (2022); 3,207 (2023).

4. *Crimes against life and health*: The number of reported cases is steadily increasing, from 33,657 in 2021 to 85,422 in 2025.

Crimes whose numbers have decreased or shown unstable trends include:

1. *Property crimes*: In the first year of the full-scale invasion (2022), there was a significant decrease in reported thefts and robberies, to 113,137 cases compared to 158,729 in 2021. In 2023, there was a spike to 178,902 cases, but since 2024, a steady downward trend has been recorded, down to 89,150 in 2025.

2. *Crimes against public order and morality*: In 2022, the number fell by nearly half (to 3,603 from 5,985 in 2021). In 2023–2024, the figures returned to pre-war levels (around 5,000–5,900), but a slight decrease was again recorded in 2025.

3. *Environmental crimes*: After the war began, the number of reported cases decreased slightly compared to 2021 (5,416 cases) and fluctuates between 4,000 and 4,700 per year.

Thus, the period of martial law is characterized by a sharp increase in serious crimes directly related to the war (war crimes, treason, desertion), while traditional types of crime, such as property crimes, declined at the start of the war, then fluctuated. Based on an analysis of statistical reports for 2021-2025, several key factors can be identified as contributing to the unstable trend in property crime. It is important to note that the reports themselves are statistical tables and do not include a detailed textual analysis of the causes; therefore, the conclusions presented below are based on comparisons of figures across different categories of offenses.

The main factors explaining the fluctuations in the indicators include the following:

1. A *sharp shift in structure*: *"Traditional" thefts vs. Fraud*. The total number of property crimes was highly volatile, driven by opposing trends in the two main categories: thefts and fraud. Decline in physical thefts (Art. 185 CC of Ukraine): The number of reported thefts steadily and rapidly decreased throughout the entire war period. While 113,517 thefts were recorded in 2021, the number dropped to 65,498 in 2022 and fell to 28,416 cases by 2025. Explosive growth in fraud (Art. 190 CC of Ukraine): It was this type of crime that caused the spike in overall property crime statistics in 2023. In 2021, 23,847 fraud cases were recorded. In 2022, the figure rose to 32,086, and in 2023, it jumped to 82,609 cases. This is nearly four times higher than in the pre-war year. Such a surge in fraud is usually linked to the rise of cybercrime, "fundraising" schemes, and phishing, which intensified during the war.

2. *The effect of the first year of the war*. In 2022, there was a significant decrease in the total number of property crimes, to 113,137 (compared to 158,729 in 2021). This may be due to the inability to record crimes in the occupied territories and in active combat zones during the first months of the invasion. A significant decrease in robberies and muggings was also observed in 2022.

3. *A peak in 2023 and a subsequent decline*. In 2023, there was an anomaly, with a record high of 178,902 reported property crimes. This was driven by the aforementioned surge in fraud. However, a steady downward trend began as early as 2024 – 132,910 crimes; in 2025 – 89,150 crimes.

4. *Trends in Serious Property Crimes*. Crimes such as robbery and armed robbery showed a steady downward trend, which also influenced the overall curve: Robbery (Art. 186 CC) – from 4,846 in 2021 to 1,322 in 2025; Robberies (Art. 187 CC) – from 952 in 2021 to 310 in 2025.

The instability in the trend (a drop in 2022, a spike in 2023, and another drop in 2024-2025) is explained by the fact that traditional types of crimes (theft, robbery) were steadily declining, while white-collar crimes (fraud) experienced an anomalous spike in the middle of the war period, after which their numbers also began to decline.

An important sociological indicator is the sharp increase in absentia investigations (by 76%), which suggests that offenders are distancing themselves from the national justice system. Alongside this, there has been a decline in the effectiveness of crime detection (by 26%), which is a consequence of the excessive burden on the law enforcement system, which is forced to perform functions atypical for it (evacuation, recording of shelling).

War, as an extreme social condition, has created a specific environment of "social anomie" (according to É. Durkheim), where customary social norms and behavioral regulators lose their effectiveness. In this context, crime is transformed under the influence of a complex of interrelated determinants:

1. *Economic factors*: resource shortages and new vectors of self-interest.

– Macroeconomic instability caused by hostilities directly affects the crime situation.

– Inflation and unemployment: a sharp decline in purchasing power and the loss of income sources push marginalized segments of the population toward committing crimes of greed.

– The transformation of property crime: despite a decrease in "traditional" petty thefts (due to curfews and increased patrolling), a phenomenon of large-scale looting has emerged. The appropriation of property belonging to evacuees or objects damaged by shelling has become a serious challenge for the law enforcement system, requiring the strengthening of criminal liability for such acts under martial law.

2. *Psychological factors*: the destructive consequences of trauma.

– The psycho-emotional state of society is a critical determinant of violent crime.

– Mass victimization and PTSD: experiencing traumatic events, the loss of loved ones, and the loss of homes lead to the accumulation of internal aggression. Post-traumatic stress disorder (PTSD), without proper rehabilitation, becomes a catalyst for unmotivated aggression, which provokes an increase in violent crimes (bodily harm, domestic violence).

– Militarization of society: Access to firearms, the number of which in the hands of the population has grown exponentially, creates conditions for domestic conflicts to escalate into serious criminal offenses. The psychological threshold for using weapons in wartime is significantly lowered.

3. *Migration processes and demographic pressure*:

– Large-scale internal displacement of persons (IDPs) has radically altered the social landscape of regions, particularly in the West.

– Pressure on infrastructure and social control: an abnormally high population concentration in certain communities places an excessive burden on life-support systems, provoking social tension and domestic conflicts.

– The vulnerable situation of evacuees creates fertile ground for new forms of fraud (renting non-existent housing, pseudo-volunteering, and manipulation of social benefits). At the same time, the difficulty of identifying individuals within large migration flows creates a conducive environment for criminals to evade law enforcement.

The sociological and criminological dimension of armed conflict requires an in-depth study not only of the consequences, but also of the causes of the aggressor state's destructive actions. In this context, it is worth drawing on the concept of Y.V. Orlov [3], who defines the current war through the category of "criminal performance" or negative majoritarian actionism. The criminality of the occupying forces' actions goes beyond the classical understanding of wartime excesses (collateral damage) and becomes a deliberate instrument for manifesting their own identity. This process occurs through the aggressive denial and total destruction of "otherness" – the annihilation of everything that marks Ukrainian statehood, culture, and value choices.

The ideological and psychological foundation of such actions is the phenomenon of Russian fascism (Rashism). From the perspective of the sociology of deviant behavior, Rashism should be analyzed not merely as a political doctrine, but as a specific pathological state of mass consciousness. The fundamental basis of this condition is social resentment – a deep sense of envious hostility arising from an inferiority complex and society's inability to realize its own ambitions through constructive means. This destructive force, compounded by unresolved collective traumas of the past and the "phantom pains" of lost imperial grandeur, serves to morally legitimize violence in the eyes of Russian society.

Such social pathology, reinforced by state propaganda, inevitably gives rise to forms of criminal activity unprecedented in their cruelty and scale. Among the most destructive phenomena of this war, aimed not at military superiority but at the ontological destruction of the enemy, are:

– *Identocide*: is the systematic and deliberate eradication of any markers of national identity. This crime is carried out through a multi-vector mechanism: from the physical destruction of the intelligentsia and cultural bearers to the elimination of the Ukrainian educational and linguistic space in the temporarily occupied territories. The confiscation and destruction of historical literature, persecution for the use of national symbols, as well as the mass deportation of children for the purpose of their forced assimilation and ideological reprogramming, are direct acts of identocide aimed at interrupting the transmission of social experience to future generations.

– *Urbicide*: is the deliberate, systematic, and irreversible erasure of entire cities from the face of the earth. In the sociocultural dimension, a city is not merely a collection of infrastructure; it is the center of civilization, collective memory, social ties, and the economic potential of society. Consequently, the destruction of urban space is an act of total desocialization of the population. By turning cities into ruins, the aggressor seeks to destroy the very possibility of recreating social and cultural life in these territories, transforming them into "dead zones" incapable of resistance.

Organized crime is adapting to martial law to fill the "governance vacuum". Criminal groups are turning to high-tech methods, including cyber fraud disguised as fundraising for the Armed Forces of Ukraine. Corruption infiltrating the structures that manage humanitarian aid and defense resources poses a particular danger, undermining public trust in the state.

The rise in offenses among service members of the Ukrainian Armed Forces is an indicator of systemic problems: moral exhaustion, inadequate medical care, and shortcomings in commanders' leadership. Desertion and insubordination are often not manifestations of ill will, but reactions to excessive strain. This requires the state not only to impose sanctions but also to develop a system of military psychology and social support.

The central issue of the transition period is transitional justice. The main challenge is striking a balance between punishing the guilty and reintegrating those who found themselves under occupation. Necessary measures:

1. Developing a crime-fighting strategy adapted to wartime realities.
2. Introducing criminological analysis of regulatory acts to minimize corruption.
3. Clearly distinguishing between voluntary collaboration and the forced survival of the civilian population.

The armed conflict has caused a structural shift in crime, with crimes against peace, human security, and military discipline now dominating. Sociological analysis shows that wartime crime results from the combined effects of external aggression and internal social erosion. After the war, a surge in drug-related crime and violent offenses is predicted due to PTSD and the large number of weapons. Effective countermeasures require not only police work but also profound sociocultural rehabilitation of society.

Conclusions. The present study allows us to draw the following theoretical and practical conclusions:

1. The period from 2022 to 2025 is characterized by a critical shift in the structure of crime toward serious and particularly serious crimes. The dominant trend is the prevalence of offenses directly caused by the war: war crimes (Art. 438 of the Criminal Code of Ukraine), crimes against national security, and military offenses. The number of cases in these categories has increased by hundreds of thousands, if not millions, of times compared to the pre-war period.

2. The armed conflict has created a specific sociocultural environment where the main factors driving criminalization are economic deprivation (looting), psychological trauma (increased aggression due to PTSD), and migration processes (pressure on social control systems in western regions).

3. A sociological analysis of the actions of the occupying forces allows us to classify them as "negative actionism", where crime serves as a tool for the destruction of national identity (identocide) and urban space (urbicide). This requires not only a legal, but also a sociocultural assessment within the framework of an international tribunal.

4. Organized crime has demonstrated high flexibility, migrating into the digital sphere (cyber fraud under the guise of aid to the Armed Forces of Ukraine) and attempt-

ing to corrupt the sectors responsible for the distribution of humanitarian and defense resources.

5. The rise in cases of combat stress disorders and desertion is primarily a socio-psychological indicator of human resource depletion, which dictates the need to shift from purely repressive measures to the development of a system of psychological support and rotations.

6. Effective stabilization of the rule of law is impossible without implementing the concept of transitional justice. The key task is to strike a balance between punishing the guilty and reintegrating the population of de-occupied territories, while avoiding excessive stigmatization of the victims of the occupation.

Prospects for further research lie in the development of long-term plans for societal rehabilitation, as a surge in violent crime and illegal arms trafficking is expected following the end of active hostilities, driven by high levels of militarization and widespread psychological trauma.

ORCID: 0009-0005-5202-9467

Abstract

The Temporary Protection Order (TPO) is emerging as an essential legal and operational tool in the rapid intervention of the police in cases of domestic violence, located at the intersection between the protection of fundamental rights and respect for the inviolability of the home. The approach is based on a multidisciplinary perspective, which integrates legal analysis, police tactics and elements of criminology, in order to evaluate the effectiveness of this mechanism in Romania and the Republic of Moldova. The complexity of the operative decision regarding the entry into the home without a warrant is analyzed by reference to the existence of an imminent danger, as well as to the determining role of the Risk Assessment Form in the objectification of the intervention. The contributions of digital probation, especially Body-Cam systems, in consolidating the evidence and diminishing the dependence on the victim's statements, frequently influenced by psychological and social factors, are highlighted.

The examination of the judicial practice reveals the main vulnerabilities that lead to the rejection of the Temporary Protection Order, among which the restrictive interpretation of imminent danger, the insufficiency of the evidence and the deficiencies of motivation are distinguished. In parallel, the comparative analysis highlights the emerging role of electronic monitoring mechanisms and the need to standardize procedures between the two states, in the context of alignment with European standards. The effectiveness of the Temporary Protection Order depends crucially on the coherent integration of the legal framework, technology and professional skills of the police officer. The strengthening of this mechanism requires the continuous professionalization of the intervention and the development of evaluation and monitoring tools adapted to the dynamics of the phenomenon of domestic violence.

***Keywords**: temporary protection order, domestic violence, risk assessment, domicile inviolability, digital probation, body cam, electronic monitoring.*

TACTICI DE INTERVENȚIE ȘI RIGOARE JURIDICĂ ÎN APLICAREA ORDINULUI DE PROTECȚIE PROVIZORIU: STUDIU COMPARATIV ROMÂNIA – REPUBLICA MOLDOVA

Abstract

Ordinul de Protecție Provizoriu (OPP) se conturează ca un instrument juridic și operațional esențial în intervenția rapidă a poliției în cazurile de violență domestică, situat la intersecția dintre protecția drepturilor fundamentale și respectarea inviolabilității domiciliului. Abordarea este fundamentată pe o perspectivă pluridisciplinară, care integrează analiza juridică, tactica polițienească și elemente de criminologie, în vederea evaluării eficienței acestui mecanism în România și Republica Moldova. Complexitatea deciziei operative privind pătrunderea în domiciliu fără mandat este analizată prin raportare la existența unui pericol iminent, precum și la rolul determinant al Formularului de Evaluare a Riscului în obiectivarea intervenției. Sunt evidențiate

contribuțiile probațiunii digitale, în special ale sistemelor Body-Cam, în consolidarea probatoriului și în diminuarea dependenței de declarațiile victimei, frecvent influențate de factori psihologici și sociali.

Examinarea practicii judiciare relevă principalele vulnerabilități care conduc la infirmarea Ordinului de Protecție Provizoriu, între care se disting interpretarea restrictivă a pericolului iminent, insuficiența probatoriului și deficiențele de motivare. În paralel, analiza comparativă evidențiază rolul emergent al mecanismelor de monitorizare electronică și necesitatea standardizării procedurilor între cele două state, în contextul alinierii la standardele europene. Eficiența Ordinului de Protecție Provizoriu depinde, în mod esențial, de integrarea coerentă a cadrului legal, a tehnologiei și a competențelor profesionale ale polițistului. Consolidarea acestui mecanism presupune profesionalizarea continuă a intervenției și dezvoltarea unor instrumente de evaluare și monitorizare adaptate dinamicii fenomenului violenței domestice.

Cuvinte-cheie: ordin de protecție provizoriu, violență domestică, evaluarea riscului, inviolabilitatea domiciliului, probațiune digital, body-cam, monitorizare electronică.

Introduction. The tactical and legal dilemma of intervention in private space. Police intervention in cases of domestic violence configures, in the legal systems of Romania and the Republic of Moldova, an area of interference between two fundamental values: the effective protection of the person and the guarantee of the inviolability of the home. This tension is not a purely theoretical one, but is concretely manifested in operative activity, where decisions must be adopted quickly, under conditions of uncertainty and pressure. From a constitutional point of view, the inviolability of the domicile is expressly enshrined, in the sense that "domicile and residence are inviolable" [1, Art.27; 2, Art.52]. At the same time, the protection of life and physical integrity requires the prompt intervention of the authorities when there are indications of the existence of a real danger.

Domestic violence situations prominently highlight this normative duality. The police officer is faced with a complex operational dilemma, where inaction can lead to serious consequences, including loss of life, and unjustified intervention can attract legal liability. The risk assessment must be carried out in an extremely short time frame, based on often incomplete or contradictory information. Under these conditions, the decision to enter the home without a warrant is not the result of a certainty, but of a reasonable assessment of the factual situation. The constitutional framework, however, provides a basis for such interventions, by establishing expressly regulated exceptions. Thus, it is possible to derogate from the principle of the inviolability of the domicile "to remove a danger regarding the life, physical integrity or assets of a person" [1, Art.27 para. (2) lit. b); 2, Art.52 para. (2) lit. b)]. The application of these provisions, however, requires a contextual analysis, in which the police officer must determine whether the danger is sufficiently serious and imminent to justify interference with fundamental rights. The difficulty lies in the fact that, in many situations, the external signs of violence are absent or ambiguous, and the victim's silence can hide a state of intimidation or coercion.

The introduction of the Temporary Protection Order represents a legislative development designed to respond to these challenges. In Romanian law, the mechanism is regulated by Law No.217/2003 for the prevention and combating of domestic violence [3], and in the Republic of Moldova by Law No.45/2007 [4]. By means of this instrument, the policeman acquires the competence to order immediate protective measures, based on a standardized risk assessment, without the need for prior court intervention. This legislative solution reflects the need to adapt legal mechanisms to the specific dynamics of domestic violence, characterized by unpredictability and rapid escalation.

From an operational perspective, the Temporary Protection Order determines a significant transformation of the role of the police. The last one no longer acts exclusively as an executor of the law, but becomes a true risk assessor, being obliged to identify in-

dicators of danger even in the absence of obvious manifestations of violence. In practice, the victim's lack of reaction or denial of the facts cannot automatically be interpreted as the absence of risk, but must be analyzed in the context of the relationship of dependence or intimidation in which it may be. The jurisprudence of the European Court of Human Rights reinforces this approach, enshrining the positive obligation of the state to prevent serious violations of the right to life and integrity. The Court ruled that the authorities must adopt operative measures when "they know or should know about the existence of a real and immediate risk to the life of an identified person" [5, p. 3159]. This obligation requires a proactive approach, where intervention is not only conditional on the existence of certain evidence, but also on the reasonable assessment of the danger.

The dilemma of the intervention is thus outlined on two distinct but interdependent levels. On the one hand, non-intervention can attract the responsibility of the state for the lack of effective protection, given that positive obligations require the adoption of preventive measures. On the other hand, a disproportionate intervention, lacking evidentiary basis, may lead to the disputing of the ordered measures and to the individual liability of the agent. In order to reduce this tension, national legislations have introduced procedural mechanisms aimed at objectifying the police decision, among which the Risk Assessment Form occupies a central place. This tool allows the structuring of the decision-making process by identifying relevant risk indicators, such as antecedents of violence, explicit threats or the aggressor's access to lethal means. The rigorous documentation of these elements contributes not only to the substantiation of the ordered measure, but also to its support before the court. In addition, the use of modern technical means, such as Body-Cam systems, provides an additional dimension of objectivity, facilitating the administration of evidence and reducing the risk of contesting the intervention.

In this context, the activity of the policeman acquires a pronounced analytical dimension, in which risk assessment becomes the central element of the intervention. The balance between the protection of fundamental rights and the need for rapid intervention can only be achieved through a well-founded decision, supported by appropriate methodological tools and a rigorous interpretation of the applicable normative framework.

Methods and materials applied. The research is based on a multidisciplinary approach, in which the dogmatic legal analysis is correlated with elements specific to police tactics and with benchmarks from contemporary criminology. Such an approach allows capturing the analyzed phenomenon not only from the normative perspective, but also from the operational one, in which the police decision is influenced by contextual, dynamic and often unpredictable factors. In this sense, the scientific approach aimed not only to identify the applicable legal framework, but also to evaluate how it is translated into practice, in real intervention conditions.

The comparative method was the main tool of analysis, being used to examine the normative framework in Romania and the Republic of Moldova, especially with regard to the regulation of the Temporary Protection Order and the powers of the police in emergency situations [3, Art. 22/4; 4, Art. 12/1]. This method allowed the highlighting of significant convergences between the two legal systems, generated by the influence of European standards in the matter, but also the identification of nuanced differences in terms of the concrete application of the rules. The comparative analysis was not limited to the formal level of the legal texts, but also aimed at their functional dimension, namely the way in which the legal provisions are used in practice to manage risk situations.

Documentary analysis complemented this approach by examining both primary legislation and subsequent normative acts with direct relevance in the field of police inter-

vention. In this sense, operational instruments such as the Risk Assessment Form, regulated by MIA Order No.146/2018, as well as MIA Instruction No.42/2018 from the Republic of Moldova [6, Art.3; 9, p.22]. These documents reflect the tendency to standardize the intervention and reduce the decisional variability, by introducing some objective criteria for risk assessment. At the same time, they provide the police officer with a methodological framework that facilitates the substantiation of the operative decision and its justification before judicial review.

A distinct role in the research was played by the analysis of specialized literature, which provides theoretical support for the understanding of risk assessment mechanisms and the dynamics of domestic violence. Criminological studies highlight the existence of recurring behavioral patterns, which may indicate an increased risk of violence escalation. Thus, it was emphasized that "certain patterns of violent behavior are predictive indicators of the risk of lethality" [11, p.658-660]. The integration of these conclusions in the legal analysis allows overcoming a strictly normative perspective and contributes to the foundation of an intervention adapted to social realities.

The case study method was used to integrate into the analysis the standards developed in the jurisprudence of the European Court of Human Rights, as well as the practice of national courts. The ECtHR jurisprudence provides an essential interpretive framework in the matter of the state's positive obligations, establishing the limits and conditions under which the intervention of the authorities becomes necessary. In this sense, the standard according to which the authorities must act when they "know or should know the existence of a real and immediate risk" [10, p.3159] has been used as a benchmark in assessing the legality and appropriateness of police intervention. The casuistic analysis also allowed the identification of relevant jurisprudential trends, especially regarding the verification of the proportionality of the ordered measures and the validity of the risk assessment.

Overall, the methodology used allows an integrated approach to the analyzed phenomenon, in which the legal, operational and criminological dimensions complement each other. This perspective provides a solid basis for evaluating the mechanism of the Temporary Protection Order and for formulating relevant conclusions both theoretically and practically.

I. Home Invasion. Operational Risks and Legal Coverage. Entry into the home without the person's consent represents one of the most sensitive forms of state interference in the sphere of fundamental rights. Constitutionally, this right is explicitly enshrined, in the sense that "domicile and residence are inviolable" [1, Art.27; 2, Art.52], which imposes a high standard of protection. However, the same normative framework admits strictly determined exemptions, when it is necessary to "remove a danger regarding the life, physical integrity or assets of a person" [1, Art.27 para. (2) lit. b); 2, Art.52 para. (2) lit. b)]. This exception is the legal basis for police intervention in cases of domestic violence, where the danger is not always visible or immediately quantifiable. In practice, intervention is not based on absolute certainty, but on the evaluation of some indications that suggest the existence of an imminent risk. From this perspective, the institution of the state of necessity acquires particular relevance, as it allows the justification of a proportional interference in rights, in order to protect higher values, such as life or bodily integrity [13, p.45-47].

Beyond the legal dimension, home invasion involves a series of specific operative risks. Unlike the public space, the private environment is characterized by a high degree of uncertainty. The configuration of the home, the number of people involved, the exist-

ence of dangerous objects or the behavior of the aggressor, are elements that cannot be fully anticipated. This situation gives the aggressor an obvious tactical advantage, as he knows the space and can use this advantage unpredictably. Under these conditions, the intervention must be carried out in a careful balance between speed and caution. On the one hand, the delay in intervention can lead to the worsening of the situation, including the occurrence of serious injuries or the death of the victim. On the other hand, an insufficiently substantiated intervention can generate legal consequences, including the annulment of the obtained evidence. Therefore, the condition of the existence of some "fundamental indications" [5, Art.157] becomes essential. They must be based on objective elements, such as noises of violence, cries for help, information provided by witnesses or the history of interventions recorded in operational databases.

Another essential aspect is the delimitation of the purpose of the intervention. In practice, there is a risk of exceeding the legal limits, in situations where the intervention to stop an aggression is transformed into a general home inspection. However, such an unjustified extension may lead to the nullity of evidence, in accordance with the principle according to which "evidence obtained in violation of legal provisions is subject to the sanction of nullity" [14, p.102-104]. Therefore, the police action must remain strictly circumscribed to the purpose for which it was initiated. From a procedural point of view, the documentation of the intervention is a determining element of its validity. MIA Instruction No.42/2018 from the Republic of Moldova requires a detailed description of the circumstances that justified the entry without the tenants' consent, including the sensory perceptions of the policeman [9, p.22-24]. This requirement is not of a formal nature, but reflects the need to allow the subsequent verification of the legality of the intervention by the prosecutor or the court.

In tactical terms, the intervention requires the observance of some essential rules. The immediate separation of the parties, the elimination of the aggressor's access to dangerous objects and the securing of the space are measures that contribute to stabilizing the situation and preventing the escalation of violence. The specialized literature emphasizes that the intervention in the private space "presupposes the rapid assessment of risks and the adaptation of tactics to the concrete conditions of the intervention" [13, p.46].

Overall, home invasion should be understood not as a discretionary manifestation of state authority, but as an exceptional measure, justified by the need to protect fundamental values. The balance between the protection of rights and the need for intervention is achieved through strict compliance with legal conditions and rigorous documentation of the intervention.

II. The Risk Assessment Form: The Foundation of the Operative Decision. The Risk Assessment Form is the central element of the Temporary Protection Order mechanism, having the role of substantiating the police decision in an objective and verifiable way. In the absence of such an instrument, the intervention would depend exclusively on the subjective assessment of the agent, which would generate a high variability of decisions and affect the legal security of the measures ordered. The regulations expressly establish that "risk assessment is carried out by corroborating the victim's answers with the police officer's observations and existing data" [6, Art.3]. This wording highlights the complex nature of the assessment, which is not limited to taking statements, but involves an integrated analysis of the factual situation. The police officer must correlate the information obtained directly from the victim with objective elements, such as traces of violence, the behavior of the aggressor or the history of previous incidents. An essential aspect of the assessment is the identification of lethality indicators. Criminological studies have

shown that certain behaviors foreshadow the escalation of violence to extreme forms. Thus, "certain patterns of violent behavior are predictive indicators of the risk of lethality" [11, p.658-660]. These indicators include a history of violence, explicit death threats, attempted strangulation, or access to weapons.

In practice, one of the major difficulties lies in assessing situations where the victim minimizes or denies the violence. This behavior is frequently encountered in the context of abusive relationships, being determined by factors such as fear, economic dependence or social pressure. Under these conditions, the police officer cannot limit the assessment to the victim's statements, but must use all available elements to assess the level of risk.

The legislation of the Republic of Moldova attaches particular importance to the imminent nature of the danger, establishing that the intervention is justified in the case of the existence of an "imminent danger of repeating acts of violence or committing acts of serious violence" [4, Art.12/1]. This formulation requires a prospective approach, oriented towards the prevention of future risks, not only towards ascertaining the facts already produced.

From an evidentiary point of view, the Risk Assessment Form is the main document analyzed by the court in the procedure to confirm the Temporary Protection Order. The judicial requirements in this matter are high, with the courts rigorously verifying the proportionality of the measure and the validity of the assessment. In this context, any omission or error of judgment may lead to the annulment of the order.

The correlation of the form with other means of evidence, especially with digital probation, contributes to the consolidation of the ordered measure. The use of Body-Cam systems allows capturing the actual situation in real time, providing the court with an objective picture of the circumstances of the intervention. The regulations provide that the police can use technical means in the exercise of their duties [12, Art.31 lit. b)], which gives these records probative value. Overall, the Risk Assessment Form should not be seen as a simple administrative document, but as an essential intervention tool, which transforms the subjective assessment into a well-founded decision. The quality of its completion directly influences the effectiveness of the measure and its ability to withstand judicial review.

III. Technology in Support of Legality: Body-Cam and Video Recordings. The integration of portable audio-video recording systems, known as body-worn cameras, into police work, particularly in domestic violence interventions, marks a significant transformation in the way probation is administered in such cases. If, traditionally, these situations were characterized by a major dependence on the statements of the parties, often contradictory and influenced by emotional or contextual factors, the use of video technology introduces an element of objectivity that considerably reduces evidentiary uncertainty.

The recordings made by the Body-Cam systems capture the intervention in real time, providing a faithful representation of the dynamics of the conflict. This ability to directly capture reality gives these means a distinct probative value, as they are not subject to the same distortions as subsequent depositions. In this sense, it was noted that the video recordings constitute a stable factual support, capable of reflecting both the behavior of the aggressor and the state of the victim at the time of the intervention, thus contributing to the clarification of the factual situation [9, Art.2; 15, p.89].

The importance of these records becomes particularly evident in the context of the phenomenon of complaint withdrawal, frequently encountered in domestic violence cases. In many situations, the victim, under the influence of pressure exerted by the ag-

gressor or economic and emotional dependence, changes his statements or refuses to support them before the authorities. In such cases, the video recording made at the time of the intervention can constitute a decisive evidentiary element, as it captures the state of affairs prior to any subsequent influences.

From a legal point of view, these records are integrated into the category of material evidence, having a relative autonomy from the statements of the parties. The criminal procedural regulations allow the use of technical means of registration in the criminal process, establishing that they can constitute evidence to the extent that they are obtained under the conditions of the law [11, Art. 158/1]. Judicial practice confirms the fact that recordings made on the spot can substantiate protective measures, including in situations where the victim's statements are retracted later [10, p.22]. This characteristic contributes to strengthening the role of the state in protecting the public interest, especially in situations where the victim's vulnerability limits his ability to support the legal action.

In addition to the evidentiary value, the use of Body-Cam systems also has a significant impact on the dynamics of the intervention. Practice has shown that simply informing the people involved that the intervention is recorded can have an effect of discouraging violent behavior. The explicit announcement of the start of the registration, carried out in accordance with the internal regulations, contributes both to ensuring the transparency of the intervention and to respecting the right to private life [9, Art.5; 19, p.114]. At the same time, this approach has an immediate psychological effect, causing, in many situations, a reduction in aggression and facilitating conflict management. An additional advantage of these recordings is to capture the spontaneous reactions of the people involved. Elements such as tone of voice, gestures, emotional state or non-verbal reactions provide a complex perspective on the situation that cannot be fully reproduced by written statements. These details can be of particular importance in assessing the degree of danger and in assessing the credibility of statements, contributing to the formation of a complete picture of the context of the intervention.

However, the use of Body-Cam technology also involves a series of strict technical and procedural requirements. Data integrity and compliance with the chain of custody are essential conditions for the admissibility of evidence. Procedures typically provide for the automatic download of recordings to secure systems, without the possibility of intervention on the content by the operator. Any irregularity in this process may affect the authenticity of the evidence and may lead to their exclusion from the criminal process, in accordance with the rules on the administration of computer evidence [11, Art.158; 12, p.73].

In this context, technology should not be seen as a simple auxiliary tool, but as an integrated element of police intervention, which contributes both to increasing operational efficiency and to strengthening the legality of the actions undertaken. The use of Body-Cam systems determines an implicit standardization of professional conduct and reduces the risk of deviations, by increasing the degree of responsibility of the personnel involved. Overall, the audio-video recordings made during interventions represent an essential factor in the modernization of police activity. They contribute to increasing transparency, strengthening evidence and protecting the fundamental rights of the people involved. By integrating them into the mechanism of the Temporary Protection Order, a direct connection is made between the technological and the legal dimension of the intervention, for the benefit of a more effective protection of the victims and a rigorous application of the law.

IV. Analysis of judicial vulnerabilities. Reasons for invalidating the Temporary

Protection Order (TPO). The effectiveness of the TPO is subject to rigorous control in a relatively short time frame, namely in the phase of confirmation by the prosecutor and later by the court. This verification mechanism, although necessary to guarantee the legality and proportionality of the measure, frequently highlights a series of structural vulnerabilities that lead to the reversal of the order. The analysis of the recent judicial practice in Romania and the Republic of Moldova reveals the fact that the cancellation of the OPP does not occur, predominantly, as a result of the non-existence of the situation of violence, but due to some deficiencies in the legal and evidentiary substantiation of the intervention [12, p.73; 14, pp.102-104].

A first major vulnerability is related to the interpretation of the concept of "imminent danger", an essential notion for the justification of the measure. From a legal point of view, imminence implies the existence of a high probability that the damage will occur in a short period of time, without the intervention of the authorities. In practice, however, this notion is often interpreted in a restrictive way, the courts being reluctant to validate the measure when there is an interval of apparent calm between the moment of aggression and the issuance of the order. Such an approach ignores the specificity of domestic violence, characterized by a cyclical dynamic, in which episodes of violence are followed by periods of apparent normality. From this perspective, the mere absence of an active conflict at the time of the intervention cannot be interpreted as the disappearance of the risk. The jurisprudence of the European Court of Human Rights emphasizes that the authorities have the obligation to assess the risk in a prospective manner, taking into account the entire context of the relationship between the parties. In the case of Talpis vs. Italy, the Court held that the lack of adequate preventive measures, in the context of a history of violence, can attract the state's liability for the violation of positive obligations [10, p.112]. Therefore, the police officer must demonstrate that the danger is not a one-time one, but derives from a behavioral pattern, characterized by coercive control and progressive escalation.

A second significant vulnerability is related to the standard of probation used at the time of the intervention. In many situations, the file submitted to the prosecutor is predominantly based on the victim's statement, without being supported by other objective elements. This approach becomes problematic in the context where the victim later changes his statements or refuses to support them. In the absence of additional evidence, the court may consider that the eviction measure is disproportionate, in relation to the protection of property rights and the inviolability of the home [1, Art.27; 2, Art.52]. However, this formal perspective does not reflect the complexity of the phenomenon of domestic violence, which includes forms of abuse that do not leave visible physical traces. Psychological violence, threats, or controlling behaviors can pose a real and significant risk, even in the absence of physical injury. In these conditions, it becomes essential to document additional factual elements, such as the emotional state of the victim, the disorder in the home or witness statements. The specialized literature emphasizes the importance of these elements, showing that risk assessment must be based on an integrated analysis of the context [8, p.18; 13, p.45].

In this framework, the use of technical means of recording, especially Body-Cam systems, becomes particularly relevant. Recordings made at the scene can directly capture the state of the victim and the behavior of the aggressor, providing the court with objective evidentiary support. They contribute to the transformation of a subjective perception into a material proof, able to support the legality of the ordered measure.

A third frequently encountered vulnerability concerns how to complete and moti-

vate the Risk Assessment Form. The analysis of these documents highlights, in practice, a tendency of excessive formalization, embodied in the mechanical ticking of some standardized boxes, without a detailed reasoning of the decision. Such an approach limits the court's ability to understand the reasoning behind the measure ordered. From a legal perspective, the reasoning is an essential element of the legality of the administrative act, as it allows the verification of its proportionality and soundness. In the case of the Temporary Protection Order, the reasoning must reflect the logical connection between the established factual situation and the need to adopt the measure. The regulations provide that the risk assessment must be carried out by corroborating several elements, including the direct observations of the police officer [6, Art.3], which implies an argument that goes beyond the mere formal recording of answers.

In this regard, an adequate justification should include explicit references to the history of the relationship between the parties, the existing power imbalance and any previous episodes of violence. It is also necessary to highlight how these elements lead to the conclusion of the existence of an imminent risk. The lack of such an argument may lead the court to consider the measure disproportionate or insufficiently substantiated.

Overall, the vulnerabilities identified do not necessarily reflect deficiencies in the regulatory framework, but rather difficulties in applying it in practice. The complexity of domestic violence situations requires an integrated approach, where risk assessment, evidentiary documentation and decision reasoning are interdependent. Consolidating the effectiveness of the Provisional Protection Order thus implies not only the improvement of the legislative framework, but also the development of the professional skills of the staff involved, in order to ensure a grounded and sustainable intervention from a legal point of view.

V. Comparative law perspectives and the evolution of electronic monitoring mechanisms. The analysis of the effectiveness of the TPO cannot be fully carried out in the absence of a reference to the regional legal context and the existing development trends at the European level. Romania and the Republic of Moldova are part of a relatively convergent normative framework, largely determined by the commitments assumed by ratifying the Istanbul Convention, which imposed common standards in the field of preventing and combating domestic violence. These standards aim not only to define the phenomenon, but also to establish effective mechanisms for intervention and protection of victims. However, the comparative analysis reveals significant differences regarding the degree of operationalization of these mechanisms, especially in relation to the integration of technology and the decision-making autonomy of the police officer [7, points 53-55; 22, p.8]. A defining element of the recent evolution is the introduction of electronic monitoring systems, intended to ensure compliance with the measures ordered by the protection order. In Romania, this process was consolidated by the adoption of Law No.146/2021 on electronic monitoring, which establishes the Electronic Monitoring Information System (S.I.M.E.) [21, Art.3]. From a functional perspective, this system responds to one of the most important limitations of the classic mechanism, namely the impossibility of continuous supervision of compliance with the prohibitions imposed on the aggressor. Monitoring through electronic devices, such as bracelets, allows real-time location and the generation of automatic alerts in case of violation of the safety perimeter established around the victim.

Criminological studies highlight the positive impact of these mechanisms on the prevention of recidivism, indicating a significant reduction in violent behaviors in situations where the aggressor is subject to active electronic surveillance [17]. Beyond the

dissuasive effect, these systems contribute to increasing the victim's sense of security and to the efficiency of police intervention, by reducing the reaction time in situations of violation of the ordered measures. In the Republic of Moldova, the normative framework allows, in turn, the use of such mechanisms, but their large-scale implementation is at an early stage, being dependent on institutional resources and strategic priorities assumed at the governmental level. Recent programmatic documents indicate that the expansion of electronic monitoring systems is a priority direction, in the context of the need to optimize human resources and increase the efficiency of the intervention [22, p.10].

A relevant difference in comparative terms concerns the duration of emergency measures and its implications for case management. In Romania, the Temporary Protection Order has a limited duration, usually up to 5 days, while in the Republic of Moldova "the emergency protection order issued by the police produces effects for a period of up to 10 days" [4, Art.12/1; 7, p.156]. This temporal difference generates distinct effects on the intervention: on the one hand, it provides a more extended interval for consolidating the evidence and for facilitating the victim's access to support services; on the other hand, it imposes an increased responsibility regarding the accuracy of the initial risk assessment. From the perspective of comparative law, one of the most persistent difficulties is represented by the conflict between the right to property and the need to protect the victim. Both in Romania and in the Republic of Moldova, the inviolability of the domicile is constitutionally protected [1, Art.27; 2, Art.52], which causes, in certain situations, a reluctance to apply the measure of evicting the aggressor, especially when he is the owner of the building. However, the jurisprudence of the European Court of Human Rights established the principle of the prevalence of the right to life and physical integrity over patrimonial rights, emphasizing the need to adopt effective protection measures in risk situations [10, p.112].

In this context, the substantiation of the police decision must be carried out with a high degree of rigor, by highlighting the elements that indicate a real and imminent risk. The specialized literature highlights the importance of using evaluation models that include relevant variables, such as access to weapons, behavioral history and the existence of coercive control patterns [23, p.89]. The concept of coercive control, enshrined in more and more European legal systems, reflects a paradigm shift, in the sense of extending legal protection to non-physical forms of violence that affect the victim's autonomy and safety. This evolution is also visible in the public policies promoted at the national level. In the Republic of Moldova, recent strategies in the field of violence prevention focus on identifying and combating forms of psychological abuse, considered major risk factors for the escalation of violence [22, p.11]. Similarly, in Romania, legislative and jurisprudential trends indicate an increasing recognition of these forms of violence, which determines an adaptation of intervention tools.

Another relevant aspect in the comparative analysis is the digitization and interoperability process of the databases used by public order structures. In Romania, the integration of information regarding contraventional and criminal antecedents in operational IT systems allows for a real-time risk assessment [6, Art.3]. This ability to quickly access relevant data contributes to substantiating the decision and increasing the effectiveness of the intervention.

In the Republic of Moldova, the digitization process is under development, being oriented towards the integration of intervention sheets and relevant registers, including those regarding the possession of weapons. From a practical perspective, access to this information is essential for risk assessment, as the perpetrator's antecedents may in-

dicate a high potential for dangerousness. Thus, issuing a Temporary Protection Order without consulting this data can lead to an incomplete assessment, with a direct impact on the effectiveness of the measure.

Overall, the comparative analysis highlights the fact that the effectiveness of the Temporary Protection Order mechanism depends not only on the regulatory framework, but also on the degree of technology integration and the institutional capacity to use the available information. The evolution of electronic monitoring systems and digital infrastructure represents, in this sense, an essential direction for strengthening the protection of victims and for increasing the legal sustainability of police intervention.

Conclusions. The analysis carried out on the mechanism of the Temporary Protection Order highlights the fact that it currently represents one of the most dynamic and complex intervention tools in the matter of the protection of fundamental rights, used by the police forces in Romania and the Republic of Moldova. Beyond its normative dimension, the TPO reflects a paradigm shift in police activity, marking the transition from a predominantly reactive approach, centered on fact-finding, to a proactive one, oriented towards risk assessment and prevention. This evolution is consistent with European standards, which impose on the state the obligation to ensure the effective protection of vulnerable people, including through quick and appropriate interventions [10, p.3159].

The analyzed chapters highlighted the fact that the effectiveness of the Temporary Protection Order does not depend exclusively on the existence of an adequate legislative framework, but essentially on the way in which it is applied in practice. Home invasion, risk assessment, use of technical means and evidentiary substantiation are interdependent stages of the same decision-making process, in which any deficiency can affect the legal sustainability of the measure. In particular, the analysis of judicial vulnerabilities demonstrated that the reversal of orders is not determined, in most cases, by the non-existence of danger, but by the insufficiency of documentation and the lack of coherent reasoning [12, p.73; 14, pp.102-104].

The integration of technology in police activity, especially through the use of Body-Cam systems and electronic monitoring mechanisms, is a determining factor for increasing the efficiency of the intervention. These tools help to objectify the evidence and reduce the reliance on the parties' statements, which are often unstable in the context of abusive relationships. At the same time, recent legislative developments, such as the introduction of electronic monitoring systems, indicate a clear tendency to strengthen protection mechanisms, by integrating technological solutions into the procedural flow [21, Art.3].

From a comparative perspective, although Romania and the Republic of Moldova have developed convergent normative frameworks, there are relevant differences regarding the degree of implementation of these mechanisms and the use of technological resources. The standardization of intervention procedures and the harmonization of risk assessment criteria represent, in this context, a practical necessity, not just a theoretical objective. Standardizing the "language of risk" and the criteria for assessing imminent danger would facilitate cross-border cooperation and contribute to increasing the coherence of interventions in the regional space [7, points 53-55; 22, p.8].

Operationally, the research results underline the importance of continuous professionalization of personnel involved in the management of domestic violence cases. Effective intervention is not limited to the mechanical application of procedures, but involves the ability to assess complex situations, identify risk indicators and rigorously document the relevant elements. In this sense, professional training must go beyond the theoretical

dimension and include practical exercises based on realistic scenarios, which simulate the conditions of uncertainty and pressure characteristic of real interventions [13, p.45; 19, p.114].

A central role in strengthening the effectiveness of the OPP mechanism is the quality of the documentation made at the time of the intervention. The Risk Assessment Form, filled in rigorously and reasoned, constitutes the legal foundation of the ordered measure and the main element analyzed by the court. Correlating it with digital evidence and other factual elements contributes to the creation of a coherent body of evidence capable of supporting the legality and proportionality of the intervention. At the same time, the analysis highlights the need for a change of perspective on the role of the police in this field. It can no longer be perceived exclusively as an executor of the law, but as an active actor in the protection of fundamental rights, responsible for assessing risks and preventing serious consequences. This dimension implies the assumption of increased responsibility, but also the development of specific skills, adapted to the complexity of the phenomenon of domestic violence.

In conclusion, the effectiveness of the Temporary Protection Order depends on the interaction between the regulatory framework, the institutional capacity and the level of professionalism of the operational staff. Strengthening this mechanism requires not only the improvement of legislation, but also the integration of technology, the standardization of procedures and the continuous development of professional skills. In this way, police intervention can adequately respond to contemporary demands regarding the protection of human rights and ensuring safety in private space.

VIOLATION OF THE TENANT'S DOMICILE BY THE LANDLORD: A CASE STUDY[1]

Andrei CAZACICOV,
PhD, University Lecturer,
"Stefan cel Mare" Academy of the Ministry of Internal Affairs,
Judge, Center Court of Appeal,
ORCID: 0000-0003-1117-1684

Abstract

The legal relationships between the owner of an apartment (the lessor) and the tenant thereof (the lessee) may give rise to controversies and, consequently, frequently lead to legal disputes. Particularly regrettable are situations in which, unlike the parties to the contentious legal relationship, legal professionals themselves misinterpret the essence of fundamental concepts – such as domicile, property, contractual validity, and criminal offence – thereby refusing to safeguard fundamental human rights and, more gravely, participating in their violation. The refugee crisis affecting the Republic of Moldova after 24 February 2022 brought to light a deeply troubling phenomenon: the unlawful violation of a tenant's domicile by the landlord is not treated as such by law enforcement authorities, which oppose the documentation of such acts and the restoration of the tenant's rights. The case study examined in this research illustrates one of the hundreds of situations encountered by refugees on the territory of the Republic of Moldova, the analysis of which is capable of generating relevant conclusions and practical solutions for those who are interested.

VIOLAREA DOMICILIULUI CHIRIAȘULUI DE CĂTRE PROPRIETAR: STUDIU DE CAZ

Abstract

Raporturile juridice dintre proprietarul unui apartament (locator) și chiriașul acestuia (locatar) pot stârni controverse și ca rezultat, adesea, litigii de drept. Regretabilă este situația când, spre deosebire de subiecții raportului juridic litigios, profesioniștii în domeniul dreptului interpretează eronat esența conceptelor fundamentale – domiciliu, proprietate, valabilitate contractuală, infracțiune –, exprimă un refuz în apărarea drepturilor fundamentale ale omului și, mai grav, participă la violarea acestora. Criza refugiaților ucraineni care a lovit din plin Republica Moldova după 24.02.2022, a scos în evidență un flagel odios – violarea domiciliului chiriașului de către proprietar nu este acceptat astfel de către organele de drept, care se opun documentării și restabilirii în drepturi a chiriașului. În studiul de caz reflectat în cercetare a fost exemplificat unul din sutele de cazuri cu care se ciocnesc cetățenii statului nostru, dar și refugiații pe teritoriul Republicii Moldova, analiza căruia este în măsură să conducă la unele concluzii și soluții relevante pentru cei interesați.

Cuvinte-cheie: domiciliu, reședință, locuință, pătrundere, locațiune, chirie, proprietate, inviolabilitatea domiciliului.

[1] The present article has been developed within the framework of the research project: 25.80012.0807.22TC, National Security and Societal Resilience in the Face of Humanitarian Crises and Geopolitical Risks.

Introduction. In judicial practice, atypical instances of unlawful interference with the inviolability of the home are frequently encountered, whose legal qualification as such is usually denied by state authorities, on the ground that an alleged lack of correspondence exists between the legal status of the property owner and that of its occupant.

Tenants generally have a legitimate status, based on a written or verbal lease/rental agreement or by virtue of a right of habitation, and the issue of illegal occupation phenomena, such as squatting, trespassing, adverse possession, etc., that are widespread in countries around the world does not arise, although even in these latter cases the right to the inviolability of the home cannot be disregarded.

Tenants (including pupils and university students, socially vulnerable families, migrants, refugees, travelers, and others) are thereby placed in a markedly disadvantaged position vis-à-vis the holder of the right of ownership, with effective protection from law enforcement authorities being afforded predominantly, if not exclusively, to the latter – irrespective of whether the lease agreement was concluded in written form or orally.

In a genuine rule-of-law state, the quintessence of the protection of constitutional and fundamental human rights presupposes the prompt and effective investigation of alleged violations, prevention and repression constituting two facets of the same legal imperative.

In a recent and particularly disturbing case from national jurisprudence, the owner of an apartment located in the Chisinau City, which had been leased since 2020, unilaterally decided to evict the tenants – a family composed of a single mother and her three minor children. In furtherance of this plan, on 4 December 2025, the landlord, acting in participation with two other individuals, waited until the tenants were absent from the residence, forcibly damaged the door lock, and unlawfully entered the domicile. Upon the tenants' return, the landlord categorically refused them access to the apartment and to the entirety of the family's property, including furniture, household appliances, clothing, personal documents, financial resources, food supplies, and companion animals. As a result, the family was expelled into the street during wintertime, deprived of any means of subsistence and dispossessed of all their belongings. Subsequently, the landlord and his accomplices used the tenants' property, part of which was destroyed, part damaged, and part unlawfully appropriated.

At the landlord's informal request, officers of the territorial police sector, acting without prosecutorial authorization, without a warrant issued by the investigating judge, and without the permission or consent of the tenants, conducted – within only a few hours of the incident – an on-site inspection of the apartment, including photographing and inventorying the tenants' belongings. In so doing, the officers of the Ministry of Internal Affairs (MIA) effectively facilitated the unlawful eviction of the tenants, categorically refusing to restore them in their rights and affording protection to the landlord, within the detriment of the tenants' rights to possession and use of the residence, of the inviolability of the domicile. as well as their right of ownership over their personal property.

Conversely, in response to the tenants' official requests (including emergency calls to the "112" service and written complaints submitted to the competent law enforcement authorities), the Rapid Response Patrol Unit refused to help; the duty unit of the police inspectorate obstructed the formal lodging of a complaint; and the investigative-operational group declined to attend the scene for the purpose of documenting the incident. Written petitions addressed to various state authorities – including the Prosecutor General's Office, the Prosecutor's Office of the municipality of Chisinau, the National Anticorruption Centre, the Internal Protection and Anticorruption Service, the General Police

Inspectorate, and the Ombudsman for Children's Rights – proved unsuccessful, as none of the aforementioned entities reacted promptly or acknowledged the violation of the tenants' right to the inviolability of their home, nor did they provide assistance to the victims in a state of acute deprivation. Ultimately, on 16 January 2026, the police inspectorate initiated criminal proceedings exclusively under Article 186(2)(b) of the Criminal Code[1] (theft committed by two or more persons), disregarding the aggravating circumstance of commission "by unlawful entry into a residence". The internal disciplinary investigation into the actions of MIA officers is being intentionally delayed by more than 3 months, contrary to paragraph 59 of the Disciplinary Statute of the civil servant with special status within the Ministry of Internal Affairs [29], which establishes a maximum time limit of up to 30 days.

In the case at hand, the law enforcement authorities justified their refusal to initiate criminal proceedings for the offense of unlawful entry into a residence on the following grounds: the alleged primacy of the right of ownership over the right to the inviolability of the home; the purported inapplicability of the concept of "domicile" to home rented by a tenant; the absence of a written lease agreement.

In light of this specific case, against the background of a sharp increase in the number of apartments offered for rent – including in the context of the refugee crisis triggered by the outbreak of the Russo-Ukrainian war, which struck the Republic of Moldova unexpectedly – the question arises whether a tenant benefits from the protection of the inviolability of his or her domicile. A second issue concerns whether the acts of the landlord, as well as those of the police officers, consisting in entering and inspecting the tenant's residence, fall within the scope of criminal law. Finally, it must be clarified whether non-compliance with the statutory form required for a lease agreement legitimizes the actions of the landlord and/or the police officers.

Methods and materials applied. Within the framework of the present study, the following research methods were employed: the case study method, as well as the methods of analysis, synthesis, logical reasoning, and comparative examination. The materials relied upon consist of the relevant normative acts, specialized scholarly publications in the field, judicial decisions rendered by national courts – including interpretative and explanatory rulings – as well as the case-law of the European Court of Human Rights (ECtHR).

Discussions and results obtained. In order to provide a clear and conclusive answer to the questions raised in the Introduction, we have undertaken a comprehensive, objective, and multifaceted examination of the key aspects of the case, deliberately avoiding a standard criminal-law analysis and confining ourselves to the presentation of the essential circumstances only.

Case-law overview. Judicial practice reveals instances of prompt intervention and proper documentation in comparable situations. Thus, on 04 December 2018, a sector police inspector, wearing his official uniform, unlawfully entered the residence of another person, where he remained for approximately 30 minutes. Upon being discovered, he refused to leave the domicile until the arrival of the investigative group. As a result of special investigative measures, it was established that the inspector had ordered the conduct of a residential search in the absence of authorization from the investigating judge, for the purpose of locating and identifying a stolen vehicle. In that case, the sector inspector

[1] **Note**: Considering the confidential nature of criminal investigations (Art. 212 of the Criminal Procedure Code), the information presented from the pending criminal case has been described in a generic manner. Moreover, pursuant to the principle of the presumption of innocence (Art. 8 of the Criminal Procedure Code), every person is presumed innocent as long as their guilt [...] has not been established by a final and irrevocable court decision.

was documented for the commission of the offense provided for in Article 179(3)(a) of the Criminal Code [2, p. 120].

In another similarly classified case, on 02 October 2013, a sector police inspector, with the aim of detecting an alleged theft of apples and by abusing his official position, unlawfully entered a person's residence, where, by applying physical force, he pushed the owner and refused to leave the domicile, subsequently carrying out an illegal search of a vehicle, garage, and household annexes [14].

A determination supporting the concurrence of offenses between unlawful entry into a dwelling and theft is illustrated in the following case: On 09 June 2006, G.V., acting pursuant to a prior agreement and together with the minor P.A., entered the household premises of M.V. Grossly violating public order and manifesting an evident lack of respect for society, G.V. and P.A. disturbed public peace and inflicted blows upon M.V., thereby causing him physical pain. Furthermore, P.A. shattered a window of the victim's house and broke an electric light bulb, engaging in conduct distinguished by particular audacity in its content. On the same occasion, while present inside M.V.'s dwelling, G.V. appropriated goods belonging to the victim in the amount of 280 lei [15].

The unlawful violation of the lessee's domicile was not upheld by the Supreme Court of Justice in a case concerning entry onto the premises of a tractor brigade. The Court reasoned that a tractor brigade is not ordinarily intended for residential use by natural persons, and no evidence to the contrary was adduced in the case file [23, § 33].

Conversely, the courts have upheld the offense of unlawful entry into the domicile of a family member vested with a right of habitation, even in the absence of a request by the owner to vacate the premises and in the absence of a prior complaint lodged by the owner. The court held that "for the legal classification of the act, the status of the victim and whether or not the victim has registered residence at the relevant domicile are immaterial. Criminal law concerns the unlawfulness of the perpetrator's conduct, not the legitimacy of the victim's position; accordingly, it is irrelevant who notified the law enforcement authorities [...]. The victim's administrative liability under Article 78 of the Contraventional Code (bodily injury), imposed upon the complaint of the convicted person, does not preclude the application of Article 179(2) of the Criminal Code to the convicted person" [24, §§ 8, 26].

The absence of a lease agreement concluded between the victim and the owner did not constitute an impediment to conviction under Article 179(2) of the Criminal Code in the following case: "On 08 May 2021, C.B., acting on fabricated grounds, repeatedly kicked the gate of the household until it opened. Thereafter, without the consent of the occupant O.M., who resided in the household of his former wife with her consent, C.B. entered the yard of O.M.'s domicile. Upon being requested to leave the premises, he failed to comply, remained in the yard, and committed acts of physical violence against O.M., consisting of a punch delivered to the nasal region" [25, §§ 6, 7, 29].

Likewise, in national jurisprudence, in a civil case concerning the eviction of occupants from an property owned by the claimant [13], it was emphasized that it is crucial for the court to fully investigate and clarify all aspects relating to the ownership and possession of the real estate – even in the absence of a written lease agreement – taking into account the rights and protection of the children involved, having regard to the best interests of the minors, and ensuring that they are not evicted from their sole domicile without a solid legal basis.

In another civil case, the Supreme Court of Justice underlined that, beyond any reasonable doubt, the defendants had resided since 2006 in the apartment located in the

municipality of Chisinau, possessed no other principal and permanent living space, and had thus established an indispensable connection with the residence in question, demonstrating an attachment akin to that of an owner and perceiving it as their home. Accordingly, it was held that the disputed apartment genuinely constituted the defendants' permanent dwelling and that they had developed durable ties with the immovable property; therefore, the apartment represented their "home" within the meaning of Article 8 of the European Convention on Human Rights [12].

The Concept. By "residence" is meant a room or a group of rooms intended for the permanent or temporary habitation of individuals, in which part or the entirety of their property is kept [21, § 29, p. 5].

The Constitutional Court has held that the notion of "domicile" possesses an autonomous meaning under criminal law and does not depend on definitions provided in other branches of law. The autonomous criminal-law definition of "domicile" does not disclose any elements of unconstitutionality [16, § 24].

The concept of domicile does not refer to the immovable property as a material object, but rather to the place in which a person conducts his or her private life [26, p. 145]. The notion of domicile is not contingent upon ownership rights over a house (living space) [19, p. 8].

Criminal law does not associate the notion of domicile with the idea of continuity (permanence). Accordingly, a room occupied for a short period or on a transient basis by a person (such as a room rented at a holiday resort during vacation, a hotel room, even where the stay is limited to one day or one night, etc.) is likewise regarded as a domicile [20, p. 292].

The European Court reiterates that the concept of "home" is of central importance to an individual's identity, self-determination, physical and mental integrity, the maintenance of relationships with others, and the existence of a stable and secure place within the community (case *Vinniychuk v. Ukraine*, ECtHR judgment of 20 October 2016, § 47). The concept of "home" within the meaning of Article 8 is not limited to spaces that are lawfully occupied or lawfully established. "Home" is an autonomous concept which does not depend on classification under domestic law. Whether a particular space constitutes a "home" attracting the protection of Article 8 § 1 depends on the factual circumstances, namely the existence of sufficient and continuous links with a specific place (case *Jansons v. Latvia*, ECtHR judgment of 8 September 2022, § 52).

The European Court has on several occasions held that the qualification of an immovable property as a "domicile" is a question of fact and does not depend on the occupant's compliance with domestic legal requirements (case *Buckley v. the United Kingdom*, ECtHR judgment of September 25, 1996, § 54).

In a particular case, previously rented social housing remained the applicant's "domicile" within the meaning of Article 8 § 1 of the Convention even after he had signed a notice to quit and no longer had, under domestic law, the right to reside there (case *McCann v. the United Kingdom*, ECtHR judgment of 13 August 2008, § 46). The loss of a residence constitutes one of the most extreme forms of interference with the right to respect for one's domicile. Any person at risk of such interference must, in principle, be able to obtain a review of the proportionality of the measure by an independent tribunal, in the light of the relevant principles deriving from Article 8 of the Convention (Ibidem, § 50).

Legislation. In accordance with Article 12 of the Universal Declaration of Human Rights, no one shall be subjected to arbitrary interference with his or her private life, family, domicile, or correspondence, nor to attacks upon his or her honor and reputation.

Everyone has the right to the protection of the law against such interference or attacks [18].

Article 8 of the European Convention on Human Rights provides: "Everyone has the right to respect for his private and family life, his residence, and his correspondence. There shall be no interference by a public authority with the exercise of this right except such as is in accordance with the law [...]" [10].

Pursuant to Article 29, paragraphs (1) and (3) of the Constitution, the domicile and residence are inviolable. No one may enter or remain in the domicile or residence of a person without his or her consent. Searches and on-site inspections may only be ordered and conducted in accordance with the law [9].

Under Article 6(11) of the Code of Criminal Procedure, the domicile is defined as a residence or building intended for the permanent or temporary habitation of one or more persons [...]. According to Article 12 of the same code, the inviolability of the domicile is guaranteed by law. Searches, inspections of the domicile, and other criminal procedural actions at the domicile may only be ordered and carried out pursuant to a judicial warrant, except in cases and in the manner provided for in this Code. In the event that procedural actions are carried out without a judicial warrant, the competent authority must submit the relevant materials to the court for review of legality immediately, but no later than 24 hours after completion of the action [7].

According to Article 38, paragraphs (1), (2), and (5) of the Civil Code, the domicile of a person is the place where he or she has habitual residence. A person is considered to retain his or her domicile as long as another has not been established. Habitual residence demonstrates a close and stable connection of the individual with the place in question. In determining habitual residence, all relevant factual elements are considered, particularly the duration and regularity of the person's presence at the location, as well as the conditions and reasons for such presence. A person whose domicile cannot be determined with certainty is deemed to reside at the place of temporary residence [6].

Furthermore, Article 179, paragraph (1) of the Criminal Code provide the act of entering or remaining unlawfully in the domicile or residence of a person without consent, or refusing to leave upon request, as well as illegal searches and inspections [...] [8]. Letter (a), paragraph (3) of the same article establishes liability for committing these same acts through the use of one's official position [8].

Special Legal Object. The special legal object of the crime of violation of domicile is the social relations regarding the realization, in accordance with Article 29 of the Constitution, of the right to the inviolability of the domicile.

The inviolability of the domicile constitutes the freedom to enjoy a personal space delineated by the boundaries of a residence. It is, therefore, nothing other than the liberty to benefit from an immovable space, characterized by territoriality, which simultaneously functions as a primary space. Such a space ensures intimacy. It can be personalized, and any intrusion is perceived by the holder of that space as a violation [30, p. 54].

Accordingly, the protection of the inviolability of the domicile is not conditioned upon the existence of a right of ownership (or any other real right) over the residence designated as a domicile. The same individual does not necessarily combine the capacities of holder of the right to the inviolability of the domicile and of holder of ownership rights over the immovable property corresponding to that domicile [3, p. 503]. In this regard, the person who acquires the right of use over the immovable property benefits from a preferential right to protection against the commission of the respective offense. This is logical, as unlawful entry into a domicile is not a crime against property [28, p. 38].

Violation of the legal prohibition against infringing the right to the inviolability of the domicile requires the restoration of that right through recourse to competent state institutions, including, where appropriate, the intervention of criminal law [30, p. 49].

An individual's freedom to enclose oneself within one's residence is not a privilege of ownership, but an aspect of personal liberty – a corollary of personality and the freedom to live somewhere. Consequently, a tenant may assert his or her right over the residence even against the property owner [1, p. 192].

According to the interpretation provided by the European Court of Human Rights, the right to respect for the private and family life of any person is not subject to any restriction, not even by the owner of the respective residence. In the Court's view, the interpretation given by the Government of Romania to the relevant legal provisions was erroneous and made in bad faith, as it would effectively permit the property owner, at any time, to violate the domicile of a potential tenant, thereby preventing the tenant from enjoying private and family life (case *Surugiu v. Romania*, ECtHR judgment of 10 November 2004, § 54). The Court further observed the striking fact that the police, alerted by the applicant following the incident, went to the site and, without intervening, merely limited themselves to drafting a report (Ibidem, § 62).

In that case, the deplorable inaction of the authorities in ceasing the interference by third parties with the right to respect for the domicile, and the resulting inability of the applicant to enjoy his domicile, led to a finding of a violation of Article 8 of the Convention.

The Court recalls that, while Article 8 primarily aims to protect the individual against arbitrary interference by public authorities, it also entails the adoption by these authorities of measures designed to ensure respect for the rights guaranteed under this article, extending even to relationships between private individuals (case *Stubbings and Others v. the United Kingdom*, ECtHR judgment of 22 October 1996, § 62; case *Ignaccolo-Zenide v. Romania*, No.31,679/1996, ECtHR judgment of 25 January 2000, § 94; case X *and* Y *v. the Netherlands*, ECtHR judgment of 26 March 1985, § 23).

The Immaterial Object of the offense of unlawful entry into a domicile, requires the following qualifications:

1. The mere existence of an immovable property is insufficient to establish a domicile associated with that property. It is also necessary that the space within that property be effectively used, such that intimate, family, or private life can be carried out there, even in a nascent form. Once a person establishes sufficient and continuous ties with the space associated with an immovable property, that space acquires the status of a domiciliary space;

2. The purpose of the domicile is to enable intimate, family, and private life;

3. The domicile constitutes a space that commands respect from third parties, who bear the negative obligation not to undertake any actions that could cause harm;

4. The legal protection of the domicile is not conditioned upon the permanent presence of the holder in the respective space [31, p. 49].

Criminal law protects the *de facto* occupant of the domiciliary space, regardless of how precarious their title may be, against any unlawful acts by another person. In a state governed by the rule of law, legality entails the use of lawful means to assert one's rights, opposing any attempt by individuals to take justice into their own hands [32, p. 59].

In this regard, the Constitutional Court of Romania has noted that [...] the provision criminalizes, irrespective of the holder and the form of legal ownership or possession, unlawful entry in any manner into a residence, room, annex, or enclosed space pertaining thereto, without the consent of the person using it, or refusal to leave upon request,

without violating the principle of equal protection of private property [17].

The right to the inviolability of the domicile may even be held by persons who have no legal rights over the residence itself [34, p. 9].

The Victim of the offense may be any person, regardless of status: owner, tenant, family member with a right of habitation, etc. It is irrelevant whether the victim holds a residence permit. Criminal law is concerned not with the legitimacy of the victim's position, but with the illegality of the perpetrator's conduct. If the holder of the right to the inviolability of the domicile has committed certain administrative offenses or infringements of property rights, these are separate matters to be resolved through the means provided by law and do not affect the existence of the offense of unlawful entry into a domicile [3, p. 504].

The victim of unlawful entry into a domicile may even be a person residing in the space without any legal basis [33, p. 12]. It is not necessary for the passive subject to be the owner of the residence or for the residence to be based on a formal title [5, p. 197].

What is essential is that the victim (the passive subject) is the holder of the constitutional right to the inviolability of the domicile [57, p. 59].

Objective Element. The actus reus of the offense of unlawful entry into a domicile requires, as a matter of imperative law, that the entry, remaining, refusal to leave, inspection, or search of the domicile be carried out without the consent of the victim and, correspondingly, in violation of the law.

From the meaning of Article 179 of the Criminal Code, it follows that the entry must occur without right – that is, abusively, without any legal justification, and without the consent of the person using the residence [11, p. 12].

"Entry" constitutes illegal access, whether covert or open, into a room, another storage space, or a residence (for the purpose of appropriation). It may be committed either by overcoming obstacles and resistance or without doing so [21, § 29, p. 5]. If, in the course of appropriation through entry into a room, another storage space, or a residence, the perpetrator intentionally destroys or damages the property of another person not forming the material object of the appropriation (for example, furniture, household appliances, etc.), such acts, when supported by sufficient grounds, must be additionally qualified under Article 197 of the Criminal Code [21, § 29, p. 5].

The Lease Arrangement. Under a lease agreement, the owner of an immovable property temporarily cedes to the tenant the right of use and possession (Article 1251 of the Civil Code). Even if the owner retains title, their rights over the residence are limited to the extent of the rights granted to the tenant under the lease agreement.

From another perspective, although Article 1252 of the Civil Code provides that a lease contract must be in writing [6], noncompliance with the written form deprives the parties of the right, in the event of a dispute, to rely on witness testimony to prove the legal act. Noncompliance with the written form renders the legal act void only if this effect is expressly provided by law or by agreement of the parties (Article 322 of the Civil Code).

When the lessor and lessee have not concluded the lease contract in writing – often as a strategy by the owner to evade income taxes[2] – the validity of the contract is not affected, provided the co-contracting parties do not deny its existence and execution, or it can be demonstrated by other evidence of the civil relationship (*e.g.* receipts for utility payments, records of major repairs, public service certificates regarding the property, etc.).

[2] **Note**: The violation of legal provisions regarding the deadlines for concluding lease agreements between the tenant and the property owner is sanctioned under Art. 180, para. (3) of the Contravention Code, while non-compliance with the procedures for preparing and submitting tax reports is sanctioned under Art. 260, para. (1) of the Tax Code.

The lessor's right to inspect the leased property (Article 1268 of the Civil Code) may not infringe upon the inviolability of the domicile and the personal life of the tenant. Termination of the lease (Article 1281 of the Civil Code) does not confer upon the lessor/owner the right to violate the tenant's domicile.

Conversely, if the tenant refuses to vacate the residence, the lessor must request a forced eviction through a court decision, in accordance with the Civil Procedure Code. Arbitrary exercise of a legitimate or purported right by circumventing the established legal procedure may give rise to criminal liability (Article 352 of the Criminal Code) or administrative liability (Article 335 of the Contravention Code).

Any person at risk of losing their residence should be able to obtain from an independent tribunal a review of the proportionality of the measure (case *Vrzić v. Croatia*, ECtHR judgment of 12 July 2016, § 62).

Under Article 8(2) of the European Convention on Human Rights, interference by an authority in the exercise of the right to respect for private life – including the inviolability of the domicile – is permissible only if it: is prescribed by law; is necessary in a democratic society; pursues a legitimate aim; is proportionate [27].

The European Court of Human Rights has found that the national court failed to evaluate competing interests, disregarding the fact that the applicants had no alternative residence and would be left homeless after more than a decade of lawful occupation, during which they not only paid rent and utility bills but also carried out substantial repairs neglected by the building administration for years (case *Naforniţa v. Moldova*, ECtHR judgment of 16 April 2024, § 41).

The Active Subject of the offense of unlawful entry into a domicile may be any person, including the owner of the property constituting the violated space or the holder of another right related to that property, if they have transferred the right of use to another person. For example, the owner of a residential space, after having leased it to another person, unlawfully enters the leased premises without the right and without the consent of the entitled persons [22, p. 1041-1042], respectively, guilt is characterized by the form of direct intention.

The Subjective Element. For the existence of the offense of unlawful entry into a domicile, the perpetrator must be aware that they are entering a space reserved for the intimate life of another person [4, p. 221].

When addressing the presence of the aggravating circumstance "through entry into a residence", it is necessary to determine the purpose for which the person entered the residence and when the intention to commit appropriation arose. If the perpetrator initially entered a room, another storage space, or a residence without the intention to commit appropriation, and subsequently appropriated the property of another person, the examined aggravating circumstance will be absent. In the case of appropriation committed through entry into a residence, no additional qualification under Article 179 of the Criminal Code is required, as the appropriation, in this aggravated form, subsumes the unlawful entry into the domicile [21, § 29, p. 5].

Conclusions and recommendations. Based on the applicable national and international legislation, the jurisprudence of national and supranational courts, and doctrinal opinions, the following conclusions can be drawn, which are relevant both to the case study analyzed and to a wide range of similar cases currently linked to latent criminality:

1. When leasing an immovable property, the owner cedes their prerogatives of possession and use to the tenant;
2. The tenant acquires protection of the right to the inviolability of their residence

regardless of whether the lease agreement is written or verbal, and such protection persists irrespective of the expiration of the lease term or the issuance of a notice to vacate;

3. The lessor may regain full ownership rights (including possession and use) only by approaching the courts for contract termination and forced eviction of the tenant;

4. In assessing the necessity of forced eviction, courts are obliged to apply the "triple test" regarding interference with human rights;

5. Entry, remaining, refusal to leave, searches, or inspections of a residence without the tenant's consent and/ or judicial authorization inevitably triggers criminal liability under Article 179 of the Criminal Code;

6. In the absence of a pre-existing intent to appropriate property, unlawful entry into a residence (Art. 179 Criminal Code) runs concurrently with acts of appropriation (Art. 186, 187, 188, 217/4 Criminal Code);

7. When there is a pre-existing intent to appropriate property, unlawful entry is subsumed under the aggravating circumstance "through entry into a room, another storage space, or residence", and separate qualification under Article 179 Criminal Code is excluded;

8. Passivity of national authorities in documenting unlawful entry committed by the owner and police officers against the tenant may, in the future, expose the state to liability before the European Court of Human Rights (ECtHR).

In the specific case study, it is strongly recommended that law enforcement authorities examine the facts under the elements of the offense provided in Article 179(1) of the Criminal Code.

Additionally, a rigorous examination is warranted from the perspective of related offenses or administrative contraventions:

- Arbitrariness (Art. 352 Criminal Code or Art. 335 Contravention Code) – for prolonged deprivation of the victims' entire property;
- Destruction or damage to property (Art. 197 Criminal Code or Art. 104 Contravention Code) – for destruction of the lock and damage to dishes, clothing, and personal belongings;
- Violation of the inviolability of personal life (Art. 177 Criminal Code) – for unauthorized access to victims' notes, notebooks, computers, laptops, tablets, mobile phones, and the dissemination of their information publicly;
- Regarding police officers – under the aggravating circumstance "using official position" (Art. 179(3)(a) Criminal Code), since the internal investigation does not exclude criminal liability.

The victims explicitly requested such measures in multiple complaints addressed to the competent authorities, and the neglect of factual and legal circumstances raised in these complaints is both inexplicable and inadmissible.

In general, we recommend strengthening the theoretical and practical training of Ministry of Internal Affairs personnel, as well as prosecutors and judges, to prevent analogous cases, the number of which is showing an alarmingly increasing trend.

Therefore, a country's economic and tourist attractiveness is directly proportional to the high level of protection provided by law enforcement authorities, but also by the speed of the state's reaction to illegalities.

PROHIBITION OF THE CARRYING PROTECTIVE WEAPONS AT PEACEFUL ASSEMBLYS

Gheorghe RENIȚĂ,
PhD, Associate Professor,
Moldova State University,
ORCID ID: 0000-0003-2722-009X

Abstract

This paper analyses the issue of prohibiting the carrying of protective weapons during peaceful assemblies. It is shown that freedom of assembly is guaranteed by a series of national and international normative acts. The analysis is focused on the norms of the European Convention on Human Rights and the Constitution of the Republic of Moldova. It is found that prohibiting the carrying of protective weapons during peaceful assemblies and, correlatively, the application of liability for defying this prohibition generates an interference with the right to peaceful assemblies.

It is concluded that if the carrying of a protective weapon during a peaceful assembly is not likely to generate a threat to public safety or order, then the right to peaceful assembly should not be restricted by the application of sanctions. This conclusion is substantiated by the case law of the European Court of Human Rights.

Keywords: protective weapon, freedom of assembly, fundamental right, public order, public safety.

INTERZICEREA PORTULUI DE ARME DE PROTECȚIE LA ÎNTRUNIRILE PAȘNICE

Abstract

Prezenta lucrare analizează problema interzicerii purtării armelor de protecție în timpul întrunirilor pașnice. Articolul evidențiază că libertatea întrunirilor este garantată printr-o serie de acte normative naționale și internaționale. Analiza se concentrează asupra normelor European Convention on Human Rights și ale Constituției Republicii Moldova. Se constată că interzicerea purtării armelor de protecție în cadrul întrunirilor pașnice și, în mod corelativ, aplicarea răspunderii pentru nerespectarea acestei interdicții generează o ingerință în exercitarea dreptului la întruniri pașnice.

Autorul concluzionează că, dacă purtarea unei arme de protecție în timpul unei întruniri pașnice nu este susceptibilă să genereze o amenințare la adresa siguranței sau ordinii publice, atunci dreptul la întrunire pașnică nu ar trebui restrâns prin aplicarea sancțiunilor. Această concluzie este susținută de jurisprudența European Court of Human Rights.

Cuvinte-cheie: armă de protecție, libertatea întrunirilor, drept fundamental, ordine publică, siguranță publică.

Introduction. Freedom of assembly is guaranteed by a number of national and international legal acts. Among others, Art. 40 (entitled "Freedom of assembly") of the Constitution of the Republic of Moldova [1] provides: meetings, demonstrations, manifestations, processions or any other assembly are free and may be organised and conducted only peacefully and without the use of any kind of weapon.

At the same time, Art. 11 (entitled "Freedom of assembly and association") of the European Convention on Human Rights [2] provides that everyone has the right to freedom

of peaceful assembly. However, this right is not absolute. It can be limited. Specifically, Art. 11 of the European Convention on Human Rights establishes the conditions for restricting this right, i.e., the exercise of the right to freedom of assembly may not be subject to any restrictions other than those provided for by law which, in a democratic society, constitute measures necessary for national security, public safety, the prevention of disorder or crime, the protection of health, morals or the rights and freedoms of others.

As can be seen, both Art. 40 of the Constitution of the Republic of Moldova and Art. 11 of the European Convention on Human Rights guarantee peaceful assemblies. At the same time, unlike Art. 11 of the European Convention on Human Rights, Art. 40 of the Constitution of the Republic of Moldova provides that assemblies must take place without any weapons. The expression "without any weapons" also includes weapons of protection / self-defence.

Therefore, in this study we will analyse whether the prohibition of the carrying of protective weapons during peaceful assemblies is a measure compatible with the imperative of respecting freedom of assembly.

Methods and materials applied. To achieve the proposed goal, we will use:

– *The logical method*: to coherently and rationally present the issues and proposed solutions;

– *The systemic analysis method*: to comprehensively analyse the legal issues that the prohibition of carrying protective weapons during peaceful assemblies requires;

– *The comparative method*: to conduct the analysis from the perspective of other legislation.

As for the applied materials, the legal basis of the study is mainly summarized in Art. 40 of the Constitution of the Republic of Moldova and, respectively, in Art. 11 of the European Convention on Human Rights. These articles guarantee peaceful assemblies. The empirical basis of the study is the jurisprudence of the European Court of Human Rights.

Discussions and results obtained. It should be noted at the outset that there is a case heard by the European Court of Human Rights that illustrates the issue which we will discuss here, i.e. whether the prohibition of carrying protective weapons during peaceful assemblies is a measure compatible with the imperative of respecting freedom of assembly. Specifically, it is the case of Russ v. Germany. The facts are as follows.

On 18 March 2015 the newly built building of the European Central Bank (ECB) headquarters was opened in Frankfurt am Main. A broad alliance of organisations and parties organised and called for various protests during that day in Frankfurt, including peaceful blockades and a demonstration. The applicant participated in a demonstration on the morning of 18 March 2015, which included peaceful blockades, under the slogan "colourful, loud – but peaceful". For about three hours, he wore a piece of transparent plastic sheeting (relatively hard but flexible and thinner than Plexiglas), which he had fastened with a rubber band so that it covered his forehead and eyes. Several participants of the demonstration wore a similar visor. The applicant had written the words "smash capitalism" on his visor. During the demonstration the police officers present neither warned nor fined the applicant nor requested that he remove the visor. Before the start of that demonstration, from around 5 a.m. until midday, groups of individuals willing to commit acts of violence also gathered in the Frankfurt district of Ostend, where the ECB's headquarters are located and where the demonstration in which the applicant participated took place. These groups blocked a number of streets, erected barricades and then set them on fire. They also damaged a large number of cars, some of which they also set on fire. They threw stones and bottles at police officers and some attacked bystanders, fire-

fighters and emergency medical services. Other activities included damaging property, setting fire to police vehicles and inflicting bodily harm on police officers [6, §§ 5-7].

Approximately one year later, the applicant was fined 40 daily rates, each amounting to 10 euros, because, as a participant in a demonstration, the applicant had temporarily worn a plastic visor over his face to protect himself against police measures, such as the use of pepper spray. The applicant appealed against that decision. Following a hearing at which the applicant was heard, the competent court (i.e. the District Court) imposed on the applicant a cumulative fine of 60 daily rates, each amounting to 30 euros, considering a previous conviction with a related fine of daily rates. The court found that wearing the plastic visor was a violation of Germany's Public Assemblies and Processions Act, which prohibits the carrying of protective weapons at outdoor public gatherings. Referring to documentation of the legislative process, the court defined protective weapons as "objects that are used for defence against attacks and are usually given this purpose at the time of manufacture". Examples given in the documentation from the legislative process included "protective shields, self-made armour or equipment for police and/or military use (e.g. steel helmets and NBC protective gas masks) or items used in the martial arts". The District Court stated that the plastic visor, despite its simple construction, was designed to be such a protective weapon as it was capable of "preventing the eyes from being directly exposed to liquids or gases, in particular to pepper spray, and thus ensuring or at least prolonging the ability of the wearer of the plastic visor to defend himself in the event that such coercive measures are used by the police". The court further found that the visor had been designed for that purpose, since no other "civil" use of such a visor was imaginable. With regard to the inscription "smash capitalism" on the plastic visor, the court held that the purpose of the visor was not solely the expression of an opinion. Therefore, the inscription did not affect the nature of the visor as a protective weapon. The applicant could have worn the visor on the back of his head, which would have allowed him to show the inscription, but the visor would not have constituted a protective weapon [6, §§ 9-11].

The applicant appealed against that decision and the Frankfurt am Main Regional Court reduced the penalty to 10 daily rates on the grounds that the previous conviction, taken into account by the District Court, had already been served. The Regional Court otherwise found the applicant guilty of carrying a protective weapon in violation of the Act on Public Assemblies and Processions. As regards the interpretation of the term "protective weapon", the Regional Court stated: "Protective weapons are not weapons in a technical sense. They are objects that are used for defence against attacks and are usually given this purpose at the time of manufacture. The plastic sheet used by the defendant with the inscription 'smash capitalism' constitutes a protective weapon according to this definition. The sheet served to defend against pepper spray attacks in the context of coercive police measures, and not just to exercise the freedom of expression; this purpose was already assigned to it when it was manufactured, as follows from the inscription "smash capitalism". The court also rejected the possibility that the applicant had made a mistake and should thus be exempted from punishment. The fact that the police officers at the demonstration had not pointed out that it was a criminal offence to carry a protective weapon was irrelevant. Given the applicant's role as a spokesperson for the one organisation and his long-standing involvement in the demonstration scene, the Regional Court did not consider that he had made a mistake; in any event, any such mistake would have been avoidable, as he could have asked the police officers present before the demonstration for clarification on the legality of wearing the plastic visor [6, §§ 12-14].

The applicant appealed on grounds of law, which the Court of Appeal dismissed. At the same time, the Federal Constitutional Court of Germany refused to admit for examination a constitutional complaint lodged by the applicant, without giving reasons [6, §§ 15-16].

Therefore, after exhausting domestic remedies, the applicant applied to the European Court of Human Rights. The applicant complained, in essence, that his conviction for wearing a plastic visor at a peaceful assembly had violated the rights to freedom of assembly and freedom of expression. According to the applicant, the plastic visor could not be considered a weapon and did not pursue a legitimate aim, since the plastic visor was not capable of protecting him against specific and legitimate coercive measures by the police, in particular the use of pepper spray. In the applicant's view, "the criminal conviction had not been necessary in a democratic society. A criminal conviction as a sanction in the context of political acts should have only been used in exceptional circumstances. Those circumstances had, however, not existed, as he had not given any reason for enforcement measures to be used by the police against him, but had demonstrated peacefully. While criminal offences had been committed on that day in Frankfurt, this had neither taken place in the demonstration in which he had participated nor had he committed any" [6, §§ 20, 26-27].

In turn, the European Court of Human Rights has elucidated, first of all, the relationship between the right to freedom of expression and the right to freedom of association. In this regard, the European Court observed that the applicant submitted that his criminal conviction had also violated his right to freedom of expression, as the domestic courts had relied on the inscription "smash capitalism" on the applicant's plastic visor in its reasoning when assessing whether the visor constituted a protective weapon. It observed, however, that, as pointed out by the Government, the applicant was not convicted for expressing his opinion, but for wearing a "protective weapon", and that the District Court emphasised that the applicant could have expressed his opinion at the assembly in ways other than through a protective weapon. In so far as the Regional Court relied on the inscription in its judgment, the Court noted that it only did so to establish a link between the construction of the visor and its intended defensive use at the demonstration. The Court considered that there are no indications that the Regional Court punished the inscription itself in any way. Only the wearing of the "protective weapon" at the demonstration was punished by the domestic courts. The Court therefore concluded that there has been no separate interference with the applicant's right to freedom of expression. Therefore, European Court of Human Rights decided to examine the case solely under Article 11 of the Convention, which guarantees freedom of assembly [6, § 35].

After this clarification, the European Court of Human Rights recalled that in order to establish whether an applicant may claim the protection of Article 11 of the Convention, it takes into account (i) whether the assembly had been intended to be peaceful or whether the organisers had had violent intentions; (ii) whether the applicant had demonstrated violent intentions when joining the assembly; and (iii) whether the applicant had inflicted bodily harm on anyone. An individual does not cease to enjoy the right to freedom of peaceful assembly as a result of sporadic violence or other punishable acts committed by others in the course of the demonstration if the individual in question remains peaceful in his or her own intentions or behaviour. The possibility of persons with violent intentions, not members of the organising association, joining the demonstration cannot as such take away that right. The mere fact that acts of violence occur in the course of a gathering cannot, of itself, be sufficient to find that its organisers had violent intentions. Even if there is

a real risk that a public demonstration may result in disorder as a result of developments outside the control of those organising it, such a demonstration does not as such fall outside the scope of paragraph 1 of Art. 11 of the European Convention on Human Rights. The burden of proving the violent intentions of the organisers of a demonstration lies with the authorities [6, §§ 36-37].

In this case, the Court considered that, while the Government submitted information about acts of violence, attacks on police officers and bystanders and other criminal offences committed on that day in Frankfurt, it was not substantiated that these acts of violence had taken place at the demonstration, entitled "colourful, loud – but peaceful", in which the applicant had participated or that they had been intended by the organisers of that demonstration. The Government also did not argue that the applicant himself had demonstrated violent intentions when joining the assembly or had inflicted bodily harm on anyone. No indications of such intentions or actions on the part of the applicant were mentioned in the domestic judgments either. While the Court took note of the violence that took place on 18 March 2015 in Frankfurt and the criminal offences committed on that day by some protestors, it considers that the Government have not sufficiently established that the specific assembly in which the applicant participated had not been peaceful or that the applicant had not been peaceful. Therefore, according to the European Court of Human Rights, the applicant's criminal conviction interfered with his right to freedom of peaceful assembly under Article 11 § 1 of the Convention [6, §§ 38-39, § 41].

Such interference gives rise to a breach of Art. 11 of the Convention unless it can be shown that it was "prescribed by law", pursued one or more legitimate aims as defined in paragraph 2 of that article and was "necessary in a democratic society" [6, § 42]. It's about the "triple test". This test is valid, with the necessary adjustments, also from the perspective of Art. 40 of the Constitution.

As to whether the interference was prescribed by law, the Court noted that the legal basis for the applicant's conviction was section 27(1) of the Act on Public Assemblies and Processions, which prescribes the criminal liability of violations of the prohibition of carrying protective weapons during public assemblies. While the Act on Public Assemblies and Processions was accessible, it is disputed by the applicant that the specific application of this provision, namely the classification of the plastic visor as a protective weapon, had been foreseeable[1]. The Court observed that, while the Act on Public Assemblies and Processions itself does not contain a definition of "protective weapon", the documentation from the legislative process, which was also publicly accessible, does include such definition and lists examples of protective weapons. Referring to that definition, the domestic courts, while acknowledging the simple construction of the applicant's plastic visor,

[1] Section 17a(1) of the Act on Public Assemblies and Processions prohibits the carrying of protective weapons or objects, suitable for use as protective weapons and, in the circumstances, intended to ward off law-enforcement measures used by a holder of sovereign power, while present at or travelling to public outdoor assemblies, processions or other outdoor public events. Subsection 3 of the provision exempts religious services and processions, pilgrimages, funerals, processions of wedding parties and traditional folk festivals from the prohibition. It also permits the competent authority to grant further exemptions where there is no reason to fear a threat to public safety or order. In accordance with subsection 4 of the provision, the competent authority is permitted to issue orders to enforce the prohibition and in particular to exclude persons from the event who violate these prohibitions.
Section 27(1) of the Act on Public Assemblies and Processions concerns the criminal liability of violations of the above-mentioned prohibition and reads, in so far as relevant, as follows: "... Any person who, 1. contrary to section 17a(1), carries protective weapons or objects that are suitable for use as protective weapons which, in the circumstances, are intended to defend against enforcement measures by a holder of sovereign power, while present] at or travelling to public outdoor assemblies, processions or other outdoor public events, ... shall incur a penalty of imprisonment for a term not exceeding one year or a fine" [apud: 6, § 18].

concluded, based on the purpose of the visor, that it constituted a prohibited "protective weapon". The Court considered that this interpretation by the domestic courts was neither arbitrary nor unpredictable. It also considers that the applicant could have asked for appropriate advice concerning the legality of the plastic visor either from a lawyer before the demonstration or a police officer during the demonstration. Moreover, the mere fact that, prior to the assembly on 18 March 2015, there had been no published court judgments directly addressing the question of whether a plastic visor should be classified as a protective weapon does not call into question the foreseeability of the ban of protective weapons. It is the role of the national courts to resolve doubts as to the interpretation of laws. In the light of the foregoing, the Court concluded that the interference complained of was "prescribed by law" within the meaning of Art. 11 § 2 of the Convention [6, §§ 44-47].

For comparison, it is worth noting that in the Criminal Code of the Republic of Moldova there is no provision that would criminalize the legal carrying of protective weapons during peaceful assemblies. Instead, Art. 129 para. (1) of the Criminal Code provides that "weapons are understood as instruments, parts or devices declared as such by legal provisions"[2]. And paragraph (2) of this article provides that "any other objects that could be used as weapons or that have been used for attack are assimilated to weapons" [3]. At the same time, Art. 361 paragraph (7) of the Code of Contraventions establishes liability for introducing, carrying, possessing or storing lethal or non-lethal weapons at meetings or in crowded places, such as stadiums, educational institutions, institutions of central public administration authorities, courts, holy places, performance halls and public gatherings, as well as in other places where the use of these weapons is prohibited by law. This contravention is sanctioned by a fine of 70 to 90 conventional units with deprivation of the right to possess or carry and use weapons for a term of 2 to 5 years [4]. Therefore, unlike Germany, in the Republic of Moldova, carrying a lethal or non-lethal weapon during peaceful assemblies is a contravention, not a crime. The sanctioning treatment of carrying protective weapons during peaceful assemblies is more lenient in the Republic of Moldova. However, according to the case law of the European Court of Human Rights, contravention relate to the notion of "criminal charge" within the meaning of Art. 6 of the European Convention on Human Rights.

After this parenthesis, regarding the legitimate aim of the prohibition on carrying protective weapons during public gatherings, the European Court of Human Rights observed that, according to the documents relating to the legislative process, a ban on protective weapons was considered necessary, since "participants who carry such protective weapons, by virtue of their martial appearance, display an obvious willingness to use violence and, according to findings in the field of crowd psychology, have an aggression-stimulating effect on the crowd. The Court was therefore satisfied that the ban of protective weapons and the applicant's conviction pursued the aims of preventing disorder and crime and of protecting the rights and freedom of others, as submitted by the Government. These aims are as such legitimate under Art. 11 § 2 of the Convention [6, § 48].

Regarding "whether the interference was necessary in a democratic society", the

[2] In this regard, the new definition of the notion of "weapon" (which will enter into force on June 30, 2026) is rendered as follows: "any object or device whose operation determines the throwing of one or more projectiles, explosive, flammable or luminous substances, incendiary mixtures or determines the dispersion of harmful, irritating, neutralizing gases or other active substances, to the extent that the respective object or device falls within one of the categories provided for in Annex No.1 to Law No.130/2012 on the regime of weapons and ammunition for civilian use". See: Art. 2 of Law No.130/2012 on the regime of weapons and ammunition for civilian use, in the drafting of Law No.301/2025 (for the amendment of Law No.130/2012 on the regime of weapons and ammunition for civilian use) [5].

European Court reiterated that he right to freedom of assembly, one of the foundations of a democratic society, is subject to a number of exceptions which must be narrowly interpreted and the necessity for any restrictions must be convincingly established. When examining whether restrictions on the rights and freedoms guaranteed by the Convention can be considered "necessary in a democratic society" the Contracting States enjoy a certain but not unlimited margin of appreciation. It is, in any event, for the Court to give a final ruling on the restriction's compatibility with the Convention and this is to be done by assessing the circumstances of a particular case. When the Court carries out its scrutiny, its task is not to substitute its own view for that of the relevant national authorities but rather to review under Article 11 of the Convention the decisions they took. This does not mean that it has to confine itself to ascertaining whether the State exercised its discretion reasonably, carefully and in good faith; it must look at the interference complained of in the light of the case as a whole and determine, after having established that it pursued a "legitimate aim", whether it answered a "pressing social need" and, in particular, whether it was proportionate to that aim and whether the reasons adduced by the national authorities to justify it were "relevant and sufficient". In so doing, the Court has to satisfy itself that the national authorities applied standards which were in conformity with the principles embodied in Art. 11 of the Convention and, moreover, that they based their decisions on an acceptable assessment of the relevant facts. The nature and severity of the penalties imposed are also factors to be taken into account when assessing the proportionality of an interference in relation to the aim pursued. Where the sanctions imposed on the demonstrators are criminal in nature, they require particular justification. A peaceful demonstration should not, in principle, be rendered subject to the threat of a criminal sanction, and notably to deprivation of liberty. Thus, the Court must examine with particular scrutiny the cases where sanctions imposed by the national authorities for non-violent conduct involve a prison sentence [6, §§ 49-51].

Applying these principles to the circumstances of the present case, the Court observed that, on 18 March 2015, several acts of severe violence and vandalism were committed in Frankfurt in the context of the protests against the opening of the ECB's headquarters. It can accept that, in principle, a ban on protective weapons may contribute to the prevention of disorder and violence where participants carrying such protective weapons demonstrate an obvious willingness to use violence and where their martial appearance, even if they remain peaceful, has an effect of inciting aggression, as is apparent from the documents relating to the legislative process. However, the Court noted that, as the District Court found, the plastic visor used by the applicant was of simple construction. Relying on the documents relating to the legislative process, the Government argued that, notwithstanding this simple construction, the visor, and other similar visors which had been worn by several participants, had had an aggression-stimulating effect and had therefore constituted a threat to public safety. This aggression-stimulating effect had contributed to the violent acts that took place on that day in Frankfurt. In the Court's opinion, the national courts considered only whether the visor could protect the applicant from pepper spray and for what purpose the visor had been constructed. Apart from stating that no other "civil" use of such a visor was conceivable, the courts did not assess in their judgments whether the applicant's visor had posed a threat to public safety. The courts likewise did not refer to an aggression-stimulating effect, as asserted by the Government in reference to the legislative material, nor did they elaborate on whether they considered that the applicant, by wearing the visor, had demonstrated an obvious willingness to use violence. While a threat to public safety and order, as explained in the

legislative documents, may be apparent for some objects and constructions falling under the definition of "protective weapons", such as the examples listed in the documentation, such as protective shields, martial arts equipment, steel helmets or NBC protective gas masks, very simple constructions would require a special assessment by the criminal courts. In the Court's view, the applicant's visor, which had been constructed with a piece of transparent plastic sheeting (relatively hard but flexible and thinner than Plexiglas) and a rubber band, falls into the latter category [6, §§ 52-53].

In this regard, the Court also noted that section 17a(3) of the Act on Public Assemblies and Processions permits the competent authority to grant exemptions from the ban on protective weapons where there is no reason to fear a threat to public safety or order. In the present case, the national courts did not examine whether the conditions for such an exemption were met before imposing a criminal conviction on the applicant [6, § 54].

Regarding the sanction, European Court noted that, while the monetary penalty was at the lower end of possible fines, it was nonetheless a criminal sanction and not an administrative fine. The Court also observed that no order under section 17a(4) of the Act on Public Assemblies and Processions was made by the competent authority to enforce the prohibition of "protective weapons" during the demonstration, in particular, the applicant was not ordered to take off the visor. Neither did the courts explain why such an order would not have been suitable to prevent violence or disorder [6, § 55].

In the context of what has been elucidated, the European Court reiterated that criminal sanctions require special justification and that, in principle, a peaceful demonstration should not be rendered subject to the threat of criminal sanctions. When considering the criminal liability of a demonstrator, criminal courts must take into account the right to freedom of assembly and decide whether a criminal conviction is proportionate and "necessary in a democratic society" within the meaning of Art. 11 of the Convention. This requires the national criminal courts to assess the entire circumstances of the specific demonstration, the legitimate aims of the ban on "protective weapons" and the exemptions from the ban as provided by the relevant national law. The Court considered that the national courts, while they took into account the applicant's freedom of expression, they did not balance the applicant's right to freedom of assembly with the legitimate aim of preventing disorder and violence; nor did they assess the specific circumstances of the demonstration. In the particular circumstances of the case, the Court considered that the domestic courts failed to explain why the carrying of the simple visor constituted a threat to public safety which rendered the applicant's criminal conviction necessary in a democratic society [6, § 56].

The foregoing considerations were sufficient to enable the Court to conclude that the reasons adduced by the national courts to justify the applicant's criminal conviction were not sufficient. It therefore concludes that the interference cannot be considered "necessary in a democratic society". There has accordingly been a violation of Art. 11 of the Convention [6, § 57], article that guarantees freedom of assembly.

It should also be noted that the applicant also complained under Article 7 of the Convention (which guarantees the principle of the legality of the criminal offence and the legality of the penalty), i.e., that the domestic courts had exceeded the limits of acceptable interpretation when interpreting the term "protective weapon" and that the plastic visor he had worn was not prohibited by Act on Public Assemblies and Processions. In view of its findings under Art. 11 of the Convention concerning the legal basis of the interference, the Court founds this complaint, however, manifestly ill-founded and declared it inadmissible [6, §§ 59-60].

The approach of the European Court of Human Rights to Art. 11 of the Convention has been criticized by some authors. For example, F. Kriener noted that "the Court's judgment is puzzling. Its central point of critique is the lacking reasoning by the national courts and their failure to demonstrate that the plastic visor was dangerous in the specific circumstances. However, German law (...) does not require a specific assessment of the danger posed by a protective weapon. To the contrary, the requirements of German law are fulfilled if a person knowingly carries a protective weapon during an assembly. The law therefore only obliges German courts to assert whether an object qualifies as a protective weapon (objective element) and then, in a second step, to assess whether this weapon was knowingly carried at an assembly (subjective element)". The same author emphasized that the district and regional courts thus applied the law as it currently stands and as interpreted by the higher courts. Introducing an additional requirement – such as an "actual danger to public safety" to qualify an item as a protective weapon – would contradict the wording of the German law and the jurisprudence of the Federal Court of Justice. According to the cited author, the European Court of Human Rights criticism of the district and regional courts for insufficient reasoning is therefore misplaced. According to him, the critique should instead have been directed at the expansive interpretation of "protective weapon" under German law. The author concludes that German law does not provide an adequate legal basis because they employ an overly broad notion of "protective weapon", which results in a law that is not sufficiently foreseeable and does not balance the competing rights and interests sufficiently [7].

In order to reach this conclusion, F. Kriener made an X-ray of the specialized literature in Germany, highlighting the solutions proposed by it. Thus, it was shown that German law was too wide and criminalizing protest too heavily. In particular, some authors have suggested raising the threshold for the subjective element. Rather than merely requiring that the individual knowingly carried the protective weapon, they propose a more stringent standard – namely, the intent to use the weapon in response to actions by law enforcement officers. Similarly, a more restrictive definition of what constitutes a "protective weapon" could be considered. Such a definition would prohibit only major protective gear – such as shields and gas masks – while permitting the use of minor items like goggles, FFP2 masks, or mouthguards. Another approach to restricting German law in question would be to introduce an individual "balancing test", requiring a proportionality assessment between the interference and the right to peaceful assembly [7].

Therefore, in this case, it is suggested that the criminal law has been used excessively (to the detriment of the freedom of peaceful assembly) and that this consequence should be attributed to the legislator, but not to the judge. Of course, this opinion has the right to exist. However, we consider it impossible for the legislator to establish an exhaustive list of objects that would constitute "protective weapons". The principle of generality has been given precedence.

Another author noted that the European Court of Human Rights' judgment in Russ v. Germany will remain a cornerstone for the right to freedom of assembly in Germany [8]. This statement is valid for all member states of the Council of Europe.

Conclusions. The prohibition of carrying protective weapons during peaceful assemblies and, correlatively, the application of liability for defying this prohibition generate an interference with the right to peaceful assemblies, a right guaranteed, among others, by Art. 40 of the Constitution of the Republic of Moldova, and by Art. 11 of the European Convention on Human Rights guarantees peaceful assemblies.

However, the right in question is not absolute. It can be restricted. But the restric-

tions must be provided for by law, pursue a legitimate aim and be necessary in a democratic society. The last requirement is the most problematic; it implies a justification on a case-by-case basis. Moreover, criminal sanctions require a special justification, and in principle, a peaceful assembly, demonstration should not be subject to the threat of criminal sanctions.

Finally, it is clear that exceptions to the prohibition on protective weapons must be granted where there is no reason to fear a threat to public safety or order. In other words, if the carrying of a protective weapon during a peaceful assembly is not likely to create a threat to public safety or order, then the right to peaceful assembly must not be restricted by the application of sanctions. This is the message of the European Court of Human Rights in the case of Russ v. Germany. This message must be heard by all Member States of the Council of Europe.

Abstract

This paper aims to analyze the main aspects that aim at a psychosocial approach to corruption, therefore as a psychosocial phenomenon, which extends to most levels of society, and represents a deviation from the norms and regulations imposed by society.

We have focused our attention on measures to prevent and combat this phenomenon. We believe that the panoply of appropriate and adapted normative acts to those sectors that have proven to generate corruption can be complemented by substantial steps to inform and raise awareness among citizens, more precisely, to educate young citizens, young people, who are fundamental to creating a solid culture of personal and organizational integrity, precisely because, as specialized studies show, the factors that seem to underlie corruption can be comparable to the factors that underlie the lack of integrity in general.

Together, Romania and the Republic of Moldova can identify, through European funds, joint projects to counter the phenomenon of corruption – as a basis for compatibility and by virtue of an educational tradition, as a renowned specialist from the Republic of Moldova appreciates – by investing everything necessary in young human resources. From our point of view, we are guided by a fundamental question: How do we put a moral compass in the hands of children and young people, to ensure their hope for a lasting and sustainable future?

Keywords: corruption, deviance, social norms, moral norms, measures to prevent corruption, measures to combat corruption, European funds.

CORUPȚIA 2.0 – FENOMEN ȘI INFRACȚIUNE

Abstract

Această lucrare își propune să analizeze principalele aspecte ce vizează o abordare psihosocială asupra corupției, deci ca fenomen psihosocial, ce se extinde la majoritatea nivelurilor societății, și reprezentând o deviață față de norme și reglementări impuse de societate.

Autorii și-au concentrat atenția asupra măsurilor de prevenire și combatere a acestui fenomen. Apreciem că panoplia actelor normative adecvate și adaptate acelor sectoare, care s-au dovedit generatoare de corupție, poate fi completată cu demersuri substanțiale de informare și conștientizare a cetățenilor, mai exact, de educare a micilor cetățeni, a tinerilor, fundamentale pentru crearea unui culturi solide a integrității personale și organizaționale, tocmai pentru că, așa cum arată studiile de specialitate, factorii care par să stea la baza corupției pot fi comparabili cu factorii care stau la baza lipsei de integritate, în general.

Împreună, România și Republica Moldova pot identifica, prin intermediul fondurilor europene, proiecte comune de contracarare a fenomenului corupției - ca bază de compatibilitate și în virtutea unei tradiții educaționale, după cum apreciază un reputat specialist din Republica Moldova - investind orice este necesar

în resursa umană tânără. Din punctul nostru de vedere, suntem ghidați de o întrebare fundamentală: Cum punem în mâinile copiilor și tinerilor busola morală, astfel încât să le asigurăm speranța într-un viitor durabil și sustenabil?

Cuvinte-cheie: corupție, devianță, norme sociale, norme morale, măsuri de prevenire a corupției, măsuri de combatere a corupției, fonduri europene.

Introduction. This paper aims at a psychosocial approach to corruption, therefore as a psychosocial phenomenon, which extends to most levels of society, and represents a deviation from the norms and regulations imposed by society, different from that of a scientific legal perspective. Previously, Cristian Popa and his team published the work "Corruption: phenomenon and crime", edited in two volumes, a consistent work that addressed this dual aspect of the corruption problem from the theoretical aspect of criminology and criminal law and contained references to the normative-legal, social and historical aspect of the subject, as well as comparative analyses of the legislation of other states and the study of the positive expertise accumulated by the international, European community in countering this phenomenon. Now, we propose to add another perspective, of a socio-human nature, appreciating that the term corruption is much more comprehensive than that defined by the criterion of criminal law, representing a true "barometer" that measures the state of legality, normativity and morality of society.

We also do not intend to emphasize with scientific precision the operationalization of the concept underlying our analysis for the simple reason that the phenomenon of corruption is a "common practice, especially in public institutions", is "a problem of the system", is a "national sport", "has existed since the beginning of time, in all more or less democratic societies" and for which "no one has yet found a solution with guaranteed effectiveness for reducing and, ultimately, eliminating corruption from the life of society". These are answers extracted from research conducted in Romania and general assessments identified in some exhaustive studies in the Moldovan specialized literature.

In another vein, the metaphor we use – Corruption 2.0 – is also supported by the resumption of the fight against corruption in Romania, the drastic limitation of this phenomenon by coordinating the efforts of institutions, including intelligence services, as reflected in one of the national security objectives stated in the National Defense Strategy for the period 2025-2030 [12], noting, at the same time, a mirror vision in the National Security Strategy of the Republic of Moldova [13], both being oriented towards regaining the trust of society and creating sustainable and efficient government institutions. As such, together, Romania and the Republic of Moldova could identify, also in this context, joint projects to counter the phenomenon of corruption by accessing non-reimbursable European funds, as a basis for compatibility and by virtue of an educational tradition, investing whatever is necessary in young human resources.

Discussions and results obtained. The Phenomenon of Corruption as Deviance and the Theory of Social Control [2]. Deviance is a maladaptation that manifests itself through behavioral deviations from basic social norms and values. Both individual and social maladaptation's are forms that are encountered throughout the historical course of the organization of social life.

Society evaluates the behaviors of its members as normal only if they are consistent with unanimously recognized norms and values, with a margin of error that must tend to zero. Norms, both moral and legal, are established as benchmarks in most social situations governed by normality.

S.M. Rădulescu says about people that "... by doing what all members of the group

do, they obtain recognition, identity and personal security". Violation of norms brings not only opprobrium and insecurity on an individual level, but also punitive, coercive measures, therefore, deviance represents "an impermissible, abnormal tendency, negatively valued by the fact that it prevents the normal development of group life" [10, p. 13]. Deviance can be explained as the set of behaviors that threaten the balance of the social system.

Corruption, as a psychosocial phenomenon that extends to most levels of society, represents a deviation from the norms and regulations imposed by society. As an expression of the imbalance between social norms and personal goals, corruption is externalized through "symptoms". The symptoms of deviance are manifested through psychological suffering caused to other people, criminal acts, sociopathic behaviors, etc., and the "symptoms" of corruption are manifested through favoritism, nepotism, bribery, blackmail, etc.

From a sociological point of view, both deviance and corruption go beyond the boundaries of the person, by exerting influence on interpersonal relationships, modifying the status of the person. Such changes with negative valences induce, in turn, influences on members of the entourage and even at the level of society. As has been observed from research on corruption, people are beginning to perceive it as something normal, inherent in the way of interpersonal interaction and it is precisely through this side that it manifests its harmfulness.

Deviance, as a type of behavior that opposes the conventional one, includes not only violations of the law (crimes, misdemeanors), but also any deviation from the rules of coexistence and the imperatives of order of a form of collective life: group, organization, institution, society, culture, etc.

Cătălin Zamfir differentiates between deviance and abnormality in that "in its essence, as a manifestation that offends the feelings and expectations of the community", deviance is distinguished from abnormality in that the latter is about "the individual's inability, accepted and medically validated, to adapt to the demands of social life and to adequately exercise social roles" [11, p. 167]. Some of the manifestations of deviance, but also of corruption, could be considered as "specific products" of the living conditions characteristic of contemporary society, which have generated and continuously generate "alternative modes of behavior", as natural reactions to the tendencies to manipulate and hierarchize the members of society.

According to Ronald L. Akers [1], deviant behavior of individuals is determined not so much by individual motivations, but by a series of organizational factors. A basic element that defines deviance at the level of social control agencies is represented by the illicit acquisition of material advantages (financial or other), as well as of positions of power or prestige for the benefit of the members of these agencies by violating the public interest, a notion that should represent the fundamental purpose of the activity of the mentioned agencies. The most frequent characteristic of deviance in this field is not only the engagement in phenomena of fraud and corruption, but also in various decisions capable of affecting, to the greatest extent, desirable social interests and goals. One of the most important contributions in this field was made by the well-known American sociologist Edwin Sutherland [3], who developed the notion of "deviant organization" in opposition to that of deviant individual. This notion, identified by several authors with the concept of "organizational deviance", has been used in various sociological or criminological conceptions that have sought to explain the reasons why certain organizations (institutions) engage, more than others, in a series of illicit activities, using illegal norms or means or promoting illegitimate methods or means to achieve legitimate social goals from the point

of view of normative expectations. It is also worth mentioning that this notion has been widely accepted by sociologists or criminologists but has been less frequently treated as a study variable.

David Ermann and Richard Lundman distinguished, in this sense, four main features of organizational corruption:

1. Acts of corruption must be supported by the internal norms that characterize the organizational culture of the respective social control agency;

2. Acts of corruption must be legitimized and justified by each new member who comes to the organization, through a socialization process, in which the "novices" learn the norms, values, and codes of conduct specific to the respective organizational cultures;

3. Acts of corruption must be supported by the members who work and effectively fulfill the goals of the organization;

4. The same acts of abuse and corruption must be supported, at the same time, by the dominant administrative "coalition" of the respective organization [4].

Organizational deviance occurs when the theft committed by a member of the organization is compatible with its real purpose, to maintain internal harmony with the help of "informal income" or by exploiting the organization's resources for the personal benefit of the organization's employees.

The problem of corruption, as a symptom [8, p. 75] in such social control agencies is one of the most debated topics in the works dedicated to organizational deviance. These works generally postulate three main theoretical models of corruption within social control agencies:

1. The participatory model or the co-optation of subjects, over whom social control is exercised, in the development of the decision-making policy of the respective social control agency. Once "co-opted" into the social control agency, the subjects in question can change the formal goals of the organization (agency), making it adopt deviant goals.

2. The model of "capturing" social control agencies for the benefit of external users or exploiters. This model refers, for example, to the use (exploitation) of the main resources of social control agencies for the benefit of politicians who use them as a "commodity" of exchange, to obtain funds necessary to support the electoral campaign from organizations or networks with illicit purposes.

3. The model of "dominance" exercised by internal exploiters of the resources of social control agencies. This model refers to the dominant administrative coalition of the social control agency, which directs the activity of the institution in its own interest, and which takes advantage of any violation of its legal purposes to obtain personal benefits.

The more social control agencies depend on the subjects they control to achieve their formal legitimate goals, the more likely it is that corruption will occur through the co-optation of these subjects.

Social control is a planned or unplanned process by which people are taught, convinced and even forced to conform to norms.

For social control at the informal level, the reactions of others are essential, and when certain attitudes of those around them are understood and internalized, that is, assumed, accepted and mastered, social control turns into self-control, which is determined by socialization.

In conclusion, informal social control is achieved through the same mechanisms through which socialization takes place. Social control can also be defined as the way in which society prevents deviance and punishes those who violate norms [7, pp. 113-156]. In a broader sense, through social control, society establishes all the norms that, taken

together, give the culture of that society.

In scientific literature, theories of social control are divided into two distinct branches [6]. On the one hand, theories of control proper, which state that all internal impulses that can push the individual towards deviance (anger, greed) and all external pressures (poverty, deviant subcultures, certain blockages of opportunities) are controlled by a first "ring" of individual resistance, consisting of the individual's character traits and certain internalized norms and values, and a second "ring", the social one, which regulates the individual's behavior through social connections, interactions and tensions. The two "rings" can function simultaneously or separately, only one of them, or even neither.

Based on the theories stated, the main components of social control have been identified, namely, attachment to others, especially to guiding models, such as:

a) Parents, educators or strong personalities of the peer group;

b) Commitment to the main institutions, such as school, state organizations, workplace;

c) Involvement in various social activities and recourse to conventional lines of social action;

d) Belief in the norms of society, in the sense of assuming them and conforming to them, accompanied by their acceptance in private life [5].

Considering the above, it can be stated that, at a formal level, control means more than criminal legislation in the field. This type of control means institutions empowered to control the behavior of all individuals, from those with responsibility, to simple executors or even delinquents, or sociopaths.

However, in an anomic society [9], informal social control is particularly weak, and this observation leads us to think about the situation in which, in the context of such profound institutional transformations, maintaining control at the formal level, the final expression of which is in criminal legislation, is almost impossible.

Attempts to control corruption have resulted in improving informal control and increasing formal social control, through the selective appropriation of external values. Additionally, through a series of impact interventions in terms of mentalities, education is carried out through internalization of group values that have the force of a positive example and have the ability to consolidate foundations of thinking in accordance with social norms, so that they can control, from within, the immense temptations that the explosion of freedom has brought and that offer illicit paths, much easier to follow, in order to occupy a higher status, which currently means, above all, money.

Shared Strategic Vision – Opportunities for Cooperation? In Romania, for the period 2025-2030, the National Defense Strategy reiterates the need to fight corruption, to drastically limit this phenomenon by coordinating the efforts of institutions, including intelligence services, as reflected in one of the stated national security objectives. Specifically, an integrated approach to the phenomenon is intended, through joint efforts of all responsible institutions and through the efficient use of available data; the involvement of intelligence services in collecting data documenting possible acts of corruption, without their interference in the criminal investigation and the justice process; and the correction of legislative and administrative mechanisms that delay the achievement of justice in matters of corruption, while respecting the separation of powers in the state and constitutional norms.

Upon careful review of the National Security Strategy of the Republic of Moldova, we also identify consistent specifications of combating corruption among the national security objectives of the Republic of Moldova and directions of action in various areas, such

as "public order and security" or "democratic resilience". Therefore, we identify a mirror image, both documents of great strategic importance being oriented towards regaining the trust of society and creating sustainable and efficient government institutions.

Translating these national security objectives into concrete and coherent action plans and activities could constitute as many measures as possible to prevent and combat this phenomenon. We appreciate that the panoply of appropriate normative acts adapted to those sectors that have proven to generate corruption can be complemented with substantial efforts to inform and raise awareness among citizens, more precisely, to educate young citizens, young people, fundamental for creating a solid culture of personal and organizational integrity, precisely because, as specialized studies show, the factors that seem to underlie corruption can be comparable to the factors that underlie the lack of integrity, in general.

Therefore, we consider as auspicious measures such as establishing a partnership between public authorities with civil society and representatives of the private sector, informing and raising awareness of citizens regarding the causes and consequences of corruption, but also regarding citizens' rights when faced with corruption cases, conducting scientific activities to diagnose and forecast the phenomenon of corruption, or conducting information and awareness campaigns on ethical behavior, both at the individual and social levels.

Conclusions. Given the ever-widening area, complexity and continuous diversification of the forms of manifestation of the phenomenon of corruption, it goes without saying that scientific assessments, theoretical and applied reflections can contribute to improvements in the social and civic environment, to the effective harmonization of the relationship between the state and the citizen. Identifying the most sensitive points of this phenomenon and, implicitly, their constant fixation on the public agenda constitutes as many possibilities as possible for restoring citizens' trust in the structures of power and authority, to maintain a fair social climate, avoid social polarization and recognize institutional authority.

The tension between the individual and society can explain the criminal state only if it is accompanied by a cultural structure that promotes justifications against inequality. In the current period, social changes have made the idea of equality deeply mark citizen's sense of justice.

Abstract
This article examines the fundamental principles governing the three-phase process of the administrative act — drafting, adoption/issuance, and application — from the perspective of administrative law doctrine in the Republic of Moldova and Romania. The study systematically analyses, for each phase, the principles that confer legitimacy, legality, and efficiency: legality, competence, and expediency in the drafting phase; motivation, proportionality, the right to a hearing, transparency, and equality in the adoption phase; mandatory force, communication/publication, revocability, and judicial review of legality in the application phase. The central conclusion is that compliance with these principles is not a discretionary option for the administration, but a legal obligation guaranteeing individual rights and the proper functioning of the rule of law.

***Keywords**: administrative act, principles of administrative law, legality, competence, proportionality, motivation, expediency, administrative procedure, judicial review.*

PRINCIPIILE FUNDAMENTALE CARE GUVERNEAZĂ ADOPTAREA ACTELOR ADMINISTRATIVE: GARANȚIE A LEGALITĂȚII ȘI EFICIENȚEI ACTIVITĂȚII ADMINISTRATIVEA

Abstract
Prezentul articol examinează principiile fundamentale care guvernează procesul trifazic al actului administrativ — elaborare, adoptare/emitere, aplicare — din perspectiva doctrinei juridice din Republica Moldova și România. Pornind de la funcțiile principiilor în dreptul administrativ, studiul analizează sistematic, pentru fiecare fază a actului administrativ, principiile care îi conferă legitimitate, legalitate și eficiență: legalitatea, competența și oportunitatea în faza de elaborare; motivarea, proporționalitatea, dreptul la apărare, transparența și egalitatea în faza de adoptare; obligativitatea, comunicarea/publicitatea, revocabilitatea și controlul legalității în faza de aplicare. Concluzia centrală este că respectarea acestor principii nu constituie o opțiune discreționară a administrației, ci o obligație juridică ce garantează drepturile persoanelor și buna funcționare a statului de drept.

***Cuvinte-cheie**: act administrativ, principii de drept administrativ, legalitate, competență, proporționalitate, motivare, oportunitate, procedură administrativă, control jurisdicțional.*

Introduction. Principles of law represent, in the classical view of the general theory of law, "the general ideas, guiding postulates or directive precepts underlying the entire legal system of a country, orienting legal regulations and the application of law" [1, p.25]. They do not constitute mere theoretical recommendations, but rather ideas endowed with their own normative force, which guide, supplement, and correct the application of legal norms, conferring coherence and predictability upon the legal system.

The practical importance of principles is analyzed by professor N. Popa in two essential dimensions: on the one hand, principles "ensure the unitary construction of the legal system" [2, p.23], constituting a primary technical instrument in the legislative drafting process; on the other hand, they acquire a cognitive dimension, contributing decisively to the understanding and correct application of legal norms in concrete cases [3, p.151].

Administrative law, as a fundamental branch of public law, presents a remarkable particularity in this respect: as emphasized in legal doctrine, it lacks a unitary codification and is characterized by significant legislative dynamism. Precisely for this reason, principles occupy a particularly important place in administrative law — they ensure the continuity and coherence of the system where written norms are absent or insufficient. As highlighted in the specialized literature, "due to the mobility, multiplicity and fragmentation of legislative provisions in administrative matters, the need arose to move from the mere knowledge of legal texts to the study of principles".

The present study aims to systematically analyze the fundamental principles governing the administrative act in the three phases of its existence: drafting, adoption/issuance, and implementation. Elements of comparative law are organically integrated into the analysis of each principle in order to reveal the convergences and particularities of the two legal systems.

Discussions and results obtained. I. Principles of Administrative Law: General Considerations. 1.1. The Concept and Functions of Principles in Administrative Law. The term principle derives from the Latin principium, meaning beginning or origin, designating, in the legal sense, a fundamental element of the legal system. In the opinion of professor Gh. Boboș, "by principle of law we understand both a foundation of the legal system and a means of coordinating legal norms around guiding ideas" [4, p.186]. Starting from this definition, principles appear not as isolated norms, but as structuring ideas that confer unity and direction upon the entire legal edifice.

The general theory of law has identified three levels of generalization of legal principles [5, p.35-51]:

1. Principles of the entire legal system — applicable to all branches of law;
2. Principles of branches of law — specific to administrative, civil, criminal law, etc.;
3. Principles of legal institutions — applicable to specific institutions such as the administrative act or administrative litigation. The principles examined in the present study belong predominantly to the second and third levels.

With regard to their functions, the principles of administrative law fulfill three essential roles. First, the law-creating function: they guide the legislator in drafting legal norms, ensuring the internal coherence of the normative system. Second, the interpretative function: in the presence of ambiguous or contradictory norms, principles provide the criterion for the correct interpretation of legislative intent. Third, the integrative function: in the case of legislative gaps — frequent in administrative law — principles allow for application by analogy and the completion of the normative system.

A distinction must be made between "principles expressly contained in a normative act and those inferred from several normative acts through generalization" [6, p.125]. This

distinction is essential in administrative law, where numerous principles — such as the revocability of administrative acts — are not explicitly codified, but are deduced from the entirety of regulations in the field. Both in the Republic of Moldova and in Romania, these principles of jurisprudential and doctrinal origin have gradually acquired the force of positive legal rules.

1.2. Categories of Principles Applicable to the Administrative Act. The analysis of the principles governing the administrative act requires a systematic classification intended to reveal their diversity and complementarity. Based on the criterion of their legal nature, doctrine distinguishes three major categories:

Substantiale principles — concern the content of the administrative act and the substantive conditions of its validity. This category includes: the principle of legality, the principle of proportionality, the principle of equality and non-discrimination, and the principle of good faith. These principles determine what an administrative act may or may not contain, establishing the substantive limits of administrative discretionary power [7, p.9].

Procedural principles — concern the manner in which the administrative act is drafted and adopted. This category includes: the principle of competence, the principle of reasoning, the principle of the right to defense, and the principle of transparency. These principles determine how the administration must act, regardless of the content of the act it intends to issue [8, p.87].

Principles of efficiency — concern the results of administrative activity, ensuring that issued acts are not only lawful but also capable of producing the intended effects in the public interest. This category includes: the principle of expediency, the principle of efficiency, and the principle of effectiveness. The particularity of these principles lies in the fact that they are not subject to judicial review of legality, but rather form the object of internal administrative control [9, p.151-154.

This tripartite classification — adopted and adapted from French, German, and European doctrine — is today accepted both in the doctrine of the Republic of Moldova [10, p.134] and in Romanian doctrine and constitutes the framework of reference for the following analysis.

II. Fundamental Principles in the Phase of Drafting the Administrative Act. 2.1. The Principle of Legality: Foundation of Drafting the Administrative Act. The principle of legality represents the backbone of the entire administrative activity. It requires that every administrative act have a legal basis, comply with the normative hierarchy, and not contradict higher-ranking legal norms. As professor Maria Orlov points out, the principle of legality means that "public authorities, including administrative authorities, in their activity must be guided by the provisions of the law and may issue legal acts only in accordance with and on the basis of the law" [7, p.10].

Doctrine distinguishes two dimensions of the principle of legality in the drafting of the administrative act. The substantive dimension requires that the content of the act comply with legal provisions and superior normative acts, viewed through the prism of the trichotomous structure of the legal norm — hypothesis, disposition, and sanction. The administrative body is obliged to issue the act when the factual conditions provided by law are fulfilled and to refrain from doing so when they are absent [11, p.32-35].

The formal dimension — consecrated by Professor Antonie Iorgovan as "legality from the perspective of the authority from which the act emanates" — requires that every general or individual measure emanate from the legally competent authority. This dimension organically intersects with the principle of competence, which it foreshadows [9, p.48].

An essential characteristic of the principle of legality is the non-retroactivity of administrative acts. As a general rule, administrative acts produce effects only for the future — ex nunc — from the date of their entry into force. Exceptions are admitted only in cases expressly provided by law or when they are favorable to the individual [8], p.90. Non-retroactivity protects the legal certainty of the addressees of administrative acts and prevents abuse of power through regulations with retroactive effects.

Both in the Republic of Moldova and in Romania, the principle of legality is constitutionally enshrined and constitutes the basis of any administrative litigation action. The particularity of the Moldovan system, emphasized by professor Cobăneanu, lies in the fact that "the application of the principle of legality encounters difficulties related to insufficient knowledge of the legislation in force and the slow overcoming of the difficulties in its application" — a reality that makes the principle all the more important to invoke and strengthen [10, p.140].

2.2. The Principle of Competence: A Condition for the Validity of the Act

Competence represents the totality of powers conferred by law upon administrative authorities, constituting both a right and an obligation of the issuing authority. Unlike capacity in private law, administrative competence is inalienable and permanent: it is not exhausted through exercise, cannot be transferred without legal basis, and depends not on the will of the authority, but on the will of the legislator.

Three forms of administrative competence may be distinguished, each determining a dimension of the validity of the act: material competence (ratione materiae) — the sphere of powers defined according to the object of activity; territorial competence (ratione loci) — the geographical limits within which the authority may act; personal competence (ratione personae) — powers linked to the office held. Failure to comply with any of these forms entails the nullity of the act.

Exceeding competence — known in doctrine as abuse of power — constitutes one of the most frequent grounds for annulment of administrative acts through administrative litigation. In the administrative practice of the Republic of Moldova, abuse of power manifests itself both through usurpation of competence — when an authority issues acts exceeding its legal powers — and through misuse of power — when the act is issued within the formal limits of competence, but for a purpose other than that provided by law.

Professor Lucia Catană adds, from the perspective of Romanian law, that an authority may not evade the obligation to issue an administrative act when the legal conditions are met: the unjustified refusal to resolve a request concerning a right recognized by law constitutes in itself an illegality, liable to challenge before the administrative courts [12, p.116].

2.3. The Principle of Expediency in the Initiation Phase. The principle of expediency concerns not the legality of the act, but the quality of the choice made by the administration in exercising its discretionary power: the choice of the moment, means, and optimal manner of intervention. Professor Ilie Iovănaș defines expediency as "the fulfillment of legal duties and powers within an optimal time frame, with minimal expenditure of material and spiritual resources, but with maximum efficiency, as well as the selection of the most appropriate means for achieving the purpose of the law" [13, p.9].

The relationship between legality and expediency is one of complementarity, not of alternativity. Doctrine unanimously emphasizes that "an inexpedient administrative act may be lawful, whereas an unlawful act can never be justified as expedient, because illegality, in a state governed by the rule of law, can never be expedient" [7, p.12]. In other words, expediency operates exclusively within the framework of legality — the adminis-

tration may choose between several lawful solutions, but may not invoke expediency to justify an unlawful solution.

Expediency may be assessed according to several convergent criteria [9, p.55]:

a) The most appropriate moment for adopting the act, depending on the factual and normative context;

b) The place and concrete conditions for applying the act;

c) The material and legal means involved in the administrative measure;

d) Compliance with the purpose of the law, which constitutes the upper limit of administrative discretion.

It is precisely this last criterion that organically links expediency to the principle of legality, preventing discretion from turning into arbitrariness.

III. Fundamental Principles in the Phase of Adoption/Issuance of the Administrative Act. 3.1. The Principle of Reasoning of the Administrative Act. Reasoning represents "the administrative operation through which the factual and legal considerations justifying the issuance or adoption of an administrative act are set forth" [9, p.62]. It is not a mere formality, but rather the instrument through which the addressee of the act may verify compliance with legality and may decide, with full knowledge of the facts, whether or not to exercise the available remedies.

The content of the reasoning comprises two inseparable components. Factual reasoning involves the description of the factual situation that led to the issuance of the act — indicating the evidence and documents taken into consideration — while legal reasoning involves identifying the specific legal basis, namely the legal norm authorizing the issuance of the act and determining its content. The reasoning shall be communicated to the applicant, either in full or in summary form, upon request or ex officio, under the conditions established by law [10, p.146].

Professor Ovidiu Podaru emphasizes that reasoning cannot be purely formal or stereotypical; it must reflect a genuine analysis of the factual situation and of the applicable legal basis. Formal reasoning devoid of substance is equivalent to a lack of reasoning and entails the nullity of the act [14, p.43]. This requirement of substantive — not merely formal — reasoning constitutes one of the most significant advances of contemporary administrative law compared to classical conceptions.

The absence or insufficiency of reasoning produces serious legal consequences: the act may be annulled through administrative litigation, and the issuing authority may be obliged to issue a new act, lawfully reasoned. Professor Sergiu Cobăneanu specifies that, in light of the legislation of the Republic of Moldova, any administrative decision capable of affecting the rights or legitimate interests of a private person "must be adequately, clearly and consistently reasoned", while also indicating the available remedies [7, p.14].

3.2. The Principle of Proportionality. The principle of proportionality requires that the means employed by the administration in adopting an act be appropriate, necessary, and proportionate to the pursued objective, without imposing excessive burdens upon the addressees. It establishes a fair balance between the public interest — which the administrative act is intended to serve — and the private rights and interests of the affected persons [8, p. 94].

The structure of the principle is tripartite [12, p.120]:

1. Suitability: the adopted measure must objectively be capable of achieving the intended aim;

2. Necessity: among several equally effective measures, the administration must choose the least restrictive one for the affected person;

3. Proportionality stricto sensu: the benefits obtained through the administrative act must outweigh the sacrifices imposed, so that the intervention is justified in light of the general interest.

The application of the principle of proportionality is particularly relevant in matters concerning administrative acts of a sanctioning or restrictive nature: contraventional sanctions, access restrictions, suspensions of activity. In the case law of the European Court of Human Rights and the Court of Justice of the European Union, proportionality has acquired the status of a criterion for reviewing the legality of administrative acts, profoundly influencing Romanian administrative doctrine and practice. Moldovan doctrine, through the work of Professor Maria Orlov, has embraced this evolution, establishing proportionality as a condition for the validity of restrictive administrative acts [7, p.16].

3.3. The Principle of the Right to Defense and Prior Hearing. The principle audi alteram partem — the right to be heard before the adoption of an unfavorable administrative act — constitutes a fundamental requirement of good administration and a concrete expression of the rule of law in executive activity. It requires that the person targeted by an administrative act capable of affecting his or her rights or legitimate interests be informed in due time about the pending procedure and be given the opportunity to present facts, arguments, and evidence in his or her defense [9, p.70].

The obligation of prior information has a dual content [14, p.55], on the one hand, the administrative authority must inform the interested person about the existence of the procedure and his or her right to participate therein; on the other hand, it must communicate the facts, arguments, and evidence on which it intends to base its decision, so that the person may formulate a useful and effective defense.

Professor Antonie Iorgovan, analyzing the French tradition in this field, demonstrated that the right to defense in administrative proceedings constitutes a mitigated expression of the adversarial principle, and that its infringement may entail the relative nullity of the act — a sanction distinct from the absolute nullity applicable in cases of incompetence or defects of substantive legality [9, p.75]. Professor Lucia Catană further adds that, in practice, the guarantee of the right to defense is also ensured through the possibility for the person to be represented or assisted before the administrative authority, without the procedure becoming inaccessible to the interested party due to excessive complexity or costs [12, p.124].

3.4. The Principle of Transparency in the Adoption Procedure. The principle of transparency requires that the procedure for adopting administrative acts be open to interested persons and to the public, within the limits established by law. It manifests itself through the right of every person to information, which the public authority is obliged to provide within a reasonable time and by effective and appropriate means [8, p.98].

Transparency fulfills a dual function in the process of adopting the administrative act [10, p.152]: a preventive function — discouraging the adoption of arbitrary or unreasoned acts by exposing the decision-making process to public scrutiny; and a corrective function — providing affected persons with the necessary tools to identify potential defects in the act and challenge them through legal remedies. The unjustified refusal to disclose relevant information concerning the issuance of an administrative act may, in itself, constitute grounds for annulment of the act.

In the Republic of Moldova, transparency in public administration is constitutionally enshrined and regulated by special laws, and the principle obliges authorities to communicate to interested persons both administrative directives and the reasons and criteria underlying individual decisions, within a reasonable time and by appropriate means, so that they may be challenged if necessary.

3.5. The Principle of Equality and Non-Discrimination. The principle of equality requires administrative authorities to treat equally persons placed in objectively similar situations and not to apply discriminatory criteria — such as sex, race, ethnic origin, religion, political opinion, or other personal status — in the adoption of administrative acts. It does not prohibit every differentiation in treatment, but only those not justified by an objective difference in circumstances.

Professor Maria Albu highlights that the principle of equality has both a negative dimension — the prohibition of discrimination — and a positive dimension — the obligation of consistency in administrative practice: objectively identical situations must be treated in the same manner [3, p.48]. The inconsistency of administrative practice — whereby identical factual situations lead to different solutions depending on subjective factors — constitutes a form of institutional discrimination contrary to the rule of law and liable to review through administrative litigation.

The principle of equality cannot be invoked in order to extend an unlawful practice: if the administration has previously adopted unlawful acts in relation to other persons, this circumstance does not create a right for others to benefit from the same unlawful acts. Equality operates only within the sphere of legality, not outside it.

IV. Fundamental Principles in the Phase of Implementation of the Administrative Act. 4.1. The Principle of Binding Force and Enforceability of the Administrative Act. Once entered into force, the administrative act becomes binding and must be complied with both by the natural and legal persons to whom it is addressed and by the issuing authority itself. Its binding force derives from the fact that the act is issued on the basis and in execution of the law, enjoying the presumption of legality — a presumption iuris tantum, which may be rebutted through administrative litigation [14, p.67].

The corollary of binding force is immediate enforceability: the administrative act becomes enforceable from the moment it enters into force, without the need for an enforcement order or the completion of additional formalities, unlike judicial decisions. Professor Ovidiu Podaru emphasizes that this feature represents the clearest expression of the public authority regime under which the administration operates: "the intrinsic enforceability of the administrative act fundamentally distinguishes it from any private law act".

The presumption of legality produces important procedural effects: a person challenging an administrative act cannot, in principle, suspend its execution merely by filing a complaint. Suspension of the effects of the act requires either an express provision of law or a court decision issued upon the request of the interested person, under the conditions established by administrative litigation legislation [15. p.28].

4.2. The Principle of Communication and Publication of the Administrative Act. The production of the legal effects of the administrative act is conditioned upon bringing it to the attention of its addressees. Doctrine and legislation establish the rule that "the moment when legal effects are produced is that of communication of individual administrative acts and publication of normative acts", because only from that moment can subjects become aware of the content of the act and be required to comply with it [10, p.157].

Communication — specific to individual acts — is the operation through which the act is transmitted to the interested person or authority. It determines the moment from which the time limits for contestation begin to run and from which concrete rights and obligations arise for the addressee. Publication — specific to normative acts — is generally carried out through the Official Gazette or other means of public dissemination, without excluding situations where the law requires the publication of certain individual acts of

general interest as well (for example, decrees concerning citizenship) [9, p.80.

The consequence of failure to communicate or publish is that the act, although lawful and binding in abstracto, is not opposable to its addressees: they cannot be required to comply with an act they had no possibility of knowing. This rule constitutes an essential guarantee of legal certainty and of the principle of legality, preventing the administration from imputing to addressees conduct contrary to an act that was not communicated to them.

4.3. The Principle of Revocability and Stability of the Administrative Act. The principle of revocability of administrative acts — developed through doctrinal and jurisprudential generalization, without being explicitly codified in all legal systems — establishes the right and, in certain cases, the obligation of the issuing authority to withdraw the act for reasons of illegality or inexpediency. It expresses the idea that the administration is not definitively bound by its own acts and that the adaptation of executive activity to changes in fact or law is a requirement of good administration [8, p.101].

Revocation produces different legal effects depending on its cause [14, p.73]: revocation for illegality has, in principle, retroactive effect (ex tunc) — the act is deemed never to have produced valid legal effects; revocation for inexpediency produces effects only for the future (ex nunc) — the act produced valid effects until the date of its withdrawal. This distinction, formulated by professor E.D. Tarangul and later consecrated by doctrine as a whole, has essential practical consequences for the rights acquired by the addressees of administrative acts.

Revocability is subject to important limitations imposed by the principle of protection of legitimate expectations: acts creating subjective rights in favor of addressees may not be arbitrarily revoked, especially where the addressees have executed them in good faith or have modified their legal situation on the basis thereof [12, p.128]. This limitation of revocability is recognized both in Romanian doctrine and in the case law of the Court of Justice of the European Union and aims to protect individuals against arbitrary changes in the administration's positions.

4.4. The Principle of Judicial Review of the Legality of the Administrative Act. The principle of judicial review of the legality of administrative acts constitutes the institutional guarantee that all the other principles analyzed are respected in practice. It expresses the idea that no public authority may be the judge of its own legality and that the addressees of administrative acts must have access to external, independent, and effective review.

Judicial review of legality is exercised through two major complementary mechanisms. Internal administrative review — hierarchical and supervisory — allows superior authorities to verify, ex officio or upon complaint, the legality of the acts issued by subordinate authorities. This mechanism has the advantage of speed, but also the disadvantage that the reviewing body belongs to the same administrative structure as the reviewed authority [7, p.18].

External judicial review — exercised through administrative courts — offers the supreme guarantee of legality through the independence of the judge from the administration. The establishment of administrative litigation represented "an evident necessity of the time," because only judicial review ensures effective protection of citizens' rights and freedoms against unlawful administrative acts.

An indirect, yet highly effective mechanism, is the plea of illegality, which allows any person to invoke, within the framework of any dispute, the nullity of an administrative act opposed to him or her, without the court annulling the act, but merely disregarding it in

resolving the case. This instrument, analyzed by professor Tudor Drăganu, strengthens the principle of legality even outside the sphere of administrative litigation proper, extending judicial review over administrative activity to the entire field of legal disputes [9, p.85].

Conclusions. The analysis of the fundamental principles governing the adoption of administrative acts through the prism of the three phases of their existence — drafting, adoption/issuance, and implementation — leads to several synthetic conclusions of both theoretical and practical value.

First, principles do not operate in isolation, but rather form a coherent and hierarchical system of legal guarantees. Legality and competence are absolutely necessary conditions — any act issued in breach thereof is null; proportionality, reasoning, and the right to defense are conditions of validity whose consequences may vary depending on the gravity of the defect; expediency and efficiency are principles of good administration, reviewable through means other than legality litigation. Knowledge of this hierarchy is essential both for legal practitioners and for citizens confronted with administrative acts.

Second, principles have an irreducible threefold role: they guide the administration regarding what and how to draft the act (drafting phase); they impose procedural and substantive standards at the moment of adoption (issuance phase); and they guarantee that the resulting act produces predictable and reviewable legal effects with respect to its addressees (implementation phase). Treating principles as relevant only in one of these phases would constitute a serious methodological error.

Third, the doctrinal convergence between the Republic of Moldova and Romania in identifying and consecrating these principles demonstrates the existence of a common body of administrative values of European origin, transcending specific legislative differences. Both systems are committed to the trajectory of alignment with the standards of good administration promoted by the Council of Europe and by the case law of the European Court of Human Rights, and this alignment is achieved precisely through the strengthening of the legal regime of the principles examined.

Finally, from a lege ferenda perspective, the study confirms the conclusion reached by the most authoritative doctrine in both states: the adoption of clear, accessible, and comprehensive administrative procedure codes — which would uniformly transpose these principles into enforceable legal norms — remains one of the most urgent necessities for the modernization of public administration both in the Republic of Moldova and in Romania.

ORGANIZED CRIME IN CONDITIONS OF MARTIAL LAW: CHALLENGES OF COUNTERACTION AND DIRECTIONS FOR SCHOLARLY ANALYSIS

Ganna SOBKO,
PhD, University Professor,
Department of Criminal Law and Criminology,
Odesa State University of Internal Affairs,
Ukraine
ORCID: 0000-0002-5938-3400

Abstract

The article is devoted to examining how organized crime in Ukraine has evolved under martial law, noting that wartime conditions have expanded and reshaped criminal activities. It highlights increased illicit activities such as arms trafficking, smuggling, and misuse of humanitarian aid, along with greater infiltration of criminal groups into strategic sectors like defense procurement and border control.

The study also emphasizes that weakened institutional coordination and strained law enforcement systems have allowed organized crime to strengthen its influence, deepen corruption, and expand the shadow economy. Overall, data from 2022-2025 indicates a growing and adapting criminal environment that is likely to persist after the war.

The article concludes that combating this threat requires stronger and more coordinated state policies, improved specialized law enforcement units, better control of key sectors, and alignment with international standards adapted to wartime conditions.

Keywords: organized crime, martial law, armed aggression, smuggling, weapons, corruption.

CRIMINALITATEA ORGANIZATĂ ÎN CONDIȚIILE LEGII MARȚIALE: PROVOCĂRI ALE COMBTERII ȘI DIRECȚII PENTRU NALIZA ȘTIINȚIFICĂ

Abstract

Articolul analizează modul în care crima organizată din Ucraina a evoluat sub legea marțială, evidențiind faptul că situația de război a extins și a remodelat activitățile infracționale. Sunt menționate activități ilegale în creștere, precum traficul de arme, contrabanda și utilizarea abuzivă a ajutorului umanitar, precum și o infiltrare tot mai mare a grupărilor criminale în sectoare strategice, cum ar fi achizițiile pentru apărare și controlul frontierelor.

Studiul subliniază, de asemenea, că slăbirea coordonării instituționale și presiunea asupra sistemelor de aplicare a legii au permis crimei organizate să își consolideze influența, să aprofundeze corupția și să extindă economia subterană. În ansamblu, datele din perioada 2022–2025 indică un mediu infracțional în creștere și în adaptare, care este probabil să continue și după încheierea războiului.

Articolul concluzionează că combaterea acestei amenințări necesită politici de stat mai puternice și mai bine coordonate, unități specializate de aplicare a legii îmbunătățite, un control mai strict al sectoarelor cheie și alinierea la standarde internaționale adaptate condițiilor de război.

Cuvinte-cheie: crimă organizată, lege marțială, agresiune armată, contrabandă, arme, corupție.

Introduction. The article is devoted to a comprehensive study of organized crime in Ukraine under martial law, which has significantly transformed both the nature and scale of criminal threats. It is emphasized that under conditions of armed aggression, organized crime acquires new forms, exploiting crisis phenomena, weakened institutional control, and the concentration of state resources on defense needs. Organized crime is defined as a complex socio-legal phenomenon characterized by criminal ties, hierarchical structure, a high level of coordination, and the active use of violence and corruption mechanisms.

Particular attention is paid to the transformation of criminal group activities following the introduction of martial law. It has been established that wartime conditions have contributed to the intensification of arms smuggling, illicit trafficking in excisable goods, and abuses in the sphere of humanitarian aid. The expansion of the shadow economy is outlined, driven both by objective difficulties in state control and by the deliberate exploitation of wartime conditions by criminal structures. It is emphasized that organized groups are increasingly infiltrating strategically important sectors, including defense procurement, the activities of military medical commissions, and customs and border control procedures.

It is proven that under martial law the destructive impact of organized crime is significantly amplified, manifesting in the legitimization of shadow practices, the spread of legal nihilism, and the deepening criminalization of social relations. Wartime realities create additional opportunities for the integration of criminal elements into legal economic and administrative processes.

An analysis of academic sources and law enforcement practice reveals a number of systemic problems that have intensified during martial law, including institutional imbalance within the law enforcement system, fragmentation of functions among newly established bodies, insufficient coordination, and limited adaptation of international standards to wartime conditions. It is emphasized that organized crime under these circumstances acts as one of the key instruments of corrupt influence on the economy and political processes.

Based on the analysis of statistical data and judicial practice for 2022-2025, a trend toward the growth of organized forms of crime, their rapid adaptation to wartime conditions and a high likelihood of further escalation in the post-war period has been identified.

It is concluded that effective counteraction to organized crime under martial law requires the modernization of state anti-crime policy, taking into account security challenges, in particular: the restoration and strengthening of specialized units, the creation of a unified database of members of criminal groups, enhanced control in strategically important sectors of the economy, and the adaptation of international standards to Ukrainian wartime realities.

Purpose and objectives of the study. Organized crime under martial law acquires qualitatively new characteristics, transforming under the influence of armed aggression and systemic changes in the socio-economic and security spheres of the state. As a complex socio-legal phenomenon, it is traditionally defined by the presence of stable criminal networks, hierarchical structures, a clear division of roles, as well as the use of violence, corruption mechanisms, and financial-economic instruments to achieve unlawful objectives. At the same time, during the period of martial law, organized crime goes beyond the classical understanding of a set of offenses and emerges as a systemic factor influencing the functioning of state institutions, the economy, and national security.

The introduction of martial law in Ukraine, in accordance with the Law of Ukraine "On the Legal Regime of Martial Law", as well as the full-scale armed aggression of the

Russian Federation, has led to significant transformations in the criminogenic situation. Under conditions of social destabilization, large-scale population displacement, destruction of infrastructure, and the overload of the law enforcement system, organized criminal groups actively adapt their activities to new realities. This is manifested in the diversification of criminal activities, particularly in the illegal trafficking of weapons and military goods, as well as in crimes related to humanitarian aid, including its misappropriation, resale, or fictitious distribution.

Particularly dangerous is the emergence of shadow markets for fuel, medicines, and food products, as well as the unlawful appropriation of property in temporarily occupied or de-occupied territories. In certain cases, such acts may fall under the qualification of war crimes in accordance with national criminal law. In this context, it is important to consider the provisions of international humanitarian law, including the Geneva Conventions of 1949 and Additional Protocol I of 1977, which prohibit unlawful interference with civilian property.

Moreover, organized criminal groups actively exploit fraudulent schemes aimed at illegally obtaining state payments, benefits, and compensations intended for military personnel and internally displaced persons. This indicates the penetration of criminal practices into the sphere of public administration and social policy. Such activities undermine financial stability and public trust in state institutions, contradicting the principles of effective governance reflected in the case law of the European Court of Human Rights, particularly regarding the obligation of the state to ensure effective investigation and protection of property rights under Article 1 of Protocol No.1 to the European Convention on Human Rights [8].

Materials applied. The scientific understanding of organized crime in Ukraine has traditionally been developed within the framework of criminology, criminal law, and related disciplines. A significant contribution to this field has been made by Ukrainian scholars such as O.M. Bandurka, Yu.P. Bytiak, O.Yu. Busol, O.V. Vynnyk, I.P. Holosnichenko, V.L. Hrokholskyi, Yu.V. Demianchuk, O.M. Dzhuzha, I.V. Zozulia, A.M. Kulish, M.I. Lohvynenko, M.I. Melnyk, O.M. Muzychuk, Ye.V. Nevmerzhytskyi, S.O. Shatrava, O.V. Shevchenko, and others. However, most of these studies were conducted under conditions of relative socio-economic stability, which limits their applicability to the realities of martial law.

In view of the above, there is an objective need to develop a new scientific paradigm for the study of organized crime that takes into account modern challenges related to armed conflict, the transformation of economic processes, and changes in the structure of criminogenic factors. In this regard, particular importance is attached to the integration of international experience, including the provisions of the Rome Statute of the International Criminal Court concerning war crimes, as well as the recommendations of the Council of Europe on combating organized crime.

The purpose of this study is to provide a systematic understanding of the current state of scientific research on the prevention and counteraction of organized crime under martial law, to identify gaps in existing theoretical and applied approaches, and to substantiate directions for their improvement. Particular attention is paid to assessing the effectiveness of the current model of combating organized criminal groups, analyzing the impact of martial law on their evolution, and developing scientifically grounded recommendations for preventive strategies in both short- and long-term perspectives.

Discussions and results obtained. Thus, the study of organized crime under martial law is not only a scientific issue but also a matter of practical importance, as its resolution directly affects national security, the rule of law, and the stability of the state in the con-

text of armed aggression and post-war recovery.

Under the legal regime of martial law, combating organized crime acquires the character of one of the key elements of ensuring national security. The transformation of the criminogenic environment caused by armed aggression is accompanied not only by changes in the forms of criminal activity but also by the exacerbation of systemic deficiencies in the institutional response mechanism. This necessitates a comprehensive rethinking of existing approaches to countering organized forms of crime, taking into account the provisions of the Criminal Code of Ukraine [9, Arts. 255, 255-1, 28, 191, 190, 263, 438], as well as international legal standards.

Among the key factors that negatively affect the effectiveness of countering organized crime under martial law, particular attention should be paid to the institutional imbalance of the law enforcement system. The liquidation of specialized units, in particular the Main Directorate for Combating Organized Crime (GUBOZ), combined with the absence of a fully functional alternative, has led to the loss of centralized coordination in combating organized criminal formations. Under martial law, this problem becomes critical, as the speed of response and the coordination of law enforcement agencies are decisive for neutralizing complex criminal networks.

Another significant factor is the fragmentation of functions among various bodies responsible for combating crime. In wartime conditions, when consolidation of resources is essential, the dispersion of powers, duplication of functions, and the lack of a unified analytical space significantly reduce the effectiveness of investigations. Such a situation contradicts the principle of effective investigation, repeatedly emphasized in the case law of the European Court of Human Rights, particularly in the context of the State's positive obligations to ensure an adequate response to criminal offenses and to protect property rights under Article 1 of Protocol No. 1 to the European Convention on Human Rights [8].

A third factor is the implementation of international standards without proper adaptation to the conditions of martial law. While the protection of human rights is a fundamental principle of the rule of law, in situations of armed conflict there arises a need to balance rights guarantees with the effectiveness of criminal justice responses. In this regard, it is necessary to take into account the case law of the European Court of Human Rights concerning the permissibility of restricting certain rights in times of emergency [8, Art. 15], as well as the requirement of proportionality of such restrictions.

These institutional and legal imbalances create favorable conditions for the adaptation of organized crime to new realities. Organized criminal groups actively exploit vulnerabilities within the state system, expanding their activities into strategically important sectors. In particular, cases of illegal seizure of businesses (raiding), abuses in the field of land relations and privatization processes, as well as manipulation of public financial resources are becoming widespread. Such actions may be qualified cumulatively under Articles 191, 206-2, and 209 of the Criminal Code of Ukraine [9].

Of particular danger under martial law is the economic subversive activity of organized criminal formations. They actively penetrate the spheres of defense procurement, logistics, and humanitarian assistance. Numerous cases have been documented involving the misappropriation of humanitarian aid arriving from abroad, fictitious tender procedures, and the embezzlement of funds allocated for defense needs. In such cases, the actions of perpetrators may fall not only under property-related criminal offenses but also under war crimes as defined by Article 438 of the Criminal Code of Ukraine [9].

In this context, the provisions of international humanitarian law are of particular importance, including the Geneva Conventions of 1949 and Additional Protocol I of 1977,

which prohibit the unlawful appropriation of civilian property and humanitarian resources. Furthermore, under the Rome Statute of the International Criminal Court (Article 8), such acts may qualify as war crimes when committed in the context of an armed conflict.

Another significant area of criminal activity is the use of pseudo-charitable organizations as instruments for laundering proceeds of crime, which corresponds to the offense defined in Article 209 of the Criminal Code of Ukraine [9]. Such schemes undermine public trust in the volunteer movement, which is a critical component of the state's defense capacity.

Equally dangerous is the corruption-driven penetration of organized crime into public authorities. Under martial law, stable corruption networks are formed, enabling criminal groups to influence decision-making processes. In particular, cases have been identified involving the integration of criminal elements into the functioning of military medical commissions, facilitating unlawful evasion of mobilization. Such actions not only violate criminal law but also pose a direct threat to national defense capabilities and must be assessed in light of both national security principles and international standards.

Thus, under martial law, organized crime demonstrates a high level of adaptability, transforming into a complex, multi-layered phenomenon that combines elements of economic, corruption-related, and war-related criminality. This necessitates the development of a comprehensive model of counteraction that integrates national criminal law provisions, the case law of the European Court of Human Rights, and norms of international humanitarian law, taking into account the specific nature of contemporary security challenges.

Under the legal regime of martial law, the issue of corruption-driven penetration of organized crime into public institutions becomes particularly acute, significantly complicating effective counteraction to this phenomenon. One of the most dangerous manifestations is the influence of organized criminal groups on officials within border, tax, and customs authorities with the aim of facilitating illegal channels for the movement of persons, goods, and resources across the state border. Such actions may be qualified cumulatively under the provisions of the Criminal Code of Ukraine [9, Arts. 364, 368, 332, 255], and pose an increased threat in the context of armed conflict, when border control is objectively weakened.

Equally dangerous is the fusion of organized crime with local self-government bodies, which may act as instruments for legitimizing illegal activities through the issuance of unlawful permits for land use, construction, or access to state programs. Such a form of corruption symbiosis undermines the capacity of the state apparatus to effectively respond to internal challenges and reduces the legitimacy of public authority at the local level. This contradicts the principles of good governance articulated in the case law of the European Court of Human Rights, particularly with regard to the State's obligation to ensure effective protection of rights and lawful interests.

A separate dimension of the impact of organized crime under martial law is its destructive social effect. This phenomenon contributes to the spread of shadow practices within society and the formation of distorted perceptions of justice and legality, leading to an increase in legal nihilism. This is particularly evident among young people and individuals involved in hostilities, who, in the absence of visible justice in the rear, may lose trust in state institutions. As a result, a dangerous model of social mobility emerges, in which success is associated not with professional competence but with participation in criminal schemes.

In general, organized crime under martial law demonstrates a high level of adapt-

ability, effectively exploiting institutional gaps and limitations of state authority. This necessitates a fundamental revision of anti-criminal policy, including the restoration or establishment of specialized units for combating organized crime, strengthening control over sectors critical to national defense, and the creation of a unified national analytical database with cross-border verification mechanisms.

According to the SOCTA Ukraine report, prepared using the methodology of the European Union Agency for Law Enforcement Cooperation (Europol), significant risks of increased organized crime are associated with growing investments in strategic sectors, including the military-industrial complex, digital technologies, agriculture, and infrastructure reconstruction. Combined with the limited capacity of state control over certain border areas, this creates favorable conditions for the expansion of illegal trade, smuggling, and other forms of transnational crime.

Statistical data indicate a substantial increase in the activity of organized criminal groups during the period 2022-2025. In particular, the number of such groups subject to completed pre-trial investigations has more than doubled, while the number of individuals involved in organized criminal activity has also shown a steady upward trend. This confirms the increasing level of organization and social danger of such criminal formations.

Law enforcement practice (including the Security Service of Ukraine, the State Bureau of Investigation, the National Police, and the State Border Guard Service) demonstrates the intensification of organized crime in the military sphere. This includes illegal drug trafficking involving military personnel, the organization of channels for illegal border crossing, and the operation of transnational fraud networks. In a number of cases, such activities involve the use of modern technologies, including unmanned aerial vehicles and communication systems.

From the perspective of international law, certain manifestations of organized crime under martial law may acquire the characteristics of war crimes under the Rome Statute of the International Criminal Court (Article 8), as well as violate the provisions of the Geneva Conventions of 1949, which prohibit unlawful appropriation of property and exploitation of civilians.

A forward-looking analysis indicates that the continuation of the war may further contribute to the growth of organized crime due to factors such as economic instability, widespread corruption, declining public trust in state institutions, increased migration flows, and the potential reduction of international assistance. A particularly serious threat is the likely increase in criminal violence, including acts committed by individuals with combat experience and access to weapons.

In this context, it is essential to consider the jurisprudence of the European Court of Human Rights regarding the State's positive obligations to ensure effective investigations, prevent violence, and guarantee the safety of individuals. Failure to meet these obligations may result in violations of rights protected under the European Convention on Human Rights, including the right to life [8, Art. 2] and the prohibition of inhuman or degrading treatment [8, Art. 3].

Thus, organized crime under martial law emerges as a multidimensional phenomenon combining elements of economic, corruption-related, transnational, and war-related criminality. Its further evolution requires a comprehensive response based on the integration of national criminal law provisions, international humanitarian law, and the standards developed by the European Court of Human Rights, taking into account the specific nature of contemporary security challenges.

Transnational connections for illegal operations, particularly in the field of arms trafficking, are expected to intensify. In the medium-term perspective, Ukraine (in the event of the cessation of hostilities) may transform from a consumer country into a supplier and transit state for illicit weapons, including to European countries. It is likely that the primary clients and purchasers of such weapons will be transnational organized criminal groups. At the same time, the main objects of smuggling will predominantly remain small arms and ammunition.

Given the destructive consequences of hostilities, the reduction of employment opportunities, rising prices for essential goods, and the simultaneous decrease in the volume of state social support, an increase in human trafficking is projected, particularly for the purposes of labor and sexual exploitation, trafficking in children, and illegal migration. In this sphere, the activity of transnational organized criminal groups is expected to intensify.

Furthermore, an increase in crimes related to unlawful deprivation of liberty or kidnapping cannot be ruled out, particularly under the guise of providing psychiatric or psychological assistance to war-affected individuals, military personnel, and their family members, as well as under the pretext of facilitating the release of persons from captivity.

An intensification of criminal activity related to various forms of addiction is also anticipated, including illegal gambling and drug trafficking. The growth of stress-related conditions and economic hardship may lead to a more active involvement of young people in the illegal drug trade. A particular threat is posed by the expected increase in demand for narcotic substances among military personnel. It is projected that the production and circulation of synthetic drugs will increase, while the popularity of plant-based narcotics—whose raw materials are cultivated within Ukraine—will likely persist. Taking into account the steady expansion of online commerce, further growth of the Internet-based drug market can be expected.

At the same time, the global development of information and telecommunication technologies, along with the active use of computer systems, networks, and electronic communication tools, will contribute to a further increase in criminal offenses in the field of cybercrime. It is anticipated that the segment of so-called “cyber-dependent” crimes will expand, where computer technologies are used in the commission of traditional criminal offenses.

An analysis of crime trends in the context of wartime and the post-war period provides grounds for formulating a number of generalized conclusions:

In the short and medium-term, crime in Ukraine will acquire new organizational and qualitative characteristics, as a result of armed aggression, socio-economic transformations, and the influence of globalization processes.

The high saturation of society with weapons, particularly following demobilization, creates preconditions for an increase in both property-related and violent crimes, as well as for the transformation of Ukraine into a supplier and transit state for illicit weapons oriented toward the European market.

Socio-economic destabilization, rising unemployment, and the reduction of state social support increase the risks of human trafficking, including for labor and sexual exploitation, as well as illegal migration. The activation of transnational organized criminal groups in this area is highly probable.

An increase in the production and circulation of narcotic substances is expected, especially synthetic drugs, alongside a sustained demand for plant-based narcotics. The expansion of online trade will contribute to the growth of the Internet-based drug mar-

ket, while Ukraine's geographical position will reinforce its role in drug trafficking routes to Europe.

The spread of information and telecommunication technologies will contribute both to an increase in cybercrime and to the growth of "cyber-enabled" criminality, where traditional offenses are committed using digital tools.

The potential merger of organized criminal groups with illegal armed formations, the emergence of new forms of terrorist activity, and the intensification of money laundering processes are also anticipated. The share of recidivist crime is expected to grow, further increasing threats to public safety.

Increased societal tolerance toward certain manifestations of crime under martial law may lead to a statistical decrease in officially recorded offenses, which will not correspond to their actual prevalence.

In the future, the most dangerous types of criminal activity will remain crimes against national security, life and health, human trafficking, drug trafficking, corruption offenses, crimes related to excisable goods, cybercrime, and offenses involving illegal arms circulation.

Thus, these trends indicate a significant complication of the criminogenic situation in Ukraine and the risk of its deeper integration into transnational criminal networks. This necessitates strengthening state policy in the field of crime prevention and counteraction, adapting national legislation to international standards, developing international cooperation, and implementing innovative law enforcement approaches.

Conclusions. Organized crime in Ukraine, adapting to the conditions of a full-scale armed invasion, has undergone significant transformation, acquiring new, more complex and latent forms of manifestation, while substantially intensifying its destructive impact on key spheres of state functioning. Martial law has acted as a catalyst for adaptive processes within the criminal environment, leading not only to the modification of traditional criminal practices but also to the emergence of new criminal markets integrated into global and transnational networks.

As of the current period, the following key trends in the development of organized crime can be identified:

– Institutionalization of criminal groups, manifested in the growing number of organized formations characterized by clearly structured hierarchies, internal discipline, and functional division of roles, corresponding to the legal features of organized forms of complicity;

– Deep transformation of criminal practices, encompassing a shift from traditional forms of criminal activity (extortion, drug trafficking) to more complex and technologically driven manifestations, including cybercrime, illicit trafficking of humanitarian aid, organization of illegal migration channels, and crimes involving digital financial instruments;

– Systemic expansion of corrupt influence by organized criminal groups over public institutions, particularly within border, customs, tax, and military medical sectors, resulting in the formation of stable corruption networks and undermining the principles of good governance;

– Decline in the effectiveness of institutional coordination among law enforcement agencies, reflected in fragmentation of competences, duplication of functions, lack of a unified analytical framework, and insufficient inter-agency cooperation, which under martial law significantly complicates the counteraction to sophisticated forms of organized crime.

The cumulative effect of these factors creates complex threats to national security, destabilizes economic processes, increases the level of criminalization within society, and contributes to the erosion of public trust in state institutions and the rule of law.

The results of this study provide grounds for formulating a set of systemic proposals aimed at improving mechanisms for combating organized crime under wartime and post-war conditions.

First, legislative modernization of the criminal law framework is required, particularly with regard to liability for the establishment and participation in organized criminal groups. It is advisable to take into account new forms of criminal activity and to introduce effective mechanisms for addressing illicit enrichment, including the implementation of asset confiscation measures without the need to prove a direct link to a specific offense (the "unexplained wealth" model), in line with contemporary international anti-corruption standards.

An important direction is the creation of a unified interagency information and analytical system on organized criminal groups, operating under the coordination of the National Security and Defense Council of Ukraine. Within this system, it is necessary to establish specialized analytical intelligence units within the structures of the Ministry of Internal Affairs and the State Bureau of Investigation, capable of processing large volumes of data, including open-source intelligence (OSINT), crypto-assets, and darknet networks.

Equally important is the introduction of mechanisms for cross-border data exchange with partners from the European Union and NATO regarding individuals involved in organized criminal activity. This would enhance the effectiveness of combating transnational crime and prevent the movement of criminal actors and illicit assets across jurisdictions.

In addition, it is necessary to expand Ukraine's participation in regional and international initiatives aimed at combating organized crime, particularly within the framework of European Union programs, which would facilitate the integration of best practices and international standards into the national security system.

At the same time, a crucial component of counteraction is the strengthening of societal resilience to organized crime, which may be achieved through the implementation of national information campaigns aimed at raising public legal awareness, highlighting the social danger of organized criminal activity, and encouraging public cooperation with law enforcement agencies in detecting criminal offenses.

Thus, effective counteraction to organized crime under martial law requires a comprehensive and systemically integrated approach combining legislative reform, institutional strengthening of law enforcement bodies, enhanced international cooperation, and active engagement of civil society.

Abstract

The present paper addresses the complex issue of crime prevention in the digital space, with a specific focus on the continuously expanding e-commerce sector. The main objective of the research is to demonstrate that the efficiency of the modern criminal process depends on the judiciary's ability to adapt preventive measures to new technological realities. The author proposes an innovative paradigm for the individualization of non-custodial preventive measures, based on the use of risk assessment algorithms (the RED-P model). This approach allows for a "surgical" and dynamic supervision of the suspect, providing law enforcement agencies with real-time monitoring tools that can prevent recidivism without resorting to the extreme measure of preventive arrest.

The methodology used combines the doctrinal analysis of constitutional guarantees with the examination of technical Smart Policing solutions. The study conclusions highlight that the digitalization of judicial supervision is not merely an administrative necessity, but a guarantee of compliance with the principle of proportionality, ensuring a balance between consumer protection on e-commerce platforms and the presumption of innocence in the era of European digital justice.

Keywords: crime prevention, e-commerce, preventive measures, digital individualization, Smart Policing.

EFICIENTIZAREA PREVENIRII CRIMINALITĂȚII ÎN E-COMMERCE PRIN INDIVIDUALIZAREA DIGITALĂ A MĂSURILOR PREVENTIVE NEPRIVATIVE DE LIBERTATE

Abstract

Prezenta lucrare abordează problematica complexă a prevenirii criminalității în spațiul digital, cu un accent specific pe sectorul comerțului electronic, aflat într-o expansiune continuă. Obiectivul principal al cercetării este de a demonstra că eficiența procesului penal modern depinde de capacitatea sistemului judiciar de a adapta măsurile preventive la noile realități tehnologice. Autorul propune o paradigmă inovatoare de individualizare a măsurilor preventive neprivative de libertate, bazată pe utilizarea algoritmilor de evaluare a riscului (modelul RED-P). Această abordare permite o supraveghere „chirurgicală" și dinamică a bănuitului, oferind organelor de aplicare a legii instrumente de monitorizare în timp real care pot preveni recidiva fără a recurge la măsura extremă a arestului preventiv.

Metodologia utilizată îmbină analiza doctrinară a garanțiilor constituționale cu examinarea soluțiilor tehnice de Smart Policing. Concluziile studiului evidențiază faptul că digitalizarea supravegherii judiciare nu reprezintă doar o necesitate administrativă, ci o garanție a respectării principiului proporționalității, asigurând un echilibru între protecția consumatorilor pe platformele de e-commerce și prezumția de nevinovăție în era justiției digitale europene.

Cuvinte-cheie: prevenirea criminalității, e-commerce, măsuri preventive, individualizare digitală, Smart Policing (Poliție inteligentă).

Introduction. The accelerated expansion of electronic commerce (e-commerce) over the last decade has generated not only an unprecedented revolution in consumer markets and global economic interactions but also a profound, multidimensional, and alarming mutation of the criminal phenomenon. The virtual space, defined by structural characteristics such as near-total anonymity, extreme data volatility, and the absence of physical borders or rigid jurisdictional boundaries, has become fertile ground for the proliferation of new forms of crime or the sophisticated adaptation of classic ones. In this digital ecosystem, we are faced with a broad spectrum of illicit activities: from complex financial fraud, phishing schemes, and social engineering to operating on digital black markets (dark markets) of the Silk Road type and money laundering through crypto-assets.

In this emergent context, the traditional mechanisms of the criminal process, historically designed for a world of physical interactions and palpable material evidence, often prove to be anachronistic, rigid, and inefficient in the face of digital dynamism. The technical reality of investigating cybercrimes demonstrates that electronic evidence is, by its very nature, extremely fragile; it can be altered, deleted, or encrypted in fractions of a second remotely. The lack of real-time monitoring of a suspect's online activity represents not only a procedural gap but a major risk that often compromises the entire evidentiary process and the state's capacity to administer justice [1, p. 45].

The central problem addressed by the present research lies in the structural and operational inefficiency of "classic" non-custodial preventive measures. Currently, the institution of judicial control, although intended to be a viable alternative to detention, is based in most jurisdictions on an analog paradigm: the suspect's obligation to periodically report to a police unit to sign a report. This approach is practically null in the face of an experienced cybercriminal. An author of e-commerce fraud may formally and rigorously respect the obligation of physical presence before the supervisory body, but in the very second following their departure from the premises, they can access a digital terminal (smartphone, laptop) to recidivate, transfer illicit assets into anonymous digital wallets, or destroy essential evidence through remote wipe commands—all before law enforcement can even detect the anomaly.

The evolution of modern forensics emphasizes that digital traces require a specific protection and surveillance regime because, unlike biological or mechanical traces, digital ones can be dissipated into a global information cloud without leaving undeniable physical clues [1, p. 52]. From this perspective, the judiciary faces a major constitutional, ethical, and administrative dilemma. On one hand, the measure of preventive arrest appears to many magistrates as a quick and secure solution for isolating the suspect and protecting the evidence. However, according to international standards and domestic legislation, arrest must remain a measure of *ultima ratio*, applicable exclusively when no other less restrictive method can remove the state of social danger or the risk to the criminal investigation. In this regard, the Criminal Procedure Code of the Republic of Moldova establishes particularly rigorous criteria for the deprivation of liberty, imposing on the magistrate the task of exhaustively motivating why milder measures are insufficient in the specific case [2, p. 94].

Furthermore, the constant and evolving jurisprudence of the Strasbourg Court emphasizes that the mere persistence of a reasonable suspicion is not sufficient to justify prolonged detention. In landmark cases, such as *Buzadji v. the Republic of Moldova*, the European Court of Human Rights has imperatively stated that state authorities have the obligation to explore, with absolute priority, alternative measures that guarantee the suspect's presence at trial and the prevention of recidivism without sacrificing the fun-

damental right to liberty and security [3]. Ignoring modern technological surveillance possibilities in favour of deprivation of liberty risks transforming preventive arrest from an exceptional measure into an anticipated punishment—a situation incompatible with the presumption of innocence.

On the other hand, maintaining the suspect at liberty without monitoring tools adapted to the digital era is not a solution, but a vulnerability. This undermines public confidence in the act of justice and leaves the community of users and consumers on e-commerce platforms exposed to often irreparable material and moral damages. The need for security in the digital civil circuit cannot be ignored in the name of an outdated legal formalism.

The necessity for a radical paradigm shift thus becomes not just a theoretical option, but a social urgency. The present paper argues that the sustainable solution does not consist in overstretching the penitentiary system by increasing the number of arrests, but in what we call the "digitalization of judicial supervision". This approach is supported by modern doctrine, which emphasizes the importance of continuously adapting the institution of preventive measures to respond to new forms of social danger without affecting the substance of individual rights [4, p. 112]. The author proposes an innovative paradigm for the digital individualization of preventive measures, grounded in the use of risk assessment algorithms through the RED-P model (Risk Evaluation and Preventive Decision).

The RED-P model goes beyond the limitations of simple geographical monitoring via GPS. It proposes a "surgical" supervision of the suspect's interaction with the digital space, allowing for the imposition of virtual barriers such as digital geofencing (logical perimeter) adapted to the specific nature of the crime committed. For example, instead of prohibiting the suspect from leaving the locality, we can prohibit their access to certain communication protocols, trading platforms, or specific IP addresses, automatically monitoring any attempt to violate these restrictions.

By integrating the concept of Smart Policing into the criminal procedural framework, judicial supervision ceases to be a passive and bureaucratic administrative task, transforming into a proactive, predictive, and efficient instrument for crime prevention. The fundamental objective of this work is to demonstrate that, by responsibly leveraging technology, we can ensure a real balance between the protection of public order and the unwavering guarantee of human rights.

We thus offer the magistrate a "third way": a technologically supervised liberty, which is, paradoxically, much safer for society than classic judicial control and infinitely more humane than preventive arrest.

Methods and materials applied. The methodological approach of the present research is eminently multidisciplinary, strategically positioned at the intersection of criminal procedural law, modern forensics, and state-of-the-art information technologies. Given the hybrid nature of e-commerce crimes, which combine elements of classic fraud with advanced IT mechanisms, it was necessary to adopt a flexible research framework. Thus, to ensure an exhaustive, multidimensional, and rigorous analysis of the complex issues regarding crime prevention in the e-commerce sector, a synergistic combination of traditional and exploratory methods was employed, aimed at capturing the volatility and complexity of the criminal phenomenon in the virtual space.

The primary method used in the legal substantiation of the paper is the comparative method. Through this, the evolution of criminal procedural legislation in the Republic of Moldova and Romania was analyzed dynamically, with a particular emphasis on recent legislative efforts to integrate electronic monitoring mechanisms into the judicial

supervision process. A central point and a pillar of reference for this analysis was Law No.146/2021 from Romania. This legal norm provides an advanced and coherent normative framework for technical supervision within judicial and penal execution procedures, representing a regional benchmark for best practices [5]. The analysis of this law was essential for establishing the minimum technical and legal standards necessary for the use of electronic surveillance devices, serving as a logical foundation for the proposals to digitalize judicial control presented in the following chapters.

In parallel, the doctrinal and exegetical analysis method was widely used, through the in-depth study of specialized treatises and relevant jurisprudence. Particular attention was paid to the concept of Smart Policing, investigating how the use of Big Data and predictive analysis can revolutionize the activity of law enforcement agencies. The research is supported by recent studies analyzing the affirmation of new incrimination norms and the imperative of adapting sanctions to the fluid forms of modern criminality [6, p. 21]. Complementarily, the research integrates the doctrinal vision on the evolution of criminal law in the digital era, analyzing how classic principles intersect with the new realities of technological surveillance [7, p. 34].

The innovative and original pillar of the methodology is represented by the conceptual and algorithmic modeling of the RED-P (Risk Evaluation and Preventive Decision) system. This method involved a systemic design process, structured on three levels of analysis:

1. *Systemic Risk Analysis*: This involved identifying, cataloging, and extracting critical variables from the suspect's digital behavior within the e-commerce environment. Indicators such as the "digital footprint" (IP addresses, metadata), the frequency of transactions considered suspicious by their typology, and the deliberate use of traffic anonymization tools (VPN, proxy, TOR) were considered.

2. *Algorithmic Modeling*: This stage involved transforming the previously extracted variables into quantifiable and processable risk indicators. The objective is to create a model that allows for real-time monitoring of the degree of social danger, providing instantaneous alerts the moment the suspect's digital behavior deviates toward activities with criminal potential.

3. *Decision Simulation*: Through this method, the way in which risk indicators can be integrated into the decision-making process of the magistrate (the judge of rights and liberties) was evaluated. The goal is to support the selection of the most appropriate preventive measure, ensuring a "surgical" individualization of the obligations imposed on the suspect, so that the restriction is minimal for the individual but maximal for preventing recidivism.

The research materials used are diverse and of high scientific quality. In addition to legal texts and doctrine, they include European technical standards regarding data security (GDPR) and ethical principles regarding the use of artificial intelligence in justice. These elements are essential to ensure that the RED-P model is not only an operationally efficient tool for the Ministry of Internal Affairs (MIA), but also a mechanism that guarantees fundamental rights, being in full accordance with the requirements of the rule of law, legal certainty, and human dignity. The integration of these diverse materials allows for a comprehensive vision of the future of criminal justice in the digital age.

Discussions and results obtained. The present research reveals the indisputable fact that the success of crime prevention in the e-commerce sector fundamentally depends on the judiciary's ability to evolve from physical monitoring—which is often inefficient, passive, and purely symbolic—to an intelligent, proactive, and dynamic digital

surveillance. The results obtained from the analysis demonstrate that the use of advanced technology in criminal proceedings should not be viewed as a mere administrative or logistical facility, but as a sine qua non condition for the genuine observance of the principle of proportionality and the efficiency of the act of justice in the 21st century.

Through the rigorous application of the RED-P model, the path is opened toward "predictive justice", capable of identifying, classifying, and neutralizing the risk of recidivism or the destruction of digital evidence before it materializes into irreparable financial damage for consumers or the irremediable compromise of the criminal process. In this regard, modern legal doctrine firmly emphasizes that the adaptation of surveillance norms and preventive measures must reflect the transborder, dematerialized, and instantaneous character of cybercrime, moving beyond the limitations of traditional geographical borders [8, p. 45].

1. Architecture and Operation of the RED-P Model in the E-commerce Ecosystem. The core of the innovation proposed in this research is represented by the RED-P (Risk Evaluation and Preventive Decision) system. It is not a mere tracking tool, but a complex decision-support algorithm designed to transform heterogeneous digital variables into binary or graded risk indicators, easily interpreted and applied by magistrates during the criminal investigation or trial phases. In offenses specific to electronic commerce, a suspect's dangerousness can no longer be exclusively correlated with their physical presence within a certain terrestrial perimeter; instead, it must be evaluated in relation to the method, intensity, and frequency of their interaction with digital infrastructure and global data networks.

The RED-P model processes real-time data streams regarding high-risk digital behaviors, such as: the systematic use of anonymization techniques (commercial VPNs, TOR nodes, or residential proxies), the frequency of transactions on unregulated financial platforms or crypto-asset exchangers, and documented attempts to access "dark markets". This analytical approach allows for a "surgical" individualization of the obligations imposed on the suspect. Instead of general and often useless prohibitions (such as the ban on leaving the locality), the judge of rights and liberties can impose specific virtual barriers and access restrictions to certain communication protocols. Such a method overcomes the recognized limitations of analog judicial control, where the total absence of monitoring of the suspect's online activity leaves a free and uncontrolled field for recidivism and the manipulation of electronic evidence **[9]**.

2. Digital Geofencing and Streamlining Operational Missions of the MIA. A major and original result of the present research is the definition and rigorous substantiation of the concept of *digital geofencing*. Unlike traditional GPS monitoring, which tracks geographical coordinates and a person's physical movement, digital geofencing creates logical perimeters and access barriers within the virtual space (IP addresses, web domains, specific applications). From the perspective of law enforcement agencies (Police and Gendarmerie), this model radically transforms operating procedures, exponentially optimizing the use of human and logistical resources, which are, in most cases, limited.

Smart Policing systems integrated with the RED-P algorithm allow for a shift from reactive to proactive surveillance by generating automated alerts transmitted in real-time to dispatch centers only at the critical moment when the suspect attempts to breach the digital barrier established by a court order. This operational efficiency is supported and validated by new regional legislative trends, such as Law No.146/2021 from Romania, which encourages the use of electronic devices and integrated IT systems to ensure compliance with preventive measures. This reduces the constant pressure on field surveil-

lance personnel and minimizes the margin for human error [10]. Consequently, the intervention of law enforcement forces within the Ministry of Internal Affairs (MIA) becomes targeted, justified, and based on indisputable technical data, which can subsequently be used as solid and irrefutable evidence in the event of a proposal to replace judicial control with the harsher measure of preventive arrest.

3. Constitutional Compatibility and Administrative Impact on the Judiciary. The legal analysis of the obtained results confirms that the digitalization of surveillance through the RED-P model is not only timely but also fully compliant with the requirements of the rule of law and the protection of fundamental human rights. Applying the proportionality test (suitability, necessity, and proportionality *stricto sensu*), it is clearly observed that limiting access to certain segments of the digital space or monitoring data traffic represents an interference considerably less harmful to the private and social life of the individual than the total deprivation of liberty through incarceration.

The jurisprudence of the European Court of Human Rights has consistently stated that any restrictive measure of rights must be strictly necessary in a democratic society and proportional to the legitimate aim pursued (prevention of crimes and protection of public order). The ECHR has encouraged Member States to explore and adopt modern technological alternatives that minimize the intrusive impact on the suspect's private life while simultaneously providing security guarantees for society [11].

Therefore, the RED-P model not only enhances collective safety in the e-commerce sector but also becomes a genuine guarantor of individual liberty. It ensures supervision that respects the dignity of the person, the right to work (as many professions require internet access), and the presumption of innocence, fitting perfectly within national and European constitutional standards regarding preventive measures [12]. The implementation of this system would lead, in the long term, to a relief of the penitentiary system and an increase in the celerity of criminal trials in the field of cybercrime.

In conclusion, based on the synthesis of the research findings, it can be stated with a high degree of certainty that streamlining crime prevention in the vast field of electronic commerce does not represent a mere technocratic option or a technical facility, but has transformed into an imperative necessity for guaranteeing the security of the global economic circuit and public order in the context of 21st Century challenges. The study has demonstrated unequivocally that traditional and analog methods of judicial supervision are, for the most part, anachronic in the face of criminal phenomena defined by instantaneity, extreme volatility of evidence, and an almost total dematerialization of illicit activity.

The digitalization of the criminal process—not only at the level of document archiving but through the adoption of intelligent real-time monitoring and intervention mechanisms—represents the only viable and sustainable way to reduce the alarming technological gap between the rapid evolution of organized cybercrime and the limited reaction capacity of state bodies [13]. The transition to a modern paradigm of digital individualization allows for the administration of a much more precise justice, which moves beyond a purely repressive function and succeeds in actively preventing the materialization of criminal risk, thereby providing a superior degree of protection for both victims and the judicial system as a whole.

1. Resilience of the Judicial System through the Implementation of the RED-P Model. We conclude that the implementation of the RED-P (Risk Evaluation and Preventive Decision) model provides the necessary resilience and agility for criminal investigation bodies and courts in effectively managing cybercriminal risk, which is inherently un-

predictable. This model radically transforms the nature of preventive measures, evolving from a passive, static, and purely administrative obligation (such as signing a register at the police station) into a proactive, dynamic, and adaptable control instrument.

The research has highlighted that a "*surgical*" supervision of the suspect's interaction with the digital space and payment infrastructures is infinitely more effective in preventing recidivism specific to the e-commerce field than simple supervision of physical presence at the police station or the restriction of geographical movement. Through the use of advanced risk assessment algorithms, the magistrate (the judge of rights and liberties) no longer decides based on subjective intuitions, but has at their disposal an objective and quantifiable database to decide on the targeted restriction of certain liberties. This mechanism ensures a real, verifiable, and proportional balance between the acute need for societal protection and the unwavering respect for the suspect's presumption of innocence, thereby avoiding abuses or unnecessary custodial measures.

2. Legislative Recommendations and Implementation Perspectives in the Context of Smart Policing. For this paradigm to achieve lasting success, the implementation of the RED-P model provides the necessary resilience for criminal investigation bodies. This mechanism ensures a genuine balance between the protection of society and the observance of the presumption of innocence, a principle guaranteed by the Constitution of the Republic of Moldova [14] and the Constitution of Romania [15]. For the success of this paradigm, it is urgent to update the legislative framework to allow for the imposition of specific "digital obligations". The integration of RED-P into Smart Policing protocols will lead to a decrease in administrative costs and an increase in citizen safety, representing the decisive step toward a modern justice system adapted to the information age [16].

In this regard, we recommend the full integration of the RED-P model into the operational working protocols of specialized units within the Police and Gendarmerie (organized crime and cybercrime units), thereby facilitating uninterrupted, precise, and automated monitoring. This techno-legal evolution will lead, in the medium and long term, not only to a considerable reduction in the enormous administrative and logistical costs associated with preventive arrest (expenses for guarding, food, transport, and the logistics of detention centers), but also to a significant increase in the level of safety perceived by citizens when using digital platforms.

The recovery of damages and the prevention of secondary victimization in the online environment thus become achievable objectives. In conclusion, the digitalization of judicial supervision is not merely a technical modernization; it represents the decisive step toward a modern, profoundly humane justice system, as it avoids incarceration when it is not absolutely necessary, and is perfectly adapted to the complex challenges of the information age in which we live.

Abstract
This paper explores the ethical foundation of public institutions' functioning, starting from the premise that a solid culture of integrity is the most effective tool for preventing corruption. Instead of focusing exclusively on criminal sanctions and coercive measures, the research investigates the essential preventive mechanisms that can transform public administration into a pillar of the rule of law. The article provides a detailed analysis of fundamental instruments such as codes of conduct, corruption risk management, decision-making transparency facilitated by digitalization processes, and the legal protection of whistleblowers. The methodology used combines normative analysis with the evaluation of international best practices, offering a holistic perspective on how ethical values can be integrated into daily administrative routines. The research results highlight that prevention is not a single event, but a systemic and continuous process of education and monitoring. The conclusions emphasize that the success of these mechanisms directly depends on political will and the professionalization of the public officials' corps, vital elements for increasing institutional resilience against criminal phenomena, while proposing practical solutions for combating crime through integrity.
Keywords: public administration, integrity, corruption prevention, ethical mechanisms, transparency.

CULTURA INTEGRITĂȚII: MECANISME DE PREVENȚIE ÎN ADMINISTRAȚIA PUBLICĂ

Abstract
Această lucrare explorează fundamentul etic al funcționării instituțiilor publice, pornind de la premisa că o cultură solidă a integrității reprezintă cel mai eficient instrument pentru prevenirea corupției. În loc să se concentreze exclusiv asupra sancțiunilor penale și a măsurilor coercitive, cercetarea investighează mecanismele preventive esențiale care pot transforma administrația publică într-un pilon al statului de drept. Articolul oferă o analiză detaliată a unor instrumente fundamentale precum codurile de conduită, gestionarea riscurilor de corupție, transparența procesului decizional facilitată de procesele de digitalizare și protecția juridică a avertizorilor de integritate. Metodologia utilizată combină analiza normativă cu evaluarea celor mai bune practici internaționale, oferind o perspectivă holistică asupra modului în care valorile etice pot fi integrate în rutina administrativă zilnică. Rezultatele cercetării evidențiază faptul că prevenirea nu reprezintă un act singular, ci un proces sistemic și continuu de educație și monitorizare. Concluziile subliniază că succesul acestor mecanisme depinde în mod direct de voința politică și de profesionalizarea corpului funcționarilor publici, elemente vitale pentru creșterea rezilienței instituționale împotriva fenomenelor infracționale, propunând totodată soluții practice pentru combaterea criminalității prin integritate.
Cuvinte-cheie: administrație publică, integritate, prevenirea corupției, mecanisme etice, transparență.

Introduction. The most visible face of the fight against corruption is often the criminal trial. Yet the most decisive arena is quieter, like recruitment committees, procurement desks, routine authorizations, and internal controls. In these ordinary settings, corruption is rarely an isolated moral failure. It is typically enabled by a context, as un-

clear rules, tolerated conflicts of interest, weak supervision, and institutional habits that normalize *small* deviations. Where such enabling conditions exist, punitive action arrives late, after damage has already occurred.

This paper starts from a practical premise, a robust culture of integrity is the most costeffective preventive tool available to public institutions. *Integrity culture* is not a slogan. It is the aggregate of shared expectations, leadership signals, formal standards, and daytoday practices that shape behavior under pressure. In public administration, integrity culture is especially relevant because the state acts through individuals endowed with authority. That authority is exercised in settings characterized by information asymmetry (the official knows more than the citizen), discretion (a decision often allows room for judgment), and imbalance of power (the citizen depends on the official's decision). These features are normal in administration, but they also create opportunities for abuse [1].

The argument developed here is deliberately preventive. It asks which mechanisms (short of criminal sanction), reduce risk and strengthen institutional resilience. The focus is placed on four instruments that are recurrent in international guidance and increasingly present in national reforms, like: (1) codes of conduct and ethics management; (2) corruption risk management; (3) transparency supported by digitalization; (4) legal protection of whistleblowers. Each mechanism is assessed not only as a formal requirement, but also as a component of an integrity ecosystem that depends on implementation quality [4].

The structure of the paper proceeds from conceptual foundations, as integrity as a governance concept and as a dimension of the rule of law, toward detailed examination of each preventive mechanism, followed by a synthetic discussion of cross-cutting success factors and practical recommendations for institutional reform.

Conceptual and Normative Foundations of Integrity in Public Administration. Integrity as a Governance Capability. In administrative practice, *integrity* is often reduced to the absence of corruption. That negative definition is insufficient. Integrity is better understood as an institutional capacity to align decisions with public purpose, under legal constraints, and in a manner that can be justified to citizens. This broader concept encompasses impartiality, legality, fairness, accountability, and responsible stewardship of public resources, each of these dimensions contributing to what scholars increasingly describe as a governance capability rather than merely a personal virtue [2; 3].

As a governance capability, integrity operates at three analytically distinct but practically interrelated levels. An individual one (ethics awareness, conflict of interest recognition, personal accountability), organizational (procedures, controls, incentive structures, and supervisory systems), and systemic (independent oversight, transparency architecture, and civic scrutiny mechanisms). A genuine culture of integrity emerges when these levels reinforce each other, when individual officials are supported by robust institutional frameworks, which are in turn embedded in credible external accountability structures. The system collapses when formal rules exist but leadership tolerates breaches, when protections exist on paper but are undermined in practice, or when external oversight is captured or ineffective [2; 3; 5].

It is important, moreover, to distinguish between compliance-based integrity (conformity with rules as a minimum threshold) and values-based integrity (active internalization of public service ethics as an identity commitment). Both approaches are necessary, because rules define the minimum acceptable standard and create enforceable obligations and values motivate conduct in the gray zones that rules inevitably leave uncovered. The most resilient integrity cultures combine clear rules with genuine professional ethos,

a combination that effective public personnel management seeks to cultivate and sustain over time.

Integrity and the preventive logic of anti-corruption. International anti-corruption frameworks increasingly emphasize prevention. The United Nations Convention against Corruption (UNCAC), the principal global instrument in this domain, calls upon States Parties to establish preventive measures in public bodies, including standards of conduct for correct, honorable, and proper fulfillment of public functions, transparent procurement systems, and mechanisms facilitating reporting and detection of corruption [1]. UNCAC's preventive chapter is not merely aspirational, it sets legally binding obligations for States Parties and functions as a normative benchmark against which national reform performance is assessed through the Implementation Review Mechanism.

Prevention is not an alternative to enforcement but its necessary foundation; it reduces the structural opportunities for corrupt behavior and increases the likelihood of early detection, before harm escalates into a criminal matter. In practice, enforcement concentrates resources on the most serious, visible, and politically salient cases, a selection that inevitably leaves significant corruption unaddressed. Prevention, by contrast, addresses the entire population of administrative interactions and therefore operates at scale.

In public administration, prevention is also ethically preferable because it protects citizens from harm before it occurs and preserves public trust, a resource that, once depleted, is slow and costly to rebuild. From a governance perspective, prevention functions as systematic risk reduction, mapping vulnerabilities, are reducing discretionary opacity, strengthening controls, and building organizational reporting capacity. The investment in prevention is thus justified both on effectiveness grounds and on the normative ground that citizens are entitled to administration that is honest by design, not merely constrained by prosecution [2; 4].

Integrity as a dimension of the rule of law. Citizens experience the rule of law not primarily in courtrooms, but also in administrative encounters, like licensing, social benefits, inspections, public procurement, and service delivery. When these decisions are perceived as tradable for favors, or as subject to arbitrary preferences, the rule of law becomes effectively negotiable at the street level, formal legality is observed in the courtroom while informal bargaining governs administrative interaction. This corrosion of institutional legitimacy has long-term consequences for citizens' willingness to comply with law and for their trust in state institutions more broadly [1; 4].

From this angle, integrity culture becomes a form of rule-of-law maintenance; it keeps administrative power connected to public purpose and legal limits, and sustains the credibility of institutions that exercise authority over citizens. International benchmarks on the rule of law, including the World Justice Project Rule of Law Index and the EU Justice Scoreboard, explicitly include measures of administrative integrity among their indicators, reflecting the scholarly consensus that procedural legality at the administrative level is constitutive of the rule of law, not merely a derivative concern [2; 3].

Codes of conduct and Ethics Management. A common failure mode in integrity reform is the adoption of a code of conduct to satisfy a legal or project requirement, followed by minimal investment in implementation. A code that is published, signed once at onboarding, and thereafter ignored has minimal preventive value, and may even create a false sense of compliance, allowing institutions to present formal integrity credentials while underlying vulnerabilities remain unaddressed. The preventive function of codes of conduct depends critically on their integration into the full institutional life cycle, for recruitment, onboarding, continuous training, performance evaluation, supervision, dis-

ciplinary proceedings, and organizational communication.

The OECD integrity framework stresses the importance of cultivating a culture of integrity supported by leadership signals, commonly described as *tone at the top*, and consistent, fair accountability. When leaders treat ethics as operationally relevant and enforce standards without discrimination, staff interpret the code as genuinely constraining, when leaders treat it as symbolic or apply it selectively, staff rationally interpret it as bureaucratic theater. The behavioral consequence is significant, because perceived inconsistency between formal rules and actual enforcement norms is among the most powerful predictors of staff willingness to engage in misconduct when opportunity arises [2; 3].

Effective codes of conduct typically include clear foundational principles (legality, impartiality, service orientation, professional discretion) and concrete behavioral rules on recurring risk areas, as conflicts of interest disclosure and management, acceptance of gifts and hospitality, outside employment and activities, use of public resources and information, and post-employment restrictions. They should also provide explicit guidance on seeking ethics advice, reporting suspected misconduct, and the links between code provisions and disciplinary frameworks.

Critically, usability matters at least as much as comprehensiveness, overly long codes become unreadable documents that staff avoid engaging with, while practical examples, decision trees, and scenario guidance make codes actionable in real administrative contexts. Codes that reflect the actual functions performed by staff, like procurement officers, benefit administrators, inspectors, licensing staff, financial controllers, that are more likely to provide decision support in the dilemma situations where guidance is most needed [3].

Codes of conduct are only one component of a broader ethics management system. Institutions benefit substantially from designated integrity advisers or ethics contact points that can provide confidential guidance on emerging dilemmas before they escalate into misconduct. The availability of professional, confidential advice reduces the risk that officials, motivated to act correctly, make uninformed decisions in ambiguous situations and incur inadvertent breaches. This advisory function is distinct from the disciplinary function and must be organizationally credible and genuinely confidential to be used.

Practical, scenario-based training, tailored to specific functions such as procurement, inspections, human resources management, or digital services, supports consistent decision-making and reduces vulnerability to external pressure. Training effectiveness is enhanced by interactive design, real case studies drawn from the sector, and periodic refreshment rather than one-off certification. Institutions that invest in scenario-based ethics training report improved capacity among staff to recognize risk situations, articulate the applicable standard, and resist informal pressure [2; 3].

Disciplinary enforcement is where the integrity culture is often won or lost. If sanctions appear selective, applied stringently against lower-ranked staff while senior officials who violate the same standards are treated leniently, staffs perceive ethics as a tool of power rather than a neutral standard. Selective enforcement may be more corrosive to integrity culture than the original misconduct, because it signals that formal rules are subordinated to informal hierarchies and political relationships. Conversely, consistent enforcement, demonstrable due process, and clear communication of standards strengthen behavioral norms and reduce the prevalence of *gray zone* practices that, while individually minor, collectively erode institutional integrity [4].

Corruption Risk Management. Corruption can be approached analytically as a probability that a structural vulnerability will be exploited under certain conditions of

opportunity, motivation, and rationalization. Risk management brings systematic structure to prevention by identifying where discretion, financial resources, and weak controls intersect, and then selecting proportionate mitigations calibrated to the level and nature of the risk. This analytical approach shifts prevention from rhetorical declarations of commitment toward concrete managerial practice embedded in organizational routines.

Recurring high-risk areas in public administration may include: public procurement and contracting (where large budgets, technical complexity, and multiple discretionary decisions converge); permits, licenses, and inspections (where officials hold gate-keeping authority over private economic interests); human resources decisions (selection, promotion, assignment to sensitive posts); asset and property management; and allocation of social benefits, subsidies, or grants. These functions are not *corrupt by nature*, they are structurally exposed because they combine discretionary decision-making power, economic incentives for influence, and information asymmetry between the official and those subject to the decision [1; 4].

The institutional consequences of corruption in these high-risk functions extend well beyond the individual transaction. In procurement, corruption distorts market competition, inflates public expenditure, and may result in substandard goods or services, with direct consequences for public service quality and safety. In inspections, corruption enables continued non-compliance with safety, environmental, or building standards, creating risks for the broader public. Understanding the nature of harm in each functional area is important for calibrating both the urgency and the design of preventive measures.

Credible corruption risk assessment combines several complementary inputs, like process mapping to identify decision points, analysis of discretion points where rules leave room for judgment, review of data indicators such as complaint records, audit findings, court cases, and unexplained procurement outcomes, and structured consultations with frontline staff, who often possess tacit knowledge of risk patterns that formal analysis misses. The output of assessment must be a concrete action plan specifying mitigation, like segregation of duties, rotation of officials in sensitive posts, expanded disclosure obligations, digital audit logs, collusion-resistant tender design, and targeted supervisory attention [2; 4].

Risk management fails institutionally when it degenerates into a formal annual report, completed to satisfy an external requirement, reviewed by a committee, and filed without generating management action. Effective systems treat risk assessment as a living management tool, updated when processes change, reviewed when incidents occur, and linked to planning cycles that allocate resources for mitigation. Periodic review of whether selected mitigations have actually reduced risk, not merely produced documentation, is essential to maintaining the credibility and effectiveness of the system.

Internal controls, like financial controls, procedural requirements, approval hierarchies, documentation standards, perform an integrity function that is often insufficiently appreciated. They protect both institutions and individual honest officials by clarifying procedures and creating defensible decision trails. An official who has followed documented procedures in a contested procurement decision is in a fundamentally different position, legally, disciplinarily, and reputationally, from one who exercised the same discretion without documentation. This protective function gives officials a material interest in maintaining robust controls, beyond compliance motivation. Internal audit functions contribute by independently evaluating control effectiveness and verifying whether selected mitigations actually reduce risk rather than merely producing administrative paperwork. Audit reports that identify systemic control weaknesses, rather than only in-

dividual irregularities, provide the most valuable management information for integrity purposes. Where internal audit recommendations are systematically addressed, the risk management cycle operates as designed, where they are ignored, the audit function becomes a detection rather than a prevention mechanism [4].

Transparency and Digitalization. Transparency is simultaneously a democratic principle, when citizens are entitled to know how power is exercised in their name and an anti-corruption tool of demonstrated effectiveness. Misconduct thrives in opacity when procedures are unclear, criteria are unstated, and outcomes are unpublished, the detection of irregular decisions is difficult and comparison across cases is impossible. Open procedures, published criteria, and publicly accessible outcomes increase detectability, enable civil society and media scrutiny, and raise the reputational and legal cost of irregular decisions. These effects are strongest where discretion is unavoidable, precisely the risk contexts where structural transparency has the most to contribute [1; 4].

Transparency also operates through deterrence, when officials who know that their decisions will be subject to scrutiny, whether by a superior, a peer, a journalist, or a citizen adjust their behavior accordingly. The mechanism is akin to the observation effect documented in experimental ethics research, as the visibility increases compliance with norms. Institutional transparency creates a sustained form of ambient observation that reinforces integrity without requiring continuous active oversight.

Digitalization on the other hand offers substantial integrity-relevant benefits, it can standardize procedures (reducing room for informal negotiation), create immutable audit trails, automate compliance checks, and enable proactive publication of data without requiring active requests. Well-designed digital systems reduce the number of informal contact points between officials and citizens, diminish the role of discretion in routine decisions, and facilitate real-time oversight of administrative operations. These potential gains have motivated significant investment in e-government and digital service delivery as elements of anti-corruption strategy. However, digitalization can also reproduce or even amplify integrity vulnerabilities if system design concentrates discretion, hides decision criteria within opaque algorithms, or creates new governance gaps for instance, around data quality, access rights management, or accountability for automated decisions. Integrity-by-design requires clear legal rules embedded in platforms, immutable and independently accessible logs, transparent algorithm governance, and accountable system stewardship arrangements. The transition to digital administration thus requires integrity analysis of new systems before deployment, not only post-hoc audit [4].

Public procurement is structurally the highest-risk domain in public administration. It involves large budgets, technical complexity that creates information asymmetry between buyers and suppliers, multiple sequential discretionary decisions, and powerful economic interests in influencing outcomes. Preventive transparency measures in procurement include publication of tender documentation and evaluation criteria, disclosure of contract modification decisions (which are a common channel for ex-post price inflation), performance reporting, and conflict of interest disclosures for members of evaluation committees [6; 7].

Integrity Pacts, like contractual arrangements in which procuring authorities and tenderers commit publicly to transparent, corruption-free procedures, monitored by an independent civil society observer, represent a more intensive form of procurement transparency that has demonstrated measurable results in reducing irregular practices in a range of national and international contexts. The evidence base from Transparency International's implementation experience indicates that structured transparency with

independent monitoring produces better procurement outcomes, not only in integrity terms but in value-for-money terms, as competition improves when participants have credible assurance that the process is fair [6; 7].

Integrity culture in administrative service delivery is reinforced when institutions publish clear, accessible, and complete service standards: required documents, processing timelines, applicable fees, legal basis for decisions, appeal routes, and complaint channels. Publication of this information reduces information asymmetry, a root condition for corruption on the demand side, and increases the ability of citizens to contest arbitrary decisions or delay tactics. When citizens know what the procedure requires, they are more resistant to demands for informal facilitation payments and better positioned to invoke their procedural rights [2; 4].

Digital portals that enable real-time tracking of application status and automated notification of decision stages further reduce the informal contact between citizens and officials that provides opportunities for pressure or solicitation. Combining service standard publication with citizen feedback mechanisms, structured complaint channels, satisfaction surveys, and published response statistics, creates a continuous accountability loop that complements formal oversight [4].

Whistleblower Protection. Many irregularities in public administration are first identified often long before external audit or inspection, by insiders, meaning colleagues, subordinates, or officials adjacent to the function where misconduct occurs. Reporting channels therefore function as early warning mechanisms that can stop harm from escalating and can simultaneously reveal systemic vulnerabilities in institutional design that would otherwise remain undetected. The preventive value of insider reporting is thus both immediate (stopping a specific irregularity) and structural (generating management information about control weaknesses) [8].

Without credible protection, however, officials who become aware of misconduct face a rational incentive to remain silent. The risks of retaliation, formal disciplinary action, informal marginalization, career damage, or social exclusion within the workplace are immediate, concrete, and personal, while the benefits of reporting accrue to the organization and the public. This asymmetric risk-benefit calculation explains why, in the absence of effective protection, silence is the modal response to awareness of misconduct. The provision of credible, enforceable whistleblower protection changes this calculus and is therefore a structural component of any serious integrity architecture.

Directive (EU) 2019/1937 on the protection of persons who report breaches of Union law establishes common minimum standards across EU Member States on reporting channel requirements, confidentiality obligations, protection against retaliation, feedback obligations, and structured handling procedures [5]. The Directive requires entities above a size threshold to establish internal reporting channels and mandates that Member States designate competent external authorities for external reporting. This architecture internal channels for first instance, external channels as a fallback, reflects the recognition that internal reporting is most efficient and most responsive when organizational culture permits it, but that external channels are essential where internal structures are themselves implicated in the misconduct.

Effective reporting systems provide multiple channels (written, verbal, digital), secure and confidential case handling procedures, timely acknowledgment and feedback to reporters, and clear communication of the legal protections available [9]. Channel design matters for use rates, like systems that are difficult to access, technically unreliable, or procedurally opaque are used less, even when the legal protection they provide is for-

mally adequate. Institutions that invest in channel usability and active communication of protection frameworks report higher reporting rates, a function not only of improved channels but of the trust that investment in these systems signals.

A legitimate concern in whistleblower protection systems is the risk of malicious or vexatious reporting, as deliberately false disclosures made to damage colleagues or institutional rivals. Well-designed systems manage this risk without undermining protection for genuine reports. The key design principle is a good-faith standard, we consider the protection attaches to reports made on a reasonable belief that the information disclosed indicates a breach, regardless of whether the belief proves correct after investigation. Reporters who provide deliberately false information with knowledge of its falsity may be subject to proportionate consequences [5].

This distinction between good-faith error and deliberate bad faith is fundamental. The protection systems that require reporters to prove the truth of their allegation as a condition of protection effectively deter legitimate reporting by making reporters bear the risk of investigation uncertainty. The balance between protecting good-faith reporters and discouraging malicious reports is best achieved through procedural fairness, adequate verification capacity, clear internal communication about protections and responsibilities, and transparent handling statistics that allow external assessment of how the system operates.

Whistleblowing should not be treated merely as a disciplinary trigger or a mechanism for identifying individual misconduct. Mature integrity systems treat reports, along with audit findings, inspection results, and complaint data, as organizational learning inputs, like patterns of reporting reveal weak controls, ambiguous rule applications, inadequate training, or toxic management practices that individual disciplinary proceedings cannot address. The feedback loop from reporting to systemic improvement, as corrective action in identified instances, control revision where gaps are identified, and communication of improvements to staff, transforms a reactive reporting mechanism into a proactive organizational resilience function.

What Makes Prevention Work? **Political Will as an Operational Variable**. Integrity mechanisms are not politically neutral instruments, they limit patronage networks, constrain discretionary allocation of benefits, and create accountability for decisions that previously operated informally. It is therefore structurally predictable that effective anti-corruption reform will encounter political resistance, not only from officials engaged in misconduct, but from political principals who benefit from the patronage networks that informal administrative discretion sustains. Political will, in this context, must be understood as an operational variable observable in concrete institutional choices, not merely in declaratory commitment.

Political will becomes visible in measurable indicators, like stable funding for integrity functions and oversight institutions, merit-based appointments to positions with integrity responsibilities, consistent enforcement of standards across the political hierarchy, active support for independent oversight (audit, inspection, and anti-corruption bodies), even when findings are politically inconvenient; and effective follow-up on recommendations from integrity assessments and external review processes. Without these operational indicators, integrity reforms risk becoming decorative, formal mechanisms whose existence satisfies external requirements while substantive implementation is deferred or undermined [4].

Professionalization of the Civil Service reduces corruption risk through several complementary mechanisms. It increases the competence of officials to handle complex

regulatory and financial functions correctly, it provides stability of tenure that reduces the pressure of short-term political loyalty calculations and it builds a professional identity that functions as an internalized motivational constraint against misconduct. Undertrained staffs in complex functions remain structurally vulnerable to manipulation, whether through ignorance of applicable rules or through dependence on informal guidance from superiors who may have interests in particular outcomes.

Professional standards in recruitment, structured career development, fair compensation calibrated to functions performed and merit-based promotion collectively increase both the ability of officials to resist external pressure and their motivation to do so. The investment in professionalization is therefore not merely a human resource management matter, it is a structural integrity measure with direct preventive consequences for crime in public administration.

Institutional resilience-aligning incentives and controls. Prevention is strongest when incentives and control systems are coherently aligned. If institutional performance is measured exclusively by output speed or budget expenditure, integrity considerations become secondary, officials who cut procedural corners to meet targets will be rewarded rather than sanctioned. Integrating integrity measures into performance management, through risk-based control requirements, documentation quality standards, complaint response rates, and regular training completion, creates conditions where compliance with integrity standards is itself a performance expectation, not a constraint on performance.

Institutional resilience (the capacity to maintain integrity under external pressure, resource constraints, and leadership transitions) is ultimately a function of system depth. An institution dependent on a single exemplary leader for its integrity standards is fragile. One with robust codes, trained staff, functioning controls, active oversight, and credible reporting channels retains integrity capacity through leadership changes and external shocks. Building this depth is the long-term objective of integrity culture development.

Conclusions. Corruption prevention in public administration cannot be reduced to criminal sanctions, even though enforcement remains indispensable as a component of a comprehensive response. Preventive mechanisms operate earlier in the causal chain, they shape incentives, reduce structural opportunities, and increase detectability before harm escalates into criminal proceedings. This paper has argued that integrity culture is effective precisely because it makes ethics operational, it creates conditions in which honest behavior is the path of least resistance and misconduct is costly, visible, and likely to be detected.

Each of the four preventive mechanisms examined (codes of conduct and ethics management, corruption risk management, transparency supported by digitalization, and whistleblower protection) contributes a distinct layer to coherent integrity architecture. Codes of conduct matter when supported by training, advisory capacity, and consistent enforcement. Risk management matters when embedded in management cycles and generates concrete mitigations rather than formal documentation. Transparency and digitalization matter when they reduce opacity and create genuine traceability rather than formal publication without substantive access. Whistleblower protection matters when reporting is safe, trusted, and connected to organizational learning rather than limited to individual disciplinary outcomes.

Across all of these mechanisms, sustained political will and progressive professionalization of the civil service are the decisive success factors. These cross-cutting determinants explain why formally similar institutional frameworks yield substantially different

integrity outcomes across national contexts. The quality of implementation is a function of the political and organizational conditions within which mechanisms operate, not merely of the design of the mechanisms themselves. Building these conditions through institutional reform, meritocratic governance, and sustained investment in public service capacity is the long-term work of which integrity culture development is a part.

Integrity is often treated in political discourse as a moral aspiration, a quality that honest individuals possess and corrupt ones lack. In public administration, it is more precisely understood as a pragmatic strategy of crime prevention: it protects citizens from harm, strengthens the rule of law at the administrative level where citizens experience it most directly, and builds the institutional resilience that is the most durable form of protection against the criminal phenomena that exploit administrative power.

Abstract

In the architecture of contemporary digital society, identity theft committed by organized criminal groups takes on the characteristics of sophisticated criminality, placed at the intersection of legal regimes with apparently divergent purposes: personal data protection and the efficiency of forensic investigation.

The present scientific endeavor seeks to explore this area of normative convergence, highlighting the complexity arising from the need to balance fundamental guarantees of private life with the specific demands of criminal investigation and the administration of evidence in criminal proceedings. The analysis is grounded in an integrative approach that coherently combines doctrinal, normative, and jurisprudential benchmarks at both national and European levels, with a view to delineating an applicable legal framework capable of responding to these dynamics.

Particular attention is devoted to the mechanisms of storage, processing, and preservation of personal data within criminalistic activities, as well as to the evidentiary vulnerabilities generated both by the inherently digital nature of such data and by the organized structure of criminal conduct. From a critical perspective, the research underscores the risk of excessive oscillation between the imperatives of data protection and the demands of effective criminal enforcement, while emphasizing the need to articulate a balanced normative and operational model capable of ensuring coherence and proportionality in legal intervention.

Finally, conceptual benchmarks and directions of reflection are advanced, intended to contribute to the configuration of coherent legal and forensic mechanisms capable of simultaneously meeting the requirements of the rule of law and the emerging challenges of organized cybercrime.

Keywords: identity theft, organized criminal groups, forensic investigation, personal data protection, electronic traces, digital evidence.

INTERFERENȚA DINTRE PROTECȚIA DATELOR CU CARACTER PERSONAL ȘI EXIGENȚELE INVESTIGAȚIEI CRIMINALISTICE ÎN CAUZELE DE FURT DE IDENTITATE COMIS DE GRUPURI CRIMINALE ORGANIZATE

Abstract

În arhitectura societății digitale contemporane, furtul de identitate comis de grupuri criminale orga-

nizate dobândește valențele unei infracționalități sofisticate, plasate la intersecția unor regimuri juridice cu finalități aparent divergente: protecția datelor cu caracter personal și eficiența investigației criminalistice.

Prezentul demers științific vizează explorarea acestei zone de convergență normativă, evidențiind complexitatea generată de necesitatea echilibrării garanțiilor fundamentale ale vieții private cu exigențele specifice investigației criminalistice și ale administrării probelor în procesul penal. Analiza se fundamentează pe o abordare integrativă, care îmbină în mod coerent repere doctrinare, normative și jurisprudențiale, atât la nivel național, cât și european, în vederea conturării unui cadru juridic aplicabil, capabil să răspundă acestor dinamici.

O atenție particulară este acordată mecanismelor de stocare, prelucrare și conservare a datelor cu caracter personal în cadrul activității criminalistice, precum și vulnerabilităților de ordin probatoriu generate atât de natura intrinsec digitală a acestor date, cât și de caracterul organizat al activității infracționale. Dintr-o perspectivă critică, cercetarea evidențiază riscul unei oscilații excesive între imperativele protecției datelor și exigențele eficientizării represiunii penale, subliniind, totodată, necesitatea configurării unui model de echilibru normativ și operațional, apt să asigure coerența și proporționalitatea intervenției juridice.

În acest sens, sunt avansate repere conceptuale și direcții de reflecție menite să contribuie la configurarea unor mecanisme juridice și criminalistice coerente, capabile să răspundă simultan exigențelor statului de drept și provocărilor emergente ale criminalității informatice organizate.

Cuvinte-cheie: furt de identitate, grupuri criminale organizate, investigație criminalistică, protecția datelor cu caracter personal, urme electronice, probe digitale.

Introduction. The accelerated digitalization of society, manifested within the sphere of social relations, has necessitated the establishment of an adapted normative framework, materialized through regulations designed to address specific legal and societal exigencies [18, p.35-36]. The alignment of national legislation with the European acquis communautaire [7] led to the adoption of Law No.133 of 8 July 2011 on the Protection of Personal Data [10]. Subsequently, the adaptation of the regulatory framework to the provisions of a European Union regulation General Data Protection Regulation [9] resulted in the replacement of the aforementioned law with a new legislative act — Law No.195 of 25 July 2024 on the Protection of Personal Data [11]. The provisions of Article 84 of the Regulation implicitly suggest the necessity of legally classifying identity theft as a criminal offence.

This necessity also derives implicitly from the provisions of Article 9(5) of Directive 2013/40/EU [8]. In the same vein, recital (14) of the Directive's preamble states, *inter alia*, that "*the implementation of effective measures aimed at combating identity theft [...] constitutes a [...] relevant component of an integrated strategy against cybercrime*" [8].

In light of Government Decision No.1171 of 28 November 2018 approving the Regulation on the Harmonization of National Legislation with the acquis of the European Union Government Decision No.1171 of 28 November 2018 [15], the establishment of criminal-law mechanisms aimed at protecting social values and legal relations against identity theft became imperative. In this regard, through Law No.136 of 6 June 2024 amending certain normative acts Law No.136 of 6 June 2024 [14], the Criminal Code of the Republic of Moldova was supplemented with Article 260^7, thereby introducing the criminalization and sanctioning of this offence.

The adjustment of national legal provisions has produced significant effects upon the nature and dynamics of the criminal mechanisms employed by organized criminal groups (OCGs). Whereas, within the classical model of organized crime, personal identity represented an attribute difficult to falsify, intrinsically linked to physical documents and state registries, it has presently evolved into a complex set of data stored and processed within electronic environments, susceptible to unauthorized access, duplication, and exploitation through sophisticated technological means [1, p. 14].

Technological progress has generated not only new modalities of communication

and information storage, but also new systemic vulnerabilities, systematically and professionally exploited by organized criminal structures. This structural transformation has led to the emergence of a distinct category of criminal conduct — digital identity theft — criminalized under Article 260[7] of the Criminal Code of the Republic of Moldova [5].

One of the most sensitive issues debated in recent years, both at the national and international levels, concerns the protection of personal data [21, p. 77]. In this context, the forensic investigation of identity theft committed within or through organized criminal groups (OCGs) encounters a methodological challenge of particular complexity: criminal investigation bodies are compelled to access, process, and evidentially exploit precisely the category of data that the legal regime governing personal data protection, established by Law No.133/2011 [10], subjects to stringent restrictions [20, p. 103].

This interference does not constitute a mere issue of legal application, but rather reflects a structural tension between two equally legitimate constitutional values: the right to private life, guaranteed by Article 28 of the Constitution of the Republic of Moldova Constitution of the Republic of Moldova and by Article 8 of the European Convention on Human Rights [3], and the right of society to security and to the effective repression of organized criminality. Neither of these values may be sacrificed in favour of the other without undermining the very foundations of the rule of law.

The forensic particularity of identity theft committed within organized criminal groups (OCGs) resides in its instrumental character: *the stolen identity does not represent the ultimate purpose of the criminal activity, but rather serves as a mechanism for concealing group members, gaining access to the financial resources of victims, and disguising illicit financial flows.* This instrumentalization of identity confers upon the offence a distinct evidentiary dimension: the forensic investigator must reconstruct not only the mechanism of identity theft itself, but also the entire chain through which the stolen identity is utilized within the criminal scheme of the OCG.

The analysis conducted by the authors of 1,142 judicial decisions delivered in cases involving an OCG component in the Republic of Moldova during the period 2015-2025 demonstrated that false or stolen identities most frequently appeared in the roles of courier (853 references) and intermediary (175 references) — functions which, by their very nature, create an operational distance between the leader of the OCG and the concrete criminal act, while simultaneously reducing the possibilities of identifying the group's actual command structure.

Moldovan forensic doctrine has not, to date, systematically examined the interference between these two normative regimes within the specific context of organized criminal groups (OCGs) and digital identity theft. The contributions of Gheorghiță M. in the field of forensic methodology [1], as well as the works of Ostavciuc D. and Odagiu Iu. concerning the investigation of organized criminality [2] – provide the general methodological framework, yet they do not address the particularities arising from the collision between the evidentiary demands of digital investigations and the legal regime governing personal data protection.

Studies in the field of special investigative activities — including the work of D. Roman concerning the grounds and conditions for special investigative measures (SIMs) [16] — approach the issue of interference with private life primarily from a procedural perspective, without correlating it with the forensic specificities of digital traces in cases involving OCGs. The present study seeks to fill this doctrinal gap by identifying and conceptualizing this interference as an autonomous methodological problem and by formulating reference points for an operational balancing model adapted to the Moldovan legal context.

The existing normative framework provides investigative instruments, yet it does not establish an integrated methodological architecture. The provisions of Articles 132[1]-132[8] of the Criminal Procedure Code of the Republic of Moldova [6] regulate access to various categories of electronic data, though without expressly distinguishing between the categories of data relevant in cases of digital identity theft — namely, the victim's identity data, the traffic data of OCG members, the content of communications, and the metadata associated with financial transactions.

This absence of methodological differentiation leads, in practice, to the application of uniform standards to situations characterized by radically different degrees of intrusiveness, thereby generating either the excessive use of intrusive measures in circumstances where less restrictive means would suffice, or the abandonment of efficient investigative techniques out of concern for exceeding the legal threshold. Both methodological errors directly affect the quality of criminal prosecution and contribute to the high rates of legal reclassification documented within the analyzed case law.

Methods and materials applied. The research employs an integrative methodology, combining doctrinal analysis, comparative normative analysis, jurisprudential analysis, and the empirical-statistical method. The selection of these methods was determined by the interdisciplinary nature of the subject under examination, situated at the intersection of forensic science, criminal procedural law, and the normative framework governing personal data protection, thereby requiring a synthetic approach capable of integrating distinct analytical perspectives within a coherent framework.

From a doctrinal perspective, the research examined the contributions of Gheorghiță M. in the field of forensic methodology [1], the works of Ostavciuc D. and Odagiu Iu. concerning the investigation of organized criminality [2], the studies of D. Roman regarding the conditions for conducting special investigative measures (SIMs) [16], as well as national and international scholarly works addressing cybercrime, digital evidence, and the legal regulatory framework applicable to personal data protection. In addition, guidance documents issued by Europol and reports of the United Nations Office on Drugs and Crime concerning global trends in organized crime within the digital environment were also consulted.

From a normative perspective, the analysis is grounded in the provisions of Article 260[7] of the Criminal Code of the Republic of Moldova [5]; Law No.133/2011 on the Protection of Personal Data [10]; Articles 132[1]-132[8] and 134[3]-134[5] of the Criminal Procedure Code of the Republic of Moldova [6]; Law No.59/2012 on Special Investigative Activity [12]; Law No.50/2012 on the Prevention and Combating of Organized Crime [13]; as well as the standards established by the Budapest Convention on Cybercrime [4] and Article 8 of the European Convention on Human Rights [3].

The comparative analysis also encompassed the examination of the Romanian normative framework in the field of cybercrime — particularly Law No.161/2003 and the relevant provisions of the currently applicable Romanian Criminal Code — with a view to identifying regulatory models potentially applicable of "lege ferenda" within the Republic of Moldova.

The empirical component of the research constitutes the original foundation of the study and confers upon it a high degree of practical relevance. A total of 1,142 judicial decisions delivered in cases involving an organized criminal group (OCG) component in the Republic of Moldova during the period 2015-2025 were analyzed, all of which were available through the official judicial platform instante.justice.md. Of these, 1,126 contained exploitable PDF text, representing 98.6% of the total sample.

Each judicial decision was examined from the perspective of the typology of predicate offences, the numerical structure of the OCG, the categories of evidentiary means administered, the presence of transnational elements, the indicators concerning the use of false or stolen identities, and the criminal investigation authority involved. Data processing was conducted through both quantitative and qualitative methods, the results being systematized into thematic categories relevant to the methodological issues under examination.

This empirical basis — unique within Moldovan forensic doctrine due to its scale — enabled the identification of patterns regarding the use of fictitious identities, the typologies of electronic traces most frequently administered as evidence, and the evidentiary obstacles generated by the interference with the legal regime governing personal data protection.

Discussions and results obtained. I. Identity Theft as an Instrument of the Organized Criminal Group. The analysis of the 1,142 judicial decisions demonstrated that false or stolen identities are instrumentally employed by organized criminal groups (OCGs) in diverse and systematic ways, constituting an element of criminal infrastructure rather than an objective in itself. The predominant offence in which this practice was identified is drug trafficking (486 cases, representing 42.6% of the total sample), where fictitious identities are used primarily for the role of courier — the most frequently documented function within the examined case files (853 references) — and for the role of intermediary (175 references).

The use of false identities within these operational roles fulfills a distinct function in the internal economy of the OCG: it creates a layer of operational protection between the leader of the group and the concrete criminal act, thereby reducing the exposure of the command structure to the risks of identification and criminal liability.

In cases involving fraud (225 cases) and smuggling (150 cases), false identities serve the purpose of creating fictitious legal entities, fraudulently accessing financial services, and concealing the origin of criminal proceeds. This systemic use demonstrates that, within the context of organized criminal groups (OCGs), identity theft does not constitute an isolated offence, but rather an instrument integrated into the broader mechanism of organized criminal activity, thereby requiring a distinct methodological approach from that applicable to the investigation of identity theft committed by individual offenders.

The empirical analysis further revealed that, in 5 cases within the examined sample, the OCG was coordinated from within penitentiary institutions. In such circumstances, false identities acquire additional significance as instruments facilitating conspiratorial communication and the execution of instructions issued by the incarcerated leader.

From a forensic perspective, it is particularly significant that transnational elements were identified in 55.9% of the analyzed cases, the states most frequently referenced being Romania (325 cases), Ukraine (288 cases), and Germany (238 cases). This transnational dimension substantially increases the complexity of the investigation, given that the stolen identity data frequently originate from information systems located in other states, while the electronic evidence is often stored on extraterritorial servers. The authors' original empirical conclusion — confirmed by the structure of the examined case files — is that the investigation of identity theft committed by transnational OCGs predominantly involves interaction with at least one additional national legal system, thereby exponentially multiplying the procedural obstacles encountered during criminal proceedings. The empirical analysis revealed that electronic traces constitute the dominant category of evidence in organized crime cases: data extracted from mobile phones was used in 926

cases (82.2%), IMEI data in 921 cases (81.8%), communications through digital platforms – Telegram, Viber, and Facebook – in 547 cases (48.6%), and GPS location data in 179 cases (15.9%).

Electronic transactions were relied upon as evidentiary means in 147 cases (13.1%), while video surveillance footage (CCTV) was utilized in 102 cases (9.1%). This evidentiary structure demonstrates that the forensic investigation of organized criminal groups (OCGs) is, in its very essence, an investigation of electronic traces, thereby placing it structurally within the sphere of interference with the legal regime governing the protection of personal data.

II. The three Dimensions of the Interference. Building upon the empirical data presented and the normative analysis conducted, we propose the identification of three distinct dimensions in which the interference between personal data protection and the exigencies of forensic investigation concretely manifests itself in cases of identity theft committed by organized criminal groups (OCGs).

The first dimension concerns the collection and evidentiary exploitation of digital traces specific to identity theft. Such traces – including IP addresses, session cookies, metadata associated with forged documents, the history of electronic transactions, and GPS location data – constitute personal data within the meaning of Law No.133/2011, which implies that access thereto by criminal investigation bodies is subject to differentiated judicial authorizations regulated under Articles 132¹-132□ of the Criminal Procedure Code of the Republic of Moldova [6].

In this context, Gheorghiță M. observes that "the global changes that are rapidly intensifying across all spheres of modern society, connected to scientific and technological progress in the field of computerized electronic technologies, dictate new directions within national forensic science" [1, p. 15], thereby requiring the continuous adaptation of investigative methodologies to emerging typologies of digital traces.

The interference arises where evidentiary urgency necessitates the immediate access to such data, while the authorization procedure – legitimate in itself – introduces operational delays capable of leading to the irreversible loss of digital traces.

An essential forensic particularity of electronic traces in cases involving identity theft committed by organized criminal groups (OCGs) resides in their ephemeral character: unlike traditional material traces, which physically persist at the crime scene, digital data are subject to automatic deletion cycles configured by service providers, may be overwritten upon the reactivation of the information system, or become inaccessible through the mere modification of access credentials.

The empirical analysis demonstrated that OCG members deliberately exploit this vulnerability by using applications based on ephemeral messaging systems and prepaid telephone cards characterized by short operational cycles. Roman D. emphasizes that the conditions governing the conduct of special investigative measures (SIMs) represent "the totality of principles and rules which ensure, on the one hand, the balance of the individual's interests – namely the right to the secrecy of private life – and, on the other hand, the interests of society in the effectiveness of combating criminality, in the timely detection of offences, and in their prevention and suppression" [16, p. 117].

In cases of digital identity theft, however, this balance becomes particularly difficult to calibrate precisely because of the speed with which electronic traces disappear or become inaccessible.

The second dimension concerns access to data stored on extraterritorial servers belonging to encrypted communication platforms. Organized criminal groups (OCGs)

operating in the Republic of Moldova systematically use Telegram, Viber and WhatsApp for the coordination of criminal activities – these platforms being identified in 547 cases within the analyzed empirical database. OCG members deliberately avoid communication through conventional mobile telephony precisely because the traffic data retained by telecommunications operators are accessible to criminal investigation bodies through the procedures established under Articles 134⁴-134⁵ of the Criminal Procedure Code of the Republic of Moldova [6].

The data stored on the servers of these platforms are subject to the legislation of the states in whose territory the respective servers are located, which renders national access procedures, in practice, either inapplicable or excessively slow. This methodological gap is further aggravated by the absence, within the Criminal Procedure Code of the Republic of Moldova, of a distinct procedure governing the search and seizure of computer data, analogous to that provided by the Budapest Convention on Cybercrime [4]. This legislative deficiency requires urgent remedial action and constitutes a "lege ferenda" issue with a direct impact upon investigative efficiency.

The third dimension concerns the particularities of international cooperation in cases involving organized criminal groups (OCGs) with a digital component. Requests for mutual legal assistance aimed at obtaining electronic data involve lengthy procedures that are incompatible with the evidentiary urgency specific to the investigation of OCGs. The Budapest Convention on Cybercrime (Budapest, 2001) establishes mechanisms for expedited cooperation; however, their practical effectiveness depends upon the degree of ratification and implementation within the requested states, the technical capacity of the authorities of the requested state, and the political willingness to cooperate [4].

The transnational dimension identified in 55.9% of the analyzed OCG cases – with frequent references to Romania, Ukraine, and Germany – illustrates the scale of this problem for Moldovan judicial practice and highlights the necessity of developing specific cooperation protocols adapted to the urgency inherent in digital investigations.

III. Specific Evidentiary Vulnerabilities and Their Methodological Consequences. The identified normative interference generates, within investigative practice, a series of specific evidentiary vulnerabilities that affect both the quality and the admissibility of digital evidence in cases involving identity theft committed by organized criminal groups (OCGs). The first vulnerability concerns the risk of exclusion of evidence obtained in violation of the authorization procedures established under Articles 94-96 of the Criminal Procedure Code of the Republic of Moldova [6].

Where the investigator, acting under the pressure of evidentiary urgency, accesses personal data without the corresponding judicial authorization, the evidence thereby obtained becomes susceptible to exclusion from the criminal proceedings, in some instances irreversibly compromising the prosecution. This reality is reflected in the 30.4% rate of reclassification of charges involving an OCG component identified within the analyzed case law, which signals, inter alia, the existence of systematic evidentiary difficulties in proving organized criminal activity within the digital environment.

The second vulnerability concerns the integrity of the chain of custody of digital evidence. Unlike traditional material evidence, electronic data may be altered, copied, or deleted without leaving visible traces, thereby requiring the use of specialized technical procedures for extraction and preservation – including cryptographic hashing, forensic imaging of storage devices, and audit logs – capable of guaranteeing the authenticity and integrity of the data relied upon as evidence.

The absence of nationally regulated methodological standards explicitly governing

this matter constitutes a legislative and operational gap identified within the present research, with direct consequences for the admissibility of digital evidence before judicial authorities.

The third vulnerability concerns the risk of overlap between the personal data of victims and those of OCG members within the investigative process. Identity theft, by its very nature, involves the exploitation of the victim's personal data, which acquire a dual evidentiary relevance: they document both the offence suffered by the victim and the criminal activity of the perpetrators.

This overlap creates parallel – and at times conflicting – obligations for criminal investigation bodies: on the one hand, the obligation to use the victim's data as evidentiary material; on the other hand, the obligation to safeguard the victim's private life in accordance with Law No.133/2011 [10]. The management of this dual obligation requires the development of specific methodological protocols, which are currently absent from the practice of criminal investigation authorities in the Republic of Moldova.

From the perspective of the implications for investigative practice, we consider that criminal investigation bodies and the PCCOCS – identified as the investigative authority in 263 of the analyzed cases – must develop specialized competencies in the digital investigation of identity theft committed by organized criminal groups (OCGs). Such competencies should include, inter alia: the initiation and execution of data preservation procedures addressed to electronic service providers, the use of forensic extraction tools for mobile phones and information systems, and the evidentiary exploitation of metadata in compliance with the admissibility standards established in the case law of the European Court of Human Rights.

The specialized training of investigators in these fields constitutes a prerequisite for the effectiveness of any improved normative framework.

IV. The Framework for Normative and Operational Balance. The analysis of the case law of the European Court of Human Rights demonstrates that not every access by criminal investigation authorities to an individual's electronic data automatically constitutes a violation of the right to private life guaranteed under Article 8 of the European Convention on Human Rights. The Court has developed a tripartite test – legality, legitimate aim, and necessity and proportionality – which does not exclude digital investigations, but rather disciplines them by imposing adequate procedural safeguards against arbitrary use [3].

Applied in cases involving organized criminal groups (OCGs), this test presupposes that access to the identity data of group members is justified where there exists a documented reasonable suspicion and where the investigative measures employed are proportionate to the seriousness of the offences under examination and to the investigative alternatives available. The case law of the European Court of Human Rights in the cases of Klass and Others v. Germany and Uzun v. Germany established that the state enjoys a margin of appreciation in configuring surveillance measures, provided that effective safeguards against abuse exist — safeguards equally applicable within the context of the digital investigation of OCGs.

We consider that the resolution of the identified interference cannot consist in subordinating one value to the other – neither may data protection be sacrificed in favour of repressive efficiency, nor may forensic investigation be paralysed by excessive protectionism. We propose the articulation of a balancing model structured around three interdependent components.

The starting point consists in the explicit regulation of the obligation of immediate

preservation of digital data – a freeze-type procedure – adapted to the specific nature of volatile electronic traces and distinct from the general procedures governing the seizure of objects regulated under Articles 126-128 of the Criminal Procedure Code of the Republic of Moldova [6].

This procedure, recommended by the Budapest Convention on Cybercrime [4], would enable criminal investigation authorities to request service providers to preserve data without effectively accessing them, the actual access subsequently being authorized through the ordinary judicial procedure. In this manner, the urgency of preservation would be separated from the judicial authority governing access.

The second component concerns the differentiation of authorization regimes according to the categories of data involved and the degree of intrusiveness of the measure employed. Access to traffic metadata – namely, who communicated with whom, when, and from where – requires a different authorization standard from that applicable to access to the actual content of communications, whereas treating these categories uniformly generates either unjustified overprotection of metadata or the trivialization of access to content.

Such differentiation is already recognized within the European doctrine of data protection and in the case law of the European Court of Human Rights, and therefore requires explicit transposition into the Criminal Procedure Code of the Republic of Moldova [6], through the establishment of clear authorization thresholds correlated both with the degree of intrusiveness of each category of data and with the nature of the offences under investigation.

The third component concerns the strengthening of international cooperation specific to OCG cases involving a digital component, through accelerated protocols and operational contact points capable of overcoming the inherent slowness of traditional mutual legal assistance procedures, while relying upon the already existing mechanisms of Europol, Interpol, and the Budapest Convention on Cybercrime [4].

The implementation of this balancing model requires not only legislative reforms, but also substantial investments in the institutional capacity of criminal investigation bodies. The digital investigation of identity theft committed by organized criminal groups (OCGs) necessitates specialized equipment for forensic data extraction, software applications designed for the analysis of metadata and electronic connections, as well as personnel possessing specialized training in digital forensic science.

The PCCOCS – identified as the investigative authority in 263 of the analyzed cases – represents the institution with the greatest potential to develop such specialized capacity at the national level, benefiting from the experience accumulated in the investigation of transnational organized criminality.

We consider that the allocation of dedicated resources for the training of investigators in digital forensic science and for the acquisition of forensic extraction equipment constitutes an institutional priority with a direct impact upon investigative efficiency, complementary to any normative reform.

Conclusions. The present scientific undertaking has demonstrated that the interference between personal data protection and the exigencies of forensic investigation in cases of identity theft committed by organized criminal groups (OCGs) constitutes an autonomous methodological problem, manifested concretely across three distinct dimensions: the collection of volatile digital traces under differentiated authorization regimes, access to data stored extraterritorially on encrypted communication platforms, and international cooperation conducted under conditions of evidentiary urgency. The

identification and conceptualization of this issue as an independent methodological entity represents the principal original contribution of the present research.

The analysis of 1,142 judicial decisions delivered during the period 2015-2025 revealed that electronic traces – telephone data (82.2%), IMEI data (81.8%), and communications conducted through digital platforms (48.6%) – constitute the dominant evidentiary category in OCG cases within the Republic of Moldova, while the transnational dimension identified in 55.9% of the cases substantially increases the complexity of accessing such evidence. These empirical findings, unprecedented within national forensic doctrine, confirm that the examined interference does not represent a marginal phenomenon, but rather an ordinary reality of Moldovan judicial practice.

We consider that resolving this interference requires not a choice between the two competing values, but the articulation of a model of normative and operational balance founded upon the immediate preservation of digital data, the differentiation of authorization regimes, and the strengthening of specialized international cooperation. The introduction into the Criminal Procedure Code of a distinct procedure governing the search and seizure of computer data, in coherence with the obligations assumed by the Republic of Moldova through its accession to the Budapest Convention on Cybercrime, constitutes a priority direction of legislative reform with a direct impact upon the effectiveness of the forensic investigation of OCGs within the digital environment.

The interference analyzed in the present study transcends the national context: it reflects a structural challenge faced by all legal systems adhering to European standards of data protection, under conditions in which digitalized organized criminality evolves more rapidly than the normative response capacity of states. Consequently, the methodological and legislative solutions developed at the national level must remain compatible with European and international developments in the field, so as not to generate new gaps in cross-border cooperation relating to the investigation of OCGs with a digital component.

LEGAL CULTURE AS A FACTOR IN THE EFFECTIVENESS OF ADMINISTRATIVE AND LEGAL REGULATION: A THEORETICAL AND LEGAL PERSPECTIVE

Mykola KNYHNYTSKYI,
PhD,
Deputy Head, Department of Law,
Academician I.M. Lutskyi, King Danylo University,
Ivano-Frankivsk, Ukraine
ORCID: 0009-0001-6206-5219

Abstract
This article presents a theoretical and legal analysis of the relationship between legal culture and the effectiveness of administrative and legal regulation in the context of contemporary transformations in public administration. It is established that legal culture serves not only as the value-based foundation of law enforcement, but also as a key subjective factor determining the quality of interaction between public authorities and citizens. The structure of legal culture is examined through the prism of administrative procedures. It is argued that low levels of legal awareness and legal nihilism are the main determinants of the dysfunction of administrative and legal norms. Ways to enhance the effectiveness of legal regulation through the digitalisation of public services and the humanisation of the administrative process are proposed.
Keywords: legal culture, administrative and legal regulation, effectiveness of law, public administration, legal nihilism, administrative procedures, digitalisation.

CULTURA JURIDICĂ CA FACTOR AL EFICIENȚEI REGLEMENTĂRII ADMINISTRATIV-JURIDICE: O PERSPECTIVĂ TEORETICO-JURIDICĂ

Abstract
Acest articol prezintă o analiză teoretico-juridică a raportului dintre cultura juridică și eficiența reglementării administrativ-juridice în contextul transformărilor contemporane din administrația publică.
Autorul constată că cultura juridică servește nu doar drept fundament axiologic al aplicării dreptului, ci și un factor subiectiv esențial care determină calitatea interacțiunii dintre autoritățile publice și cetățeni. Structura culturii juridice este examinată prin prisma procedurilor administrative. Se argumentează că nivelul scăzut al conștiinței juridice și nihilismul juridic constituie principalii factori determinanți ai disfuncționalității normelor administrativ-juridice. Sunt propuse modalități de sporire a eficienței reglementării juridice prin digitalizarea serviciilor publice și umanizarea procesului administrativ.
Cuvinte-cheie: cultură juridică, reglementare administrativ-juridică, eficiența dreptului, administrație publică, nihilism juridic, proceduri administrative, digitalizare.

Introduction. The processes of European integration and legal reform in Ukraine call for a rethinking of traditional approaches to administrative regulation. The effectiveness of legal norms depends not only on their formal perfection, but also on the willingness of society and public servants to accept these norms as fair and binding. In this context, legal culture becomes the 'soft' regulator that ensures the viability of 'hard' administrative regulations. Sociological and legal observations in recent years indicate that without an adequate level of legal awareness, any administrative reforms are doomed to

formalism and low efficiency.

Subject of the study is the social relations arising in the sphere of administrative and legal regulation under the influence of factors of legal culture.

Purpose of the article is to explore the role of legal culture as an internal regulator of the effectiveness of administrative and legal norms and to identify ways of minimising legal nihilism in public administration.

Discussions and results obtained. The state of academic research into the issue of legal culture in the context of public administration indicates a gradual but irreversible shift from an outdated formal-legal approach to a modern anthropocentric one. Within this paradigm, the individual, their rights, freedoms and legitimate interests become the central focus of legal attention, rather than merely an element of public administration or an object of state influence. As M.I. Kharvoniuk rightly notes in his fundamental analysis of trends in the rule of law and crime dynamics in Ukraine for the period 2019-2024, the current state of social relations requires the state to fundamentally and systematically rethink the role of legal institutions as such [8, p. 298]. The author emphasises that without adapting the institutional framework to the real socio-cultural demands and moral values of society, any attempt at administrative reform will remain merely on paper. In particular, it is worth emphasising that the actual effectiveness of administrative regulations is directly determined by the level of public trust in state institutions. This thesis finds substantial empirical confirmation in the Razumkov Centre's reports for 2025, which indicate that citizens' legal culture and their willingness to voluntarily comply with administrative regulations are directly correlated with the level of transparency and accountability of the state apparatus [1, p.15].

In contemporary legal doctrine, administrative and legal regulation is no longer viewed as a purely punitive, coercive or restrictive mechanism of state influence. On the contrary, in the light of European standards of 'good governance', it serves as a key instrument for ensuring, realising and protecting human rights and freedoms in the complex daily interactions between the individual and the state apparatus. Yu.V. Orlov, analysing the challenges facing the legal system, emphasises that in the context of a protracted and large-scale armed conflict, the legal environment inevitably encounters the dangerous and destructive phenomena of 'social anomie' [3, p.104]. This is a specific state of society in which traditional moral filters and legal mechanisms of social control are significantly weakened, and the usual regulators of behaviour lose their authority under the pressure of extreme circumstances. In such complex and volatile circumstances, it is precisely the legal culture of those in positions of authority – officials, civil servants and representatives of administrative bodies – that becomes the decisive subjective factor preventing the state apparatus from taking destructive steps. As P.S. Eprintsev emphasises, a high level of professional legal awareness and ethical maturity on the part of civil servants is, in fact, the only reliable internal barrier that prevents corruption from infiltrating government bodies and minimises the risks of administrative arbitrariness in conditions of legal uncertainty [2, p.73].

Research shows that the multifaceted effectiveness of legal regulation in the complex sphere of modern public administration is not a linear quantity, but is instead revealed through several interrelated and complementary dimensions, each of which is directly grounded in the foundation of legal culture:

1. *Value dimension*: this involves a deep internal perception of each administrative procedure not as a formal burden, but as a fair, legitimate and comprehensible algorithm for interaction between the state and the individual. It is this dimension that provides

the 'social breath' of the law, transforming dry norms into a living instrument of social harmony.

2. *Procedural dimension*: this aspect consists of the unwavering and conscious adherence to high standards of 'good administration', which allows for the radical minimisation of any manifestations of bureaucratic formalism, procedural delays and subjectivity. A culture of due process acts as a safeguard against the administrative apparatus becoming a closed caste.

3. *Technological dimension*: in today's context, this involves the active and professional use of the latest digital tools. This is done with the aim of maximising the objectivity of management decisions, eliminating the corruption-prone 'human factor' and creating a transparent digital trail for every administrative action.

In the context of the extremely complex global challenges currently facing Ukraine, the consistent and systematic implementation of the latest approaches to administrative procedures, as well as an uncompromising and comprehensive response to corruption risks under the extreme conditions of martial law, are not merely another legal task, but a critical strategic priority for ensuring national security and maintaining the state's functional governability [7, p.57]. It should be noted that during periods of crisis, the administrative apparatus is subjected to an enormous workload, which requires officials not only to possess technical knowledge of the law but also a high level of ethical resilience. As leading researchers in the field of public law quite rightly point out, the actual level of legal protection afforded to citizens in their daily and sometimes complex dealings with state authorities is the most important indicator of the viability and humanity of the country's entire legal system.

At the same time, a thorough analysis of current law enforcement practice and official statistics from the Office of the Prosecutor General for the period 2021-2025 provide compelling evidence of serious destructive trends. In particular, the data indicate that numerous offences in the sphere of official duties, abuse of authority and various forms of power abuse are most often a direct and logical consequence of the critically low level of legal culture prevailing in certain parts of the state apparatus [5]. This indicates a profound distortion of professional legal consciousness, where personal gain or bureaucratic indifference takes precedence over serving the public interest.

This state of affairs requires the state not only to step up repressive measures and criminal prosecution, but above all to work systematically towards changing the mindset of public servants. The formation of a new legal culture, based on the principles of integrity, respect for human dignity and the unconditional primacy of the law, is becoming a necessary prerequisite for administrative and legal regulation to transform from an instrument of coercion into an instrument of effective social service. Thus, legal culture serves as the intellectual and moral foundation without which any institutional reform in the sphere of public administration is doomed to stagnation and a loss of public trust.

Moreover, the deeply distorted sense of justice among certain categories of officials –which, in practice, manifests itself in the consistent prioritisation of narrow corporate, clan-based or purely self-serving personal interests over the fundamental public interests of the community and the state – effectively nullifies and reduces to nothing any systematic legislative efforts by the state aimed at the strategic reform of the security, defence and public administration sectors. As researchers H.I. Pishchenko and A.O. Lysenko note, when analysing the structure of contemporary offences, it is precisely this self-serving orientation, combined with the opportunities afforded by office that creates the most dangerous precedents of destructive influence on the system of public govern-

ance [4, p.647]. In this context, legal culture ceases to be merely a theoretical category and becomes a practical safeguard: where the law has gaps, it is culture and ethics that must deter officials from making anti-social decisions.

According to existing academic observations, disregarding the spirit of the law whilst formally adhering to its letter is one of the most dangerous forms of distortion of legal consciousness. This creates an illusion of legality whilst effectively undermining the rule of law. Thus, the systematic and uncompromising overcoming of legal nihilism, which is deeply rooted within the state apparatus itself, becomes not merely a desirable change, but a primary, imperative condition for a real increase in the efficiency of administrative and legal influence on social processes.

The issue of professional misconduct among civil servants in wartime takes on particular urgency. M.I. Kharvoniuk emphasises that times of crisis expose weaknesses in the management system, and if the legal culture of managers is fragile, this inevitably leads to the erosion of standards of lawful conduct and an increase in shadow practices [8, p.301]. Consequently, only through a qualitative transformation of the bureaucracy's internal attitude towards its duties, and through the cultivation of a culture of responsibility and service, is it possible to ensure the effectiveness of administrative and legal regulation that meets the challenges of the modern era and the demands of civil society. Nurturing a new generation of public administrators with a high level of legal culture is a long-term process; however, without it, any institutional transformations will remain merely an imitation of reforms.

The global digitalisation of the public sector, the most striking manifestation of which in Ukraine has been the rapid development and scaling up of the multifunctional 'Diia' platform, is now seen not merely as yet another technical or software update to the state infrastructure, but above all as a fundamental ideological and cultural shift in the 'citizen–state' relationship. The key value of this process lies in the fact that digital algorithms virtually eliminate the so-called 'human factor' at those critical touchpoints where, for decades, it has served as the primary source of systemic corruption, subjectivity and bureaucratic red tape. Thus, the automation of administrative procedures effectively creates a new ethic of digital interaction, based on the principles of speed, equality and transparency, which were previously unattainable within the framework of paper-based document flow.

However, despite the obvious successes of technological progress, it must be understood that digitalisation in itself is not a panacea for all legal ills. As researchers G.I. Pishchenko and A.O. Lysenko rightly point out, the high adaptability of offenders to new digital conditions (which is particularly evident in the sophisticated rise of cyber fraud, manipulation of registers and electronic data) is an alarming indication that purely technical, software or engineering security measures are critically insufficient for the full stabilisation of the rule of law [4, p.648].

The authors emphasise that the technological shell merely changes the form of the offence but does not eliminate its root cause if the individual's legal culture remains distorted. Consequently, at the current stage of administrative and legal regulation, there is an urgent need for long-term, systematic and targeted educational work aimed at fostering legal virtues in both providers and consumers of public services. This involves fostering digital hygiene and legal responsibility, where compliance with the law in the digital environment must become an individual's intrinsic need, rather than merely a consequence of fear of automated monitoring. Consequently, only a harmonious combination of high technology with a high level of legal awareness will enable true effectiveness in

administrative regulation, where the digital platform will become not merely a convenient website, but a space for the realisation of a new model of legal culture.

The legal regime of martial law occupies a special, strategically important place within the overall structure of modern administrative and legal regulation, introducing radical changes to the usual mechanisms of interaction between the state and society [6]. This specific mode of operation of public authority demands of the legal culture of both administrators and ordinary citizens a particular degree of social flexibility, resilience and a high level of awareness. Under martial law, legal culture transforms into a kind of stabilising factor, enabling the system to remain manageable under the pressure of external aggression and internal tension. On the one hand, this regime entails citizens' conscious willingness to accept certain, sometimes substantial, restrictions on constitutional rights and freedoms for the sake of a higher goal – the preservation of the state's sovereignty and territorial integrity. Here, legal culture manifests itself in the form of a high level of patriotic legal consciousness and an understanding of the need for a temporary curtailment of individual freedom in the interests of public safety. Without an appropriate cultural foundation, such restrictions could be perceived as repression, which would inevitably lead to a rise in social discontent. On the other hand, the legal regime of martial law demands exceptional, almost iron-clad self-discipline and responsibility from state authorities and local self-government bodies in matters of strict adherence to the law. In circumstances where administrative bodies are granted expanded discretionary powers, the risk of abuse increases exponentially. It is precisely for this reason that a professional legal culture among civil servants becomes the critical safeguard that prevents 'extraordinary powers' from becoming a tool for arbitrariness or corrupt enrichment.

As demonstrated by the implementation of the provisions of the Act of Parliament of Ukraine 'On the Legal Regime of Martial Law', the effectiveness of administrative measures during this period depends not so much on the severity of sanctions as on the moral unity of the parties involved. Legal culture acts here as a mediator, ensuring a delicate balance between security requirements and the preservation of the fundamental values of democracy. Thus, in wartime, legal culture transforms from an abstract ideal into a practical mechanism for the state's survival, where the authorities' exceptional self-discipline becomes a mirror image of society's trust and patience.

Conclusions. Summing up the results of this theoretical and legal study of the role of legal culture as a fundamental factor in the effectiveness of administrative and legal regulation, the following conceptual conclusions may be drawn:

1. *Legal culture as a central element of law enforcement*. It has been established that legal culture is not merely a theoretical abstraction or a passive backdrop to social life, but acts as a living, integral part of the complex mechanism of administrative and legal regulation. It is precisely this culture that acts as a kind of socio-psychological mediator, ensuring the effective translation of formal legal provisions into the realm of actual lawful behaviour by individuals. Without an adequate level of legal culture, even the most perfect legislative framework remains ineffective, since it is an individual's internal value orientations that determine the degree of compliance with legal norms.

2. *Transformation towards a service-oriented model of the state*. It has been argued that a high level of legal culture, particularly among representatives of public authorities, is a fundamental prerequisite for the successful implementation of a modern service-oriented model of the state. In such a model, a civil servant or public official acts not as a source of unquestionable coercion or bureaucratic pressure, but first and foremost as a professional provider of high-quality public services. This requires a shift away from the

'right to govern' towards the 'right to serve', where the priority is respect for human dignity and the protection of individual rights.

3. *Strategic prospects and determinants of development*. The future prospects for strengthening the legal culture and, consequently, improving the efficiency of administrative regulation, are inextricably linked to three main directions:

a. Firstly, ensuring maximum, physically tangible transparency and accountability across the entire state apparatus;

b. Secondly, the comprehensive digitalisation of administrative processes, which minimises corruption risks and subjectivity [4, p.649];

c. Thirdly, the unwavering implementation of European standards of administrative procedure, based on the principles of predictability, fairness and objectivity.

CRIMINALISTIC INVESTIGATION OF OFFENCES COMMITTED IN THE ONLINE ENVIRONMENT AGAINST CHILDREN

Sorin Silviu FINTA,
PhD, University Lecturer,
"1 Decembrie 1918" University of Alba Iulia,
Romania
ORCID: 0009-0009-1006-9937

Abstract

The study examines, from a criminalistic and criminal procedural perspective, the investigation of offences committed against children in the online environment, with a particular focus on digital evidence, the protection of child victims, and the integration of financial investigations.

The methodology combines a normative analysis of Romanian substantive criminal law and criminal procedure with an examination of European standards, relevant case law, recent institutional reports, and specialised literature. The research is structured around five main directions: identifying the offender beyond the apparent digital identity; the role of computer searches in the discovery, preservation, and interpretation of data; the contribution of special investigative measures, cooperation with platforms and service providers, and analytical structures; the interviewing of child victims with a view to preventing secondary victimisation; and the tracing of financial flows in cases of online sexual exploitation.

The findings support the view that investigative efficiency depends on an integrated model of inquiry, in which technical data, digital traces, behavioural indicators, and payments are correlated so as to reduce exclusive reliance on the victim's statement. The main conclusion is that the technical performance of the investigation must be accompanied by effective procedural safeguards in order to ensure that the gathering of evidence remains lawful, robust, and compatible with the best interests of the child.

INVESTIGAREA CRIMINALISTICĂ A INFRACȚIUNILOR COMISE ÎN MEDIUL ONLINE ÎMPOTRIVA COPIILOR

Abstract

Studiul analizează, din perspectivă criminalistică și procesual penală, investigarea infracțiunilor comise în mediul online împotriva copiilor, cu accent pe probele digitale, protecția victimei minore și integrarea investigației financiare.

Metodologia combină analiza normativă a dreptului penal și procesual penal român cu examinarea standardelor europene, jurisprudența relevantă, rapoartele instituționale recente și literatura de specialitate. Cercetarea este structurată pe cinci direcții: identificarea autorului dincolo de identitatea digitală aparentă; rolul percheziției informatice în descoperirea, conservarea și interpretarea datelor; aportul metodelor speciale de supraveghere, al cooperării cu platformele și operatorii și al structurilor de analiză; tactica audierii minorului victimă în vederea prevenirii revictimizării; și urmărirea fluxurilor financiare în cauzele de exploatare sexuală online.

Rezultatele analizei susțin că eficiența anchetei depinde de un model integrat de investigație, în care datele tehnice, urmele digitale, elementele comportamentale și plățile sunt coroborate astfel încât dependența exclusivă de declarația victimei să fie redusă. Concluzia principală este că performanța tehnică a investigației trebuie dublată de garanții procedurale efective, pentru ca administrarea probelor să rămână legală, robustă și compatibilă cu interesul superior al copilului.

Cuvinte-cheie: criminalistica, minori, online, probă, percheziție, revictimizare, cooperare.

Introduction. The criminalistic investigation of offences committed against children in the online environment is today situated at the intersection of criminal law, criminal procedure, digital forensics, the special protection of minors, and international judicial cooperation. The increase in the number of cases concerning online recruitment, the distribution of materials depicting child sexual abuse, and digital sexual extortion is also confirmed by recent institutional data, with the DIICOT Activity Report for 2025 explicitly noting the intensification of the phenomenon, including in the form of the self-production and distribution of sexual materials involving minors and grooming activities carried out through social networks and messaging applications [1].

The specific nature of these cases lies in the fact that most relevant evidence is created, transmitted, stored, and deleted in a digital, cross-border, and partly anonymised environment. Consequently, the investigation can no longer be built exclusively through the classic means of criminal prosecution, but requires the rapid preservation of data, the correlation of logs, the analysis of devices, the use of cooperation with service providers, and the integration of financial data into the evidentiary framework [2; 4; 5].

At the same time, in cases involving minors, the legality and effectiveness of the investigation cannot be separated from the obligation to prevent secondary victimisation. Repeated interviews, the absence of a child-friendly setting for the child victim, procedural delays, or unjustified exposure to the case materials may turn the investigation itself into a source of secondary trauma, so that the victimological dimension must remain present at every stage of evidence gathering [4; 7; 8; 9].

One of the objectives of this research is to examine how an investigative model can be constructed that is simultaneously technically effective, legally robust, and compatible with the best interests of the child. At the same time, practical experience supports an integrated model of investigation in which classic evidentiary procedures are complemented by digital forensics, analysis of extracted computer data, cooperation with platforms and operators, protected interviewing tactics, and the tracing of financial flows [10; 13; 17].

The analysis is structured around five coordinates: identification of the offender; computer searches and post-extraction data analysis; special surveillance methods and institutional cooperation; interviewing the child victim; and tracing money transferred in exchange for materials.

Throughout the study, the term “child pornography” is used mainly when discussing the statutory wording of the offence, whereas the descriptive expression “materials depicting child sexual abuse (CSAM)” is preferred, in line with the terminology promoted in recent European literature and guidelines [20].

Methods and materials applied. This study was prepared by using research methods suited to the interdisciplinary nature of the topic, which lies at the confluence of criminal law, criminal procedure, criminalistics, and the investigation of cybercrime. Primarily, the method of legal analysis was used, by examining the relevant national, European, and international rules concerning offences directed against children in the online environment, with an emphasis on provisions relating to criminalisation, the gathering of digital evidence, computer searches, cooperation with service providers, and the procedural protection of the child victim.

The research also used content analysis, applied to doctrinal sources, institutional materials, public reports, and relevant case law. Both specialised works and teaching materials in the field were considered, together with reports and public data issued by specialised bodies and structures, useful for understanding the scale of the phenomenon, offenders’ operating mechanisms, and the practical difficulties encountered in identifying

them, especially in the context of false identities, compromised accounts, VPN networks, or anonymised infrastructures. An important role in shaping the analysis was also played by the examination of judicial practice and relevant case law, both in terms of the gathering of digital evidence and in relation to the standards for protecting child victims during criminal proceedings. In this way, the study seeks not only to present the theoretical normative framework, but also to capture the real difficulties that these cases raise in criminal prosecution and in evidentiary terms.

The present approach is also supported by the author's professional experience in relation to the investigation of acts committed in the digital environment and cases involving minor victims. This practical dimension made it possible to direct the research towards issues that consistently generate difficulties in judicial activity: identifying the real offender behind the digital avatar, preserving and using computer evidence, inter-institutional cooperation, and avoiding the secondary victimisation of the minor through the very conduct of criminal procedures.

The materials used in preparing the study therefore consisted of legislation, specialised doctrine, judicial decisions, and institutional reports, corroborated with observations drawn from professional practice. This approach sought to provide a balanced analysis in which the theoretical perspective is constantly related to the concrete realities of criminalistic investigation in cases concerning offences directed against children in the online environment.

I. General Criminalistic Aspects of the Investigation. The criminal investigation of acts committed against children in the online environment starts from national offences concerning sexual acts with minors, sexual corruption, online recruitment, and child pornography, supplemented by the rules of criminal procedure on technical surveillance, undercover investigators, the preservation and examination of computer data, victim protection, and computer searches. At European level, Directive 2011/93/EU requires Member States to criminalise, among other things, child pornography and the online solicitation of minors for sexual purposes, while the Digital Services Act, Regulation (EU) 2022/2065 on digital services (DSA) has introduced, for very large platforms, a framework for mitigating systemic risks associated with illegal content. In the remainder of the analysis, the term CSAM is used descriptively, while the expression "child pornography" is reserved, as far as possible, for references to the legal name of the offence [2; 3; 4; 5; 20].

In this field, digital evidence, the chain of custody, the standardisation of technical operations, and international cooperation are defining elements of the investigation. From a criminalistic perspective, this means that the object of the inquiry is not limited to the unlawful content, but includes the storage environment, metadata, connection logs, the chronological sequence of actions, and the correlation between accounts, devices, and users, while also taking into account the connection between the special surveillance methods used Europol, Eurojust, INTERPOL cooperation, and the need for protected interviewing of the child victim. The competence to investigate child pornography offences (Article 374 of the Criminal Code) belongs exclusively to the Directorate for Investigating Organised Crime and Terrorism (DIICOT) prosecutor, who usually involves specialised judicial police officers from the Romanian Police structures (Directorate for Combating Organised Crime (DCCO) and Brigade(s) for Combating Organised Crime (BCCO), as applicable) for investigative and examination activities.

The criminalistic investigation of these offences may involve a high degree of complexity and cannot be reduced to a single act, such as seizing a mobile phone or obtaining an IP address. It is, in reality, an evidentiary construction combining the legal component, which legitimises the evidentiary means; the technical component, which makes it possible

to extract and analyse computer data; the operational component, which uses the data in a timely manner; and the victimological component, which involves observing the procedure necessary to protect the child and avoid secondary victimisation. Where one of these components is missing, the investigation becomes fragile: either the evidence becomes contestable, the offender remains unidentified, or the child is revictimised [4, Art. 111, 124, 168].

1.1. Practical Difficulties in Identifying Offenders. The first major difficulty specific to these cases is that digital identity must be associated with physical identity. The offender may use false profiles, temporary accounts, virtual numbers, disposable e-mail addresses, Virtual Private Networks (VPNs), proxies, Tor networks, or compromised devices. The offender may also operate through stolen identities, using the real accounts of other persons to create a false trail and to shift suspicion onto a third party. Under these conditions, a conclusion based exclusively on the profile name, account photograph, or even the subscriber of a connection is methodologically precarious. [16; 17, p. 5-6].

The official policies of platforms reveal the structural limits of identification. X specifies that it does not require users to use their real names and that non-public information is disclosed only on the basis of an appropriate legal process or an emergency request. Meta operates through a dedicated request system for law enforcement authorities and examines requests individually through a specialised team. The practical consequence is that judicial authorities do not receive "the identity of the offender", but a set of raw or only partially correlated data: account identifiers, IP addresses, subscriber data, authentication logs, and possibly device data. The investigation must then transform these data into a procedural identity [15; 16]. From a criminalistic perspective, the IP address remains important, but it is never sufficient. It must be correlated with the exact time of the offence, the internet service provider, subscriber data, the seized terminal, locally found content, browser history, application artefacts, cloud data, and often the financial trail. Where the offender used Virtual Private Network (VPN) or The Onion Router (Tor), the final IP may lead only to an intermediate node. In such situations, evidentiary value shifts towards local artefacts: cache files, access histories, crypto-wallet data, saved conversations, local application databases, cloud synchronisations, and evidence of logins to accounts [4, Art. 168; 10, pp. 14, 44-46].

In addition, identifying the offender also requires a behavioural reading. A false account is not entirely "authorless"; it produces a style of interaction, a selection of platforms, an activity schedule, recurring linguistic formulas, targeting preferences, and payment patterns. Therefore, analytical units must combine technical data with content analysis, Open Source Intelligence (OSINT), and, where applicable, comparisons between several suspicious accounts. In cases of blackmail associated with compromising images or grooming, for example, the same approach formula, the same type of bait photograph, the same sequence of requests, and the same wallet address may reveal the offender's identity, even if each account appears autonomous [10, pp. 6, 29; 12].

1.2. The Central Role of Computer Searches. In many cases, the true evidentiary turning point is the computer search. Under the Criminal Procedure Code, it is "the procedure of examining, discovering, identifying, and collecting evidence stored in a computer system or on a storage medium, carried out by technical means and procedures capable of ensuring the integrity of the information". In cases involving minors, the heightened relevance of the computer search derives not only from the volume of data, but also from the need to separate strictly the information useful to the investigation from the broad mass of sensitive data belonging to the child and the child's family [1; 4; 6].

Improving computer searches should not be reduced to the acquisition of equipment. In cases concerning Child Sexual Abuse Material (CSAM), evidentiary value does

not automatically result from the mere existence or discovery of files after extraction. In practice, defendants often invoke accidental access to the materials or the absence of effective control over the data, in the context of having incidentally opened unsolicited materials. From this perspective, post-extraction analysis becomes essential: for the formulation of the accusation, it is relevant for the evidence to show whether the materials were requested by the defendant, whether they were accessed repeatedly, whether they were downloaded and/or archived in a coherent structure, whether they were protected by passwords or other additional measures, whether payments or patrimonial benefits associated with access existed, and whether there was subsequent distribution to other accounts, devices, or users [4; 10].

Consequently, the relevance of forensic software lies especially in its capacity to organise and interpret data after extraction: indexing, timeline reconstruction, correlating local artefacts with access logs, identifying deleted files, browsing history, cloud synchronisations, virtual wallets, conversations, and metadata. Equally important is the manner in which investigating officers present their conclusions in the report on the analysis of data: it must clearly indicate the source of the data, the method used to preserve integrity, the tools used, the analytical path followed, the elements supporting the deliberate nature of access, and the inherent limits of interpretation. A precise and intelligible report transforms technical findings into valid judicial evidence and reduces the risk that the analysis will be perceived as a mere listing or enumeration of files [4; 10].

1.3. Special Surveillance Methods and the Contribution of Information Analysis Units. The computer search is not the only relevant instrument. In many situations, identifying the offender or documenting criminal activity requires resorting to special surveillance methods. The Criminal Procedure Code includes, within the scope of technical surveillance, the interception of communications, access to a computer system, and other procedures suitable for certain serious offences, while Article 148 regulates the use of undercover investigators, including in the digital environment [4, Arts. 138, 148]. In cases of grooming, distribution of materials depicting child sexual abuse (CSAM – Child Sexual Abuse Material in specialised literature), or access to closed forums, the use of an online investigator may be decisive. Nevertheless, in such cases, the line between documenting an offence and provoking it must be treated with the utmost caution. The investigator may not replace the offender and may not artificially create the criminal intent, but may only document an activity already taking shape or gain access to a criminal circuit in order to map it evidentially. From a tactical point of view, maximum usefulness is achieved when the data obtained through undercover investigation are corroborated with the results of computer searches and with data provided by platforms or operators [1; 4, Art. 148].

The modern investigation of the online exploitation of children is too broad to rely exclusively on the work of the undercover investigator or of a single investigator. The number of reports, the volume of files, the number of accounts, the variety of platforms, and the speed with which offenders migrate between applications require the contribution of specialised information analysis structures. Their role is to transform dispersed data by centralising and interpreting them. Interpretation may concern practical aspects necessary to prove the criminal activity: identifying associated accounts, mapping links between users, extracting Open Source Intelligence (OSINT) indicators, comparing hashes, prioritising urgent cases, and integrating financial components into the risk model [10, pp. 6, 44-46; 13].

The scale of the phenomenon explains why, without such units, investigations are overwhelmed numerically. National Center for Missing & Exploited Children (NCMEC) states that in 2024 the CyberTipline received 20.5 million reports, of which 20.3 million

came from electronic service providers. The published data also indicate approximately 546,000 reports concerning the online solicitation of minors for sexual purposes, a major increase compared with previous years, more than 51,000 reports of urgent or imminent danger, and the fact that only ten providers generated more than 95% of reports. These figures demonstrate that the selection, prioritisation, and integrated analysis of data are indispensable [11, p. 1; 12].

In addition, INTERPOL explicitly describes victim identification as an activity involving the detailed analysis of images and videos in order to locate and rescue children, in which investigators often start from digital evidence and retrospectively reconstruct the scene, the context, and the identity of the victim. The International Child Sexual Exploitation database (ICSE) uses comparison software and information exchange and, according to data published by INTERPOL, has already contributed to the identification of a very large number of victims and offenders. Therefore, content analysis serves not only an incriminating purpose, but also an immediate protective purpose: identifying and removing the child from the abusive situation [13; 14].

Realistically, a considerable part of the relevant data is held by private platforms. Facebook and Instagram operate within the Meta ecosystem, where requests from judicial authorities are submitted through the Law Enforcement Online Request System and are examined individually by a specialised team. X has its own law enforcement guidelines and discloses non-public data only on the basis of valid legal requests or justified emergencies. An effective investigation must therefore know not only "what data it wants", but also how to formulate the request procedurally: preservation requests, requests for subscriber data, logs, content, emergency disclosure of information, or data associated with other identifiers [15; 16].

In relation to electronic communications operators, the role is different but equally important. Vodafone's transparency report shows that law enforcement authorities use communications data such as the IP address, telephone number, time, duration, location, and subscriber data to investigate serious offences, while interception of content is reserved for the most intrusive cases and must be subject to strict laws and judicial oversight. This means that, in an investigation involving minors, the operator rarely provides the "solution", but offers evidentiary links essential for establishing the user, the timing, and the digital mobility of the offender [17, pp. 5-6].

For Romania, market coordinates must be updated: Orange completed its merger with Orange Romania Communications on 1 June 2024, and, from 1 October 2025, Telekom Romania Mobile became a company majority-controlled by Vodafone Romania. From a practical perspective, this means that the institutional relationship with the "large operators" must be conceived according to the current structure of the market and the existing operational channels, not according to historical names used reflexively [18; 19].

From this perspective, the modern investigation requires public laboratory capabilities that combine secure collection, rapid triage, correlation of logs, content analysis, and standardised evidentiary reporting. In the absence of these capabilities, the large volume of data and the volatility of the online environment may turn even extracted information into a resource that is insufficiently used or difficult to translate into judicial evidence.

1.4. Tactics for Interviewing the Child Victim. Interviewing the child victim is probably the most delicate procedural act in these cases. The Criminal Procedure Code provides that when the injured person is a minor, the interview is recorded by audio or audio-video means in all cases and, if this is not possible, the reason must be recorded. In addition, the interview must be conducted immediately or without unjustified delay. For a

minor witness under the age of 14, the interview takes place, in principle, in the presence of the parent, guardian, or the person or institution to whom the minor has been entrusted; if there are suspicions of influence or a conflict of interest, the representative of the competent authority or another appropriate person takes part, and, if the judicial authority considers it necessary, a psychologist may be present. The law expressly requires that the interview must not produce negative effects on the child's psychological condition [4, Art. 111 para. 8-9, Art. 124].

Normatively, these safeguards are correct; in practice, they may become sources of additional pressure if the procedure is not organised properly. Tactics for interviewing the child victim show that open questions, an appropriate rapport with the minor, avoidance of suggestion, and the limitation of duplicative interviews increase both the quality of information and the psychological protection of the child. The best-practice guide on child interviewing prepared by the United States authorities, as well as models based on the National Institute of Child Health and Human Development protocol (NICHD), emphasise that the minor should not be required to relive the traumatic experience several times merely because procedures are not sufficiently well organised [21].

The interview should be conducted as early as possible, in a safe setting adapted to the child, by a trained person, with as few interviews as possible and, as far as possible, by using audio-video recording in order to avoid unnecessarily repeating the statement. The Council of Europe Guidelines on child-friendly justice and the Barnahus model point in the same direction: coordinated, multidisciplinary, and child-friendly intervention reduces the risk of secondary victimisation and, at the same time, improves the quality of evidence [22; 23].

In this logic, the case law of the European Court of Human Rights is instructive. In S.N. v. Sweden, the Court analysed the use of the video interview of a minor in the context of defence guarantees, confirming the relevance of such a procedural solution when the requirements of a fair trial are maintained [8].

Even clearer is B v. Russia, in which the Court held that the repeated interviewing of the child, direct contact with the offenders, and the lack of appropriate procedural adaptations generated severe trauma and led to a finding of a violation of Article 3. The Court's press release mentions 12 interviews over a period of one year and seven months, the loss of the first video recording, and the absence of sufficient measures to minimise the number of interviews and adapt the procedure to the status of a child victim. This judgment shows that "more procedure" does not necessarily mean "more protection"; sometimes, the repetition of criminal investigation acts is itself a factor of secondary victimisation [9].

In conclusion, the tactics for interviewing the child victim should follow three rules: uniqueness as far as possible, specialisation of the interviewer, and intelligent use of audio-video recording. The aim is not only to protect the child, but also to ensure the quality of the evidence: a statement taken once, in an appropriate setting, is often more faithful and more useful evidentially than four or five partially inconsistent statements obtained under institutional pressure [4, Arts. 111, 124; 9].

The protection of the minor victim is not limited to the interview. The Criminal Procedure Code also allows other protective measures, and in the case of threatened witnesses solutions may be ordered such as surveillance of the home, protection of identity data, or audio-video interviewing with distortion of the image and voice. Even though not all these measures apply automatically to every child victim, their existence shows that the procedural system can be made flexible in order to limit the child's exposure and the risk of intimidation [4, Arts. 113, 126]. At the same time, the investigation must remain compatible with the right of defence. This is precisely where the procedural ten-

sion arises: how can the child are protected without compromising the defence's ability to challenge the evidence? The answer is not the direct confrontation of the child with the defendant, but an evidentiary architecture involving diverse means: video interview, the possibility of formulating questions through the magistrate or specialist, the use of a single high-quality interview, and corroboration with digital evidence, platform data, and financial elements. The stronger the technical evidence, the less pressure is placed on the child's statement [8; 10, pp. 29, 44-46].

One of the most difficult and most important missions of the investigation is to identify minor victims from files discovered during computer searches. In these cases, the investigation seeks not only to establish guilt for possession, distribution, or production of Child Sexual Abuse Material (CSAM), but also to ensure the effective rescue of a child who may be in an ongoing abusive situation. For this reason, the criminalistics of image and context becomes essential [13]. The meticulous analysis of the background, objects, inscriptions, reflections, ambient sounds, accent or spoken language, the time zone inferred from metadata, camera characteristics, clothing, furniture, and other markers may contribute to the identification process. Each element may function as a vector of localisation. In parallel, hash comparison and dedicated international databases are used, especially International Child Sexual Exploitation database (ICSE), which make it possible to connect new files to already known series or to previous investigations [13; 14]. It must be observed that victim identification follows a different logic from offender identification. While the offender may be proven by correlating accounts, devices, and financial flows, the victim is often identified through the "background" details of the material and through international content comparison. This justifies the existence of specialised units and permanent cooperation with INTERPOL or other structures with similar responsibilities. Treating the analysis of files merely as an activity of criminal inventory means losing sight of their rescue function [13; 14].

1.5. Identifying the Financial Flows Connected to Sexual Online Exploitation. In recent years, financial investigation has become an indispensable pillar in cases of online sexual exploitation of children. Financial Action Task Force (FATF) expressly states that understanding financial flows may help link online child sexual exploitation transactions to offenders and victims and may support investigative strategies, reducing dependence on the victim's testimony. The better developed the financial evidence is, the less need there is to "extract" additional details from the child [10, pp. 6, 29].

The FATF report identifies a variety of relevant payment channels: bank transfers, money transfer services, online P2P platforms, PayPal-type services, and gift cards. It also indicates a series of risk indicators, such as uncharacteristic use of P2P accounts, frequent purchases of digital gift cards, repeated transfers of small amounts, and the use of virtual assets to create an additional level of perceived anonymity [10, pp. 14, 44-46].

In cases concerning paid access to files, private groups, livestreams, darknet forums, or P2P ecosystems, the "follow the money" approach must be applied from the beginning of the investigation, not only at its end. This means identifying wallet addresses, screenshots of transactions, confirmation e-mails, installed financial applications, exported CSV files, photographed seed phrases or private keys, and correspondence between payments and files. In many cases, financial data are the bridge linking the digital pseudonym to the physical person [10, pp. 29, 44-46].

Moreover, FATF notes that approaches based on financial intelligence and the interception or detection of payments have led directly to the identification and protection of victims and may reduce the need to obtain additional details by re-interviewing the child. This is one of the strongest justifications for integrating financial analysis into the core of the investigation, rather than placing it at the periphery [10, p. 29].

P2P networks and darknet forums amplify the classic investigative difficulties. In these environments, distribution may be fragmented, decentralised, and sometimes separated from the payment component. A user may share files through one network and receive payment through an entirely different channel, including cryptocurrencies or external P2P systems. For this reason, the investigation must go beyond the linear logic of "account–file–offender" and operate with more complex models: multiple accounts, different platforms, anonymised infrastructures, and indirect payments [10, pp. 14, 44-46]. In practice, useful evidence is often dispersed: a wallet address in a chat, an alias on a forum, the same nickname in a gaming application, a local folder containing payment screenshots, an exported contact list, a note with passwords, or a browser profile preserving cookies and logins. A high-performing computer search must therefore be conceived and executed as a relational search: the investigator looks for connections between sources, not just isolated digital objects [4, Art. 168; 10, pp. 44-46].

II. Recent Normative, Jurisprudential and Doctrinal Landmarks. At the normative level, the centre of gravity of criminalisation in Romanian law is represented by the provisions of the Criminal Code concerning sexual acts with minors, sexual corruption of minors, recruitment of minors for sexual purposes, and child pornography. With regard to Article 374 of the Criminal Code, it should be observed that successive legislative interventions, including those made by Government Emergency Ordinance No.18/2016, have expanded the modes of commission and have emphasised the need for a systemic interpretation of the text in relation to the digital realities of the distribution and making available of unlawful content [5; 32].

At the procedural level, an essential role is played by Article 138 of the Criminal Procedure Code on technical surveillance, Article 148 on undercover investigators, Article 168 on computer searches, Article 111 on the rights and interviewing of the injured person, Article 124 on interviewing the minor witness, and Article 126 on protective measures for threatened witnesses. Together, they create the procedural architecture necessary both for obtaining digital evidence and for protecting the child during the investigation [4].

At European level, Directive 2011/93/EU remains the basic instrument for standardising the criminalisation of sexual abuse of children, sexual exploitation, and child pornography, including the online solicitation of children. In relation to platforms, Regulation (EU) 2022/2065 (DSA) imposes obligations to assess and mitigate risks and strengthens the response framework for illegal content with systemic impact [2; 3].

The current analysis cannot ignore the amendments made to the Criminal Code by Law No.217/2023, which entered into force, in the form relevant to this field, on 1 January 2024 and was subsequently adjusted by Law No.424/2023. The declared purpose of the legislative intervention was to strengthen the protection of minors against sexual abuse, but recent doctrine has noted that the new normative architecture generated difficulties of interpretation and application, including overlaps, debatable solutions for legal classification, and legislative drafting choices regarded as confusing or difficult to apply. In the vicinity of this issue is Law No.171/2023 on the unlawful disclosure of intimate images, useful as a delimiting reference, but distinct from the special regime governing acts involving minors and materials depicting child sexual abuse [26; 27; 28; 29; 30; 31].

The case law of the European Court of Human Rights provides particularly important principles. In K.U. v. Finland, the Court emphasised the State's obligation to ensure a framework enabling the identification of the author of an online-facilitated sexual assault against a minor. In S.N. v. Sweden and B v. Russia, the Court showed, from complementary perspectives, that child protection and the requirements of a fair trial are not incompatible, but the procedure must be designed so as to avoid repeated interviews

and secondary trauma [7; 8; 9].

Article 374 of the Criminal Code still raises difficulties of interpretation, especially in relation to other offences and to new forms of commission in the digital environment. Both the meaning of paragraph (1^1) and the extent to which the expression "making available, in any manner" may also cover situations encountered in metaverse-type virtual spaces (virtual places where content may be displayed, transmitted, exchanged, or made available to others) are debated. These discussions are of practical importance because they influence both the legal classification and the digital evidence that must be identified and analysed [24; 25; 32].

III. Limits of the Study and Proposal for Good Practices. This study primarily uses public normative, doctrinal, jurisprudential, and institutional sources, without relying on specific criminal case files or non-public operational databases. For this reason, the analysis cannot replace the particularities of each investigation and cannot exhaust the technological dynamics of platforms, applications, and anonymisation tools, which change rapidly and require constant updating.

As institutional good practices, at least five directions are necessary: the standardisation of preservation and data disclosure requests addressed to platforms and operators; the development of uniform protocols for post-extraction analysis and for drafting technical reports; the consolidation of child-friendly interview rooms and teams, inspired by the Barnahus model; the early integration of financial analysis in online sexual exploitation cases; and the continuous training of investigators in Open Source Intelligence (OSINT), digital forensics, and the protection of minor victims [10; 21; 22; 23].

Conclusions. The criminalistic investigation of offences directed against children in the online environment can no longer be conceived as a simple digital extension of the classic criminal investigation. It presupposes a paradigm shift in which the object of the inquiry is no longer only the completed act, but also the technical infrastructure, the data trail, the network of accounts, the financial ecosystem, and the mechanisms for protecting the child within the procedure. In these cases, the success of the investigation depends on the ability to build bridges between law and technology: the warrant must be precise, the extraction must be verifiable, the analysis must be intelligible, and the correlation of evidence must go beyond the intuitive level [4; 10].

The difficulty of identifying offenders is structural and will increase as anonymisation, compromised identities, VPN/Tor infrastructures, and platform fragmentation become more accessible. Therefore, an effective investigation should not absolutise either the IP address or the digital profile, but should operate through corroboration: platform data, subscriber data, local artefacts, Open Source Intelligence (OSINT), victim identification, and financial traces [10; 15; 16; 17].

Equally, cases involving minors require a procedure that does not turn protection into trauma. Audio-video recording, early interviewing, avoidance of repeated interviews, specialisation of interviewers, and the use of a victim-based approach grounded in the best interests of the child are not only humanitarian requirements, but also conditions for better evidence. European case law confirms this, and Romanian law already provides an important basis, which must, however, be supported institutionally through specialised rooms, equipment, protocols, and training [4; 8; 9].

Finally, a mature investigation in this field must systematically introduce both the financial component and the rigorous analysis of data after extraction. "Follow the money" and the contextual interpretation of digital artefacts reduce exclusive dependence on the victim's statement, counter simplistic defences concerning accidental access to materials, and allow a more accurate legal classification of the conduct under investigation. The

best investigation of online offences against children is one that manages to be simultaneously technically high-performing, legally robust, and humanly minimally invasive for the child victim [10; 13].

ORGANIZATIONAL AND TACTICAL PRINCIPLES OF FORENSIC PROTECTION FOR COMBATING CRIMES AGAINST THE BASIS OF NATIONAL SECURITY

Anastasiia VUIMA,
PhD, Associate Professor,
Department of Criminalistics and Forensic Science,
Educational and Research Institute № 1,
Kharkiv National University of Internal Affairs,
Ukraine
ORCID: 0000-0002-6215-5361

Abstract

The article examines the concept, system, and forensic support for the investigation of crimes against the foundations of Ukraine's national security. It is determined that such crimes are among the most socially dangerous categories of criminal offenses, as they encroach on state sovereignty, territorial integrity, the constitutional order, defense capability, and the state's economic and information security. The classification of crimes against the foundations of Ukraine's national security is analyzed, and the main groups of such encroachments are characterized by their direct object.

Special attention is paid to forensic support for the investigation of these crimes. It is substantiated that forensic support includes a system of forensic knowledge, personnel training, technical and forensic means, tactical techniques, methods, and information and reference resources. It is emphasized that effective investigation of crimes against the foundations of national security is impossible without the use of modern digital technologies, forensic examinations, international cooperation, and proper interagency interaction.

The article also identifies the main problems of forensic support, including: the lack of scientifically sound methods for investigating such crimes, insufficiently developed tactical recommendations, lack of modern technical equipment, difficulty in accessing information located on the territory of the aggressor state, and a high level of resistance to the activities of pre-trial investigation bodies. The conclusion is that there is a need for further development of forensic methods, improvement of technical support, and accumulation of empirical material and judicial practice. It is especially emphasized that Ukraine's experience in this area is of important international importance and can be used by other states to counter modern threats to national security.

Keywords: national security, forensic support, treason, collaborative activities, pre-trial investigation, tactical support, technical and forensic support.

PRINCIPII ORGANIZATORICE ȘI TACTICE ALE ASIGURĂRII CRIMINALISTICE ÎN COMBATEREA INFRACȚIUNILOR ÎMPOTRIVA FUNDAMENTELOR SECURITĂȚII NAȚIONALE

Abstract

Articolul examinează conceptul, sistemul și suportul criminalistic pentru investigarea infracțiunilor împotriva fundamentelor securității naționale a Ucrainei. Se stabilește că astfel de infracțiuni se numără printre cele mai periculoase categorii de fapte penale din punct de vedere social, deoarece aduc atingere suveranității statului, integrității teritoriale, ordinii constituționale, capacității de apărare, precum și securității economice și informaționale a statului. Este analizată clasificarea infracțiunilor împotriva fundamentelor securității naționale a Ucrainei, iar principalele grupuri ale acestor atentate sunt caracterizate în funcție de obiectul lor direct.

O atenție specială este acordată suportului criminalistic pentru investigarea acestor infracțiuni. Se argumentează că suportul criminalistic include un sistem de cunoștințe criminalistice, pregătirea personalului, mijloace tehnico-criminalistice, tehnici tactice, metode, precum și resurse informaționale și de referință. Se subliniază că investigarea eficientă a infracțiunilor împotriva fundamentelor securității naționale este impo-

sibilă fără utilizarea tehnologiilor digitale moderne, a expertizelor criminalistice, a cooperării internaționale și a unei interacțiuni interinstituționale corespunzătoare.

Autorul identifică, de asemenea, principalele probleme ale suportului criminalistic, inclusiv: lipsa unor metode fundamentate științific pentru investigarea acestor infracțiuni, recomandări tactice insuficient dezvoltate, lipsa echipamentelor tehnice moderne, dificultatea accesului la informațiile aflate pe teritoriul statului agresor și nivelul ridicat de rezistență față de activitatea organelor de urmărire penală. Se concluzionează că este necesară dezvoltarea în continuare a metodelor criminalistice, îmbunătățirea suportului tehnic, precum și acumularea de material empiric și practică judiciară. Se subliniază în mod deosebit că experiența Ucrainei în acest domeniu are o importanță internațională majoră și poate fi utilizată de alte state pentru a contracara amenințările moderne la adresa securității naționale.

Cuvinte-cheie: securitate națională, suport criminalistic, trădare de stat, activități colaborationiste, urmărire penală, suport tactic, suport tehnico-criminalistic.

Introduction. The protection of the state's sovereignty and territorial integrity, and the ensuring of its economic and information security, are the basic tasks of any state. National security is defined as the protection of Ukraine's state sovereignty, territorial integrity, democratic constitutional order, and other national interests from real and potential threats. In turn, the national interests of Ukraine are the vital interests of man, society, and the state, the realisation of which ensures the state sovereignty of Ukraine, its progressive democratic development, as well as safe living conditions and the well-being of its citizens [1]. To protect national interests, the state's military formations and law enforcement agencies are involved.

All illegal acts related to encroachments on national interests constitute crimes against the foundations of national security. Crimes against the foundations of national security of Ukraine are socially dangerous, illegal, culpable, and punishable acts that cause harm or create a threat of such harm to the security of the state in the domestic, foreign, military, economic, environmental, and other spheres of the functioning of national security, committed by the subject of the crime [2, p. 20].

The system of crimes that encroach on national security in Ukraine is divided into seven main groups by the direct object (subject of the encroachment). The first group includes crimes against the security of the constitutional order and territorial integrity of the state, namely: actions aimed at forcibly changing or overthrowing the constitutional order or seizing state power (Article 109 Criminal Code of Ukraine), encroachment on the territorial integrity and inviolability of Ukraine (Article 110 CC of Ukraine), financing of actions committed with the aim of changing the boundaries of the territory or state border of Ukraine (Article 110-2 CC of Ukraine), high treason (Article 111 CC of Ukraine), espionage (Article 114 CC of Ukraine), as well as obstruction of the lawful activities of the Armed Forces of Ukraine and other military formations during a special period (Article 114-1 Criminal Code of Ukraine).

The second group consists of crimes against the state's human, economic, defense, and environmental potential. This primarily concerns sabotage (Article 113 Criminal Code of Ukraine), which may consist of committing explosions, arson, and other actions aimed at the mass destruction of people, causing damage to critical infrastructure, defense capabilities, the economy, or the environment. The third group comprises crimes that pose a threat to state security in the information sphere. These include disclosure of state secrets (Article 328 Criminal Code of Ukraine), loss of documents containing state secrets (Article 329 Criminal Code of Ukraine), transfer or collection of information constituting official information collected in the process of operational-search, counterintelligence activities or in the field of national defense (Article 330 Criminal Code of Ukraine), as well as disclosure of information of a military nature or loss of documents containing such

information (Article 422 Criminal Code of Ukraine).

The fourth group comprises crimes that undermine the state's security in the political sphere. Among them: encroachment on the life of a state or public figure (Article 112 CC of Ukraine), interference in the activities of a state figure (Article 344 CC of Ukraine), threat or violence against a state or public figure (Article 346 CC of Ukraine), as well as obstruction of the activities of a people's deputy of Ukraine or a deputy of a local council (Article 351 CC of Ukraine).

The fifth group consists of crimes against the state's external sovereignty. These include attempts on the life of a representative of a foreign state (Article 443 Criminal Code of Ukraine) and crimes against persons and institutions enjoying international protection (Article 444 Criminal Code of Ukraine). The sixth group consists of crimes against the stability of the state's budgetary and financial system, as an important component of economic security. These include the manufacture, storage, purchase, transportation, shipment, import into Ukraine for the purpose of use in the sale of goods, sale of counterfeit money, government securities or state lottery tickets (Article 199 Criminal Code of Ukraine), misuse of budget funds (Article 210 Criminal Code of Ukraine), issuance of regulatory legal acts that reduce budget revenues or increase budget expenditures contrary to the law (Article 211 Criminal Code of Ukraine), evasion of taxes, fees and other mandatory payments (Article 212 Criminal Code of Ukraine), illegal manufacture, counterfeiting, use or sale of excise tax stamps or control stamps (Article 216 Criminal Code of Ukraine), as well as fraud with financial resources (Article 222 Criminal Code of Ukraine).

The seventh group comprises crimes against the fulfillment by citizens of Ukraine of their constitutional duty to protect the state and against the established procedure for performing military service. These include, in particular, evasion of conscription for military service (Article 335 Criminal Code of Ukraine), evasion of conscription during mobilization (Article 336 Criminal Code of Ukraine), evasion of military registration or training (Article 337 Criminal Code of Ukraine), disobedience (Article 402 Criminal Code of Ukraine), failure to comply with an order (Article 403 Criminal Code of Ukraine), resistance to a superior or forcing him to violate his official duties (Article 404 Criminal Code of Ukraine), threat or violence against a superior (Article 405 Criminal Code of Ukraine), violation of the statutory rules of relations between servicemen (Article 406 Criminal Code of Ukraine), unauthorized abandonment of a military unit or place of service (Article 407 Criminal Code of Ukraine), desertion (Article 408 Criminal Code of Ukraine), evasion of military service by self-mutilation or in another way (Article 409 Criminal Code of Ukraine), disclosure of military secrets or loss of documents containing such information (Article 422 Criminal Code of Ukraine), negligent attitude to military service (Article 425 Criminal Code of Ukraine), surrender or abandonment of means of warfare to the enemy (Article 427 Criminal Code of Ukraine), unauthorized abandonment of the battlefield or refusal to use weapons (Article 429 Criminal Code of Ukraine), voluntary surrender into captivity (Article 430 Criminal Code of Ukraine), and criminal actions of a serviceman who is in captivity (Article 431 Criminal Code of Ukraine) [3, p. 10-11].

The systematization of crimes is based on various indicators that differentiate crimes threatening the state's internal and external security. Establishing precise criteria enables us to clearly distinguish crimes against national security from other crimes. The presence of a set of criteria allows crimes against national security to be divided into two types: those that encroach on external and internal security. It is considered necessary to group crimes against the foundations of national security into blocks according to the scope of encroachment [4].

Crimes against the foundations of national security are socially dangerous actions (actions or inactions) committed with the direct content of the subject of the crime and encroaching on state sovereignty, territorial integrity, democratic constitutional order and other national interests of Ukraine; the criteria for classifying crimes against the foundations of national security are the subject of the crime, the object of criminal law protection, the direct object, and the scope of application.

The legislative consolidation of crimes against the foundations of national security in Section I of the Criminal Procedure Code of Ukraine is recognized as appropriate due to their greatest social danger. Scientists express positions that it is possible to group crimes against the foundations of national security in certain blocks, such as crimes related to the intelligence and subversive activities of foreign intelligence agencies; crimes that encroach on the territorial integrity and sovereignty of the state; crimes that encroach on the economic sphere of Ukraine; crimes that encroach on the scientific and technical potential of Ukraine; crimes that encroach on the defense sphere of Ukraine; crimes related to the threat of corruption in state authorities and local self-government bodies; the threat of terrorist use of nuclear facilities on the territory of Ukraine; illegal import of weapons, explosives, ammunition and means of mass use into the territory of Ukraine; attempts to create and operate illegal paramilitary armed formations, etc. [5].

Representatives of the criminal law cycle indicate that the issue of criminal liability for crimes against the foundations of Ukraine's national security requires further, thorough, and detailed scientific research. This requires, among other things, the development and implementation of necessary changes to Ukraine's current criminal legislation. Therefore, it seems appropriate, primarily at the constitutional and legislative levels, to clearly define the objects of national security of Ukraine, since the current Law of Ukraine "On National Security of Ukraine" distinguishes between national and state security and focuses on the control powers of the President of Ukraine, relevant state executive bodies, and local self-government bodies (which overloads the law, since it duplicates the relevant powers contained in the Constitution of Ukraine or special laws, or those of them that could be provided for in them). It also requires the development of individual strategies, in particular the Strategy for National Security of Ukraine and others, and the development, already based on a subordinate regulatory legal act, of the Strategy for Ensuring State Security and other documents. However, there are no norms that clearly define the objects of national security of Ukraine.

In the Law of Ukraine "On the Fundamentals of National Security of Ukraine", which has lost its force, the objects of national security were: constitutional rights and freedoms of man and citizen; society, in particular its spiritual, moral and ethical, cultural, historical, intellectual and material values, information and natural environment and natural resources; as well as the state, its constitutional order, sovereignty, territorial integrity and inviolability. There was a clear definition of the national security of Ukraine. Scientists argue that this law only needs appropriate changes to obtain high-quality regulation at the legislative level of the issue of the fundamentals of national security of Ukraine. Instead, several subordinate regulatory legal acts were adopted, but there is no holistic understanding of Ukraine's national security.

O. Kovalchuk, for example, emphasizes that the legislator, starting from a clearly defined concept of national security of Ukraine and objects of national security of Ukraine at the constitutional and legislative levels, could determine the objects of crimes against the foundations of national security of Ukraine, which today pose a real threat to the national security of Ukraine. Each object of national security of Ukraine must correspond to the

object of a crime in the Criminal Code of Ukraine, for which criminal liability should be established in Section I, dedicated to crimes against the foundations of national security of Ukraine [6].

Crimes against the foundations of Ukraine's national security pose a heightened public danger, as they encroach on the state's sovereignty, territorial integrity, constitutional order, defense capability, economic stability, information security, and the proper functioning of the military sphere. Effective criminal law protection of these values is key to maintaining state stability, the state's ability to counter internal and external threats, and the security of society and its citizens. Therefore, proper regulatory consolidation and systematization of crimes against the foundations of Ukraine's national security are necessary prerequisites for forming an effective mechanism for protecting the most important interests of the state.

Crimes against the foundations of Ukraine's national security constitute one of the most socially dangerous groups of criminal offenses, as they encroach on state sovereignty, territorial integrity, constitutional order, defense capability, economic security, information security, and other components of state security. Their heightened danger stems from the fact that the consequences of such acts can go far beyond harming individuals or damaging public relations and pose real threats to the state's functioning as a whole.

The analysis shows that the system of crimes against the foundations of Ukraine's national security is complex and multi-level. It includes both encroachments on the constitutional order, territorial integrity, and the state's sovereignty, and crimes that harm the state's defense, economic, information, financial, political, and military potential. Therefore, their classification should be carried out by taking into account the subject of the crime, the direct object of the encroachment, the sphere of public relations in which the harm is caused, as well as the focus of the threat - internal or external security of the state.

Of particular importance is the need to further improve legislative regulation in the field of national security protection. Today, there is a need for a clear normative definition of the objects of national security of Ukraine at the constitutional and legislative levels, which, in turn, will allow for a more consistent definition of the objects of criminal law protection and improve the system of crimes against the foundations of national security of Ukraine. It is also important to form a holistic approach to distinguishing between the concepts of national and state security, as well as to bring criminal legislation into line with modern threats associated with terrorism, hybrid aggression, cybercrime, information attacks, illegal arms trafficking, and the activities of illegal paramilitary groups, and even transnational crime, which is also considered by scientists to be a threat to national security [7].

Therefore, effective counteraction to crimes against the foundations of Ukraine's national security is possible only under the condition of a comprehensive combination of criminal law, criminological, organizational, and security measures aimed at protecting key national interests, strengthening statehood, and ensuring the stable functioning of a democratic constitutional system.

Our attention is drawn to the forensic support required for the investigation. Forensic support can be defined as a system of introducing forensic knowledge, recommendations, technical means, methods, and technologies into the practical activities of pre-trial investigation bodies aimed at the effective detection, disclosure, investigation, and prevention of crimes. In a broader sense, it encompasses both a set of scientifically developed means, conditions, and instruments, and the process of their creation, imple-

mentation, and application in specific criminal proceedings.

Forensic support is systemic and comprises several interrelated components.

The first component is forensic knowledge. These are scientific developments in forensics, covering theoretical foundations, patterns of crime mechanisms, methods of trace formation, methods of detection, fixation, extraction, research, and evaluation of evidentiary information. Forensic knowledge serves as the theoretical basis for developing practical recommendations, technical means, and investigative methods.

The second component is forensic education or personnel training. It consists of forming investigators, operational officers, prosecutors, and experts with the knowledge, skills, and abilities to apply forensic methods and techniques. Without proper training, even the most modern recommendations or technical means remain unrealized. That is why forensic education is a prerequisite for the effective functioning of the entire forensic support system.

The third component is technical and forensic support. It covers a system of technical means, scientific and technical devices, special equipment, information technologies, and methods of their application in the investigation process. It includes photographs, videos, audio recordings, methods for detecting traces, expert equipment, digital technologies, software, forensic records, and other tools that ensure the receipt, preservation, and study of evidentiary information.

The fourth component is tactical and forensic support. It consists of the development and application of tactical techniques, combinations, and operations during investigative (search) actions. Tactical support is aimed at overcoming complex investigative situations, minimizing the risk of losing evidence, ensuring effective interaction between investigative and operational units, and ensuring the proper sequence and methods for conducting procedural actions.

The fifth component is methodological and forensic support. It covers a system of specialized recommendations and algorithms for investigating certain types of crimes. Methodological support includes typical versions, investigation programs, the investigator's sequence of actions, the features of working with certain categories of evidence, as well as recommendations on the use of specialized knowledge and international cooperation [8].

Of particular importance is information support, which is sometimes considered an independent component of forensic support. It is an organized system of obtaining, accumulating, processing, storing, and using information necessary for the investigation. These include forensic records, databases, automated information systems, reference resources, international information exchange channels, and other information tools that ensure the effectiveness of the investigation. Thus, forensic support is a multi-level system that combines scientific knowledge, personnel training, technical means, tactical techniques, methodologies, and information resources aimed at the effective resolution of criminal proceedings tasks.

Forensic support for the investigation of crimes against the foundations of national security is a key tool for effective counteraction to such threats. It ensures timely detection, recording, research, and evaluation of evidence, allowing for the exposure of criminal acts that encroach on the sovereignty, territorial integrity, constitutional order, defense capability, economic and information security of the state. The peculiarity of such crimes lies in their high latency, the complexity of the mechanisms of commission, the use of modern technologies, conspiracy, the involvement of foreign entities, and transnational ties. That is why an effective investigation requires the use of specialized foren-

sic methods, digital technologies, forensic examinations, and analytical tools, as well as proper cooperation among law enforcement agencies, special services, and international partners. Without proper forensic support, such crimes may remain unsolved, and the guilty may avoid responsibility, thereby posing a real threat to national security and the stability of the state.

In the field of forensic support for the investigation of crimes against the foundations of national security, there are several serious problems today that concern almost all of its components.

First, the methodological and forensic components are problematic. Today, there are still no sufficiently developed and scientifically substantiated methods for investigating crimes against the foundations of national security, especially those committed in conditions of war, occupation, or hybrid aggression. Recommendations for the analysis of empirical material, primarily judicial practice in cases of treason, collaboration, aiding and abetting an aggressor state, justification of armed aggression, unauthorized dissemination of information about the movement of the Armed Forces of Ukraine, and other crimes of this category, are not sufficiently formed. The relevant practice is still being actively developed; therefore, there are no established approaches to building forensic characteristics, identifying typical investigative situations, presenting versions, and developing investigation algorithms.

Significant difficulties also arise in tactical and forensic support. At present, no clear, universal recommendations have been developed for documenting such crimes, conducting separate investigative (search) actions, conducting simultaneous interrogations, identification, searches, examinations of electronic media, conducting covert investigative (search) actions, etc. The peculiarity of these proceedings is that a significant number of persons who may be witnesses, victims, or suspects are in temporarily occupied territories, in the combat zone, or are traveling abroad. This creates difficulties in identifying them, summoning them, conducting procedural actions, ensuring their appearance, and recording testimony. Also difficult is the problem of documenting the activities of persons who act remotely, use anonymous accounts, VPNs, messengers, or other means to conceal their activities. Among the problems of tactical and forensic support, it is also necessary to separately highlight the high level of counteraction to the activities of pre-trial investigation bodies. In cases of crimes against the foundations of national security, such countermeasures are often organized, systematic, and premeditated. Individuals involved in these crimes may use concealment methods, forged documents, change their location, use closed communication channels, employ encryption, VPN services, and delete or hide digital information.

In addition, counteraction may manifest itself in influencing witnesses, victims, or other participants in criminal proceedings, inducing them to refuse to testify, providing false testimony, concealing physical evidence, creating fictitious alibis, discrediting investigative bodies, or spreading disinformation. The situation is especially dangerous when such counteraction is carried out with the support of foreign special services, illegal armed groups, or organized networks associated with the aggressor state.

In this regard, there is a need to develop special tactical recommendations for overcoming counteraction to the investigation, ensuring the safety of participants in criminal proceedings, rapid documentation of evidence, the use of covert investigative (search) actions, and effective interaction between investigators, operational units, and prosecutors.

No less important are the problems of technical and forensic support. In many cas-

es, law enforcement agencies do not have a sufficient amount of modern equipment and software solutions for copying, storing, decoding, and analyzing digital information. This is especially true for obtaining information from mobile phones, servers, cloud storage, instant messengers, social networks, registries, databases of mobile operators, and Internet providers. There is also a problem of a lack of technical means to restore deleted information, decrypt files, record network activity, and ensure a continuous chain of preservation of digital evidence. The situation is additionally complicated by the rapid development of digital technologies, to which the law enforcement system does not always have time to adapt.

A separate problem remains: information and reference support. In cases of crimes against the foundations of national security, there is often a need to obtain information that is located outside Ukraine or controlled by the aggressor state. This may be data on telephone connections, banking transactions, movement of persons, use of Internet resources, registration of accounts, data on the location of servers, accounts or IP addresses. Obtaining such information is extremely difficult due to the lack of cooperation with the aggressor state, the secrecy of relevant databases, the lack of international mechanisms for quick access to information, or the length of international legal assistance procedures. This significantly complicates establishing the full mechanism of the crime and proving the involvement of specific individuals.

Another problem is the insufficient coordination among investigators, prosecutors, operational units, the Security Service of Ukraine, expert institutions, and international partners. Due to the lack of unified interaction algorithms, important information may be lost, actions may be duplicated, or difficulties may arise in agreeing on an evidentiary strategy.

Thus, the main problems in forensic support are the lack of sufficiently developed methodologies, imperfect tactical recommendations, insufficient modern technical equipment, difficulties accessing information, and insufficient interdepartmental coordination. It is these areas that require the most active scientific and practical development.

Thus, crimes against the foundations of national security of Ukraine are one of the most dangerous categories of criminal offenses, as they encroach on the sovereignty of the state, its territorial integrity, constitutional order, defense capability, economic stability and information security. The peculiarity of such crimes is that their consequences go beyond harm to individuals or public relations and can create a real threat to the existence of the state, the stability of its functioning, and the ability to counteract internal and external challenges.

Conclusions. The conducted research confirms that the system of crimes against the foundations of national security is complex, multi-level in nature and covers various spheres of public relations: political, military, economic, information, financial, environmental and others. In this regard, their classification should be carried out not only according to the formal features of the crime, but also taking into account the direct object of the attack, the nature of the threat, its focus on internal or external security, as well as the peculiarities of the mechanism for committing such acts.

It has been established that effective investigation of crimes against the foundations of national security is impossible without proper forensic support, which includes a system of forensic knowledge, personnel training, technical means, tactical techniques, methods, and information and reference resources. It is forensic support that allows for timely detection, fixation, research, and assessment of evidence, as well as creating conditions for effective interaction between investigators, operational units, prosecutors, ex-

perts and international partners.

At the same time, there are a significant number of problems in the field of forensic support that require scientific understanding and practical solutions. In particular, methodological and forensic approaches to the investigation of crimes against the foundations of national security remain insufficiently developed, especially in conditions of war, occupation and hybrid aggression. There are no established methods for analyzing empirical material and judicial practice, which is only beginning to form regarding such crimes as high treason, collaboration, aiding and abetting an aggressor state, justification of armed aggression, or illegal dissemination of information about the activities of the Armed Forces of Ukraine.

The problems of tactical support also remain significant. No unified recommendations have been developed regarding the documentation of such crimes, interrogations, searches, examinations of electronic media, covert investigative (search) actions, as well as ensuring the participation of witnesses, victims, or suspects who may be in temporarily occupied territories, in the combat zone, or outside Ukraine. An additional challenge is the high level of counteraction to the activities of pre-trial investigation bodies, which is manifested in the concealment of evidence, the use of means of conspiracy, false documents, anonymous accounts, encryption, influencing witnesses, and the spread of disinformation.

An important area of improvement is technical-forensic and information-reference support. Current practice shows the insufficiency of technical means for copying, decrypting, analyzing, and storing digital information, as well as the difficulty of accessing data stored on the territory of the aggressor state or in foreign information systems. This significantly complicates the establishment of the mechanism of the crime, the identification of the persons involved, and proving their guilt.

Therefore, the further development of forensic support for the investigation of crimes against the foundations of national security should be aimed at creating specialized methods, improving tactical recommendations, developing digital technologies, strengthening interdepartmental coordination and international cooperation. Of particular importance is the accumulation and generalization of empirical material and judicial practice, which will allow the formation of more effective algorithms for documenting and proving such crimes [9].

At the same time, Ukraine's experience in the field of investigating crimes against the foundations of national security, as well as the identified gaps in forensic support, are of not only national but also international importance. In the current conditions of increasing hybrid threats, cyberattacks, information operations, terrorism and transnational crime, other states may face similar problems. That is why the Ukrainian experience, including both positive developments and identified shortcomings, can be used by other countries for the timely improvement of their own legislation, investigation methods, technical support and response systems to crimes against the foundations of national security.

Abstract

This study analyzes the role of artificial intelligence (AI) in preventing and combating crime in contemporary society, focusing on both the opportunities and associated risks. AI-based technologies are increasingly used by authorities to enhance the detection, analysis, and prevention of criminal activities. Applications such as predictive analytics, pattern recognition, biometric identification, and data-driven risk assessment have significantly improved the efficiency and speed of criminal investigations. At the same time, the use of AI raises important legal, ethical, and operational concerns. These include issues related to algorithmic bias, the transparency of decision-making processes, data protection, and the impact on fundamental rights such as privacy and the presumption of innocence. The reliability of AI-generated outcomes and accountability for their use remain central challenges in the integration of these technologies into criminal justice systems.

We argue that, although AI offers significant benefits for crime prevention and control, its implementation must be carefully regulated to ensure compliance with modern legal standards and human rights. A balanced approach is required, one that maximizes technological advantages while minimizing the risks associated with misuse or excessive reliance on AI-based systems. In essence, we consider that the effective use of AI in crime prevention and combating crime depends on achieving a balance between innovation, legal safeguards, and ethical responsibility.

Keywords: artificial intelligence (AI), forensic science, crime prevention, crime control, predictive policing, human rights.

ROLUL INTELIGENȚEI ARTIFICIALE ÎN PREVENIREA ȘI COMBATEREA CRIMINALITĂȚII: OPORTUNITĂȚI ȘI RISCURI

Abstract

Acest studiu analizează rolul inteligenței artificiale (IA) în prevenirea și combaterea criminalității în societatea contemporană, concentrându-se atât pe oportunitățile, cât și pe riscurile asociate acesteia. Tehnologiile bazate pe IA sunt utilizate din ce în ce mai frecvent de autorități pentru a îmbunătăți detectarea, analiza și prevenirea activităților infracționale. Aplicații precum analiza predictivă, recunoașterea tiparelor, identificarea biometrică și evaluarea riscurilor bazată pe date au îmbunătățit semnificativ eficiența și rapiditatea investigării infracțiunilor. În același timp, utilizarea IA ridică probleme importante de natură juridică, etică și operațională. Acestea includ aspecte legate de biasul algoritmic, transparența proceselor decizionale, protecția datelor și impactul asupra drepturilor fundamentale, precum viața privată și prezumția de nevinovăție. Fiabilitatea și responsabilitatea pentru rezultatele generate de IA rămân provocări centrale pentru integrarea acestor tehnologii în sistemele de justiție penală.

Susținem că, deși IA oferă beneficii semnificative pentru prevenirea și combaterea criminalității, implementarea sa trebuie reglementată cu atenție pentru a asigura conformitatea cu standardele juridice moderne și drepturile omului. Este necesară o abordare echilibrată, care să maximizeze avantajele tehnologice, minimizând în același timp riscurile legate de utilizarea necorespunzătoare sau dependența excesivă de sistemele bazate

pe IA. În esență, considerăm că utilizarea eficientă a IA în prevenirea și combaterea criminalității depinde de realizarea unui echilibru între inovație, garanții juridice și responsabilitate etică.

Cuvinte-cheie: inteligență artificială (IA), criminalistică, prevenirea criminalității, combaterea criminalității, poliție predictivă, drepturile omului.

Introduction. The development of Artificial Intelligence (AI) has brought previously unforeseen perspectives for human society. The directions in which AI can evolve are virtually unlimited, encompassing both beneficial and malicious uses. With regard to the commission of criminal offences, AI offers significant opportunities for offenders, who can more easily carry out fraud or cyberattacks, for example by using deepfake technology [1, p. 16]. At the same time, AI also provides enhanced capabilities in the fight against offenders. This paper focuses on the potential use of AI to improve the ways in which crime is prevented and combated. The advantages of using AI for this purpose are readily observable, such as its ability to handle very large volumes of data, which represents a major advantage in combating criminal phenomena. At the same time, however, AI also presents risks which, if not properly managed, may lead to undesirable outcomes [2]. Among the aspects that may be affected by the improper use of AI-based systems are human rights and the fairness of investigative and crime prevention processes, these being essential elements, and jeopardizing them ultimately threatens the foundations of a democratic society. In the following, we will critically analyze not only the opportunities but also the risks associated with the use of AI in crime prevention and combating criminality. Our aim is, essentially, to identify the conditions that must be met in order to use AI responsibly in the field of crime prevention and in forensic science.

Methods and materials applied. In our research approach, we used several methods, namely: the systematic literature review method, the inductive method, the deductive method, the prospective method, and the method of critical comparative analysis. The materials used consist mainly of relevant scientific studies on the use of AI in crime prevention and combating crime, as well as a series of legal acts applicable in the field of AI use. At the same time, we also analyzed several practical examples that illustrate both the opportunities and the risks of using AI in crime control activities. The use of these methods and materials was guided by three research questions: 1) what are the opportunities of using AI in crime prevention and combating crime; 2) what are the risks associated with this approach; 3) how can these risks be mitigated so that the use of AI in crime prevention and combating crime can achieve maximum efficiency. In this way, we developed a paper that is mainly theoretical in nature but grounded in factual reality, which provides validation for the conclusions drawn.

Discussions and results obtained. AI has begun to be used in a wide variety of fields, as people have become aware of the major advantages that this technology can bring. In practice, AI can be used both in everyday life and in highly specialized activities. AI offers new ways for people to communicate, analyze data, make decisions, and it is redefining the way people work [3]. Moreover, the ability of AI to analyze large volumes of data allows for improved performance in areas considered "classical" in forensic science, for example in the detection of simulated behaviour [30].

The development of AI began earlier than one might think, as the literature shows that in 1947 Alan Turing introduced the concept of what we now call AI, which he believed could develop through progress in computer programming [5]. The term "artificial intelligence" itself was introduced in 1956 by John McCarthy [3].

Before beginning the analysis of how AI can be used for crime prevention and control,

we consider it necessary to understand what AI actually means. Although there are several interpretations of this term [3], in essence, AI refers to the existence within machines of cognitive abilities specific to living beings [6]. The field of AI is highly complex and also relates to deeply human aspects such as psychology and philosophy. It is sufficient to consider the fact that AI leads us to ask what knowledge is and how it can be used, in order to understand the implications of AI in areas that, at first glance, appear to concern exclusively the analysis of human behaviour [6].

In the field of forensic science, specialists have recognized that AI can bring significant improvements to investigative activities, due to the remarkable characteristics of this technology [4]. It should be emphasized that forensic science is, essentially, an interdisciplinary field in continuous development, which has consistently adopted innovations from other sciences in order to enhance its specific investigative activities. It was therefore only natural that AI technology would be rapidly adapted for use in forensic science.

The usefulness of AI in crime prevention and combating crime derives from a range of its capabilities, such as the ability to collect and analyze large volumes of data, pattern recognition, and the very short time required to perform various types of analysis. These capabilities enable highly useful operations in crime prevention or forensic investigations, such as predictive analytics, biometric recognition and identification, ensuring the integrity of the chain of custody, detecting details that would be impossible for humans to observe, developing strategies for responding to hacking incidents, and reconstructing the timeline of cybercrimes. The use of AI in such activities allows for the anticipation of how and when offenders may act and provides significant advantages in identifying perpetrators.

At the same time, however, the use of AI for the purposes described above entails a number of risks, such as the risk of error, risks related to the opaque nature of AI systems, ethical risks, and risks concerning human rights (such as the right to privacy or the presumption of innocence).

In the following, we will provide a detailed analysis of the opportunities and associated risks present in some of the most important uses of AI in crime prevention and combating crime.

The ability of AI to collect and analyze large volumes of data enables the examination of extensive information sets in order to prevent the commission of crimes. Specifically, algorithms can analyze information derived, for example, from police reports regarding the frequency of crimes in certain areas, social media posts, geographical data, etc., in order to correlate certain events or individuals between which, at first glance, no connection appears to exist, or to identify areas or time periods in which there is an increased risk of criminal activity. In this way, criminal behaviour can essentially be anticipated, allowing for the allocation of necessary resources so that law enforcement authorities can intervene in time to prevent crimes [7].

Theoretically, such a system could function effectively in relation to offences that involve repetitive patterns or observable behaviours that generate data. This category may include street crime, such as pickpocketing or theft from vehicles, street violence, and public disorder. In such cases, AI can highlight high-risk areas, days, and time intervals, generating veritable crime maps that can be highly detailed and updated in real time. This information can be used to organize preventive patrols by law enforcement agencies in those places and at those times where the risk of criminal activity is high [8]. Other types of offences for which these AI capabilities may be effective include those committed

by organized crime, such as drug trafficking, human trafficking, and smuggling. In such cases, AI can assist in revealing hidden connections between members of organized criminal structures, for example through the monitoring of social networks [9, p. 17-18]. Cybercrime is an area in which AI can deliver particularly strong results in prevention and control, as both AI and offenders operate with natively digital data. In such cases, AI can identify attack patterns, network traffic anomalies, or suspicious behaviours, contributing significantly to countering phishing operations, ransomware, hacking, or other similar activities [10]. Another category of offences in which AI can produce important results in prevention and control is economic and financial crime, such as tax evasion, credit card fraud, insurance fraud, money laundering, etc. Specifically, AI is frequently used to detect behaviours that deviate from normal patterns, such as unusual banking transactions by a user [11].

Another benefit brought by AI, in the context of the large volume of data that must be analyzed, is the automation of repetitive processes. AI can perform preliminary checks, classify data into relevant categories, and filter data by removing information that is not relevant to a case. In this way, judicial authorities can focus their attention on activities that require the exclusive intervention of the human factor, and overall, the efficiency and speed of investigations are increased [14; 31].

However, the obvious advantages brought by AI in performing the activities mentioned above are accompanied by major risks concerning several aspects. It is important to be aware of these risks and to take them into account when assessing the outputs provided by AI, in order to effectively benefit from the opportunities offered by this technology.

The large-scale storage of data may lead to violations of the right to privacy, as guaranteed by Article 8 of the European Convention on Human Rights (ECHR). This outcome may occur if AI stores and processes data without respecting the principles of necessity and proportionality. The use of AI requires significant volumes of data in order to identify relevant patterns, and in order to fulfil its purpose, the collection of necessary information must be allowed. However, the fact that the effective functioning of AI requires very large amounts of data does not justify the indiscriminate storage and processing of data relating to all individuals. In such a scenario, it would lead to forms of mass surveillance, which is incompatible with European standards on the protection of fundamental rights [15; 16].

With regard to the data that may be stored, some are highly sensitive, such as biometric data or information concerning an individual's behaviour over time, including criminal records. The storage and indiscriminate processing of such data may lead to the permanent monitoring of individuals and their activities, which would amount to continuous mass surveillance of individuals. Moreover, the use of such data may result in behavioural profiling, which could infringe upon the presumption of innocence [17].

Data storage also entails the risk of being used for purposes other than the original one. For example, if certain information is lawfully stored for a legitimate purpose, such as crime prevention, in the absence of adequate safeguards, such data could be used for other purposes without an appropriate legal framework or without the consent of the data subject. For instance, a person's genetic data could be used for identifying an individual based on familial DNA, without that person having consented to this extended use of their genetic information [18].

Databases also represent a preferred target for cyberattacks, which means that significant data breaches may occur if appropriate protective measures are not

implemented. In practice, there is a risk that sensitive information about individuals may become public or be made available to criminal organizations. There is also the risk that information may be misused even by those responsible for protecting personal data, for example for purposes of blackmail.

Another risk associated with AI's ability to operate with large databases lies in the creation of an illusion of correctness of the generated conclusions. Because it is known that AI uses large volumes of data, there may be a perception that the outputs are objective and based on scientific grounds. In reality, however, the data may not be of high quality, may be unbalanced across different categories of individuals, geographical areas, or types of behaviour, and may reflect previous human decisions (for example, the decision to monitor a certain area more intensively may lead to the conclusion that more crimes are committed there) [2].

The ability to identify patterns through the analysis of large volumes of data represents one of the most important functions that AI can perform in crime prevention and combating criminality. As shown above, AI can simultaneously analyse data relating to different aspects (geographical, digital, temporal data, as well as data from police reports), making correlations that are difficult or even impossible for a human observer to establish [19]. For example, the analysis of communication and interaction patterns between different individuals may reveal a structure of organised crime and the roles that individuals play within such a network (whether they are leaders or occupy lower positions in the hierarchy). Thus, AI provides an in-depth understanding of the dynamics of criminal phenomena, enabling appropriate actions by authorities responsible for preventing and combating crime.

An essential outcome deriving from AI's capacity to identify patterns is that it enables a shift from reactive to preventive approaches to criminality. This means that preventive measures can be taken, as crime can be anticipated, allowing intervention before offenders carry out their intentions. This is the basis of predictive policing, which relies on data analysis to identify risks and intervene before crimes occur [7]. In this way, a form of *a priori* crime prevention is developed, prior to the commission of offences, which offers effective protection for society. Of course, there is also a preventive dimension arising from actions taken by authorities after a crime has been committed, through the sanctioning of offenders, thereby warning those who might consider committing similar acts. However, this *a posteriori* prevention implies that social order has already been harmed, and the negative consequences of the offence cannot be entirely eliminated.

The ability of AI to identify patterns allows for the optimisation of resource allocation in crime prevention activities [7]. In practice, high-risk elements can be prioritised, which means, for example, that police patrols can be efficiently deployed, thereby reducing unnecessary interventions. In this way, operational efficiency increases, while overall costs of crime prevention efforts are reduced. Optimisation also occurs in situations where an offence has already been committed, as the existence of prior data regarding the area or other circumstances related to the commission of the act allows for a faster response by judicial authorities and increases the likelihood of identifying offenders.

The effectiveness of AI in pattern recognition provides substantial support in the actual investigative process following the commission of an offence. Advantages may arise, for instance, from the fact that AI can establish correlations between seemingly unrelated pieces of evidence, which would be difficult for a human analyst to detect, especially when dealing with large volumes of information [2]. In this way, it becomes possible to identify the sequence of events related to the commission of the act and to reconstruct

the chronology of the offence. Consequently, the time required to resolve a case is reduced, and the likelihood of achieving accurate results regarding the identification and sanctioning of offenders increases.

Anomaly detection is another outcome that AI can achieve, deriving from its ability to identify patterns. By highlighting deviations from normal behaviour, indicators of criminal activity can be revealed. Such anomalies may include, for example, unusual financial transactions by individuals, suspicious behaviour in the digital environment, or any other activities that do not fit established patterns. This capability of AI is highly useful for the prevention and combating of certain categories of offences, such as fraud, cybercrime, or financial crime [19; 20].

The identification of patterns by AI also presents a number of risks. One of these risks is algorithmic bias, which can lead to discrimination. The accuracy of the outcomes obtained in pattern recognition depends heavily on how the databases are constructed. If the stored information is incomplete, distorted, or disproportionately represents certain categories of individuals, activities, etc., then the outputs generated by AI will, in practice, reflect the imbalances present in the underlying data [21]. For example, if a district of a city is more closely monitored than others, more data will be collected about that area, which may indicate that more crimes are committed there. This may lead to the conclusion that the area has a higher crime risk than other areas; in reality, however, other areas may also have a high level of risk, but no sufficient data is available for them.

An important aspect to emphasize regarding how AI identifies and analyses patterns is that this technology highlights correlations between data, rather than establishing causal relationships. Interpreting AI-generated outputs as evidence of causation may lead to the erroneous conclusion that certain patterns are predictive, in the sense that they generate a high probability of a specific outcome [22]. In this way, incorrect decisions may be made on the basis of weak statistical foundations. For example, if data show that an individual, during childhood, was involved in several conflicts with school peers, this information may be interpreted as indicating a predisposition toward violent behaviour; however, in the absence of any subsequent violent conduct, such a correlation does not support the conclusion that the individual would have a high likelihood of committing violent offences in adulthood, especially if, after childhood, that person has no history of violent acts. Such a conclusion would indicate a misuse of data and could lead to findings that are not supported by a sound statistical basis.

The identification of certain behavioural patterns in individuals may lead to labelling and stigmatization of persons and, from a legal perspective, may even result in the violation of the presumption of innocence and equality before the law [16; 17]. Such consequences may arise in situations where AI highlights that certain individuals present a high risk of committing offences (for example, if the person has previously committed several offences). These individuals may be subject to increased monitoring (thereby infringing the right to privacy) and may be regarded as suspects from the very beginning of an investigation, even if, at least at that stage, there is no evidence supporting such a hypothesis.

The aspects outlined above indicate that, in essence, the algorithms underlying AI systems may incorrectly identify certain individuals as presenting a heightened risk of being perpetrators of criminal acts, thereby generating unjustified actions by judicial authorities against these persons. In this way, criminal justice would be seriously affected in its very core element, namely the establishment of the truth.

The speed at which AI processes data, far exceeding the capabilities of a human

analyst, represents one of the greatest advantages brought by this technology. This feature directly influences the efficiency of crime prevention and forensic investigations. For example, an AI fingerprint analysis system can verify millions of fingerprints within seconds or minutes. The specialized literature highlights that human analysis of relatively small fingerprint datasets would require days or weeks [13]. By extrapolation, it can be concluded that, in the case of databases containing millions of records, an analysis performed exclusively by a human analyst would take months or even years.

The high speed of information processing significantly reduces the time required to identify patterns and establish relevant correlations, both in crime prevention and investigative activities. In terms of prevention, the rapidity of AI technology enables real-time action by competent authorities, which can prevent the commission of offences or at least limit their effects [21]. For instance, AI can detect suspicious behaviour of individuals in public spaces in real time, instantly flag fraudulent financial transactions, or identify ongoing cyberattacks. Regarding investigative activities, AI can quickly establish connections between pieces of evidence and reduce the time needed to reconstruct the chronology of an offence and identify perpetrators. In this way, the efficiency of judicial authorities' activities is increased, and the duration of case resolution is reduced.

Another effect of AI's speed of analysis is the ability to detect changes in patterns of criminal behaviour, particularly in relation to cybercrime [19]. In practice, new modes of operation can be identified in a timely manner, which allows for the adoption of preventive strategies in response to emerging criminal patterns.

Moreover, the high speed at which AI operates contributes to reducing delays in decision-making in a given situation [21]. This supports the adoption of effective operational decisions, reducing response time, which is particularly crucial in critical situations requiring urgent action.

However, the high speed of information analysis also presents a number of risks. The rapid processing of data may lead to the accelerated propagation of errors (for example, the misidentification of a person as a potential offender). At the same time, correcting such errors becomes difficult once they have already been incorporated into the information flow processed by AI [23]. In addition, the fact that AI produces conclusions and predictions in very short timeframes may create pressure on law enforcement authorities, pushing them to act as quickly as possible. If AI-generated information is not properly validated, this may result in unjustified interventions (for example, traffic stops or searches). Furthermore, the continuous flow of information generated by AI may desensitize human operators, who may begin to ignore certain alerts, some of which could be highly important [24; 25].

The way AI operates, particularly technologies characterized by opacity (generically referred to as "black box" systems), represents one of the sources of AI's advantages, but at the same time generates a distinct category of risks.

Complex technologies used in AI systems that exhibit varying degrees of opacity, such as those based on deep learning, enable high performance in certain tasks, for example in pattern recognition, often surpassing the accuracy of explainable AI models. These results can be highly useful in essential forensic activities such as facial recognition, fingerprint identification, or the detection of criminal patterns [24; 27; 32].

At the same time, opaque systems enable the combined processing of different types of information (for example video, audio, and text data) [28]. In this way, subtle correlations between data can be uncovered, allowing for the development of a more complex understanding of criminal phenomena.

Also, the opacity of these technologies makes them more difficult to detect by potential offenders, which facilitates the collection of relevant data, for example in the case of crimes committed in the online environment [29].

Thus, there are a number of advantages that stem precisely from the opacity of the way AI operates. At the same time, however, this opacity also generates risks.

One of the most significant risks arises from the lack of transparency in the reasoning applied by opaque AI systems to reach a particular outcome. Specifically, this means that the way in which this type of AI generates a conclusion cannot be clearly understood by humans. Even if there is a logical process that led to a given result, this process often cannot be traced by humans for several reasons. For example, it may not be possible to determine which variables had the greatest influence, or to verify whether erroneous data or bias were involved. The difficulty in understanding how such systems function becomes evident when considering that some AI models are extremely complex, having millions or even billions of parameters, while the relationships between variables are non-linear (effects are not proportional or predictable) and interdependent (variables influence each other) [24; 26].

This difficulty in understanding how AI operates leads to the impossibility of clearly justifying the adoption of certain measures (for example, pre-trial detention) or decisions (for example, a conviction), especially when AI has played a decisive role in the decision-making process. Consequently, the individual directly affected cannot effectively challenge the measure or decision, being unable to demonstrate the existence of errors in the AI's reasoning. In this way, the transparency of judicial acts would be undermined, affecting several fundamental rights, such as the right to a fair trial (guaranteed overall by Article 6 ECHR), the presumption of innocence (Article 6(2) ECHR), the right not to be discriminated against (Article 14 ECHR), and the right to liberty and security (Article 5 ECHR).

Another risk lies in the potential reduction of critical analysis by human operators, who may develop excessive trust in AI-generated outputs, especially if, in previous similar cases, those outputs were confirmed by practical findings. At the same time, the opacity of AI makes it difficult to detect errors, bias, imbalances in datasets, or the existence of discrimination [24].

Reducing the risks associated with the use of AI is a priority in the context of ongoing debates surrounding this technology. As long as these risks persist, the benefits of AI cannot be fully realized. Measures that may be adopted for this purpose include ensuring the transparency of how AI systems operate, guaranteeing the quality and security of the data used, and establishing an appropriate legal framework that also includes rules on liability for damages caused by the use of AI.

Within the efforts aimed at mitigating the risks associated with AI, we consider that a particularly important role is played by the *European Union Regulation on Artificial Intelligence* (*Artificial Intelligence* Act), which entered into force on 1 August 2024 [33]. This instrument classifies AI applications according to their risk of causing harm into four categories: unacceptable risk, for which AI uses are prohibited (with limited, explicitly provided exceptions); high risk, which requires compliance with security, transparency, and quality requirements; limited risk, which entails only transparency obligations; and minimal risk, which is not subject to regulation. In addition to these categories, a separate category is provided for general-purpose AI systems, which must comply with transparency rules.

With regard to applications falling within the unacceptable risk category, this includes: systems that manipulate human behaviour in a way that affects an individual's

decision-making autonomy; systems that use real-time remote biometric identification in public spaces (such as facial recognition); and "social scoring" systems, through which individuals are evaluated and classified based on personal characteristics, socio-economic status, or behaviour. Exceptions, which nonetheless allow the use of AI applications within this category, concern cases where AI systems are used exclusively for military, defence, or national security purposes, as well as cases where AI systems are developed and used solely for scientific research and development purposes [33].

Conclusions. The use of AI in crime prevention and combating crime marks a significant transformation in the way authorities carry out their activities, generating both substantial opportunities and important risks. The analysis conducted highlights that the advantages of AI derive mainly from its ability to process very large volumes of data, identify complex patterns, and operate at a speed that is difficult to achieve through traditional means.

A major opportunity lies in the possibility of shifting from a reactive approach to a preventive one. Through the use of methods such as predictive analytics and anomaly detection, AI enables the anticipation of criminal behaviour and the adoption of preventive measures before offences are actually committed. This effect represents a genuine paradigm shift, contributing to an increased level of societal protection and to the enhancement of the efficiency of law enforcement activities. At the same time, the ability to identify patterns facilitates investigative work, allowing for the rapid correlation of seemingly disparate pieces of information and the reconstruction of the chronology of events within a short timeframe.

Other major opportunities arise from the speed and automation of processes. AI can perform preliminary checks, filter out irrelevant information, and classify data, significantly reducing the workload of human operators. This increased efficiency allows resources to be allocated to activities that require exclusively human judgment and contributes to the acceleration of case resolution. In addition, complex AI models, particularly those characterized by a certain degree of opacity, can achieve high levels of accuracy, especially in areas such as facial recognition or fingerprint identification.

However, the same characteristics that generate advantages may also constitute sources of risk. First, the reliance on large volumes of data raises concerns regarding the protection of privacy and the observance of the principles of necessity and proportionality. The indiscriminate storage and analysis of data may lead to forms of mass surveillance that are incompatible with European standards on fundamental rights. Moreover, if the data used are incomplete, unbalanced, or influenced by prior decisions, they may produce distorted outcomes, generating risks of discrimination and algorithmic bias.

Another sensitive issue concerns the opacity of certain AI systems. Although opacity is often associated with high performance, the inability to explain AI-generated outcomes affects transparency and the possibility of control. In a judicial context, this may have direct consequences for the right to a fair trial, including the presumption of innocence, as affected individuals may face difficulties in challenging algorithmic conclusions. Furthermore, there is a risk of excessive reliance on automated systems, which may lead to a diminished role of the human factor in the decision-making process.

The speed of data processing, while beneficial, may amplify errors and create pressure to adopt rapid decisions, sometimes insufficiently verified. In addition, the continuous flow of information may lead to the desensitization of human operators and to the overlooking of relevant signals. Last but not least, the use of AI raises issues of legal accountability, particularly in situations where decisions are influenced by opaque

systems that are difficult to audit.

Reducing these risks requires the adoption of a coherent set of technical, organizational, and legal measures. From a technical perspective, it is necessary to develop transparent and explainable systems, as well as to improve the quality and security of the data used. At the operational level, maintaining effective human oversight over relevant decisions is essential, so that AI functions as a support tool rather than an autonomous decision-maker, especially in sensitive areas. Additionally, periodic testing of systems can contribute to identifying and correcting bias or errors.

From a legal perspective, legislation plays a key role in limiting the risks associated with the use of AI. At the European Union level, the *Artificial Intelligence Regulation* (*AI Act*) establishes a risk-based approach, prohibiting certain applications considered unacceptable and imposing strict requirements on high-risk systems. It is complemented by other relevant legal instruments, such as the *European Convention on Human Rights*, contributing to ensuring a balance between technological innovation and the protection of fundamental rights.

In conclusion, AI offers valuable opportunities for the prevention and combating of criminal activity, but its use must take place within a rigorously regulated framework. It is necessary to maintain a balance between harnessing technological potential and safeguarding fundamental rights, by ensuring transparency, human oversight, and accountability in the use of these systems. Only under these conditions can AI sustainably contribute to strengthening the efficiency and legitimacy of crime prevention and enforcement mechanisms.

Abstract
The right to privacy is part of and is included in the category of fundamental rights. However, globalist transformations have emphasized the respect for the right to privacy, precisely as a necessary component in a changing society, in such a way as to impose in a state of law, in a society in full transformation, a control that guarantees this protection in balance with the interest of the state. Its polymorphic and evolutionary character necessarily highlights, within the evidentiary procedures, a balance between the protection of privacy and the legitimate interests of the state, achieved in this sense by applying the proportionality test.
In this sense, in order to respect the right, the institutions have provided as tasks, the analysis of the application method, including within the evidentiary procedures for the application of criminal law, of all actions carried out in return for the right to privacy. The notion and essence of the right to privacy precisely presents the role held within the evidentiary procedures in order to understand, protect and respect it.
Keywords: right to privacy, notion, protection, analysis, criminal procedures.

NOȚIUNEA ȘI ESENȚA DREPTULUI LA VIAȚA PRIVATĂ

Abstract
Dreptul la viața privată face parte și este inclus în categoria drepturilor fundamentale. Transformările globaliste însă au pus accent pe respectarea dreptului la viața privată, tocmai ca o componentă necesară într-o societate în schimbare, în așa mod în care să impună într-un stat de drept, într-o societate în plină transformare, un control, care să garanteze acestă protecție în echilibrul cu interesul statului. Caracterul său poliform și evolutiv evidențiază obligatoriu, în cadrul procedeelor probatorii, un echilibru însă între protecția vieții private și interesele legitime ale statului, realizat în acest sens prin aplicarea testului proporționalității.
În acest sens, pentru respectarea dreptului, instituțiile au prevăzut ca și sarcini, analiza modului de aplicare, inclusiv în cadrul procedeelor probatorii de aplicare a legii penale, a tuturor acțiunilor desfășurate în contrapartidă cu dreptul la viața privată. Noțiunea și esența dreptului la viața privată prezintă tocmai rolul deținut în cadrul procedeelor probatorii în vederea înțelegerii, protejării și respectării lui.
Cuvinte-cheie: dreptul la viața privată, noțiune, protecție, analiză, proceduri penale.

Introduction. The right to privacy is the fundamental right guaranteed to every person, which encompasses several fundamental rights, such as respect for privacy, freedom of expression, private and family life, domicile, correspondence, protection of personal data, etc. thus protecting the individual from illegal interference from, generically speaking, the state, through the authorities of state institutions, but also from other persons.

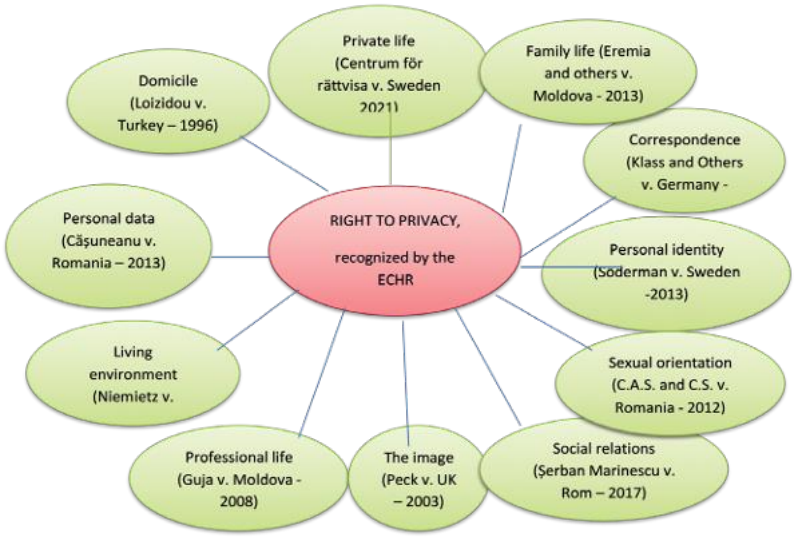
The limits of interference that guarantee the legality of the right to privacy are specified in the laws of the states, as a way of respecting them, problems arise regarding the protection of the individual as a result of the arbitrary action exercised by the state authorities.

Methods and materials applied. The research methods include the analytical method of the legislation regarding the need to protect the right to privacy and its role in its application at the national level; the logical method, from the point of view of the deduction technique, and last but not least the empirical method, by presenting the cases from the ECtHR jurisprudence.

Discussions and results obtained. The right to privacy was first explained in the Universal Declaration of Human Rights of 1948 as "the right to be left in peace", but it has evolved and perpetuated itself in a much broader concept, which could be defined as the right of an individual to be protected, primarily as a result of arbitrary action exercised by state authorities, in accordance with respect for privacy, freedom of expression, private and family life, home, correspondence, protection of personal data, etc., since, as a result of the application of criminal procedure, the right to privacy "excludes any unlawful or arbitrary interference, whether by the authorities or by third parties" [1, p. 42]. In this sense, we want to believe that privacy is a space protected by law against all external legal intrusions.

The jurisprudence of the ECHR (European Court of Human Rights) has developed one of the most influential interpretations of the right to privacy, namely Article 8 of the European Convention on Human Rights, which guarantees respect for private and family life, home and correspondence. However, the Court has constantly expanded the scope of this right, including, among others, personal identity, image, data protection, sexual orientation, living environment. For example, from the ECHR jurisprudence: the case of ***Peck v. United Kingdom*** [2] (2003), the recognition of the right to the protection of one's image against public dissemination in the event of an intrusion into private life; the case of ***Niemietz v. Germany*** [3] (1992), which includes, in addition to intimate life as a right to private life, professional life, with everything that arises in protecting it; since 1996, in the case of ***Loizidou v. Turkey*** [4] (1996), the protection of privacy has also been extended to the inviolability of the home. Also, the case of ***S. and Marper v. United Kingdom*** [5] (2008), concerns the violation of the right to privacy regarding the storage of biometric data (fingerprints, DNA), without consent.

However, the ECHR recognizes the dimensions of privacy increasingly deeply, in the sphere of influence of intimate, family, home life, correspondence, personal identity, image, sexual orientation, social relationships, personal data, professional life, living environment. The following graph illustrates this aspect:



In all areas, the right to privacy is protected by the supreme law, the Constitution of the Republic of Moldova, where Art. 28 provides that "the state respects and protects intimate, family and private life" [6], the Constitution of Romania Art. 26. [7]. However, "the notion of privacy does not lend itself to an exhaustive definition" [8, p.429]. This aspect, subscribed to in the specialized literature and doctrine, is mentioned precisely because of the various definitions. For example, the author Cristina Sâmboan [9, p.191] in her work mentioned that the right to privacy came into being in the United States when a lawyer from Boston, Samuel Warren, together with his friend Louis Brandeis, a professor at Harvard University, wrote in 1890, an essay entitled "The Right to Privacy", defining the right to privacy as "the individual's right to be left alone". In other words, the author mentions that "private life circumscribes that "zone" of existence that we want, for various and natural reasons, to be sheltered from any foreign gazes or intrusions, a domain in which we either do not let anyone "enter", or we reserve the right to select any guests" [9, p. 191]. Author Ion Cobîșenco [10, p.150] also opined about private life that it is in a stage of remodeling, closely related to the accelerated technical and scientific development based on "the main aspects that must be ensured so that the person has the right to be left alone" [10, p. 150]. In another vein, the author Iulia Butnaru focused, in understanding the notion, on the jurisprudence of the European Court of Human Rights, namely on "the right to privacy, the right to an intense life, as much as a person wants to be protected from publicity" [11, p. 183-184]. And the author Alan Westin understood by private life: "People's desire to freely choose in what circumstances and to what extent they will expose themselves, their attitude and behavior" [12, p. 2].

In the specialized literature, the right to privacy is assimilated with the individual's right to a restricted and anonymous life [13, p. 16]. Privacy in private life is also protected in such a way as to protect the individual against state interference in the application of criminal procedural norms. In this sense, the author Boris Glavan opines that "the right to privacy (...) presupposes that a citizen has the right to demand from the state positive actions aimed at ensuring the protection of this right" [14, p.238]. We are talking about reasonable and objective justifications, such as the legitimate aim, proportionality between the aim pursued and the means used.

In the application of criminal procedure, we also refer to Resolution No.428 of the Consultative Assembly of the Council of Europe, of 23 January 1970, which states: "in its essential limits, the right to respect for private life consists in the possibility for the individual to lead his life as he wishes, with a minimum of interference. This right refers to private life, family life and that of the home, to physical and moral integrity, to honour and reputation, to not being presented in a false light, to not disclosing unnecessary and embarrassing facts, to the publication without authorisation of private photographs, to protection against espionage and unjustified or inadmissible indiscretions, to protection against the misuse of private communications, to protection against confidential information communicated or received by a private individual" [15, p. 62]. In the opinion of authors Alina Săvoiu and Cătălin Căpățîne, the right to privacy represents "our right to preserve an area around us, which includes those things that are part of us, such as our home, body, feelings, secrets and identity" [16, p. 90]. The authors mention that the right to be left alone has passed into the right to control one's own data, imposing behavioral rules on all those who operate with personal data, which has allowed a concrete application of the principles of equality and social dignity [16, p. 91].

From the case law of the ECHR, it follows that interference by a public authority in the private life of a person is lawful only if it satisfies the conditions imposed by para-

graph 2 of Article 8, namely: if it was provided for by law, if it pursued one or more legitimate aims and if it was necessary in a democratic society. "The absence of a reasonable and objective justification, namely if it is not justified by a legitimate aim and if there is no reasonable relationship of proportionality between the means employed and the aim pursued" [17, p. 141], interference in private life is not only prohibited, but also sanctioned. In the sense of Article 8 of the Convention for the Protection of Human Rights and Fundamental Freedoms, states through their authorities "must act in such a way as to allow those concerned to lead a normal family life, protecting the individual from arbitrary interference by public authority." Iulia Butnaru, referring to Art. 8 of the ECHR (right to private life), argues that "a person has the right to live free from restrictions imposed by the state, that private life is superior to public life" [18, p. 3], and when restrictions are imposed on this right, they "must be clearly defined, logically justified and represent the minimum necessary to achieve the legitimate collective objective" [18, p. 3]. The same author Iulia Butnaru specifies the elements that fall within the scope of Art. 8 of the European Court's practice, namely private life: "sexual life, sexual orientation, the person's name and surname, ethnicity, image (photograph) of the person, (...), but also the collection and processing of personal data" [19, p. 145].

We ask ourselves the question, "what does it mean to be clearly defined", insofar as both Romania and the Republic of Moldova have been condemned by the ECtHR countless times, regarding the violation of the right to private life, at different stages and in different years (e.g.: Case ***Toma v. Romania*** [20], of February 24, 2009; Case ***E.M. v. Romania*** [21], of October 30, 2012; Case ***Elena Pop Blaga v. Romania*** [22], of April 10, 2012; Case ***Apostu v. Romania*** [23], of February 3, 2015; Case ***Amaradei and others v. Romania*** [24], of April 26, 2016; Case ***Buturugă v. Romania*** [25], of February 11, 2020; Case ***P. v. Romania*** [26], of December 12, 2023, etc.; Case ***Mușuc v. Moldova*** [27], of 06 February 2008; Case ***Eremia and others v. Republic of Moldova*** [28], of 28 May 2013; Case ***T.M. and C.M. v. Republic of Moldova*** [29], of 28 January 2014; Case ***Munteanu v. Republic of Moldova*** [30], of 26 May 2020, Case ***Luca v. Republic of Moldova*** [31], of 17 October 2023, etc.), however, states have the possibility of regulating the legal framework, in order to prevent other violations of the right to private life. The essence of the right to private life lies precisely in the establishment and correct application of criminal procedural measures, when there is interference in private life. Thus, as the authors A.-I. Bogdan and A.-V. Farcas, establishing an exact boundary between aspects of private life and aspects of public life, considers it a difficult task [32, p.26-27]. We can present the situation of public figures whose intimate life is exposed, the higher the prestige and the more intimate life is affected. Countless public appearances violate the right to privacy (right to one's own image and reputation) and can lead to condemnation by public opinion, before it is established by the court, which often cannot be influenced in the decision that will be issued. We can present in this regard the opinion of the author Sergiu Russu, who states that "the state has the possibility through its means and even must provide security for personal data" [33, p. 80] and not only, security with regard to all measures as a result of state interference in private life (e.g.: the case ***Căşuneanu v. Romania*** [34], of April 16, 2013).

As can be deduced from the doctrinal accounts listed above, the right to privacy consists of the person's right to dispose of himself. In the context of criminal procedural activities, hearings are usually and largely held at the headquarters of the criminal investigation body. Communication, human and vocal language can be affected due to this activity, due to the intimidation of the headquarters, office, external and internal factors, even leading to privacy being affected, as a right to privacy. Witnesses are considered impor-

tant elements in finding the truth in criminal cases, and the obligation not to record the statement in this capacity is limited. The interference between the interests of finding the truth, interference in the intimate life of witnesses, can be affected and cause violations of the right to privacy and more. In Romania, the violation of the right to privacy can also occur as a result of the recording of witness statements by criminal investigation bodies, on the occasion of which the latter typewrite the aspects presented by the witnesses. Typing is not always the expression of free will and the exact account of the declared aspects, as could happen as a result of recording statements by hand by the parties (witnesses), a procedure that gives the criminal investigation body the possibility to change the meaning of the sentence, mainly due to its interest in the matter. In such situations, we no longer find ourselves recording the statement of the person who is the subject of the hearing, being obstructed due to these means that can distort and completely change the meaning of the statement. In such circumstances, we cannot consider the statement as being that of the person who was heard, and the right to privacy is also violated due to the possibility of carrying out the activity of recording statements, by typing by the criminal investigation bodies. Freedom of expression is affected to the extent that the statement of the persons who are the subject of the hearing is typed through the filter of the criminal investigation body. In such situations, through the eyes, training and senses of the investigator, they can change the meaning of some sentences. If, during the hearing, the statements of the persons subject to the hearing were only typed by the criminal investigation bodies, we were not in a position to make changes to the statements, but procedurally, the criminal investigation bodies are the ones that, we cannot say that they only type, to the extent that the aspects presented vocally by the parties are recorded in the statements of the parties by the latter, by developing, elaborating the sentences, therefore by means of their understanding. In the situation of writing and changing the meaning of the sentences, we are in the still of the diverse string of words. The venue where the hearing is held gives the criminal investigation bodies the opportunity to observe, through the emotion created in the parties (witnesses), education, etc., the human language, in such a way as to lead to taking over of various realities that change the meaning of the truth, without abrupting the reality, which can be discovered during the hearing. The criminal investigation bodies can change the meaning of the expression, by combining the elementary meanings of the words of the parties. Although, upon completion of typing, the parties sign and record that they have read the statement recorded by the criminal investigation bodies, in most cases due to destabilizing factors, they sign without reading it. We find ourselves in such situations, with a violation of the right to privacy, through the violation method of disposing of the party themselves. E.g., the countless cases regarding the investigation of witnesses for the crime of perjury, precisely as a result of contesting the aspects recorded in the statements during the criminal investigation phase, contrary to the aspects presented to the courts. We ask ourselves why this form of recording of the parties' statements by the criminal investigation bodies is considered legal, to the extent that it can produce negative effects or why some categories of witnesses are obliged to record the statement for the cause in which they are requested. We call this obligation an intrusion into the private life of the party, in the situation where he does not want to be a party to the case, to be requested to be present at established dates and times, etc. Of course, the essence of the right to privacy is to protect the parties from violations that also affect their privacy, even through the legal intrusion of the state into their lives, by establishing procedural norms for the correct application of private life. Privacy in the criminal process must also be a component part of private life based on legality, consti-

tuting, as the authors I. Ifrim and R.O. Ionescu mention, "an essential element of the harmonious development of man" [35, p. 27].

Although the Romanian legislation provides for liability for "violation of private life", Art. 226 of the Romanian Criminal Code, it does not provide for the violation of private life as a result of the recording of different aspects of the parties by criminal investigation bodies. Similarly, according to the legislation of the Republic of Moldova, Art.177 of the Romanian Criminal Code "violation of the inviolability of personal life", amendments are necessary to regulate such a practice.

The scope of the notion of "private life", which falls within the scope of Art. 8 of the ECHR: "sexual life, sexual orientation, name and surname of the person, ethnicity, image (photograph) of the person, (...), but also the collection and processing of personal data" [19, p. 145], and in relation to Art. 28 of the Constitution of the Republic of Moldova, the CCRM mentioned that "it allows individuals to rely on their right to private life with regard to information that, although neutral, is collected, processed and disseminated" [19, p. 145].

Conclusions. The following conclusions and recommendations do not represent a mere recapitulation of the ideas developed in this paper, but rather a coherent integration of them into a unitary vision, necessary for understanding the role that the right to privacy plays in the architecture of human rights and in the application of criminal procedures.

The evolution of the right to privacy in Romania and the Republic of Moldova has diversified and has also extended to the application of criminal procedures due to the transformations and evolution generated by the digital age and beyond.

Today, privacy no longer means only the protection of privacy, domicile and correspondence, but also their defense, but also of the identity, personal data and dignity of the individual.

Regarding interference in the application of criminal procedure, the right to privacy remains a dynamic and sensitive fundamental right, between constitutional compliance, the national legislation of ROM and RM and the jurisprudence of the ECHR, being considered one of the greatest challenges of societies.

Even if it does not have a single definition, covering a set of situations, such as personal identity, dignity, reputation, family life, domicile, correspondence, personal data, privacy in the application of criminal procedures is necessary to protect the parties involved in the processes.

As recommendations, we present the following:

– Criminal procedural rules should be adapted and inspired by the ECHR jurisprudence and GDPR standards;

– Periodic training in the field, on the application of procedures, as a result of interference in private life and impact assessments on compliance with criminal procedures in accordance with private life;

– Inclusion in criminal procedural practice of clear rules on the duration, purpose, limits of interferences, on interceptions, searches, technical surveillance, mechanisms for subsequent notification not only of the persons concerned, but also of the persons who were intercepted following conversations with the person concerned, by introducing such new rights in the Criminal Procedural Code (CPC);

– Introduction of clear rules on the use of algorithms in criminal proceedings, facial recognition, biometric surveillance and protection of digital identity;

– Development of a guide to good practices in the field, on the application of crimi-

nal procedure in accordance with the respect for the right to privacy;

– Development of solid procedural guarantees regarding the respect for the right to privacy, as a result of the application of criminal procedures, clear legislation and coherent case law;

– Periodic inter-institutional cooperation on all aspects related to the procedure and the way to respect the right to privacy between the police, prosecutors' offices, courts and data protection authorities.

Also, the statements of witnesses being personal, there should be no possibility of their being recorded by the criminal investigation body conducting the hearing.

Introduction of a new paragraph (3) to Art. 123 of the CPC ROM, "Recording of statements" with the following wording: "The statements of the witness cannot be recorded by the criminal investigation body conducting the investigation".

Introduction of a new paragraph (1^1) to Art. 105 of the CPC RM, "Witness statements and the conditions of their hearing" with the following wording: "Witness statements cannot be recorded by the criminal investigation body conducting the investigation".

Abstract

This article analyzes the complex process of genesis and evolution of the Republic of Moldova's law enforcement and security structures (Ministry of Internal Affairs, National Army, Intelligence and Security Service, and the State Protection and Guard Service) during the 1990–2026 period. The study highlights how the national security architecture was shaped not merely through administrative reforms, but primarily as a critical response to the secessionist conflicts in Transnistria and political tensions in TAU Gagauzia. The paper traces the transition from the reactive legislation of the 1990s toward a modern normative framework, culminating in the 2023 National Security Strategy, which introduces the concept of hybrid resilience. Particular attention is paid to the taxonomy of contemporary threats, demonstrating how factors such as systemic corruption, energy blackmail, and external electoral interference undermine territorial integrity and internal systemic stability.

In conclusion, the article argues that the security of the Republic of Moldova has evolved from a military-centric paradigm toward an integrated security model, where the success of security institutions increasingly depends on their capacity to protect democratic processes against asymmetric and transborder challenges within a volatile geopolitical context.

Keywords: National Security, Law Enforcement Structures, Hybrid Warfare, Territorial Integrity, Intelligence and Security Service (SIS), Ministry of Internal Affairs (MAI), National Army, Security Strategies.

MEDIUL DE SECURITATE NAȚIONALĂ A REPUBLICII MOLDOVA: RISCURI ȘI AMENINȚĂRI

Abstract

Articolul analizează procesul complex de constituire și evoluție a structurilor de ordine publică și securitate ale Republicii Moldova (Ministerul Afacerilor Interne, Armata Națională, Serviciul de Informații și Securitate și Serviciul de Protecție și Pază de Stat) în perioada 1990–2026. Studiul evidențiază faptul că arhitectura securității naționale s-a configurat nu doar prin reforme administrative, ci, în principal, ca răspuns la conflictele secesioniste din Transnistria și la tensiunile politice din UTA Găgăuzia. Lucrarea urmărește tranziția de la legislația reactivă a anilor 1990 către un cadru normativ modern, culminând cu Strategia Securității Naționale din 2023, care introduce conceptul de reziliență hibridă. O atenție deosebită este acordată taxonomiei amenințărilor contemporane, demonstrând modul în care factori precum corupția sistemică, șantajul energetic și interferențele externe în procesele electorale afectează integritatea teritorială și stabilitatea internă a sistemului statal.

În concluzie, articolul susține că securitatea Republicii Moldova a evoluat de la o paradigmă centrată pe dimensiunea militară către un model integrat de securitate, în cadrul căruia succesul instituțiilor de securitate depinde tot mai mult de capacitatea acestora de a proteja procesele democratice împotriva provocărilor asimetrice și transfrontaliere, într-un context geopolitic volatil.

Cuvinte-cheie: securitate națională, structuri de ordine publică, război hibrid, integritate teritorială, Serviciul de Informații și Securitate (SIS), Ministerul Afacerilor Interne (MAI), Armata Națională, strategii de securitate.

Introduction. The Republic of Moldova is going through a period with multiple risks and threats, both older and newer, of both internal and external nature, such as the existence of an unresolved conflict or the risk of aggression manifesting in the region, or the presence of elements specific to hybrid warfare [1]. Among these are the unresolved Transnistrian conflict, the risk of escalation or manifestation of aggressive actions in the region, as well as the intensification of hybrid warfare elements, such as disinformation, cyberattacks, economic pressures, and attempts to influence democratic processes. These challenges, directly or indirectly, affect the national security, political stability, and socio-economic development of the state, necessitating the strengthening of public institutions, increasing societal resilience, and deepening cooperation with international partners.

Traditionally, when we thought about a state's security, the reference image was that of an army defending its borders. Today, however, the configuration of the security environment has radically transformed, shifting from clear and predictable threats to a complex ecosystem of interconnected global, regional, and internal challenges. The main characteristic of this new context is accelerated dynamism; the world is changing so rapidly under the influence of technology and tensions between major powers that the reaction capacity of state institutions is often severely tested. This "speed of dangers" currently represents the greatest vulnerability for any sovereign state.

Thus, the concept of security has expanded beyond the protection of constitutional order and the military sphere, now including vital elements such as digital stability, the protection of energy resources, and the ability to resist disinformation or economic blackmail.

A state that does not constantly analyze its risk environment becomes extremely fragile in the face of strategic surprises. For the Republic of Moldova, situated at the intersection of major geopolitical interests, the continuous adaptation of its security structures and legislation is not merely an option for modernization, but a fundamental necessity. This adaptation process, documented in national security strategies over recent decades, represents the foundation upon which the resilience of our society is built in the face of increasingly invisible and constant threats.

The construction of our state began with the Declaration of Sovereignty (1990) and was finalized with the Declaration of Independence (1991). In those critical moments, Moldova had an urgent mission: to create its own security system to replace the old mechanisms controlled from Moscow. In a period marked by the dissolution of the Soviet Union and internal tensions that led to the tragic war on the Dniester, the new security institutions (the Police, the National Army, the Intelligence and Security Services) were not just structures of law and order; they represented the very guarantee that the Republic of Moldova would survive as a state on a world map that was changing radically before our eyes.

The transition from the militarized and politically controlled system of the Soviet era to a democratic one was not easy. The state had to confront three major challenges:

– Gradually removing the military footprint from internal affairs;
– Transforming soldiers into professionals who respect the country's neutrality;
– Reforming the Intelligence Services so that they operate strictly within the limits of the law.

Today, as we move ever closer to the European Union, we are witnessing a shift in vision: the Republic of Moldova no longer wants to be just a country that "asks for" help and security, also the protagonist of a new European policy – and of the "new neighborhood" [19]. Reducing the chances of the European path for the Republic of Moldova facilitates the accentuation of certain risks [8]. Our objectives go beyond simple border guarding; we wish to actively participate in European defense platforms and international crisis management missions. This evolution is essential, because without a modern and robust security system, we cannot speak of a stable economy or the success of EU accession negotiations [12].

The increasingly close collaboration with Europe, from visa-free travel to trade agreements, has been supported by the political will to bring European standards to all state institutions. Only thus, by participating in various international missions, will it be shown that the Republic of Moldova shares the same security values as the entire European community.

Therefore, this article analyzes how the institutions of the Republic of Moldova emerged and developed. We will see how the journey from independence to the present day now allows us to occupy a respected place in the European security system, and how we have managed to build our resistance (resilience) in the face of modern dangers, from hybrid attacks to the major current geopolitical tensions.

Methods and materials applied. The rigorous foundation of this study required the adoption of a multidisciplinary methodological approach, capable of integrating the historical, legal, and political science dimensions of the national security system. The research design was based on a broad spectrum of documentary materials, segmented between the normative-legislative framework of the Republic of Moldova and the relevant specialized literature for the European space.

The empirical basis of the work includes the founding acts of the state, such as the Declaration of Independence and the Constitution, complemented by a meticulous analysis of the organic laws regulating the functioning of various structures and the national security strategies adopted over the three decades of statehood.

To process this volume of information, priority was given to the historical method, essential for reconstructing the process of institutional genesis from the period 1990-1992 and for understanding how the Soviet administrative legacy conditioned the early stages of democratic reform.

The analytical dimension of the study was strengthened by applying the comparative method, used to measure the degree of alignment of national institutions with the standards of the European Union's Common Security and Defence Policy. At the same time, the adoption of a systemic approach allowed for the examination of the Ministry of Internal Affairs, the Ministry of Defence, the Ministry of Economy and Digitalization, the Intelligence and Security Service, and others, not as isolated entities, but as interdependent elements of a unitary mechanism, in constant interaction with the regional security environment.

Finally, through the use of logical and deductive analysis, it was possible to outline the correlations between internal vulnerabilities, such as corruption or energy insecurity, and the major risks to territorial integrity, thus offering a prospective view of the state's

response capacity in the face of contemporary geopolitical challenges.

Discussions and results obtained. The current security environment is characterized by increased unpredictability in the global system of international relations and the difficulty of delineating classic risks and threats from asymmetric ones [21].

The genesis of the security system in the Republic of Moldova can be divided into three fundamental stages: 1) the transition period (1990-1991); 2) the stage of consolidation through fire (1992); and 3) the phase of modernization reforms (after 1999).

Unlike other structures, the Ministry of Internal Affairs was the "promoter of institutional reform". On December 18, 1990, with the adoption of the Law on Police, the Republic of Moldova became one of the first states in the post-Soviet space to abandon the terminology of "militia". This change was not merely semantic; it aimed at transitioning from a body of repression to one focused on the protection of citizens' rights [14].

Subsequently, on December 12, 1991, the Carabinieri Troops were established, a hybrid structure intended to ensure public order in crisis situations, adopting the model of traditional European states (Italy, France) [16].

While the police inherited and reformed, the National Army had to be created almost from scratch. The turning point was September 3, 1991, when Decree No.193 laid the foundations of the Armed Forces. The war for the territorial integrity of the Republic of Moldova forced an acceleration in the equipping and organization of the Ministry of Defense (officially established in February 1992) [10]. The absence of a pre-existing military infrastructure (most Soviet units being directly subordinate to Moscow) turned this process into an act of national volunteerism and resilience.

In the security architecture of the Republic of Moldova, the segment dedicated to state protection has undoubtedly undergone the most complex and sensitive institutional transformation, having the delicate task of managing the succession and, subsequently, the detachment from the central structures of the Soviet KGB. This process of identity and functional rupture formally began in September 1991, with the transformation of the former State Security Committee into the Ministry of National Security (MNS) [15]. This first stage represented an attempt to provide the new sovereign state with its own protection instrument; however, the structure initially retained a classic ministerial configuration with extensive executive functions, specific to the transition period. The evolution towards a democratic security model reached a turning point with the reform of 1999. This stage was marked by the crystallization of the understanding that a rule-of-law state does not require an "institution" with discretionary executive powers in the field of security, but rather a specialized, lean, and efficient body.

The result of this strategic reevaluation was the creation of the Intelligence and Security Service (SIS), an institution redefined as a specialized structure strictly focused on intelligence and counterintelligence activities. Beyond the name change, the reform aimed to streamline the service's mission and, crucially, to place it under rigorous parliamentary control, thereby ensuring the necessary balance between the imperative of operational secrecy and respect for citizens' rights in a democratic society.

At the same time, the relevant legislation defining national security treatment must be sufficiently flexible to allow a security intelligence service to scan the horizon and prepare for emerging threats [18].

Unlike structures with a general mission, the State Protection and Guard Service (SPPS) crystallized as a niche necessity, being designed to ensure the continuity of governance through the protection of state representatives. The institution was founded on January 27, 1992 (Decree No.11) under the name of the Presidential Protection Service,

initially functioning as a subdivision with strictly limited duties confined to the bodyguard of the head of state [9].

A decisive stage of maturation occurred in 1998, when the structure was reorganized into the State Protection and Guard Service. This reform significantly expanded the institution's competencies and reconfigured its political oversight, marking the transition from the exclusive tutelage of the Presidency to a variable subordination regime (Government, Parliament, or Presidency), depending on the evolution of the legislative framework [13].

Currently, the SPPS is an institution specialized in the national security architecture, with the complex mission of ensuring the protection of domestic dignitaries, foreign guests, and the working premises of the main state institutions. Thus, the service has evolved from a tactical escort unit to a strategic pillar guaranteeing the functional stability of the Republic of Moldova's authorities.

The outbreak of the Dniester conflict in the early 1990s came as a surprise to the international community, which, at the time, did not know how to react.

At the same time, the young state, still burdened by the Soviet legacy and lacking the necessary diplomatic experience, was drawn into several settlement schemes that most often proved unsuccessful. The Russian Federation, as the "first violin" in the negotiation process, dictated the signing of agreements by the Republic of Moldova that further bogged down the negotiation process and made Tiraspol increasingly less "dependent" on Chișinău. The European Union's enlargement process in the mid-2000s, and the concomitant entry of the Republic of Moldova into the EU's "sphere of attraction," rekindled certain hopes that this conflict would be resolved in a manner that would preserve the sovereignty and territorial integrity of the Republic of Moldova.

During the critical early period of the 1990s, the authorities in Chișinău found themselves facing a major strategic dilemma: how to maintain order in the south of the country without provoking an open conflict, similar to the one on the Dniester. Tensions with leaders in Comrat and the emergence of local paramilitary formations created the imminent risk of a "second front" [6], which would have exhausted the already limited resources of the young state. In this context, the establishment of the Carabinieri Troops on December 12, 1991, was not merely a routine administrative decision but a tactical move of vital importance.

Unlike the army, which is trained to destroy the enemy, the Carabinieri Troops (currently the General Inspectorate of Carabinieri) were formed as a force with a dual status (military and public order), capable of intervening with proportional force. This "adaptability" allowed the state to deploy units to areas of ethnic instability that could restore peace without being perceived as an occupation army. Their presence provided Chișinău with "precious time" for negotiations, acting as a security filter that prevented direct clashes between radicalized civilians and government forces [11].

Moreover, the choice of the European gendarmerie model sent a clear message to international partners: the Republic of Moldova was choosing the path of democratization and civilized management of internal crises, even under conditions of extreme pressure. This strategy of "moderate force" was decisive in preventing a humanitarian catastrophe in the south, demonstrating that stability can be maintained through institutions that prioritize de-escalation and dialogue over armed confrontation. Thus, the carabinieri became the backbone of a new security doctrine, one in which maintaining public order is seen as an essential step towards lasting political peace.

The security architecture of the Republic of Moldova has traversed a complex evolu-

tionary trajectory, marking the transition from a normative framework based on sectoral functioning laws towards an integrated and multidimensional public policy structure. The genesis point of this strategic configuration lies in the adoption of the 1994 Constitution, where Article 11 established the status of permanent neutrality [5]. This provision did not merely represent a foreign policy option but functioned as a limiting strategic framework that directly determined the volume of investment in the defense sector and outlined the limits of international cooperation, forcing the state to define its security within a paradigm of military self-restraint.

This traditional vision began to be nuanced with the adoption of the 2011 National Security Strategy, a document that laid the foundations for a multidimensional approach to state security [7]. If at that stage the emphasis was on creating structures capable of ensuring internal stability and public order in relation to classic risks, the New National Security Strategy of 2023 marks a fundamental qualitative leap in Chișinău's strategic thinking.

The current public policy document operates a paradigm shift, abandoning the restrictive vision of "border defense" in favor of the modern concept of "national resilience". This change reflects a deep understanding of the contemporary geopolitical context, recognizing that modern threats are often invisible, constant, and hybrid.

Thus, security is no longer perceived as a simple reaction to external aggression, but as a systemic capacity of the state and society to absorb shocks and maintain functionality in the face of multi-directional challenges. Through this fine-tuning of the legal and political framework, the Republic of Moldova moves from a reactive to a proactive security model, focused on strengthening internal resistance as the main guarantor of state integrity.

The European Union has made important decisions and given new impetus to its efforts to strengthen security and the defense dimension. The development of a common foreign security policy includes the progressive definition of a common defense policy, as well as the definition of its security interests, particularly in its immediate neighborhood [3].

In the current geopolitical context, some of the most important the national security of the Republic of Moldova transcends the paradigm of classical military confrontations, being targeted by a complex ecosystem of hybrid threats designed to erode the foundations of the state from within. A critical dimension of this new security landscape is systemic corruption, treated in recent strategic documents not merely as a common crime, but as a major factor of national insecurity.

Currently, the most significant threats to the security of the Republic of Moldova are the Transnistrian conflict, external hybrid influences, cyberattacks, energy vulnerabilities, and the effects of the war in Ukraine. These risks require a combination of military, economic, informational, and institutional measures to protect the state's stability and sovereignty.

Simultaneously, democratic processes have become prime targets of hybrid warfare, where interference in electoral processes through illicit financial flows and concerted disinformation campaigns has imposed a redefinition of missions for security institutions.

These actions are not always evident or declared, but act subtly in the gray zones of security, combining non-military methods with psychological, economic, and informational influence tools [2]. These entities have evolved towards the role of guarantors of the integrity of the electoral process, extending their area of competence from the physical protection of dignitaries to securing digital infrastructure and the legitimacy of citizens' votes.

At the same time, internal pressure is compounded by energy vulnerability, frequently used as an instrument of political blackmail, a fact that has shifted the security "front" into the area of critical infrastructure management.

Therefore, diversifying supply routes and ensuring energy security have become national security priorities, under the direct monitoring of the Supreme Security Council.

Thus, by integrating responses to corruption, hybrid attacks, and energy blackmail into a unitary strategy, the Republic of Moldova is recalibrating its force structures to face a security environment where the border between internal and external threats becomes increasingly fluid.

Alignment with European standards involves implementing modern policies and regulations in the energy field, in accordance with European Union practices. This process favors market transparency, attracting investments, and consumer protection. Aligned with the country's international commitments, the National Integrated Energy and Climate Change Plan (PNIEC) will play a vital role in ensuring a fair and sustainable energy transition, thus contributing to environmental protection and improving the quality of life for all citizens [17].

At the national level, cybersecurity is a shared responsibility that requires coordinated actions for prevention, preparedness, response, and recovery from incidents by government authorities, the private sector, and civil society. For this to work smoothly and to ensure a secure and resilient digital sphere, a comprehensive framework or strategy needs to be developed, implemented, and executed in a multi-stakeholder approach [4].

The security of the Republic of Moldova is governed by a fragile balance between proclaimed sovereignty and the complex administrative realities on the ground, being exposed to a category of interdependent risks targeting both territorial integrity and the stability of the internal system. The most visible security vulnerability of the Republic of Moldova remains the unconstitutional foreign military presence in the Transnistrian region, where the existence of the Operational Group of Russian Forces (OGRF) contingent and Transnistrian paramilitary structures constitutes a permanent asymmetric threat. The major strategic risk lies in the potential activation of these forces in the event of a change in the dynamics of the regional front, turning the separatist region into a bridgehead for offensive operations that could irremediably compromise state security.

Complementary to territorial risks, the integrity of the state border is subjected to enormous pressures generated by massive migration flows and the risk of illicit trafficking in weapons or prohibited substances, requiring multidimensional coordination between the Border Police and the Intelligence and Security Service (SIS).

However, state stability is conditioned not only by geographical demarcation lines but also by the cohesion of the internal system. The political instrumentalization of ethnic and linguistic diversity represents a risk of radicalization of certain social groups, which can challenge central authority through mechanisms similar to the crises of the 1990s. This polarization is often amplified by what experts define as "strategic corruption", a process by which foreign actors undermine the loyalty of public officials, causing institutional paralysis that prevents the state from exercising its monopoly on legitimate violence at critical moments.

In conclusion, the security of a state is a central element for every community and constitutes a fundamental condition for the life of a democracy [20].

Conclusions and recommendations. If we look back at the path taken by the Republic of Moldova's security institutions from the moment of independence to the present day, we see a continuous adaptation to a turbulent and often unfriendly regional reality.

The building of these institutions was not merely a routine bureaucratic procedure, but a real struggle for the survival of the state. The transition from the old Soviet model to a modern, democratic security system has shown that our society possesses an astonishing capacity for resilience. Even with limited resources and a frozen conflict on its territory, we have managed to professionalize and modernize our security institutions.

A key conclusion of this study is that today, a country's security is no longer just about guarding its borders. In the century we live in, a state's independence depends just as much on how we defend ourselves against "invisible" threats: cyberattacks, blackmail involving gas and energy, or the various forms of corruption through which foreign actors try to control institutions from within. The changes within the Intelligence and Security Service (SIS) and the State Protection and Guard Service (SPPS), the modernization of the police and gendarmerie according to European models, the new 2023 Security Strategy, and other essential changes show that Moldova has learned to stop being merely reactive (waiting for something bad to happen before acting) and has become proactive, building a well-structured national resilience.

In the digital age, modern societies are globally interconnected and increasingly dependent on ICT and digital infrastructure. However, in the Republic of Moldova, this interconnectivity also creates interdependencies and vulnerabilities to emerging threats that must be managed at the national level. Improving cybersecurity and protecting critical information infrastructures are essential for the nation's security and economic well-being – especially during the global transition to the digital economy and the information society.

At the same time, harmonizing legislation facilitates integration into the European energy system and access to funding programs and international cooperation. In this regard, our state has made progress in aligning its legislation with European standards in the fields of environment and energy. Among these achievements is the development of a Monitoring, Reporting, and Verification (MRV) system for greenhouse gas emissions, which represents an important step in achieving the country's climate goals.

On our path towards the European Union, we are witnessing a very important shift in mentality: Moldova no longer wants to be just a country that receives aid, but a state that actively contributes to the region's stability. Our participation in international peace missions and alignment with European standards are the only ways to achieve a stable economy and a protected democracy.

Therefore, we must recognize that strengthening the defense system is a process that never stops. We are constantly challenged to find a balance between the neutrality enshrined in the Constitution and the need to have modern, effective defense. Our success will depend on how well the security institutions collaborate with each other. Only by working hand in hand can these institutions ensure that the Republic of Moldova remains a point of stability on the edge of Europe, capable of defending its sovereignty against any type of attack, whether with conventional weapons or through hidden (hybrid) methods.

The analysis of the historical journey and current risks highlights the need for profound reform, oriented towards resilience and technological modernization.

An absolute priority is the strengthening of the digital capabilities of the security structures, particularly through the modernization of the technical units within the Intelligence and Security Service (SIS) and the Ministry of Internal Affairs (MAI). The creation of an integrated national cyber incident response center would ensure the protection of state databases and the banking system, thus preventing the risk of an internal shutdown caused by hybrid attacks on democratic processes.

In parallel, the Republic of Moldova must fully assume its role as a reliable partner in the region, transforming from a consumer of assistance into a state that actively contributes to European security. This objective requires more intense participation in European Union peace missions, which necessitates aligning the equipment and training of security institutions with international interoperability standards.

All these efforts will only be truly effective if bureaucratic barriers between institutions are eliminated through the creation of a National Rapid Reaction Protocol. Genuine collaboration, based on real-time information sharing between the SIS, the MAI, and the National Army, will allow the state to function as a unitary mechanism, capable of facing the hybrid and geopolitical challenges of the present.

SUBJECTS OF EVIDENCE ADMINISTRATION IN THE DIGITAL ERA: BALANCING INVESTIGATIVE EFFICIENCY AND FAIR TRIAL GUARANTEES

Monica DANILIUC,
PhD Student,
General Secretary, Town Hall of Broșteni, Suceava County, Romania
ORCID: 0009-0005-2027-2753

Abstract

The administration of evidence constitutes the core of criminal proceedings, through which judicial truth is established and the right to a fair trial, as enshrined in the jurisprudence of the European Court of Human Rights, is ensured. Over recent decades, the legal frameworks of the Republic of Moldova and Romania have evolved by expanding the category of subjects involved in the collection, preservation, and valorisation of evidence, including investigative bodies, specialised structures such as Asset Recovery Agencies, and investigative officers.

Although this diversification is aimed at enhancing efficiency and specialisation, it generates risks of overlapping competences and of evidence being administered outside the procedural framework, with direct consequences for the integrity of evidence and the fundamental rights of the parties.

In the context of technological progress, digitalisation, and the development of advanced forensic methods, the topic becomes even more relevant: subjects involved in evidence administration must operate within strict legal boundaries to ensure verifiable evidentiary chains (chain of custody), legality, and procedural fairness. This study analyses the national and European regulatory frameworks, identifies legislative gaps, examines relevant case-law from the Republic of Moldova, Romania, and the ECHR, and proposes solutions for optimising cooperation between procedural actors, aligned with European standards and international best practices.

The research findings highlight the necessity of a balance between investigative efficiency and the protection of fundamental rights, offering de lege ferenda recommendations for harmonising competences, strengthening judicial control, and integrating modern technologies into evidence administration. This approach contributes to preventing procedural errors and increasing public confidence in the criminal justice system, being relevant both for academics and practitioners in the field of crime prevention and control.

Keywords: evidence administration, procedural subjects, fair trial, digitalisation, chain of custody, comparative law, European standards.

SUBIECȚII ADMINISTRĂRII PROBELOR ÎN ERA DIGITALĂ: ECHILIBRU ÎNTRE EFICIENȚA INVESTIGATIVĂ ȘI GARANȚIILE PROCESULUI ECHITABIL

Abstract

Administrarea probelor constituie nucleul procesului penal, prin intermediul căruia se realizează adevărul judiciar și se asigură respectarea dreptului la un proces echitabil, consacrat de jurisprudența Curții Europene a Drepturilor Omului. În ultimele decenii, cadrul normativ din Republica Moldova și România a evoluat prin extinderea sferei subiecților implicați în colectarea, păstrarea și valorificarea probelor, incluzând organe de constatare, structuri specializate precum Agenția de Recuperare a Bunurilor Infracționale și ofițeri de investigații. Această diversificare, deși orientată spre eficiență și specializare, generează riscuri de suprapunere a competențelor și de administrare a probelor în afara cadrului procesual, cu efecte directe asupra integrității probelor și drepturilor fundamentale ale părților.

În contextul progresului tehnico-științific, digitalizării și dezvoltării metodelor criminalistice avansate, tema devine și mai actuală: subiecții administrării probelor trebuie să acționeze în limite precise, pentru a asigura trasee probatorii verificabile (chain of custody), legalitate și loialitate procesuală. Studiul propus anali-

zează cadrul normativ național și european, identifică lacunele legislative, examinează jurisprudența relevantă din Republica Moldova, România și CEDO, și propune soluții de optimizare a cooperării între subiecți, aliniate la standardele europene și bunele practici internaționale.

Rezultatele cercetării evidențiază necesitatea unui echilibru între eficiența investigativă și protecția drepturilor fundamentale, oferind recomandări de lege-ferenda pentru armonizarea competențelor subiecților, consolidarea controlului judiciar și integrarea tehnologiilor moderne în administrarea probelor. Această abordare contribuie la prevenirea erorilor procesuale și la creșterea încrederii publice în sistemul de justiție penală, fiind relevantă atât pentru teoreticieni, cât și pentru practicieni în domeniul prevenirii și combaterii criminalității.

Cuvinte-cheie: administrarea probelor, subiecți procesuali, proces echitabil, digitalizare, chain of custody, legislație comparată, standarde europene.

Introduction. Criminal proceedings represent the legal mechanism through which the state responds to the commission of an offence, in order to restore the rule of law and protect fundamental social values. Within this framework, the administration of evidence plays a central role, as it is the instrument through which judicial authorities reconstruct the factual situation and establish judicial truth. Doctrine has consistently emphasised that criminal proceedings cannot be conceived outside evidentiary activity, which forms the foundation of any judicial decision.

Traditionally, evidence administration was limited to classical means—witness testimony, documents, expert reports, or material evidence. However, the evolution of contemporary society, characterised by accelerated digitalisation and the development of information technologies, has profoundly transformed the nature of evidence used in criminal proceedings. A significant proportion of human activity now takes place in the digital environment, inevitably leading to the emergence of new types of evidence—electronic or digital evidence—which require a distinct legal approach.

This shift is not merely technical; it has profound implications for the architecture of criminal proceedings. Whereas procedural roles were previously relatively well-defined, digitalisation has led to a significant expansion of the range of subjects involved in evidence administration. Alongside traditional actors—investigative bodies and prosecutors—specialised structures, IT experts, and auxiliary institutions are increasingly involved, which may generate coordination difficulties and risks of fragmentation of evidentiary activity.

From a doctrinal perspective, Romanian legal scholarship has emphasised that evidence must be administered in strict compliance with the principles of legality and procedural fairness, any deviation potentially affecting the validity of the entire judicial process. Similarly, Moldovan doctrine stresses the essential nature of admissibility, highlighting that only lawfully obtained and properly administered evidence may form the basis of a judicial decision.

A key concept in contemporary evidentiary analysis is the “chain of custody”, which requires complete and continuous documentation of the evidentiary path from collection to presentation in court. In the case of digital evidence, this concept becomes essential due to the volatile and easily alterable nature of electronic data. Failure to ensure strict control over this chain may compromise evidentiary value and affect the right to a fair trial.

Moreover, the development of cybercrime and its transnational nature creates additional challenges for evidence administration. Access to data stored in foreign jurisdictions, international cooperation, and differences between national legal systems complicate the process of collecting and using digital evidence. Consequently, the need for

legislative harmonisation at both European and international levels becomes evident.

In its jurisprudence, the European Court of Human Rights has consistently held that the use of evidence must comply with fair trial guarantees, including the rights of defence and the principle of equality of arms. Thus, not only the legality of obtaining evidence is relevant, but also the manner in which it is administered and assessed within proceedings.

Therefore, this study addresses a highly complex and topical issue at the intersection of criminal procedural law, information technology, and fundamental rights protection. The objective is to analyse the subjects involved in evidence administration in the digital era, identify existing dysfunctions, and formulate de lege ferenda proposals aimed at ensuring a real balance between investigative efficiency and fair trial guarantees.

Methods and materials applied. The scientific approach of the present research is based on the necessity of analysing a complex issue situated at the intersection of criminal procedural law, information technology, and fundamental rights protection. In this context, the methodology employed is pluralistic, combining classical legal research methods with instruments specific to the analysis of contemporary legal phenomena.

The research uses a mixed legal methodology: doctrinal, normative, comparative, and jurisprudential.

The following sources were examined:

- Criminal Procedure Code of Romania;
- Criminal Procedure Code of the Republic of Moldova;
- Case-law of the European Court of Human Rights (Article 6 ECHR);
- Budapest Convention on Cybercrime (2001);
- Regulation (EU) 2023/1543 and Directive (EU) 2023/1544;
- Specialised academic literature on digital forensics and electronic evidence.

Also, this methods used in literature, especially in legal digital criminalistic and electronic proves [2].

1. Doctrinal research method. A first pillar of the research consists of doctrinal analysis, carried out through the study of reference works in the field of criminal procedural law, both in Romania and the Republic of Moldova. This method allowed the identification of fundamental concepts regarding evidence administration, the role of procedural subjects, and fair trial guarantees, as well as the construction of the theoretical framework necessary for the development of the topic.

Accordingly, authoritative works of Romanian doctrine were analysed, emphasising evidence as a central element of criminal proceedings and highlighting the active role of judicial authorities in establishing the truth. In parallel, Moldovan legal literature provided a complementary perspective, stressing the admissibility of evidence and the protection of procedural rights.

The doctrinal method also enabled the identification of theoretical gaps in the treatment of digital evidence, particularly regarding the integration of the chain of custody concept into national legal systems.

2. Legislative analysis method. The research involved a detailed examination of the applicable legal framework governing evidence administration, including the Criminal Procedure Code of Romania and the Criminal Procedure Code of the Republic of Moldova, with particular focus on provisions relating to the collection, administration, and assessment of evidence.

This method allowed the identification of how the legislator regulates the competences of procedural subjects and the limits within which they may act in gathering and using evidence. At the same time, the analysis revealed that current regulations are pre-

dominantly designed for traditional forms of evidence and are insufficiently adapted to the specificities of digital evidence.

In addition, relevant European legal instruments were examined, in particular Regulation (EU) 2023/1543 and Directive (EU) 2023/1544, which establish modern mechanisms for obtaining and preserving electronic evidence in criminal matters, reflecting a clear trend towards European harmonisation.

3. Comparative law method. Given the transnational nature of cybercrime and digital evidence, the research employed the comparative law method by analysing legislative and doctrinal solutions from different legal systems.

The study primarily considered:

- The legal systems of Romania and the Republic of Moldova as the direct object of research;
- European standards developed through the jurisprudence of the European Court of Human Rights;
- Relevant international instruments, such as the Budapest Convention on Cybercrime.

This method allowed the identification of regulatory models and best practices in the field of digital evidence administration, as well as the highlighting of differences between systems, particularly regarding the role of procedural subjects and procedural safeguards.

4. Jurisprudential analysis method. An essential tool of the research is the analysis of case-law, particularly that developed by the European Court of Human Rights, which has established relevant standards concerning the use of evidence in criminal proceedings.

This method highlighted that, from the ECHR perspective, not only the legality of obtaining evidence is relevant, but also the overall fairness of the proceedings, including the manner in which evidence is administered and challenged by the parties.

Moreover, the analysis of national case-law revealed a tendency of courts to sanction non-compliance with procedural rules governing evidence administration, particularly in cases involving technically or digitally obtained evidence.

5. Interdisciplinary analysis method. Given the technical nature of digital evidence, the research also adopted an interdisciplinary approach, integrating elements of digital forensic science and legal informatics.

Thus, concepts such as data integrity, chain of custody, and methods of collection and preservation of electronic data were analysed.

This approach enabled a better understanding of the practical limitations faced by judicial authorities and the necessity of cooperation with IT specialists in the proper administration of digital evidence.

6. Research limitations. The study takes into account certain limitations, mainly determined by the rapid evolution of regulations in the field of electronic evidence and the lack of uniform international standards.

Furthermore, the technical nature of digital evidence implies dependence on technological progress, which means that legal and doctrinal solutions are in constant development. In this context, the conclusions of the research should be regarded as adaptable to future normative and technological changes.

I. Subjects of Evidence Administration in the Digital Era. The transformations generated by digitalisation have produced significant changes in the structure and functioning of criminal proceedings, particularly with regard to the subjects involved in evidence

administration. While, in the traditional conception, this activity was predominantly carried out by criminal investigation bodies and the prosecutor, in the current context there is a clear expansion of the range of procedural actors, determined by the technical complexity of evidence and the need for specialisation.

This diversification raises essential issues concerning the delimitation of competences, the legality of evidence administration, and the respect for procedural guarantees.

1.1. Criminal investigation bodies: traditional role and transformations in the digital context. These bodies remain the primary procedural actors; however, their role is evolving towards the coordination of interdisciplinary evidentiary activity in the digital environment.

In the architecture of criminal proceedings, criminal investigation bodies represent the main active subject in the investigative phase, being responsible for the collection and administration of evidence. Traditional doctrine has emphasised that they are obliged to carry out evidentiary activities in order to establish the truth, both in favour of and against the suspect or defendant.

In the context of digitalisation, their role has significantly expanded. Investigation activities no longer involve only the administration of traditional evidence, but also the identification and collection of electronic data, the use of advanced technical tools, and cooperation with IT and digital forensic specialists.

This evolution marks a paradigm shift, in which the criminal investigation body becomes a coordinator of interdisciplinary activity, requiring additional competences and increased responsibility in managing digital evidence.

At the same time, the risk of excessive dependence on technical expertise arises, which may affect the authority's capacity to effectively control the evidentiary process.

1.2. The prosecutor: guarantor of legality and coordinator of evidentiary activity. The prosecutor acts as the guarantor of legality and coordinator of evidentiary activity, being responsible for verifying compliance with the conditions of admissibility of evidence.

The prosecutor holds a central position in evidence administration, being both the holder of the prosecution function and the guarantor of procedural legality. Doctrine has emphasised that the prosecutor is not only a party to the accusation but also a procedural subject bound to ensure the protection of fundamental rights.

In the context of digital evidence, the prosecutor's role becomes even more complex, involving the coordination of investigative bodies, the authorisation of intrusive evidentiary measures (such as searches of computer systems or interceptions), and the verification of the legality of obtaining and administering evidence.

The prosecutor must also ensure compliance with the principle of procedural fairness, particularly in situations where evidence is obtained through sophisticated technical means.

In practice, however, the expansion of procedural actors involved in evidence collection may lead to a reduction in the effective control exercised by the prosecutor.

1.3. Fact-finding bodies and specialised structures: expansion of procedural subjects. The extension of competences to administrative bodies and specialised institutions creates risks of functional overlap and dilution of procedural control.

A defining feature of recent developments, particularly in the Republic of Moldova, is the extension of evidentiary competences to additional categories of subjects, such as fact-finding bodies, state control authorities, investigative officers, and specialised institutions (e.g., Asset Recovery Agencies).

This expansion has been justified by the need to increase investigative efficiency and to make use of specialised technical expertise. However, doctrine has highlighted significant risks generated by this diversification, including overlapping competences, lack of effective coordination, and the administration of evidence outside the criminal procedural framework.

In the absence of clear regulatory boundaries, evidentiary activity may become fragmented, affecting the integrity of evidence and its admissibility before the court.

1.4. Specialists and experts in the digital field: necessity and vulnerability.

These actors play an essential role in analysing digital evidence, but their intervention must remain strictly limited so as not to replace judicial authorities.

A specific feature of the digital era is the increasing involvement of IT specialists and digital forensic experts in evidence administration. They are indispensable for extracting electronic data, analysing digital devices, and interpreting digital evidence.

However, their involvement raises sensitive procedural issues. First, their legal status and the limits of their intervention must be clearly defined. Second, there is a risk that technical findings may be accepted without rigorous judicial scrutiny, potentially affecting the principle of free evaluation of evidence.

Moreover, the technical nature of digital evidence may create an imbalance between prosecution and defence, particularly where access to technical expertise is unequal.

1.5. The court: role in evaluating digital evidence. The court is required to verify the legality and reliability of evidence, but its assessment is challenged by the technical complexity of digital material.

Although evidence is primarily administered during the investigation phase, the court plays an essential role in verifying its legality and probative value.

In the context of digital evidence, courts face additional challenges, including:

- The technical complexity of evidence;
- Difficulties in verifying authenticity and integrity of data;
- The need to assess technical expert reports.

According to European jurisprudence, courts must ensure respect for the principle of equality of arms and allow effective challenge of evidence by the parties.

In the absence of adequate technological training, courts risk placing excessive reliance on expert conclusions, without sufficient critical analysis.

1.6. The need for clear delimitation of competences: a prerequisite of fair trial. The analysis of procedural subjects reveals a clear trend towards diversification and specialisation. However, this evolution must be accompanied by a clear delimitation of competences and effective control mechanisms.

Clear regulatory boundaries are necessary to prevent the undermining of criminal procedural fairness. In the absence of precise rules, there is a risk that evidence will be administered outside the legal framework, that fundamental rights will be affected, and that the criminal process will become inequitable.

Therefore, it is necessary to strengthen the role of the prosecutor as guarantor of legality and to reinforce judicial control over evidentiary activity, particularly in relation to digital evidence.

Discussions and results obtained. The analysis of subjects involved in evidence administration in the digital era reveals a set of structural dysfunctions arising from the interaction between accelerated technological development and legal frameworks that remain partially anchored in traditional evidentiary paradigms.

Although the expansion of procedural actors is formally justified by considerations

of efficiency and specialisation, the empirical and doctrinal findings indicate that such diversification produces systemic side effects on both the coherence of criminal proceedings and the substantive guarantees of procedural fairness.

2.1. Fragmentation of competences and the risk of extra-procedural evidence administration. A primary finding of the research is the emergence of a pronounced fragmentation of evidentiary competences. The increasing involvement of multiple institutional actors—fact-finding bodies, investigative officers, and specialised administrative structures—generates a diffusion of responsibility within the evidentiary chain.

In practice, this institutional plurality often results in weakened hierarchical coordination and an attenuated capacity of procedural oversight, particularly on the part of the prosecutor. This fragmentation becomes particularly problematic when evidentiary activities are performed prior to, or outside, the formal procedural framework, thereby raising serious concerns regarding admissibility, traceability, and defence rights.

From a systemic perspective, such developments risk undermining the epistemic unity of the criminal process, transforming evidence into a composite and partially uncontrollable construct.

2.2. Digital evidence vulnerabilities and the epistemology of the chain of custody. Digital evidence introduces a distinct vulnerability profile, fundamentally different from traditional evidentiary forms. Its volatility, replicability, and susceptibility to undetectable alteration require a procedural architecture grounded in strict standards of integrity assurance.

Within this context, the chain of custody ceases to be a merely technical requirement and becomes a normative guarantee of evidentiary legitimacy. The absence of uniform regulatory standards for documenting the lifecycle of digital evidence significantly increases the risk of contamination, manipulation, or loss of evidentiary authenticity.

Consequently, evidentiary reliability in the digital environment is no longer a static attribute but a continuously constructed procedural status, dependent on verifiable technical and institutional continuity.

2.3. Structural imbalance between prosecution and defence. The research further identifies a persistent asymmetry between prosecution and defence in access to technical infrastructure, forensic expertise, and digital analytical tools.

While investigative authorities benefit from institutionalised access to specialised capabilities, the defence is frequently placed in a structurally disadvantaged position, particularly in relation to independent verification of digital evidence.

This asymmetry affects the substantive content of the principle of equality of arms, transforming it from a formal procedural guarantee into a potentially unevenly realised safeguard. In adversarial terms, this imbalance risks distorting the dialectical equilibrium upon which the fairness of criminal proceedings is premised.

2.4. Judicial assessment of digital evidence and epistemic dependency. Courts are increasingly confronted with evidentiary materials whose probative value is inseparable from technical interpretation. This structural complexity generates a form of epistemic dependency on expert conclusions, particularly in relation to authenticity, integrity, and metadata analysis.

Such dependency may lead to a gradual contraction of judicial epistemic autonomy, manifested either through excessive deference to expert findings or through reduced capacity for independent verification of technical evidence.

In the absence of specialised judicial literacy in digital forensics, the principle of free evaluation of evidence risks being transformed into a formally preserved but substantive-

ly constrained guarantee.

2.5. Cybercrime and the transnationalisation of evidentiary constraints. The expansion of cybercrime introduces a transnational evidentiary dimension characterised by jurisdictional fragmentation, delayed cross-border cooperation, and divergent standards of admissibility.

These structural asymmetries significantly complicate the acquisition, preservation, and validation of digital evidence across jurisdictions. As a result, criminal proceedings increasingly depend on international legal cooperation mechanisms whose efficiency is often conditioned by procedural heterogeneity.

This context underscores the necessity of normative convergence at European and international levels, particularly in relation to electronic evidence admissibility and cross-border data access.

2.6. Reconfiguration of procedural roles in the digital evidentiary paradigm. The cumulative findings of the research suggest that the traditional model of evidence administration is no longer fully adequate to the epistemic and technological realities of digital criminality.

A reconfiguration of procedural roles is therefore required, based on three interdependent axes:

(i) Consolidation of the prosecutor's role as guarantor of legality and evidentiary coherence;

(ii) Normative clarification of competences among procedural and auxiliary actors;

(iii) Institutionalisation of continuous technical training for all procedural subjects involved in digital evidence handling.

Such reconfiguration is not merely organisational, but structural, reflecting a transition from a linear evidentiary model to a distributed and technologically mediated evidentiary ecosystem.

2.7. Synthesis of research findings. The comprehensive analysis undertaken reveals several foundational conclusions regarding the contemporary architecture of evidence administration in digital criminal proceedings.

First, the progressive expansion of procedural subjects contributes to a redefinition of the evidentiary system; however, in the absence of precise normative boundaries, this expansion generates risks of competence fragmentation, diffusion of responsibility, and weakened legal oversight.

Second, the intrinsic nature of digital evidence exposes systemic vulnerabilities related to data volatility, replicability, and technological dependency, thereby requiring strengthened procedural safeguards, particularly through the standardisation of chain of custody mechanisms.

Third, a structural imbalance persists between prosecution and defence in terms of access to technical resources and forensic expertise, which may compromise the effective equality of arms within adversarial proceedings.

Fourth, judicial authorities face increasing difficulties in independently assessing digital evidence due to its technical complexity, resulting in a heightened reliance on expert testimony and potential attenuation of judicial epistemic autonomy.

Finally, the accelerating evolution of cybercrime, characterised by transnationality and technological sophistication, necessitates continuous adaptation of both normative frameworks and institutional cooperation mechanisms at European and international levels.

From a systemic perspective, these dynamics reveal a fundamental tension between the classical architecture of criminal proceedings—grounded in immediacy and direct ev-

identiary control—and the emerging digital paradigm, in which evidence is algorithmically mediated, distributed, and technologically contingent.

Conclusions. The analysis conducted on the subjects of evidence administration in the digital era confirms that criminal proceedings are undergoing a profound structural transformation, driven by the impact of technology on the traditional mechanisms of justice delivery. Within this context, evidence administration can no longer be conceptualised within classical procedural parameters, as it requires a systemic reconceptualisation aligned with the complexity and dynamics of digital environments.

A first essential conclusion is that the expansion of the category of subjects involved in evidence administration, although justified by imperatives of efficiency and functional specialisation, generates significant risks to the coherence and internal unity of criminal proceedings. The diversification of institutional actors—particularly through the involvement of fact-finding bodies, specialised structures, and ancillary administrative entities—leads to a fragmentation of competences, which may weaken effective judicial control over the legality and regularity of evidentiary activities.

In this context, the central role of the prosecutor must be reaffirmed and substantially strengthened. Beyond the formal status of a party to the criminal action, the prosecutor must be understood as the genuine guarantor of the legality of evidence administration. This function requires the exercise of continuous, effective, and substantive oversight over the entire evidentiary process, including activities conducted by auxiliary or specialised actors.

A second fundamental finding concerns the intrinsic vulnerability of digital evidence. The volatile, replicable, and technologically dependent nature of electronic data necessitates the establishment of stringent procedural safeguards regarding integrity, authenticity, and traceability. In the absence of a clear and coherent regulatory framework governing the chain of custody, the probative reliability of digital evidence is exposed to systemic risks, with direct implications for the establishment of judicial truth.

Furthermore, the research highlights a structural imbalance between prosecution and defence in terms of access to technical resources, digital infrastructure, and specialised forensic expertise. This asymmetry has the potential to affect the substantive content of the principle of equality of arms, as recognised both in domestic procedural law and in the jurisprudence of the European Court of Human Rights, thereby generating functional inequality in the ability to challenge and verify digital evidence.

Regarding judicial authorities, it has been observed that courts are confronted with genuine epistemic difficulties in the assessment of digital evidence, arising from its high technical complexity and frequent reliance on expert evaluations. In the absence of adequate training in digital technologies, there is a risk that judicial reasoning may become excessively deferential to expert findings, thereby affecting the principle of free evaluation of evidence and the autonomy of judicial conviction.

Additionally, the transnational nature of cybercrime significantly amplifies the challenges associated with evidence administration, highlighting the need for strengthened mechanisms of international judicial cooperation and deeper legislative harmonisation at European level, in order to ensure an effective and coherent criminal justice response to digital criminal phenomena.

On the basis of these findings, several de lege ferenda orientations emerge as necessary: the explicit regulation of the chain of custody for digital evidence; the strict delimitation of competences among procedural subjects; the consolidation of the prosecutor's role as supervisory authority over evidentiary activities; the establishment of effective

safeguards ensuring equality of arms through access to independent technical expertise; the continuous professional specialisation of procedural actors in digital forensics; the harmonisation of national legislation with European standards on electronic evidence; and the development of efficient international cooperation mechanisms enabling rapid and lawful access to cross-border digital evidence.

In conclusion, achieving a genuine and functional equilibrium between the requirements of investigative efficiency and the imperatives of fair trial guarantees in the context of criminal procedural digitalisation requires moving beyond a purely incremental or corrective approach to legal reform. It necessitates a systemic reconceptualisation of evidentiary mechanisms, grounded in a coherent model of juridical governance of informational evidence.

Such a paradigm shift entails the transition towards an integrated evidentiary architecture capable of ensuring both the effective combating of criminality and the substantive, not merely formal, protection of fundamental rights, in full alignment with the standards of the European Convention on Human Rights.

REGULATION OF SPECIAL AND EXTENDED CONFISCATION IN THE CRIMINAL LEGISLATION OF THE REPUBLIC OF MOLDOVA

Veaceslav URSU,
PhD, University Professor,
Department of Criminal Law and Criminology,
"Ștefan cel Mare" Academy of the Ministry of the Internal Affairs,
Republic of Moldova
ORCID: 0000-0002-0696-4391

Abstract

The developed article constitutes a multidimensional analysis of the institutions of special confiscation (Art. 106 CC) and extended confiscation (Art. 106[1] CC) within the criminal legislation of the Republic of Moldova, evaluating their degree of alignment with European standards. The author highlights the transition from a paradigm focused on punishing the individual toward one centered on the recovery of criminal proceeds, which is considered a strategic tool of criminal policy.

The comparative analysis emphasizes the fundamental distinctions between these two security measures: while special confiscation targets assets with a direct link to the offense (in rem), extended confiscation relies on the presumption of the illicit nature of wealth that is disproportionate to licit income, covering assets acquired within the last 5 years. A central role is attributed to the Criminal Assets Recovery Agency (CARA) in conducting parallel financial investigations using the "follow the money" method to identify beneficial owners and assets hidden through intermediaries.

The study identifies critical barriers in judicial practice, such as the inconsistent interpretation of the standard of proof, the low solvency of convicted individuals, and the courts' reluctance to apply the "partial reversal" of the burden of proof. Finally, lex ferenda proposals are formulated, including the introduction of civil forfeiture (non-conviction based), the specialization of judicial panels, and the expansion of the list of predicate offenses, partially inspired by the American RICO model.

Keywords: special confiscation, extended confiscation, CARA (Criminal Assets Recovery Agency), parallel financial investigation, security measures, licit income, asset disproportion, confiscation by equivalent, intermediaries.

REGLEMENTAREA CONFISCĂRII SPECIALE ȘI EXTINSE ÎN LEGISLAȚIA PENALĂ A REPUBLICII MOLDOVA

Abstract

Articolul elaborat constituie o analiză multidimensională a instituțiilor confiscării speciale (art. 106 CP) și confiscării extinse (art. 1061 CP) în legislația penală a Republicii Moldova, evaluând gradul de aliniere a acestora la standardele europene. Autorul evidențiază tranziția de la o paradigmă axată pe pedepsirea persoanei către una centrată pe recuperarea profitului infracțional, considerată un instrument strategic de politică penală.

Analiza comparativă subliniază distincțiile fundamentale dintre cele două măsuri de siguranță: în timp ce confiscarea specială vizează bunurile cu o legătură directă cu infracțiunea (in rem), confiscarea extinsă se bazează pe prezumția caracterului ilicit al averii disproporționate față de veniturile licite, acoperind activele dobândite în ultimii 5 ani. Un rol central este atribuit Agenției de Recuperare a Bunurilor Infracționale (ARBI) în desfășurarea investigațiilor financiare paralele prin metoda „follow the money" pentru a identifica beneficiarii reali și activele ascunse prin interpuși.

Studiul identifică bariere critice în practica judiciară, precum interpretarea neunitară a standardului de probațiune, solvabilitatea scăzută a condamnaților și reticența instanțelor de a aplica „inversarea parțială"

a sarcinii probei. În final, sunt formulate propuneri de lex ferenda, printre care introducerea confiscării civile (fără condamnare), specializarea completelor de judecată și extinderea listei infracțiunilor predicat, inspirate parțial din modelul american RICO.

Cuvinte-cheie: confiscare specială, confiscare extinsă, ARBI (Agenția de Recuperare a Bunurilor Infracționale), investigație financiară paralelă, măsuri de siguranță, venit licit, disproporție patrimonială, confiscare prin echivalent, interpuși.

Introduction. In the modern architecture of criminal law, the sanctioning paradigm has undergone a significant shift from punishing the individual toward "punishing" criminal profit. In a state governed by the rule of law that aspires to the integrity standards of the European Union, such as the Republic of Moldova, the efficiency of the repressive system is no longer measured solely by the number of prison sentences, but by the state's capacity to strip the offender of the proceeds of crime.

The recovery of assets derived from offenses represents today not only a measure to restore social equity, but also a strategic tool of criminal policy. In the Republic of Moldova, the evolution of the legislative framework has been marked by the need to align with international standards, particularly after the signing of the EU Association Agreement.

The institutions of special confiscation and extended confiscation, regulated by Articles 106 and 106[1] of the Criminal Code of the Republic of Moldova [1], represent the fundamental levers through which the restoration of social equity and the deterrence of corruption and organized crime are pursued.

However, the gap between the letter of the law and the reality of enforcement remains considerable, marked by methodological challenges, evidentiary difficulties, and an occasionally non-uniform jurisprudence. The mere existence of norms in the Criminal Code (Articles 106 and 106[1]) does not guarantee success if the application mechanisms are deficient.

The purpose of this article lies in the multidimensional analysis of special and extended confiscation mechanisms in the Republic of Moldova, evaluating the degree of compatibility of national legislation with the new European standards (Directive 2024/1260/EU) [2] and identifying the procedural barriers that prevent a high recovery rate of criminal assets in current judicial practice.

Research Objectives. To achieve the proposed goal, the following derived objectives were established:

- Conceptual delimitation of special confiscation from extended confiscation, highlighting their legal nature as security measures;
- Analysis of the conditions for applying extended confiscation through the prism of proving the disproportion between licit income and the wealth acquired by the convicted person;
- Evaluation of the role of the Criminal Assets Recovery Agency (CARA) in the process of identifying, tracking, and freezing assets under the control of intermediaries;
- Examination of recent national jurisprudence to detect recurrent reasons for rejecting confiscation motions and non-uniform interpretations by the courts;
- Formulation of *lex ferenda* proposals aimed at optimizing the confiscation process, including by analyzing the opportunity of introducing the civil forfeiture model (non-conviction based).

Research Strategy (Methodology). The research is based on a diversified methodological approach, designed to ensure the objectivity and rigor of the findings:

- **Logical and Analytical Method**: Used for interpreting the legal norms of the

Criminal Code and the Criminal Procedure Code, as well as for deconstructing the concepts of "licit income" and "assets resulting from criminal activity".

- **Comparative-Legal Method**: Applied by comparing the legislation of the Republic of Moldova with successful models from other jurisdictions, highlighting the strengths and gaps of the national system.
- **Method of Jurisprudential Observation**: Consists of the empirical study of rulings by the Supreme Court of Justice and courts of appeal from the 2023-2026 period to extract practical trends in applying confiscation.
- **Statistical Method**: Analysis of quantitative data provided by criminal investigation bodies (NAC, CARA) to evaluate the ratio between seized assets and those effectively confiscated through definitive sentences.
- **Prospective Method**: Used to foreshadow the evolution of the institution of confiscation in the context of the digitalization of the economy (virtual/crypto assets) and European integration.

Discussions and results obtained. I. Comparative Analysis: Special Confiscation (Art. 106 CC) vs. Extended Confiscation (Art. 106¹ CC).

1.1. Historical Evolution of the Analyzed Institutions. The evolution of confiscation institutions within the criminal legislation of the Republic of Moldova reflects the transition from a system focused strictly on the instruments of crime to a modern one, adapted to European standards for combating organized crime and corruption.

Special confiscation has been present since the adoption of the current Criminal Code (Law No.985/2002), which entered into force on June 12, 2003. In the original 2002 version of the Code, special confiscation was provided under Article 106. It was defined as a security measure consisting of the forced and free-of-charge transfer into state ownership of assets used in or resulting from the commission of offenses. Regarding the object of confiscation, emphasis was initially placed on: assets resulting from the commission of the offense, instruments used to commit the act, and assets that served to reward the offender.

Unlike special confiscation, ***extended confiscation*** is a much more recent institution, introduced to allow the state to recover assets that exceed a person's licit income, even if a direct link cannot be demonstrated between those assets and a specific offense. This was introduced by Law No. 326 of December 23, 2013, which entered into force on February 25, 2014. Through this reform, a new article was introduced into the Criminal Code — Art. 106¹ (Extended Confiscation), and its introduction was driven by the necessity of harmonizing national legislation with European Union norms (specifically Directive 2014/42/EU) and providing law enforcement bodies with more effective tools against the illicit accumulation of wealth.

Over time, both institutions have undergone modifications to clarify the application procedure. While the purpose of special confiscation is to eliminate profits obtained from a specific offense, including the means of the offense, the purpose of extended confiscation is to combat illicit enrichment and organized crime. In the first case, the state must prove the direct link to the proven offense and the criminal origin of what is subject to confiscation; in the second case, the link consists of the discrepancy between licit income and the actual wealth held by the subject, with the state having to demonstrate this disproportion so that the court is convinced that the assets derive from illicit activities.

Recently, the legal framework [3; 4] was adjusted to facilitate the application of these measures even in the absence of a conviction sentence under certain conditions (civil forfeiture or forfeiture based on reasonable suspicion evidence within the criminal

process), consolidating the role of the Criminal Assets Recovery Agency (CARA).

In conclusion, while special confiscation is a "traditional" institution of the 2002 Criminal Code, extended confiscation emerged as a modern legislative response over a decade later to cover gaps in recovering illicit wealth that could not be strictly tied to a single demonstrated criminal act.

1.2. Essence and Legal Nature. The criminal law defines the concept of ***special confiscation*** in Article 106 para. (1) CC, establishing that ***special confiscation*** consists of the forced and free-of-charge transfer into state ownership of the assets indicated in para. (2), according to this paragraph, the following are subject to special confiscation assets (including currency values): a) used or intended for the commission of an offense; b) resulting from offenses, as well as any income or benefits derived from such assets; c) given to induce the commission of an offense or to reward the offender; d) held contrary to legal provisions; e) converted or transformed, partially or entirely, from assets resulting from offenses and from income or benefits obtained from these assets; f) which constitute the object of money laundering or terrorist financing offenses.

In case these assets no longer exist, cannot be found, cannot be recovered, or their confiscation is impossible for any other reason, another asset of equivalent value is confiscated as a priority, and in its absence, its monetary value is confiscated.

If the assets indicated in para. (2) have been intermingled with legally acquired assets, the part of the assets or their counter-value corresponding to the value of the assets resulting from offenses and the income or benefits obtained from those assets shall be confiscated (para. (3) Art. 106 CC).

Special confiscation applies even if the suspect, accused, defendant, or convicted person is released from criminal liability or criminal punishment, or if amnesty was applied or their death occurred. Special confiscation does not apply in case of release from criminal liability due to the expiration of the statute of limitations, except for minor, less serious, or serious offenses, and if the term expired after the initiation of the criminal proceedings (para. (4) Art. 106 CC) [1].

Conclusion. According to this last cited provision, the state loses the possibility of applying special confiscation if the statute of limitations expired prior to the initiation of criminal proceedings (definitively)!

If, however, the statute of limitations expired but *after* the initiation of criminal proceedings, the state will not prosecute the person criminally but will apply special confiscation, yet another condition is imposed — the committed offenses must be minor, less serious, or serious. Therefore, offenders will not be punished, but the illicit wealth or assets will still be confiscated (many perpetrators intentionally delayed the criminal process to remain in possession of certain assets).

Para. (5) Art. 106 CC stipulates that special confiscation does not apply to offenses committed through a press organ or any other mass media outlet.

Conclusion. The provision in para. (5) aligns with Article 10 of the ECHR [5] (freedom of expression); thus, the state will not apply special confiscation to the "instruments of crime" (machinery or other equipment of a press organ, TV station, etc., with the help of which certain offenses were committed). If it proceeded otherwise, there is a risk that the state could use confiscation to limit or even suppress freedom of expression (Article 10 presumes that state interference with freedom of expression must be minimal and strictly necessary).

In turn, Art. 106^1 CC does not explicitly define the concept of extended confiscation; however, following the legislator's logic, the term "confiscation" has the same meaning,

except that the area of confiscated assets/values is larger (according to the dictionary [6], the term "extended" means grown, broadened, enlarged, increased), the law mentions that assets other than those indicated in Art. 106 are also subject to extended confiscation. Nevertheless, analysis of the cited provisions allows us to conclude that assets subject to extended confiscation are those acquired by the suspect, accused, defendant, or convicted person within the last 5 years before and, if applicable, after the moment the offense was committed, up to the date the act of referral to the court is issued, the value of which exceeds by more than 20 forecasted average monthly salaries per economy, established by Government decision, the licit income acquired by them.

To order extended confiscation, a series of conditions expressly provided by law must also be met, namely: the court forms its conviction that the respective assets may derive from criminal activities. The court's conviction may be based, inter alia, on the difference between licit income and the value of assets acquired in the same period, on the fact that there is no plausible licit source for the assets, or that the suspect, accused, defendant, or convicted person has ties to organized crime; and the offenses indicated in para. (1) Art. 106[1] CC have been committed, for which the law provides a maximum penalty of imprisonment for a term of at least 4 years.

When applying the provisions of para. (2), the value of assets held both by the suspect, accused, defendant, or convicted person and by the third-party natural or legal persons mentioned in Art. 106[2] CC shall be taken into account.

When establishing the difference between licit income and the value of acquired assets, the value of the assets at the date of their acquisition and the expenses incurred by the suspect, accused, defendant, or convicted person and their family members shall be taken into account, including those of third-party natural or legal persons mentioned in Art. 106[2] (para. (4) Art. 106[1]).

If, upon the adoption of the decision by the court, the assets subject to extended confiscation no longer exist, cannot be found, or have been intermingled with legally acquired assets and cannot be separated from them, or if their confiscation is impossible for any other reason, money and other assets covering their value shall be confiscated instead (para. (5) Art. 106[1]).

Para. (6) provides that assets and money obtained from the exploitation or use of assets subject to confiscation shall also be confiscated, including assets into which criminal assets have been transformed or converted, as well as income or benefits obtained from these assets.

According to para. (7) Art. 106[1] CC, if the suspect, accused, defendant, or convicted person holds money, it shall be confiscated as a priority. If the money held is insufficient, other assets shall be confiscated [1].

Although both measures involve the forced and free-of-charge transfer of assets into state ownership, their legal nature is defined by their preventive, rather than punitive, purpose, with both institutions being categorized as security measures [7, p.342].

Special Confiscation has an eminently objective character (*in rem*). It targets the *instrumentum sceleris* (tools of crime) and *productum sceleris* (direct product). The state intervenes to neutralize the state of danger created by holding assets that served to commit an act provided for by criminal law.

Extended Confiscation introduces a subjective and presumption-based dimension. It is not limited to assets resulting from the specific offense for which the person is convicted, but extends "the arm of the law" over the entire patrimony acquired within a determined period (as a rule, 5 years before committing the act and, if applicable, after the

moment of committing the offense, up to the date of issuing the act of referral to the court), if there is evidence that its value considerably exceeds licit income (exceeding by more than 20 forecasted average monthly salaries per economy, established by Government decision). It targets assets that exceed the licit income of a person convicted of certain categories of serious offenses [8, p.89].

1.3. Similarities between the Two Institutions:

- **Legal Nature**: Both are security measures (Art. 98 CC RM) aiming to remove a danger and prevent the commission of new acts.
- **Public Law Character**: The transfer of assets is forced and free of charge in favor of the state.
- **Subject of Application**: Both can only be ordered by a court of law through a conviction sentence (with the exceptions provided by law for special confiscation in case of termination of criminal proceedings.
- **Rights of Third Parties**: Both measures provide for the protection of *bona fide* third parties (persons who did not know and could not have known about the illicit origin of the assets).

1.4. Fundamental Differences.

1. Link to the Offense: In the case of special confiscation, a direct link must be demonstrated (the asset was used in or resulted from act X); in contrast, extended confiscation is based on an indirect link (patrimonial disproportion suggests general criminal activity).

2. Standard of Proof: In special confiscation, there is certain proof regarding the origin or destination of the asset, opposite to extended confiscation where there is only a rebuttable presumption of an illicit character based on the impossibility of justification through licit income.

3. Burden of Proof: Art. 106 CC – rests exclusively with the prosecution; Art. 106^1 CC – rests with the prosecution (to demonstrate the disproportion), but a "partial reversal" occurs (the defendant must justify the difference).

4. Scope of Application: Special confiscation applies to any offense provided for by the Criminal Code, whereas extended confiscation applies only to a limited list of serious and exceptionally serious offenses ("Assets other than those indicated in Art. 106 are subject to extended confiscation in case the person is suspected, accused, under trial, or convicted for committing the offenses provided in Art. 140^1–142, 144, 158, Art. 164 para. (2) lit. f), Art. 165–168, Art. 171 para. (2) lit. a) and para. (3) lit. a), Art. 172 para. (2) lit. a) and para. (3) lit. a), Art. 173 para. (2), Art. 174–175^1, 181^1–181^3, 186–191, 206, 208–208^5, 214^1, 217–217^4, 218–220^1, 223–233, 236–246^1, Art. 247 para. (2), Art. 248–253, 257, 259–260^6, 260^8, 275, 278–280, 282–286, 289–290, 292, 295–295^2, 302, 324–329, 330^2, 332–335^1, 342, 343, 361, and 362^1, if the act is natured to generate an economic benefit (para. (1) Art. 106^1)").

5. Moment of Asset Acquisition: The asset must exist at the moment of committing the act or immediately after in the case of special confiscation; extended confiscation targets assets acquired "within the last 5 years before and, if applicable, after the moment the offense was committed, up to the date of issuing the act of referral to the court".

6. Value of Assets: In special confiscation, the value of the assets subject to confiscation does not matter; in extended confiscation, one of the conditions for ordering it is that the value of the assets acquired "exceeds by more than 20 forecasted average monthly salaries per economy, established by Government decision, the licit income acquired".

A frequent problem in Moldovan courts is the confusion between these two institutions:

Special confiscation (Art. 106 CC) has the character of an "object punishment" (*in rem*). It targets assets used or intended for the commission of the offense. *Example from practice*: In cases of smuggling (Art. 248 CC), Moldovan courts constantly apply special confiscation to vehicles modified for hiding goods [9].

Extended confiscation (Art. 106[1] CC) is much more complex because it targets assets exceeding the person's licit income, even if a direct link cannot be proven to a specific offense for which the person is accused, being deduced instead from general criminal activity.

A critical distinction resides in the ***standard of proof***. In special confiscation, the prosecution must demonstrate the direct asset-offense link. In extended confiscation, a partial reversal of the burden of proof applies: once the prosecutor demonstrates the disproportion between wealth and income, the possessor must justify the licit origin of the assets [10].

In connection with this, problems regarding the "reversal of the burden of proof" frequently appear in Moldovan jurisprudence [11] practice shows that prosecutors encounter difficulties in demonstrating the disproportion between wealth and income, and courts tend to be extremely cautious not to violate Article 46 of the Constitution (the right to property). Courts in the Republic of Moldova often remain absolutely faithful to the principle of *actori incumbit probatio*. For example, in illicit enrichment cases (Art. 330[2] CC), the defense frequently argues that the assets belong to relatives (parents, in-laws) who worked abroad, or that assets were acquired from donations at festive events, etc.

In the absence of strict monitoring of financial flows by CARA from the initial phase, Moldovan courts often refuse extended confiscation, considering that *in dubio pro reo* (doubt favors the accused) also applies to the origin of money. Even in extended confiscation, judges sometimes demand that prosecutors indicate exactly from which illicit activity the sum for every single brick of a house originates, which defeats the very essence of the "extended" concept. This approach is contrary to the spirit of ECHR jurisprudence (*Gogitidze v. Georgia*), which accepts that the state can presume the illicit nature of disproportionate wealth if the person has already been convicted of a profit-generating offense. Here, we note that in cases handled in Chișinău, a frequent problem is how the judge interprets Art. 106[1] para. (2). While in special confiscation the prosecutor must say "this car was used to commit smuggling", in extended confiscation, he says "this defendant has 3 properties, though his cumulative salary over 5 years does not cover even half the value of one".

II. Procedural and Substantive Aspects Regarding the Evaluation and Substitution of Criminal Assets. Another important issue in applying extended confiscation is the evaluation and substitution of assets (the standard of evaluation).

Paragraph (4) of Article 106[1] CC stipulates that "when establishing the difference between licit income and the value of acquired assets, the value of the assets at the date of their acquisition and the expenses incurred by the suspect, accused, defendant, or convicted person and their family members shall be taken into account, including those of third-party natural or legal persons mentioned in Art. 106[2]", keeping in mind the condition stipulated in para. (2) lit. a) that: "the value of assets acquired... exceeds by more than 20 forecasted average monthly salaries per economy... the licit income acquired". This legislative specification is fundamental to respecting the principles of legality and predictability, but raises major challenges in practice:

- **The Problem of Inflation and Market Volatility**: In the Republic of Moldova, the real estate market and that of mobile assets (cars, luxury items) have experienced major fluctuations over the last decade. Evaluating an asset at its value from 5 years ago requires complex expertise.

- **Parallel Financial Investigation (The Role of CARA)**: Determining the value at the moment of acquisition is not done simply by consulting the price indicated in the contract (which is often undervalued to avoid taxes or hide the origin of money), but through comparative market analyses. In these cases, the court must rely on evaluation reports by CARA specialists, who use indirect methods to estimate real value rather than just relying on legal acts of property transfer.
- **Transformed Assets:** If a defendant bought land with illicit money and subsequently built a villa on it, para. (4) obliges a clear distinction between the value of the initial expenditure/investment and the surplus value added later, a process that complicates the burden of proof for the prosecutor.

Paragraphs (5) and (6) of Art.106[1] CC institute the so-called mechanism of a "safety net" or **confiscation by equivalent**. Thus, "if, upon the adoption of the decision by the court, the assets subject to extended confiscation no longer exist, cannot be found, or have been intermingled with legally acquired assets and cannot be separated from them, or if their confiscation is impossible for any other reason, money and other assets covering their value shall be confiscated instead. Assets and money obtained from the exploitation or use of assets subject to confiscation shall also be confiscated, including assets into which criminal assets have been transformed or converted, as well as income or benefits obtained from these assets".

Therefore, confiscation by equivalent intervenes when assets that should have been confiscated in-kind can no longer be found, have been consumed, alienated, or mixed with legally acquired assets. The legal essence of this institution lies in the fact that it no longer targets the specific asset (*in rem*), but targets its patrimonial value. The state transforms its claim over a specific object into a general monetary claim over the patrimony of the convicted person.

The criminal law provides that if the suspect, accused, defendant, or convicted person holds money, it shall be confiscated as a priority. If the money held is insufficient, other assets shall be confiscated (para. (7) Art. 106[1] CC).

In the practice of applying extended confiscation, difficulties in executing the measure can appear:

- **Alienation to *Bona Fide* Third Parties**: If the defendant sold a car bought with bribe money to a person who did not know the origin of the funds, the state cannot take the car from the new owner. In this case, the court will oblige the defendant to pay a sum of money equivalent to the sale price.
- **Fungible Assets (Money)**: If sums of money derived from the offense were spent on vacations, services, or perishable goods, the confiscation of an equivalent sum from present or future licit income is ordered.
- **Capital Intermingling**: If corruption money was used to pay the mortgage for an apartment partially paid from salary, a share of the apartment or the counter-value of the illicit sum injected into that asset will be confiscated.

A major problem in Moldova is the solvency of convicted individuals at the moment of the definitive sentence. Frequently, even though the confiscation by equivalent of colossal sums is ordered, judicial executors find that the defendant "owns no property".

In this context, we recommend establishing the necessity of applying a **precautionary seizure** on any licit asset of the defendant right from the start of the criminal investigation, precisely to guarantee the possibility of confiscation by equivalent at the end of the trial.

III. The Role of CARA in Recovering Criminal Assets. The regulatory framework

governing ARBI's activity is constituted by Law No.48 of 30.03.2017 on the Criminal Assets Recovery Agency (CARA) [12] and other internal acts of the NAC (National Anti-Corruption Center). The purpose of the law is to create the normative framework necessary for recovering criminal assets, identical to the purpose for which CARA was established. As for the process of recovering criminal assets, it is regulated by the Criminal Procedure Code of the Republic of Moldova (Chapter III) [13].

In the Republic of Moldova, the Criminal Assets Recovery Agency (CARA), an autonomous subdivision within the National Anti-Corruption Center (NAC), is the central actor without which Art. 106[1] CC would remain a dead letter.

3.1. CARA's Competences in the Recovery Process. The Criminal Procedure Code expressly lists the stages of this process in Art. 229[1], according to which the recovery process of criminal assets unfolds in the following stages:

1. Tracing and identifying criminal assets, accumulating evidence (utilizing national and international databases through CARIN or INTERPOL networks to find hidden assets);

2. Freezing and managing criminal assets (rapid application of precautionary measures to "freeze" assets, including managing seized assets; for example, the early sale of cars that lose value through non-use, an important legislative novelty in RM);

3. Confiscation of criminal assets and reparation of damages;

4. Effective execution of the decision regarding the recovery of criminal assets (including cooperation with foreign authorities to return funds to the state budget of Moldova).

To fulfill its mission, ARBI has the following duties:

a) tracing and identifying criminal assets and accumulating evidence by conducting parallel financial investigations and drafting reports on their results, as well as freezing criminal assets under the conditions of the Criminal Procedure Code;

a[1]) Conducting financial investigations in the sense of Art. 91;

b) Evaluating, managing, and capitalizing on frozen criminal assets;

c) Keeping records regarding frozen criminal assets, including based on requests from competent foreign authorities;

c[1]) Managing the national information system for records of seized criminal assets, seizure orders, confiscation orders, as well as decisions subsequently adopted regarding these assets;

d) Participating in negotiations regarding the repatriation of confiscated criminal assets;

e) International cooperation and information exchange with competent foreign authorities, including specialized bodies and agencies of the European Union;

f) Collecting and analyzing statistical data relating to the offenses provided by this law;

g) Representing the interests of the state and public legal entities in criminal and civil proceedings for asset recovery and reparation of damages caused by violating the legislation of the Republic of Moldova and other states;

h) Cooperating with public authorities that exercise relevant functions for CARA's activity;

i) Supporting judicial bodies, under the law, to use best practices in identifying and managing assets that may be subject to freezing and confiscation measures within the criminal process [12].

3.2. The Concept of Parallel Financial Investigation. The aforementioned law es-

tablishes that the Criminal Assets Recovery Agency conducts parallel financial investigations under the Criminal Procedure Code (CPC) in connection with the commission of one or more offenses, at least one of which is provided in Art. 2 para. (2) of this law (Art. 90), financial investigations are the totality of activities consisting of accumulating information, analyzing, and verifying all financial, economic, and other relations related to tracing and identifying assets that do not have a legal origin or are/can be the object of freezing and/or confiscation measures (Art. 9^1). The Criminal Procedure Code establishes that the criminal investigation body conducts parallel financial investigations and instructs CARA, by delegation, to trace and identify criminal assets, as well as accumulate evidence regarding them, under Art. 258 of CPC.

Unlike the classic criminal investigation, which focuses on proving the person's guilt (the act, the author, culpability), the parallel financial investigation run by CARA focuses exclusively on "the trail of money" (*follow the money*). In such cases, certain principles/rules must be respected, such as: 1. **Simultaneity**: The essence of success lies in launching the financial investigation at the same time as the criminal investigation. If CARA intervenes only at the trial stage, assets are usually already "laundered" or transferred to inaccessible jurisdictions and **2. Profile of the Beneficial Owner**: CARA has the capacity to look beyond the legal screen. In Moldova, a major barrier in extended confiscation is the use of intermediaries (relatives, friends, or offshore companies). CARA utilizes operational analysis techniques to demonstrate that although a villa is registered under a pensioner's name, the real beneficial owner who pays the bills and lives there is the defendant.

However, the imperfection of the legislation in force or even the lack of normative acts regulating certain key issues regarding asset recovery creates certain impediments to the effective recovery of assets. For example, according to the CARA report for 2021, the agency stated: "Following the evaluation of assets, cash in national currency and freely convertible foreign currency in a total sum of 15,474,135.10 lei was taken into administration and subsequently deposited into treasury accounts managed by CARA" [14]. During 2025, the Criminal Assets Recovery Agency seized assets worth nearly 710 million lei [15].

In cases where precautionary measures are lifted, large sums of money are returned, among the reasons for restitution presented by the agency are: "dismissal of the criminal case and removal of the person from prosecution; acquittal of the person of charges of committing the offense (155,726.95 lei); payment of the counter-value of confiscated sums and/or fines" [14].

In addition, Moldovan courts hesitate to apply confiscation if there is no definitive conviction sentence for the main offense, even if the asset disproportion is obvious.

As methodological barriers, we can invoke: ***justification through "prior savings"*** (defendants frequently claim that financial resources or assets were obtained from licit activities, such as performance bonuses for sports, etc.) and the ***use of intermediaries*** (a portion of assets are identified as being under the control of relatives who lack personal income to justify the purchases).

In this context, CARA expressly points out the lack of provisions that would allow the successful performance of its asset recovery missions [14].

At the same time, following the conducted analysis, it is found that although the normative framework of the Republic of Moldova was substantially modernized in the 2024–2025 period, the effective asset recovery rate remains disproportionate to the damages caused. To overcome this impasse, the following interventions are required:

- **Standardization of Proving "Licit Income"**: It is imperative for the Supreme Court of Justice to develop a Methodological Guide clarifying income evaluation criteria.

In Moldova, invoking "wedding donations" or "unconfirmed remittances" is a common practice to justify wealth. We propose that the burden of proof be considered fulfilled by the prosecution once the discrepancy is demonstrated, leaving the burden of presenting irrefutable evidence (banking documents, customs declarations) to the defendant to overturn the presumption of an illicit character.

- **Introduction of Civil Forfeiture (Non-Conviction Based Forfeiture)**: Moldova should examine adopting a mechanism through which assets can be confiscated within a civil procedure, independently of a criminal conviction sentence. This would allow asset recovery in cases where the defendant dies, flees the country, or benefits from the statute of limitations on criminal liability but cannot justify their wealth.
- **Specialization of Judicial Panels**: Given the complexity of CARA investigations and the technical nature of asset evaluation (crypto-assets, bearer shares, layering schemes), it is recommended to create specialized panels for economic crime and grand corruption within courts of first instance and appeal.
- **Early Sale of Seized Assets:** Extending the practical application of the mechanism for capitalizing on assets before the final sentence to avoid their depreciation (especially for vehicle fleets and technological equipment) and to ensure the liquidity of the recovery fund.

IV. Comparative Law Analysis: Between the American "RICO ACT" Model and Procedural Realities in the Republic of Moldova. Evaluating the efficiency of confiscation mechanisms in the Republic of Moldova cannot be done in isolation; it requires benchmarking against pioneering international standards, particularly the RICO Act (Racketeer Influenced and Corrupt Organizations Act) adopted by the US in 1970 [16]. Although grounded in different legal systems (Common Law vs. Civil Law), both regulations pursue the same strategic objective: annihilating the financial infrastructure of organized crime. RICO served as a global source of inspiration for what we call today "extended confiscation".

In essence, RICO was created to strike at the "brains" of criminal organizations (the Mafia), not just the "hands" executing the offenses, emphasizing the confiscation of the assets of the entire criminal enterprise. Both RICO and Moldova's legislation (Art. 106^1 CC) share the same premise: organized crime cannot be defeated solely by sentencing leaders or members of organized criminal groups to prison, but by bankrupting them.

4.1. Similarities We can identify certain similarities between the content and essence of the compared legal provisions. First, it concerns **targeting indirect profit:** both systems admit that a criminal leader is rarely caught "red-handed". Therefore, both allow the confiscation of assets that cannot be tied to a single specific offense, but are the result of a "racketeering activity" (in the US) or a "general criminal activity" (in Moldova).

Secondly, just like in the Republic of Moldova, where CARA (Criminal Assets Recovery Agency) tracks assets transferred to relatives, RICO allows for "criminal forfeiture," targeting any illicitly acquired interest, property, or contractual right, even if held through intermediaries or shell companies (**third-party confiscation** – *When applying the provisions of paragraph (2), the value of assets held by both the suspect, accused, defendant, or convicted person, as well as by the third-party natural or legal persons mentioned in Article* 106^2), paragraph (3) of Article 106^1 of the Criminal Code, *shall be taken into account*)".

Third, it concerns the **evidentiary standard:** although RICO is a criminal law, it introduced the concept of "preponderance of the evidence" for the forfeiture part in the US, an idea reflected in the spirit of extended confiscation in Moldova (where asset disproportion creates a presumption that must be rebutted).

4.2. Major Flaws and Differences (Moldova vs. USA). Although the goal is similar, the mechanisms in the Republic of Moldova present certain structural weaknesses or differences compared to the American model:

4.2.1. From "Criminal Enterprise" to "Predicate Offense". The main difference lies in the object of confiscation. While the legislation of the Republic of Moldova (Art. 106[1] CC) conditions extended confiscation on the existence of a specific **predicate offense** (the serious act for which the conviction was obtained), the RICO Act introduces the concept of a **"criminal enterprise**". In the American model, once membership in a racketeering-type organization is proven, the state can confiscate any interest or property that circulated through that organization, without needing to tie every single asset to a specific individual criminal act.

In the Republic of Moldova, the major flaw lies in the fragmented approach. If a criminal leader is convicted of an offense that is not found on the restrictive list of Art. 106[1] CC, his manifestly disproportionate wealth often remains untouched, even if there are reasonable indications that it derives from unsanctioned illicit activities. This "list barrier" drastically limits CARA's capacity to act proactively.

4.2.2. Civil Forfeiture vs. Dependency on a Criminal Sentence. A fundamental lesson offered by the RICO model is the use of civil forfeiture (*in rem*). This allows the state to act directly against the asset under the "preponderance of the evidence" standard of proof, without requiring a prior criminal conviction of the possessor.

In contrast, the system in the Republic of Moldova remains dependent on a **definitive criminal conviction**. This dependency transforms the recovery process into an arduous journey, vulnerable to delay tactics or the death/flight of the suspect. National jurisprudence demonstrates that applied seizures often "melt away" during the judicial stage because courts hesitate to apply the presumption of an illicit character in the absence of proof "beyond a reasonable doubt" — a standard much more rigid than that applied in RICO-type jurisdictions or in ECHR jurisprudence (*Gogitidze v. Georgia*).

4.2.3. The Burden of Proof. RICO is extremely aggressive. Once racketeering activity is demonstrated, the presumption that all profit is illicit is very hard to combat. In Moldova, courts are much more protective of property rights. Moldovan judges often demand additional proof tying the asset "almost directly" to the illicit activity, thereby diluting the force of the "extension" of confiscation.

In conclusion, adopting elements from the "spirit of RICO" in Moldova would require a paradigm shift. We propose expanding the scope of Art. 106[1] CC to include any profit-generating offense and validating judicial presumptions so that the burden of proof is effectively shifted onto the possessor of disproportionate wealth. Only thus will confiscation transition from a "complementary penalty" status to that of a national economic security tool.

This would mean:

- **Partial Decoupling from the Criminal Conviction**: Introducing a civil procedure for confiscating unjustified wealth (similar to civil forfeiture in the US), moving focus from criminal guilt to the lack of a licit origin of funds.
- **Expanding the List of Offenses**: RICO covers a vast range of activities (from gambling to mail fraud). Moldova could extend the list under Art. 106[1] CC to include any offense generating significant financial profit.
- **Utilizing "Judicial Presumptions"**: Encouraging judges to use logical deductions (if an official has a salary of 10,000 lei but drives a 100,000 euro car, the presumption of illicitness must be the starting point, not the exception).

Unlike the rigors of the RICO Act, which allows the financial dismantling of the en-

tire organized structure, legislation in the Republic of Moldova remains dependent on individual conviction, leaving escape hatches for assets controlled through complex layering schemes.

The conducted study highlights a major discrepancy between the modern legislative framework of the Republic of Moldova and the low efficiency of asset recovery in practice. Although the institutions of special and extended confiscation are regulated, their application is hampered by rigid standards of proof and procedural barriers.

V. Conclusions and recommendations. As a result of our intervention in the matter of special and extended confiscation, we have identified the following conclusions:

- **Excessive Dependency on the Criminal Sentence:** Unlike international models (such as RICO in the US), confiscation in the Republic of Moldova remains tethered to a definitive criminal conviction. This leaves the process vulnerable to delay tactics, or the death or flight of the suspect.
- **Fragmented Approach to Offenses:** Extended confiscation is limited to a strict list of predicate offenses. If a criminal leader is convicted of an act outside the list, his disproportionate wealth remains untouched.
- **Non-Uniform Standard of Proof:** Although the law allows for a "partial reversal" of the burden of proof (the defendant must justify the wealth gap), courts tend to apply highly rigid standards. Judges often demand proof linking the asset "almost directly" to the illicit activity, neutralizing the essence of the "extended" concept.
- **The Problem of Solvency and Intermediaries:** A major barrier is the use of relatives or offshore companies to hide assets. Often, at the end of the trial, even if confiscation by equivalent is ordered, it is found that the defendant officially owns no assets.

Concrete Proposals for Optimizing the Legal Framework (*Lex Ferenda*).

1. Procedural and Institutional Reform:

- ***Introduction of Civil Forfeiture (Non-Conviction Based)***: Adopting a mechanism independent of the criminal process that allows the confiscation of assets when the accused flees the country, dies, or when the statute of limitations expires.
- ***Specialization of Magistrates***: Creating specialized judicial panels for economic crime and grand corruption to handle the complexity of financial investigations (such as crypto-assets or layering schemes).
- ***Standardization of Proving "Licit Income"***: Development of a Methodological Guide by the Supreme Court of Justice to clarify income evaluation and limit unfounded justifications (e.g., "wedding donations" or unconfirmed remittances).

2. Streamlining Recovery and Administration:

- ***Mandatory Precautionary Seizure***: Instituting the obligatoriness of applying a seizure on any licit asset of the defendant right from the beginning of the criminal investigation to guarantee confiscation by equivalent.
- ***Early Capitalization***: Expanding the practical use of selling assets before the final sentence (especially for cars or equipment) to avoid their depreciation and ensure the liquidity of the recovery fund.

3. Legislative Adjustments (Criminal Code):

- ***Elimination of the "List Barrier":*** Expanding the application of Art. 106^1 CC to any offense that generates significant financial profit, inspired by the broad spectrum of the RICO Act.
- ***Validation of Judicial Presumptions*:** Encouraging the use of logical deductions in the judicial process; a manifest discrepancy between an official's salary and held assets must be the starting point for a presumption of illicitness.

TERRORISM AND ORGANIZED CRIME: MODERN FORMS OF MANIFESTATION, INTERACTION AND OPERATIONAL CONVERGENCE

Ștefan-Gabriel DASCĂLU,
PhD, University Lecturer,
"Alexandru Ioan Cuza" Police Academy, Bucharest,
Romania
ORCID: 0009-0005-9739-1646

Abstract

This article analyzes the nexus between terrorism and organized crime from a criminological and operational perspective, highlighting both the points of convergence and the fundamental differences between the two phenomena. In the context of the globalization of crime and the intensification of threats to international security, both academic literature and institutional discourse tend to emphasize the existence of a direct and systematic link between terrorism and organized crime. However, the critical analysis conducted within this study demonstrates that this connection is not universal, but rather dependent on contextual, political, economic, and social factors.

The findings indicate that there is an operational convergence between the two phenomena, reflected in the use of shared resources such as trafficking networks, logistical infrastructures, and illicit financing mechanisms. Nevertheless, the motivational differences remain essential: organized crime is primarily profit-driven, whereas terrorism pursues ideological, political, or religious objectives.

In conclusion, the relationship between terrorism and organized crime should be understood as opportunistic and context-dependent, and institutional approaches must reflect this complexity in order to avoid analytical and policy errors.

Keywords: terrorism, organized crime, international security, police cooperation, operational convergence, radicalization, transnational networks.

TERORISMUL ȘI CRIMINALITATEA ORGANIZATĂ: FORME MODERNE DE MANIFESTARE, INTERACȚIUNE ȘI CONVERGENȚĂ OPERAȚIONALĂ

Abstract

Prezentul articol analizează conexiunea dintre terorism și criminalitatea organizată dintr-o perspectivă criminologică și operațională, evidențiind atât punctele de convergență, cât și diferențele fundamentale dintre cele două fenomene. În contextul globalizării criminalității și al intensificării amenințărilor la adresa securității internaționale, literatura de specialitate și discursul instituțional tind să accentueze existența unei legături directe și sistematice între terorism și criminalitatea organizată. Analiza critică realizată în cadrul acestui demers evidențiază însă faptul că această conexiune nu este universală, ci depinde de factori contextuali, politici, economici și sociali.

Rezultatele cercetării arată că există o convergență operațională între cele două fenomene, manifestată prin utilizarea unor resurse comune, precum rețelele de trafic, infrastructura logistică sau mecanismele de finanțare ilicită. Cu toate acestea, diferențele de natură motivațională rămân esențiale: criminalitatea organizată este orientată predominant spre profit, în timp ce terorismul urmărește obiective ideologice, politice sau religioase.

În concluzie, conexiunea dintre terorism și criminalitatea organizată trebuie înțeleasă ca fiind una oportunistă și contextuală, iar abordările instituționale trebuie să reflecte această complexitate pentru a evita erorile de analiză și de politică publică.

Cuvinte-cheie: terorism, criminalitate organizată, securitate internațională, cooperare polițienească, convergență operațională, radicalizare, rețele transnaționale.

Introduction. In the context of accelerated globalization and profound transformations in the field of international security, the relationship between terrorism and organized crime has become a central subject in both academic literature and institutional discourse [1]. The intensification of economic flows, increased mobility of individuals, and rapid technological development have contributed to shaping a global environment in which criminal activities are becoming increasingly complex and interconnected. Within this framework, the clear delineation between different forms of criminality becomes progressively more difficult, while the interactions between them gain particular relevance for the analysis of security phenomena.

In particular, the relationship between terrorism and organized crime is often portrayed as direct, systematic, and continuously intensifying. Numerous institutional approaches and security strategies promote the idea of convergence between the two phenomena, emphasizing the existence of common mechanisms of financing, logistics, and operational activity [8]. In this regard, it is frequently argued that terrorist groups resort to activities specific to organized crime in order to secure the resources necessary for their operations, while criminal organizations may benefit from the context of instability generated by terrorist actions.

However, a careful examination of the specialized literature reveals the existence of divergent perspectives regarding this relationship. Thus, certain theoretical approaches support the idea of a progressive convergence between terrorism and organized crime, driven by their adaptation to the new realities of the global environment, while other approaches emphasize the structural and functional differences that limit such convergence [2]. This diversity of perspectives reflects the complexity of the phenomenon and the difficulty of framing it within a single theoretical model.

On the other hand, the development of transnational networks and the consolidation of illegal markets have created the conditions for the emergence of areas of intersection between the two phenomena, particularly in regions characterized by political instability, armed conflict, or weakened state authority. In such contexts, terrorist groups may resort to activities such as drug trafficking, smuggling, or money laundering in order to sustain their operations, while criminal organizations may exploit the opportunities generated by unstable environments to expand their own activities. These interactions contribute to shaping an image of convergence; however, they do not necessarily reflect the existence of a stable structural relationship between the two phenomena.

In reality, the interaction between terrorism and organized crime is, in many cases, limited to punctual collaborations, determined by immediate interests and contextual opportunities. Not all terrorist groups are involved in organized criminal activities, and not all criminal organizations are willing to cooperate with terrorist entities, especially given that such an association may attract a stronger reaction from authorities. This perspective highlights the variable and non-uniform character of the relationship between the two phenomena, contrary to the tendency toward generalization found in some analyses.

At the same time, it is important to emphasize that the differences between terrorism and organized crime are not limited to operational aspects, but fundamentally concern their motivational nature. While organized crime primarily pursues profit and the maintenance of control over illegal markets, terrorism is oriented toward the achievement of ideological, political, or religious objectives [7]. This difference influences not only the strategies adopted by such groups, but also the way in which they interact with the external environment and with other criminal entities.

In this context, the tendency to treat terrorism and organized crime as interde-

pendent phenomena may lead to distortions in analysis and, implicitly, to the formulation of inadequate security policies. An approach that ignores the fundamental differences between these two types of threats risks generating disproportionate or ineffective measures that fail to adequately reflect operational realities. Therefore, a critical and nuanced analysis is required, one that takes into account both the elements of convergence and their limitations.

Therefore, this article aims to analyze the relationship between terrorism and organized crime from a criminological and operational perspective, highlighting both the points of intersection and the fundamental differences between the two phenomena. The main objective of this research is to demonstrate that this connection is neither universal nor structural, but rather variable, opportunistic, and context-dependent, which necessitates the adoption of differentiated approaches in the field of security policies.

Research methodology. The methodology employed in this article is based on a qualitative approach, grounded in doctrinal, criminological, and normative analysis [4] of the phenomena under study. The research relies on the examination of specialized literature in the fields of criminology and security studies, as well as on the analysis of relevant international documents concerning organized crime and terrorism.

At the same time, the analytical approach incorporates a comparative dimension, through the examination of different theoretical perspectives on the relationship between the two phenomena, as well as by highlighting the differences between the operational and motivational models of the groups involved.

The data used are predominantly of a secondary nature, derived from criminological studies, institutional reports, and normative documents, considering the difficulty of direct access to primary information in the case of the analyzed phenomena, which are characterized by a high degree of secrecy and operational dynamism.

1. Theoretical framework of the research. The theoretical framework of this research is grounded in contributions from the fields of criminology and security studies, which analyze the relationship between terrorism and organized crime. The specialized literature highlights two main directions: on the one hand, convergence theory, which supports the existence of a growing proximity between the two phenomena, and on the other hand, differentiation theory, which emphasizes their distinct character from both a motivational and organizational perspective.

In this context, the article adopts an integrative perspective, examining both the points of intersection and the structural differences between the two types of entities. The theoretical approach employed makes it possible to highlight the dynamic and context-dependent nature of the relationship between terrorism and organized crime.

This approach allows for a nuanced understanding of the phenomenon under analysis, avoiding both the oversimplification of the relationship between terrorism and organized crime and the tendency to treat them as entirely independent phenomena. At the same time, it provides a coherent analytical framework for interpreting the evolving interactions between these forms of criminality in different operational environments. Such a perspective reinforces the need to move beyond rigid theoretical models and to adopt flexible interpretative approaches.

2. Methodological approach. The research methodology is based on a qualitative approach, employing methods specific to doctrinal and criminological analysis. Relevant concepts, definitions, and theoretical models are examined, as well as the manner in which these are reflected in institutional documents and security strategies.

At the same time, the study employs a comparative method, by analyzing the char-

acteristics of terrorism and organized crime from the perspective of their objectives, organizational structures, and modes of operation. This approach enables the identification of both common elements and fundamental differences between the two phenomena.

Therefore, the methodology employed provides an appropriate analytical framework for the critical assessment of the relationship between the two phenomena, allowing for the formulation of scientifically grounded conclusions. Moreover, it facilitates a structured comparison between different analytical perspectives, contributing to a clearer understanding of the complexity of the subject matter. Such an approach strengthens the reliability of the findings and enhances the overall coherence of the research.

3. Data sources and research limitations. The data used in this article are predominantly of a secondary nature, derived from specialized literature, institutional reports, and relevant normative documents. The choice of this approach is justified by the difficulty of accessing primary data in the field under analysis, which is characterized by a high degree of secrecy.

The main limitation of the research lies in its reliance on secondary sources, which may reflect certain institutional or doctrinal perspectives. Nevertheless, the diversity of the sources employed contributes to increasing the degree of objectivity and to the formulation of relevant conclusions. In this regard, the use of multiple types of sources allows for a more balanced interpretation of the analyzed phenomena.

In this sense, the research findings must be interpreted within the context of these methodological limitations, without, however, diminishing the relevance of the conclusions reached. Acknowledging these limitations enhances the transparency of the research process and reinforces the credibility of the analytical approach adopted.

Discussions and results obtained.

I. Operational and Motivational Dimensions of the Relationship between Terrorism and Organized Crime. **1.1. Conceptual Delimitations Regarding Terrorism and Organized Crime**. Terrorism and organized crime represent two distinct phenomena, traditionally analyzed separately in the specialized literature, yet interconnected in certain operational contexts. Organized crime is generally defined as a set of illegal activities carried out by structured, stable, and coordinated groups, with the aim of obtaining profit [4] or influence through the use of violence, corruption, and intimidation. In contrast, terrorism is characterized by the deliberate use of violence or the threat of violence for political, ideological, or religious purposes, with the primary objective of creating a state of fear and influencing the decisions of public authorities [7].

The fundamental difference between the two phenomena is determined by the nature of their motivation: while organized crime predominantly seeks material gain, terrorism is based on ideological or political objectives. However, in certain situations, the two phenomena may interact, generating hybrid forms of manifestation. Such interactions, although not systematic, illustrate the adaptive capacity of both types of entities in response to changing operational environments.

This conceptual delimitation represents an essential starting point for the analysis of the relationship between the two phenomena, preventing theoretical confusion and erroneous interpretations. At the same time, it provides a clear analytical foundation for distinguishing between superficial similarities and structurally significant differences.

1.2. Operational Convergence between Terrorism and Organized Crime. The analysis of these phenomena highlights the existence of an operational convergence between terrorism and organized crime, primarily manifested at the level of resources and functional mechanisms. In practice, terrorist groups frequently resort to activities specific to

organized crime in order to secure the financing and logistical support necessary for the conduct of their operations [8].

Thus, activities such as drug trafficking, human trafficking, smuggling, document forgery, or money laundering represent common instruments used by both types of entities [5]. Moreover, criminal infrastructure—consisting of transportation networks, distribution channels, and corrupt contacts—can be exploited by terrorist groups to facilitate movement, supply, and concealment of their members. This shared use of illicit infrastructures underscores the practical advantages derived from such operational overlaps.

At the same time, globalization and technological development have contributed to the expansion of these networks at a transnational level, facilitating ad hoc cooperation between different groups. However, such collaboration is generally opportunistic and driven by immediate interests, rather than the result of a structural or ideological alliance. These forms of interaction are therefore better understood as pragmatic adaptations to environmental conditions rather than indicators of a deep structural convergence.

This difference in motivational nature constitutes the essential criterion for distinguishing between the two phenomena, even in the context of potential operational interactions. Consequently, operational convergence should not be interpreted as evidence of a fundamental transformation in the nature of either phenomenon.

1.3. Motivational Divergence: The Central Element of Distinction. Despite the existence of operational convergence, the differences between terrorism and organized crime remain essential at the motivational level. Organized crime is primarily oriented toward profit generation and the maintenance of control over illegal markets [3], which determines a pragmatic relationship with the state, based on the avoidance of direct confrontation and, in some cases, on infiltration into institutional structures.

In contrast, terrorism aims to destabilize the existing order and to impose an ideological, political, or religious vision [7]. In this regard, violence does not represent merely an instrumental means, but also a tool of communication and intimidation, oriented toward achieving a symbolic impact on both the population and public authorities. This symbolic dimension of violence differentiates terrorism from other forms of criminality in a fundamental way.

This fundamental difference also influences the organizational behavior of the two types of groups. While criminal organizations seek stability and continuity of their illegal activities, terrorist groups may accept significant risks and even self-destruction in the name of a cause perceived as superior. Such contrasting behavioral patterns highlight the profound divergence in strategic logic between the two phenomena.

1.4. Hybrid Models and the Limits of the Terrorism – Organized Crime Nexus. The concept of "hybrid" is frequently used to describe situations in which elements specific to organized crime and terrorism intersect. This model explains the existence of overlapping areas [2], in which terrorist groups adopt criminal practices, while criminal organizations may, in certain contexts, employ methods characteristic of terrorism.

However, critical analysis shows that this connection should not be generalized. In many cases, cooperation between the two types of groups is limited, temporary, and determined by specific circumstances. Furthermore, there are numerous situations in which criminal organizations deliberately avoid association with terrorist groups, in order to prevent attracting the attention of authorities and to protect the continuity of their economic activities. This selective avoidance behavior reflects the fundamentally different risk calculations underlying the two types of entities.

Therefore, the relationship between terrorism and organized crime can be char-

acterized as contextual and opportunistic, rather than structural [1]. This conclusion has important implications for the development of security policies, which must avoid oversimplified approaches and consider the complexity of the analyzed phenomena. It also highlights the necessity of adopting flexible and evidence-based policy responses.

Consequently, the hybrid model should be interpreted as a contextual exception rather than a general rule in the analysis of the relationship between terrorism and organized crime. Such an interpretation prevents the misapplication of theoretical models and contributes to a more accurate understanding of the dynamics between the two phenomena.

Conclusions. The analysis conducted highlights the fact that the relationship between terrorism and organized crime is a complex one, characterized by a balance between operational convergence and motivational divergence. Although both academic literature and institutional discourse frequently promote the idea of a direct and systematic connection between the two phenomena, the findings of this research demonstrate that such a relationship cannot be generalized [1]. Rather, it must be understood within the limits imposed by specific contextual conditions.

Operational convergence is evident in the use of shared resources, such as trafficking networks, logistical infrastructure, and illicit financing mechanisms. These elements facilitate ad hoc collaborations between terrorist groups and organized crime entities, particularly in contexts characterized by political instability, armed conflict, or weakened institutional control.

However, the fundamental differences between the two phenomena remain essential. Organized crime is predominantly oriented toward profit generation and the maintenance of stability in illegal activities, whereas terrorism pursues ideological, political, or religious objectives and is characterized by a greater propensity for direct confrontation with the state and the assumption of significant risks. *This divergence fundamentally shapes the strategic behavior and long-term objectives of the groups involved.*

The concept of "hybrid" provides a useful framework for understanding areas of overlap; however, its application must be approached with caution in order to avoid oversimplification of reality. In many cases, the connection between terrorism and organized crime is opportunistic, limited, and dependent on contextual factors. *Consequently, the hybrid model should be regarded as an analytical tool rather than a definitive explanatory paradigm.*

In this regard, future research directions must move beyond general approaches and focus on the concrete mechanisms through which terrorism and organized crime interact in specific contexts, characterized by political instability, weakened institutional control, or the existence of consolidated illegal markets. The present analysis demonstrates that the relationship between the two phenomena is neither uniform nor predictable, but manifests itself in a variable and opportunistic manner, depending on factors such as the operational environment, available resources, the pressure exerted by authorities, and the strategic objectives of the groups involved.

Thus, it becomes essential to develop more sophisticated analytical tools capable of capturing not only the existence of connections between the two phenomena, but also their nature, intensity, and duration. Future approaches should integrate interdisciplinary perspectives, combining criminological analysis with insights from security studies, international relations, and public policy, in order to provide a deeper understanding of the dynamics of these forms of criminality. *Such an integrative approach enhances both analytical depth and policy relevance.*

Furthermore, the practical implications of these findings are significant. Security policies should not assume of a generalized fusion between terrorism and organized crime, but rather should be constructed on the basis of differentiated analyses that consider the specific characteristics of each phenomenon. Otherwise, there is a risk of adopting disproportionate or ineffective measures that fail to adequately reflect operational realities and may lead to inefficient allocation of resources.

In particular, international law enforcement cooperation must be adapted to these realities through the development of flexible mechanisms oriented toward the rapid exchange of relevant information, without neglecting the structural and motivational differences between the two types of threats. In this regard, the role of international institutions and specialized agencies becomes essential; however, their effectiveness depends on their capacity to understand and integrate the complexity of the relationship between terrorism and organized crime.

Therefore, future research should aim not only at the theoretical deepening of the phenomenon, but also at identifying concrete operational models of interaction that would enable more effective anticipation and counteraction of these forms of criminality. Only through such an approach, grounded in critical analysis and continuous adaptation to the evolving security environment, can coherent and effective public policies be developed, capable of addressing the complex challenges posed by contemporary criminality.

Abstract
The article examines the current state of the Ukrainian system of subjects of forensic expert activity and highlights certain problems related to its functioning. The provisions of the Law of Ukraine on "Forensic Examination" concerning the system of subjects of forensic expert activity are analyzed. It is demonstrated that forensic, forensic medical, and forensic psychiatric examinations may be conducted exclusively by specialized state forensic institutions of the Ministry of Internal Affairs of Ukraine, the Ministry of Justice of Ukraine, the Ministry of Defense of Ukraine, the Ministry of Health of Ukraine, the Security Service of Ukraine, and the State Border Guard Service of Ukraine. These subjects, together with experts who are not employees of specialized state institutions, are also authorized to conduct all other types of forensic examinations.

The structure and principal tasks of the expert services within the Ukrainian Ministry of Internal Affairs, the Security Service of Ukraine, and the State Border Guard Service, as well as the forensic science institutes of the Ministry of Justice of Ukraine, are examined in detail. Attention is also drawn to the ongoing reform of forensic institutions subordinated to the Ministry of Health. It is noted that the forensic expert powers previously vested in the Ministry of Defense have been transferred to civilian institutions. The article also presents proposals put forward by representatives of Ukraine's anti-corruption law enforcement bodies regarding the establishment of a specialized forensic institution within the structure of the National Anti-Corruption Bureau of Ukraine. Furthermore, the system of forensic institutions and independent experts who do not belong to the category of state specialized institutions is demonstrated.

Emphasis is placed on the principal problems associated with the formation and functioning of the system of forensic institutions in Ukraine. Among these, particular attention is drawn to the absence of a single center responsible for the development and implementation of state policy in this field, the lack of coherent legislative regulation, the subordination of forensic institutions to different governmental agencies, and the potential for conflicts of interest arising from the institutional subordination of both the ordering bodies and the providers of forensic examinations within the same authority, among other issues.

Keywords: forensic expert activity, forensic examination, forensic expert, judicial proceedings, criminal proceedings, system of subjects, public administration.

SISTEMUL SUBIECȚILOR ACTIVITĂȚII DE EXPERTIZĂ CRIMINALISTICĂ ÎN UCRAINA: STAREA ACTUALĂ ȘI PROBLEMELE FORMĂRII ACESTEIA

Abstract
Articolul examinează starea actuală a sistemului ucrainean de subiecți ai activității de expertiză criminalistică și evidențiază anumite probleme legate de funcționarea acestuia. Sunt analizate prevederile Legii

Ucrainei privind „expertiza criminalistică" referitoare la sistemul subiecților activității de expertiză criminalistică. Se demonstrează că expertizele criminalistice, medico-legale și psihiatrico-legale pot fi efectuate exclusiv de instituții criminalistice de stat specializate din cadrul Ministerului Afacerilor Interne al Ucrainei, Ministerului Justiției al Ucrainei, Ministerului Apărării al Ucrainei, Ministerului Sănătății al Ucrainei, Serviciului de Securitate al Ucrainei și Serviciului de Grăniceri de Stat al Ucrainei. Acești subiecți, împreună cu experți care nu sunt angajați ai instituțiilor de stat specializate, sunt de asemenea autorizați să efectueze toate celelalte tipuri de expertize criminalistice.

Sunt analizate în detaliu structura și principalele sarcini ale serviciilor de expertiză din cadrul Ministerului Afacerilor Interne al Ucrainei, Serviciului de Securitate al Ucrainei și Serviciului de Grăniceri de Stat, precum și ale institutelor de criminalistică ale Ministerului Justiției al Ucrainei. De asemenea, este evidențiată reforma în curs a instituțiilor de expertiză subordonate Ministerului Sănătății. Se menționează că atribuțiile de expertiză criminalistică anterior deținute de Ministerul Apărării au fost transferate către instituții civile. Articolul prezintă, de asemenea, propuneri formulate de reprezentanți ai organelor anticorupție din Ucraina privind înființarea unei instituții criminalistice specializate în structura Biroului Național Anticorupție al Ucrainei. În plus, este prezentat sistemul instituțiilor criminalistice și al experților independenți care nu fac parte din categoria instituțiilor de stat specializate.

Se pune accent pe principalele probleme asociate formării și funcționării sistemului instituțiilor criminalistice din Ucraina. Dintre acestea, o atenție deosebită este acordată lipsei unui centru unic responsabil de elaborarea și implementarea politicilor de stat în acest domeniu, lipsei unei reglementări legislative coerente, subordonării instituțiilor criminalistice diferitelor autorități guvernamentale și potențialului de conflicte de interese generate de subordonarea instituțională atât a organelor solicitante, cât și a furnizorilor de expertize în cadrul aceleiași autorități, printre alte probleme.

Cuvinte-cheie: activitate de expertiză criminalistică, expertiză criminalistică, expert criminalist, proceduri judiciare, proceduri penale, sistem de subiecți, administrație publică..

Introduction. Forensic examinations constitute an important procedural instrument for establishing the truth in all categories of judicial proceedings. Such examinations are initiated and conducted in cases where the resolution of issues before the court requires specialized knowledge that, as a general rule, is not possessed by the court or by the participants in judicial proceedings. At the same time, the conduct of forensic examinations represents a socially significant and controlled sphere of human activity that is thoroughly regulated by current legislation and access to which is granted only to specifically authorized subjects. Meanwhile, the system of subjects of forensic expert activity operates under conditions of continuous reform, regular updates to relevant legislation, and excessive workload associated with the ongoing war in Ukraine. These circumstances indicate the need for a detailed study of its current state, the identification of existing problems in its functioning, and the development of possible ways to address them.

Discussions and results obtained. In accordance with Article 7 of the Law of Ukraine n "Forensic Examination", the subjects of forensic expert activity include state specialized institutions and their territorial branches, expert institutions of municipal ownership, as well as forensic experts who are not employees of these institutions, and other specialists (experts) in relevant fields of knowledge, acting in the manner and under the conditions defined by the cited Law.

The system of state specialized institutions includes: research institutions of forensic examinations of the Ministry of Justice of Ukraine; research institutions of forensic examinations, as well as forensic medical and forensic psychiatric institutions of the Ministry of Health of Ukraine; and the expert services of the Ministry of Internal Affairs of Ukraine, the Ministry of Defense of Ukraine, the Security Service of Ukraine, and the State Border Guard Service of Ukraine [1]. Only the aforementioned specialized state institutions are exclusively authorized to conduct forensic expert activity, including forensic, medical, and psychiatric examinations. Other types of forensic examinations may also be conducted by forensic experts who are not employees of specialized state institutions.

The State Judicial Administration of Ukraine also operates its own state forensic expert institution [2]. However, since this authority is not mentioned in Article 7 of the Law

of Ukraine on "Forensic Examination," the state-owned limited liability company "Center for Forensic Examination and Expert Studies" operating under its authority is not classified as a "specialized" forensic institution. Consequently, its experts are not authorized to conduct forensic examinations of a criminalistic nature.

The most extensive component of the system of subjects of forensic expert activity, both in terms of the number of institutions and the staff of forensic experts, is the ***Expert Service of the Ministry of Internal Affairs (MIA) of Ukraine***.

The institutions of the Expert Service of the MIA of Ukraine that carry out forensic expert activity include the State Scientific Research Forensic Center of the MIA of Ukraine in Kyiv, as well as territorial research forensic centers of the Ministry of Internal Affairs of Ukraine [3], which operate in almost all regional centers of the country in accordance with the administrative-territorial structure defined by Article 133 of the Constitution of Ukraine. The Donetsk Research Forensic Center of the Ministry of Internal Affairs of Ukraine is currently located in Dnipro due to the temporary occupation of Donetsk, while the Luhansk Research Forensic Center of the Ministry of Internal Affairs of Ukraine was reorganized in 2025.

The units of the Expert Service of the Ukrainian MIA conduct a full range of forensic examinations, with the exception of forensic medical and forensic psychiatric ones, which, in accordance with the law, may be performed exclusively by forensic institutions subordinated to the Ministry of Health of Ukraine. The State Scientific Research Forensic Center of the Ministry of Internal Affairs of Ukraine serves as the central unit of the Expert Service, entrusted with the tasks of organizational, legal, and methodological coordination of the activities of the Expert Service units of the Ministry of Internal Affairs of Ukraine. It is also responsible for providing forensic and technical-criminalistic support to law enforcement agencies, conducting research in the field of forensic and technical-criminalistic support, performing forensic examinations, maintaining forensic records, and participating in the development of technical-criminalistic tools as well as ensuring their application in practical activities.

A separate task assigned to the Expert Service of the Ministry of Internal Affairs of Ukraine is to ensure the participation of forensic experts and specialists of the Service's institutions as specialists during crime scene examinations, the conduct of pre-trial investigations, and judicial proceedings in accordance with the law [3]. Employees of the Expert Service of the MIA of Ukraine may be involved in conducting a crime scene examination in criminal proceedings as part of a specialized mobile laboratory. Such involvement is carried out upon a written request from the head of the pre-trial investigation body or a person acting in that capacity (in exceptional cases an oral request may be made and subsequently formalized in writing). It is applied in situations involving particularly serious incidents, including homicide or grievous bodily harm committed with firearms, armed robbery with injured victims, sexual violence against minors, major traffic accidents, large-scale fires, explosions or threats of explosions, the discovery of improvised explosive devices, as well as other complex cases [4].

The functions of the expert service of the ***State Border Guard Service of Ukraine*** are performed by its own Main Forensic Center. The primary purpose of this institution is to conduct forensic examinations and expert studies of passport documents that, in accordance with the law, are used when crossing the state border of Ukraine, with the aim of preventing, detecting, and investigating criminal and other offenses through the application of forensic and criminalistic methods and techniques [5]. The aforementioned institution conducts technical examinations of physical documents (2.1 "Examination of document requisites"; 2.3 "Examination of printing forms and other means used in the production of

documents") and portrait examinations (6.2 "Identification of a person based on features of appearance using material images"). These examinations are carried out upon request of the units of the State Border Guard Service of Ukraine, as well as upon appointment by pre-trial investigation bodies or by courts.

Although the activities of the State Border Guard Service of Ukraine are coordinated through the Ministry of Internal Affairs of Ukraine, the Main Forensic Center of the State Border Guard Service of Ukraine is not a unit of the Expert Service of the Ministry of Internal Affairs and is not directly subordinated to the State Scientific Research Forensic Center of the Ministry of Internal Affairs of Ukraine.

Within the system of the ***Ministry of Justice of Ukraine***, seven independent research institutions of forensic examinations operate. These include the Kyiv Scientific Research Institute of Forensic Examinations in Kyiv, which has territorial branches in Cherkasy, Vinnytsia, Ivano-Frankivsk, Ternopil, Chernihiv, Kropyvnytskyi, Zhytomyr, Chernivtsi, and Khmelnytskyi; the National Scientific Center "Hon. Prof. M. S. Bokarius Forensic Science Institute" in Kharkiv, which has territorial branches in Kyiv, Poltava, and Sumy, as well as a Donetsk branch temporarily relocated to Kyiv; the Odesa Scientific Research Institute of Forensic Examinations in Odesa, which has branches in Mykolaiv and Kherson; the Lviv Scientific Research Institute of Forensic Examinations in Lviv, which has branches in Uzhhorod, Rivne, and Kyiv; the Dnipropetrovsk Scientific Research Institute of Forensic Examinations in Dnipro, which has a branch in Zaporizhzhia; the Research Center for Forensic Examination in the Field of Information Technologies and Intellectual Property in Kyiv, which has a Western Ukrainian branch located in Ivano-Frankivsk; and the Research Center of Independent Forensic Examinations of the Ministry of Justice of Ukraine in Kyiv. The forensic institutions of this ministry conduct a full range of forensic examinations, with the exception of forensic medical and forensic psychiatric ones, upon appointment by pre-trial investigation bodies, the prosecution, and courts, as well as upon request of private individuals.

Within the structure of the Ministry of Justice of Ukraine there also operates the Department of Expert Support of Justice, which is entrusted with directing and supervising the activities of research institutions of forensic examinations belonging to the sphere of administration of the Ministry, as well as forensic experts who are not employees of state specialized institutions. This department is also responsible for organizing scientific and methodological support for forensic expert activity and for ensuring the functioning of the Central Expert Qualification Commission under the Ministry of Justice of Ukraine. Article 8 of the Law of Ukraine on "Forensic Examination" assigns to the Ministry of Justice of Ukraine the responsibility for providing scientific-methodological and organizational-managerial support for the activities of forensic experts who are not employees of state specialized institutions. In accordance with procedures established by the Ministry, it also exercises oversight over compliance with legislation governing forensic expert activity by experts of this category.

In addition, the Ministry of Justice of Ukraine ensures the publication of the interdepartmental scientific and methodological journal Criminalistics and Forensic Examination, which serves as a specialized professional publication in the field of scientific and methodological support for forensic expert activity.

Forensic institutions subordinated to the ***Ministry of Health of Ukraine*** possess the exclusive authority to conduct forensic medical [6], forensic psychiatric, and comprehensive forensic psychological and psychiatric examinations [7] upon appointment by pre-trial investigation bodies, the prosecution, and courts, as well as at the request of private individuals.

In particular, forensic medical examinations are carried out by state institutions

of the forensic medical service of Ukraine, which is currently undergoing reform. As of May 2024, a number of municipal institutions of the regional bureaus of forensic medical examination of the Ministry of Health of Ukraine were in the process of termination [8]. The central institution of this service, the Main Bureau of Forensic Medical Examination of the Ministry of Health of Ukraine, was reorganized by Order No.448 of April 3, 2026, issued by the Ministry through its merger with the Institute of Forensic Psychiatry of the Ministry of Health of Ukraine [9]. The process of reorganizing the state regional bureaus of forensic medical examination has also been initiated [10].

Forensic medical experts of the Ministry of Health of Ukraine are also systematically involved by pre-trial investigation bodies as specialists to participate in the inspections of corpses and in exhumations on the basis of Articles 238 and 239 of the Criminal Procedure Code of Ukraine.

Forensic psychiatric examinations may be conducted exclusively by employees of state specialized institutions for forensic psychiatric and forensic psychological examinations subordinated to the Ministry of Health of Ukraine, which include research institutions of forensic examinations and forensic psychiatric institutions of the Ministry. The leading entity within this system is the Institute of Forensic Psychiatry of the Ministry of Health of Ukraine, which has forensic examination branches in the Vinnytsia, Volyn, Dnipro, Donetsk (temporarily relocated to Kyiv), Zhytomyr, Zakarpattia, Zaporizhzhia, Ivano-Frankivsk, Kyiv, Kirovohrad, Lviv, Mykolaiv, Odesa, Poltava, Rivne, Ternopil, Kharkiv, Kherson, Khmelnytskyi, Cherkasy, Chernivtsi, and Chernihiv regions. At the same time, inpatient forensic examinations are conducted exclusively at the Lviv branch of forensic examinations of the Institute [11]. It should be noted that the Ministry of Health of Ukraine has initiated the reorganization of forensic medical examination bureaus through their merger with the aforementioned Institute of Forensic Psychiatry, which may indicate an effort to unify the subjects of forensic expert activity subordinated to the Ministry of Health into a single organizational and managerial structure.

In accordance with Part 2 of Article 71 of the Fundamentals of the Legislation of Ukraine on Health Care, organizational management of the forensic medical and forensic psychiatric services is carried out by the central executive authority responsible for implementing state policy in the field of health care [12], namely the Ministry of Health of Ukraine. A commission also operates under the Ministry of Health of Ukraine, the purpose of which is to monitor compliance by state specialized institutions of forensic psychiatric and forensic psychological examinations of the Ministry, as well as by their employees performing administrative and organizational functions, with legislation governing forensic expert activity [13].

Within the system of the ***Security Service of Ukraine***, the Ukrainian Research Institute of Special Equipment and Forensic Examinations operates, performing the functions of the Expert Service of the Security Service of Ukraine [14]. The Institute is entrusted with the tasks of carrying out scientific, research, scientific-technical, and scientific-organizational activities; developing, producing, and maintaining special technical equipment; conducting forensic expert activity; and providing technical and criminalistic support for operational-search and counterintelligence activities, investigative (search) actions, and related functions [15].

The primary expert division of the Institute is the Center for Forensic and Special Examinations. Territorial units (substructural branches) of this Center conduct more than 45 types of forensic examinations in the cities of Kyiv, Vinnytsia, Dnipro, Zhytomyr, Uzhhorod, Ivano-Frankivsk, Kropyvnytskyi, Lutsk, Lviv, Odesa, Poltava, Rivne, Ternopil, Kharkiv, Khmelnytskyi, Cherkasy, Chernivtsi, and Chernihiv [16].

Until November 28, 2013, the structure of the Medical Forces of the Armed Forces of Ukraine included the Center for Forensic Examinations of the ***Ministry of Defense of Ukraine***, which conducted a significant number of complex forensic medical examinations, forensic technical examinations of documents, forensic handwriting examinations, forensic ballistic examinations, and forensic traceological examinations. However, as noted by N. M. Erhard, in 2013 a decision was made to liquidate this institution and to transfer the relevant powers to conduct forensic examinations to civilian subjects of forensic expert activity [17, p. 181-182]. As of the time of preparation of this study, regulatory legal acts and other open sources contain no information on the conduct of forensic expert activity by institutions subordinated to the Ministry of Defense of Ukraine. This may also be related to restrictions on access to information concerning the activities of the Defense Forces of Ukraine under the legal regime of martial law.

Since 2023, the leadership of the National Anti-Corruption Bureau of Ukraine and the Specialized Anti-Corruption Prosecutor's Office have consistently advocated the establishment of an independent forensic institution to conduct examinations in criminal proceedings concerning criminal offenses falling within the investigative jurisdiction of the National Bureau. Among the arguments advanced by law enforcement officials in support of this proposal are the acceleration of forensic examinations, the absence of unlawful administrative influence on experts by state authorities whose officials may be subjects of criminal proceedings conducted by the Bureau, and the prevention of information leaks regarding the course of pre-trial investigations, etc. [18]. At the same time, this proposal has been received ambiguously by specialists in the field of criminal justice. As noted by Yurii Hryhorenko, the establishment of a dedicated expert service within the National Anti-Corruption Bureau of Ukraine may lead to a conflict of interest due to the common institutional subordination of both the pre-trial investigation body and the newly created forensic institution [19].

As previously noted, within the system of subjects of forensic expert activity it is also appropriate to distinguish state non-specialized forensic institutions. Among these is the State Enterprise "Center for Forensic Examination and Expert Studies" subordinated to the State Judicial Administration of Ukraine [2], which is currently undergoing reorganization through its transformation into a limited liability company, one hundred percent of the shares in the authorized capital of which will be owned by the state. The aforementioned institution conducts forensic examinations upon request or appointment by participants in criminal, civil, commercial, and administrative proceedings. Among the types of examinations carried out by the Center are forensic engineering and transport examinations, construction technical examinations, computer technical examinations, construction evaluation examinations, land evaluation examinations, commodity examinations, economic examinations, and examinations in the field of intellectual property.

Another numerous group of subjects of forensic expert activity, consists of *forensic experts who are not employees of state specialized institutions*. As of the time of preparation of this study, the Register of Certified Forensic Experts of Ukraine [20] contains information on 1,995 forensic experts who are not affiliated with state specialized institutions, although the certificates of some of them have been terminated. These individuals may carry out professional activities either independently (as self-employed entrepreneurs) or as members of privately owned forensic institutions. Forensic experts who are not employees of state specialized institutions are authorized to conduct a wide range of forensic examinations, with the exception of criminalistic, forensic medical, and forensic psychiatric examinations. As noted above, the responsibility for overseeing the activities of forensic experts who are not employees of state specialized institutions is assigned to

the Ministry of Justice of Ukraine.

The only interdepartmental body within the system of public administration of forensic expert activity is the Coordination Council on Problems of Forensic Examination under the Ministry of Justice of Ukraine, which operates in accordance with regulations approved by the Cabinet of Ministers of Ukraine. The composition of this council is formed from representatives of the aforementioned ministries and other state bodies responsible for state specialized forensic institutions, heads (or deputy heads) of state specialized institutions, as well as forensic experts who are not employees of state specialized institutions, have at least five years of professional experience as forensic experts, and have not been subject to disciplinary liability during the previous year [21]. One of the key tasks of the Coordination Council is the certification and state registration of methodologies for conducting forensic examinations [22].

At the pan-European level, the coordination of subjects of forensic expert activity is carried out by the European Network of Forensic Science Institutes. Ukrainian forensic institutions that participate in this network include the State Scientific Research Forensic Center of the Ministry of Internal Affairs of Ukraine, the Kyiv Scientific Research Institute of Forensic Examinations and the National Scientific Center "Hon. Prof. M. S. Bokarius Forensic Science Institute" of the Ministry of Justice of Ukraine, the Ukrainian Research Institute of Special Equipment and Forensic Examinations of the Security Service of Ukraine, as well as the Main Forensic Center of the State Border Guard Service of Ukraine. The purpose of this network is to improve the exchange of information in the field of forensic science, ensure quality management and professional competence in forensic examinations, promote scientific cooperation, and support the training and professional development of expert personnel. In practice, the European Network of Forensic Science Institutes functions as a self-governing international organization that has been recognized by the European Commission as the leading organization in the field of forensic science [23].

Conclusions. Thus, the system of subjects of forensic expert activity in Ukraine consists of state specialized institutions subordinated to the Ministry of Justice of Ukraine, the Ministry of Health of Ukraine (currently undergoing active reform), the Ministry of Defense of Ukraine (where forensic expert activity has been discontinued), the Security Service of Ukraine, and the State Border Guard Service of Ukraine, which possess the exclusive authority to conduct criminalistic, forensic medical, and forensic psychiatric examinations; state non-specialized institutions (in particular those subordinated to the State Judicial Administration of Ukraine); as well as a network of private forensic experts who operate either independently (as self-employed entrepreneurs) or within privately owned legal entities. The only interdepartmental body within the system of forensic expert activity is the Coordination Council on Problems of Forensic Examination under the Ministry of Justice of Ukraine. At the international level, coordination among subjects of forensic expert activity is carried out by the European Network of Forensic Science Institutes, to which a number of Ukrainian forensic institutions have joined.

An analysis of the current state of the system of subjects of forensic expert activity in Ukraine makes it possible to identify the following pressing problems related to its existence and functioning:

- The absence of a unified and centralized system of public administration in the field of forensic expert activity due to the subordination of state forensic institutions to different public authorities;
- The lack of a single, coherent regulatory and legal framework governing forensic expert activity;
- The absence of a mature system of forensic professional self-governance, which

may be modeled after the systems established in the notarial profession or bar;

- Public concerns regarding potential conflicts of interest arising from the institutional subordination of both the initiators and the providers of forensic examinations (for example, the Ministry of Internal Affairs of Ukraine, the Security Service of Ukraine, and the prospective expert service of the National Anti-Corruption Bureau of Ukraine);

- As well as unequal access to forensic expert services for different entities initiating examinations, including the prosecution and the defense, the victim, and other participants in criminal proceedings.

The authors see the ways to address these problems in the implementation of a comprehensive reform of the system of subjects of forensic expert activity in Ukraine, the unification of relevant legislation, and the strengthening of self-governing principles in the management of this socially significant sphere of activity.

In this regard, a promising direction for further scientific research is the study of the specific features of public administration of the subjects of forensic expert activity in Ukraine.

THE IMPORTANCE OF THE REGULATION OF ART. 19 OF LAW NO. 682/2002 ON WITNESS PROTECTION IN PREVENTING AND COMBATING CRIME IN ROMANIA

Elena-Irina RAHIMIAN (CÎRCIUMARU),
University Assistant, "Alexandru Ioan Cuza" Police Academy, Bucharest, Romania,
PhD Student, Bucharest University of Economic Studies, Romania
ORCID: 0009-0005-3395-5705

Abstract

In a criminal trial, the witness represents that "key" person, a natural person, who has knowledge of the circumstances and facts that form the object of the probation. Each state presents a well-defined criminal policy through regulations that configure one of the most important institutions used in preventing and combating crime, namely the witness protection institution.

The development of the process of discovering crimes and increasing the level of safety in terms of the protection conditions for the persons involved represent the main procedural measures of the criminal policy of the Romanian state.

Judicial bodies need data and information that determine the establishment of the factual reality and the person of the offender, in order to fairly resolve any criminal case submitted to trial. In such a context, witnesses are exposed to a series of threats or intimidation in their relationship with criminals, which determines the increased responsibility of the state in ensuring their security. An important role in providing appropriate protection to witnesses is played by a special regulation, Law No.682/2002 on the protection of witnesses, a normative act that ensures the protection and assistance of witnesses, whose life, freedom or bodily integrity is endangered as a result of possessing information regarding the commission of crimes, information that they have provided to judicial bodies in order to discover criminals and resolve criminal cases.

Keywords: evidence, witness, witness protection, Art.19 of Law No.682/2002, criminal policy.

IMPORTANȚA REGLEMENTĂRII ART. 19 DIN LEGEA NR. 682/2002 PRIVIND PROTECȚIA MARTORILOR ÎN PREVENIREA ȘI COMBATEREA CRIMINALITĂȚII ÎN ROMÂNIA

Abstract

În cadrul unui proces penal, martorul reprezintă acea persoană „cheie", persoană fizică, care are cunoștințe depre împrejurările și faptele ce formează obiectul probațiunii. Fiecare stat prezintă o politică penală bine definită prin reglementări ce configurează una dintre cele mai importante instituții folosite în prevenirea și combaterea criminalității, respectiv instituția protecției martorilor.

Dezvoltarea procesului de descoperire a infracțiunilor și creșterea nivelului de siguranță în ceea ce privește condițiile de protecție pentru persoanele implicate reprezintă principalele măsuri cu caracter procedural ale politicii penale a statului român.

Organele judiciare au nevoie de date și informații care să determine stabilirea realității faptice și a persoanei infractorului, cu scopul de a soluționa în mod just orice cauză penală supusă judecății. În astfel de context, martorii sunt expuși la o serie de amenințări sau intimidări în relația cu infractorii, fapt care determină creșterea responsabilitaății statului în asigurarea securității acestora. Un rol important în oferirea unei protecții corespunzătore martorilor îl prezintă o reglementare specială, Legea nr.682/2002 privind protecția martorilor, act normativ prin care este asigurată protecția și asistența martorilor, a căror viață, libertate sau integritate corporală este pusă în pericol ca urmare a deținerii unor informații cu privire la săvârșirea unor

infracțiuni, informații pe care aceștia le-au furnizat organelor judiciare cu scopul de a descoperi infractorii și a soluționa cauzele penale.

Cuvinte-cheie: mijloc de probă, martor, protecția martorilor, art.19 din Legea nr.682/2002, politică penală.

"*Witnesses are the cornerstones of successful criminal justice systems*" [1]

Introduction. Against the backdrop of the globalization phenomenon, economic exchanges have intensified among the world's states, which have influenced the emergence of strong competition in increasing the profits of each country and at the same time an alarming development of crime [2, p.5].

The dynamics that have arisen within societies over time are of several types, namely social, financial and economic dynamics, determining in turn a new form of crime. The size of the crime phenomenon is impossible to measure, but its magnitude can be analyzed in the context of the triggering of large financial systems, by inventorying acts of terrorism, human trafficking, drug trafficking, etc. Unfortunately, confusion has arisen between the legal economy and the money made from illicit activities, states being powerless in confronting the phenomenon of the multiplication and instantaneity of fraudulent financial businesses [3, pp.1-2].

The development of the phenomenon of organized crime represented a challenge for the Romanian legislator, but also for the criminal doctrine, determining them to find effective legal solutions to combat the criminal phenomenon. The category of these effective solutions to combat the criminal phenomenon includes evidentiary procedures that must take into account the particularities of offenses specific to organized crime [4, p.35; 5, p.49; 6, p.33].

In this context, the legislator intended that the fight against the phenomenon of organized crime be carried out both by incriminating the crime of association for the commission of crimes, and by developing a legal framework for the protection of witnesses [7, p.98].

Witnesses represent one of the most important and most frequently used means of evidence in criminal proceedings. In addition to aspects such as the probative force of witness statements, the technique of their interrogation or their relationship with other evidence, an important issue at the level of the Romanian state's criminal policy is the status of witnesses outside the procedural framework. Thus, in a situation where a witness possesses information or data regarding the commission of serious crimes that he has provided to the judicial bodies responsible for discovering criminals, a state of danger is created both for the witness and for his family and close people. The legal institution of witness protection and assistance was developed precisely to balance and reconcile the two great interests, namely finding the truth with the help of the witness and limiting the risks for those who have the quality of witness in a criminal trial [8, p.85].

Research methodology. The first stage of a scientific study is represented by an organized and structured process, which is called the research methodology. The researcher plans within this stage the structure and model that he is going to follow in his scientific work, using methods, phases, principles, tools of scientific knowledge in the chosen research field [9, p.51].

The word "methodology" is a word composed of two Greek words "methodos" and "logos" which mean "method" and "science", and in free translation "the science of method". Any legal phenomenon requires the use of such scientific research methods. Also,

the word "methodos" is formed from two words: "meta" and "odos", meaning "after the way", after the path or guideline that ensures the success of any scientific investigation [10, p.23].

The study on the importance of the regulation of Art.19 of Law No.682/2002 on witness protection in preventing and combating crime in Romania required the use of a complex range of methods, principles and means, because the legal theme is a complex one, referring not only to the protection of witnesses in the Criminal Procedure Code, but also in the special law, namely Law No.682/2002 on witness protection.

The first stage of the scientific research is represented by reviewing the bibliography, in order to know the scientific context regarding the protection of witnesses in Romanian criminal law. A bibliographical list was made and the database of the National Library of Romania and the Central University Library was studied.

The main legal methods used in the scientific research entitled "The importance of the regulation of Art.19 of Law No.682/2002 on witness protection in preventing and combating crime in Romania" are represented by:

– Logical method: used in the presentation of Chapter III and subchapter IV.1 to define the concepts of "witness" and "witness protection";

– Analysis method: general research method, based on the decomposition of a whole into its component elements and the study of each one separately. With the help of the analysis method, we identified throughout the article the special cause of reduction of the sentence contained in Law No.682/2002 on witness protection.

Discussions and results obtained. I. The Concept of "Witness" in Romanian Criminal Law. The witness is part of the extensive list of participants, included in the category of other procedural subjects in the criminal trial. Criminal Procedure Code expresses the essential role of the witness in a criminal trial, namely the provision of evidence related to the subject of the criminal case. The witness represents any person who possesses information about facts or factual circumstances that may constitute evidence in the criminal trial, being summoned by the judicial body in connection with the data he knows in the respective criminal case [11, p.22].

A problem often discussed by criminal doctrine is the situation in which the witness knows facts or circumstances perceived directly, through his own senses or he learned them indirectly, through other persons. In Romania, criminal legislation does not condition the quality of witness depending on the direct or indirect knowledge by the witness of the aspects he reports. The explanation of Romanian criminal doctrine regarding the lack of a condition imposed by the legislator is that in the Romanian criminal procedural system, career judges establish the factual situation by analyzing, after administering all the evidence, the reliability of the witness's statement and his credibility, and not by jurors like in other legal systems that regulate the admissibility of evidence obtained indirectly, namely "by hearsay" [12, p.980].

II. Witness Protection in the Administration of Justice. **2.1. The Concept of "Witness Protection"**. The set of legal provisions by which the witness is protected from possible abuses by the judicial bodies constitutes, in a broad sense, the protection of the witness in criminal law. Also, the rights granted to witnesses pursuant to the Criminal Procedure Code, are also part of witness protection [13, p.109].

The rights that witnesses enjoy according to the Criminal Procedure Code are provided for in general terms in the matter of hearing persons, namely: Art.105 paragraph (1) of the Criminal Procedure Code (CPC) – the right to be heard by an interpreter when he/she does not understand, does not speak or does not express himself/herself well in Ro-

manian; Art.105 paragraph (3) of the CPC – the right to be heard in the presence of a person who has the ability to communicate through the special language, if he/she is deaf, mute or deaf-mute; Art.106 paragraph (1) of the CPC – the right to interrupt the hearing and, if applicable, to be consulted by a doctor, when, during the hearing, he/she shows visible signs of excessive fatigue or symptoms of an illness that affects his/her physical or mental capacity to participate in the hearing. Also, to these are added the rights expressly regulated in the fourth section of chapter II regarding the hearing of witnesses.

In a narrow sense, witness protection refers to the adoption of protective measures aimed at defending the life, freedom, physical and mental integrity, professional activity, and family of witnesses who provide or have provided statements, who may suffer negative consequences for this capacity. Witness protection has two different regulatory bodies, namely the Criminal Procedure Code – General Part, Title IV, Chapter II, Section 5, and Law No.682/2002 on witness protection. Unlike the Criminal Procedure Code, Law No.682/2002 on witness protection offers much more extensive protection to persons who have the status of witness in a criminal case, as it does not refer only to protective measures as regulated by the Criminal Procedure Code, but also to measures to assist them [11, p.31].

2.2. Statements of Protected Witnesses. The provisions of Art.103 of the Criminal Procedure Code regulate the principle of free assessment of evidence, which establishes that evidence does not have a value predetermined by law, for which reason the court evaluates the statements of witnesses together with the other evidence administered in the case. The limitation of this principle is represented by the presence of the protected witness, who, unlike the ordinary witness, presents statements with conditional probative force. This aspect is regulated by the legislator through the provisions of Art.103 paragraph (3) of the Code of Criminal Procedure, which stipulates that the decision to convict, to waive the application of the penalty or to postpone the application of the penalty cannot be based to the decisive extent on the statements of the protected witnesses.

In conclusion, the latter must be corroborated with the circumstances and facts resulting from all the evidence administered in the case [14, p.506].

By Decision No.248 of April 16, 2019, published in the Official Gazette No.494 of June 19, 2019, the Constitutional Court of Romania justifies the limited probative value of the protected witness's statement by the fact that the administration of evidence with witnesses in the criminal trial, under the conditions of Art.126 paragraph (1) of the Criminal Procedure Code, constitutes an exception to the general rules regarding the hearing of witnesses, an exception that infringes the right to a fair trial, especially with regard to the right to defense [15; 11, pp.33-34].

2.3. Witness Protection in Romania. 2.3.1. Witness Protection in the Criminal Procedure Code. Under the Criminal Procedure Code (CPC), witnesses eligible for protection fall into two categories, namely vulnerable witnesses and threatened witnesses. The first category of witnesses, namely the category of vulnerable witnesses, includes concrete situations of vulnerability as a result of the subsequent behavior of the suspect or defendant, the age of the witness, the results of the crime, while threatened witnesses refer to a potential state of danger in which the witness or a member of his family is located, as a consequence of the statements he provided to the judicial bodies [11, p.35].

Witness protection is a legal institution regulated by the provisions of Arts.125-130 CPC, consisting of two components, namely granting the status of threatened or vulnerable witness and ordering one or more protection measures provided for by law.

2.3.2. Law No.682/2002 on Witness Protection. Law No.682/2002 regulates the

protection and assistance of witnesses whose freedom, life or physical integrity are endangered as a result of their possession of information, information regarding the commission of serious crimes, which they have provided or agreed to provide to judicial bodies with a decisive role in discovering criminals [11, p.49].

With the help of this law, the National Office for Witness Protection was established, which presents a series of activities that make up the Witness Protection Program. In order for a person to be included in this Witness Protection Program, there must be a motivated proposal for inclusion, addressed by the criminal investigation bodies to the prosecutor during the criminal investigation phase or by the prosecutor to the judge, after the case has been referred to court. Following the proposal, an ordinance or a conclusion will be issued, by which it is decided whether or not the witness can be included in the program [11, p.50].

III. Art.19 of Law No.682/2002: Special Case for Reduction of the Penalties. In Romanian criminal law, there are two major categories of causes for reducing the sentence: passive or static causes for reducing the sentence, and active or dynamic causes for mitigating the sentence. The category of passive causes for reducing the sentence is represented by several subcategories: causes based on a certain inherent quality of a person (the quality of spouse, close relative, family member) or causes based on another determined quality of a person; causes for reducing the sentence based on a certain objective, determined state, situation or circumstance. The second category of active mitigating causes includes several subcategories: causes for reducing the sentence determined by the offender's adoption of a certain conduct at a time prior to the commission of the crime and mitigating causes regulated in consideration of the offender's determination to adopt a certain post-crime behavior [16, p.337].

The importance of special cases for reducing the sentence in Romanian criminal law concerns several aspects: firstly, by encouraging criminals to provide important information to the criminal prosecution authorities during the criminal prosecution phase regarding other persons who have committed crimes by denouncing them; secondly, by fully covering the damage to the civil party in terms of tax evasion crimes; and last but not least, by the abbreviated procedure of admitting guilt presented in Art.396 paragraph 10 of the Criminal Procedure Code [17, p.107].

According to Art.19 of Law No.682/2002 – the person who has the status of a witness, within the meaning of Art.2 letter a) point 1), and who has committed a serious crime, and before or during the criminal investigation or trial denounces and facilitates the identification and criminal prosecution of other persons who have committed such crimes benefits from a halving of the limits of the punishment provided by law.

Conclusions. The institution of witness protection is a fairly new institution for Romanian criminal law, being regulated by Law No.682/2002 and the Criminal Procedure Code. The dynamics of social changes taking place at the level of the Romanian state require a permanent adaptation of criminal law.

The main concerns of the Romanian legislator are represented by the tightening of penalties and the regulation of procedures that can facilitate the criminal liability of perpetrators.

In this context, given that the witness represents a main pawn in the criminal process, he has been given increased attention by law, through special protection that he can benefit from by meeting certain conditions.

HUMAN TRAFFICKING FOR THE PURPOSE OF ORGAN HARVESTING: FROM A FRAGMENTED REGULATORY FRAMEWORK TO A UNIFIED APPROACH

Raluca-Mihaela BUCULEA,
University Assistant,

"Tibiscus" University, Timisoara, Romania
Judge,
Timis County Court, Romania
ORCID: 0009-0002-2743-9091

Abstract

An analysis of the legal framework governing human trafficking for the purpose of organ harvesting reveals a fragmentation of regulatory provisions. Although the Palermo Protocol defined human trafficking for the purpose of exploitation—with organ harvesting included within the scope of exploitation—the legal framework is often inconsistent.

There are regulations that criminalize, on the one hand, human trafficking for the purpose of organ harvesting, and on the other hand, organ trafficking. In this regard, we find criminal offenses defined in the Criminal Code, in special laws on organized crime, or in health legislation. This overlap creates difficulties in legal classification, as there are differences between the concepts of exploitation and trafficking, with implications for victim protection and international cooperation mechanisms.

According to international statistical analysis, human trafficking for the purpose of organ harvesting is underreported compared to trafficking for other purposes, such as sexual exploitation or forced labor.

A unified and coherent approach is necessary to integrate this form of exploitation into a clear legal framework; only in this way can a prompt response be provided to a complex phenomenon that is difficult to detect and control, and effective protection of fundamental rights be ensured.

Keywords: human trafficking, organ trafficking, exploitation, organ harvesting, regulation.

TRAFICUL DE PERSOANE ÎN SCOP DE PRELEVARE DE ORGANE: DE LA FRAGMENTARE NORMATIVĂ LA ABORDARE UNITARĂ

Abstract

Analizând regimul juridic al traficului de persoane în scopul prelevării de organe, se constată o fragmentare a reglementărilor normative. Deși Protocolul de la Palermo a definit traficul de persoane în scopul exploatării acestora, în sfera exploatării fiind inclusă și prelevarea de organe, cadrul juridic nu este de cele mai multe ori uniform.

Există reglementări care incriminează pe de o parte traficul de persoane în scop de prelevare de organe, pe de altă parte traficul de organe. Regăsim în acest sens fapte incriminate în codul penal, în legi speciale privind criminalitatea organizată sau legislația din domeniul sănătății. Această interferență generează dificultăți de calificare juridică, existând diferențe între conceptul de exploatare și comercializare, cu implicații asupra protecției victimelor și a mecanismelor de cooperare internațională.

Din analiza statistică la nivel internațional, traficul de persoane în scop de prelevare de organe este inferior ca și raportare celui în alte scopuri, respectiv al exploatării sexuale sau supunerii la muncă forțată.

Este necesară o abordare cât mai unitară, coerentă, care să integreze această formă de exploatare într-un cadru juridic clar, doar în acest mod putându-se oferi un răspuns prompt unui fenomen complex, greu de depistat și controlat și o protecție eficientă a drepturilor fundamentale.

Cuvinte-cheie: trafic de persoane, trafic de organe, exploatare, prelevare organe, reglementare.

Introduction. As noted in the specialized literature, human trafficking constitutes a violation of human rights and of physical and mental integrity, while simultaneously undermining human dignity. However, human trafficking affects not only the individual through its impact on them but also society as a whole. This type of criminal activity has led to an increase in corruption, as well as in crime in general, and to its diversification through the creation of increasingly sophisticated mechanisms to support trafficking, while simultaneously undermining international security.

It is unanimously recognized and accepted that human trafficking is not a new phenomenon specific only to our times. However, the evolution of modern society, the development of communication technologies, and the uneven economic development of nations have led to the emergence of a global phenomenon that is difficult to manage [1, p.160-161].

Furthermore, the advent of the camera, followed by video cameras, the advancement of science—particularly medicine—and the emergence of the first organ transplants have facilitated human trafficking activities, with the aforementioned activities gradually falling within the scope of human trafficking.

What is important, however, in understanding human trafficking is that, regardless of its forms or the periods during which the criminal activity took place, the key elements have remained the same [2].

Methods and materials applied. In terms of research methods, the study employs complex research methods, including analysis, historical research, and the comparative method. The materials used include international and European conventions, criminal codes and special laws, and specialized scientific works.

Discussions and results obtained. I. International and European Concerns regarding Human Trafficking and Organ Trafficking. The scale of the human trafficking phenomenon has prompted the international community to take action and launch initiatives aimed at understanding the phenomenon and developing mechanisms to combat it. Nations around the world have realized that, to combat a phenomenon with global implications, regulation by all states is necessary. Furthermore, the terms needed to be clearly defined so they could be incorporated into the national laws of states.

The first international instrument binding on signatory states was the Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children, supplementing the United Nations Convention against Transnational Organized Crime (also known as the Palermo Protocol). It "provides, for the first time in the history of global legislation on this crime, an internationally agreed definition" [3].

In Article 3, the Protocol defines the term "*trafficking in* persons" as *the recruitment, transportation, transfer, harboring, or receipt of persons, by means of the threat or use of force or other forms of coercion, by abduction, fraud, deception, abuse of authority or of a position of vulnerability, or by offering or accepting payments or benefits to obtain the consent of a person having control over another for the purpose* of exploitation. The same article also defines the concept of exploitation, which "*includes, at a minimum, exploitation through the prostitution of another person or other forms of sexual exploitation, forced labor or services, slavery or practices similar to slavery, and the removal or sale of organs*" [4].

The objectives of the Protocol are to prevent transnational human trafficking carried out by organized criminal groups, to protect victims of trafficking, and, very importantly, to encourage international cooperation in this area. The Protocol requires signatory states to adopt legislation criminalizing the activities defined in Article 3 of the Protocol.

The Protocol places significant emphasis on prevention, stating that "it is important

to address the factors that make people vulnerable to trafficking, such as poverty, underdevelopment, and lack of equal opportunities, through bilateral and multilateral cooperation" [5].

Although, as we have shown, this Protocol plays an important role among international instruments aimed at combating human trafficking and trafficking in persons for the purpose of organ removal, there are also critical views regarding the approach taken to address this phenomenon. Thus, some have argued that the Protocol has not proven effective due to non-compliance by signatory states and issues with its implementation, while others contend that the lack of concrete results stems from deficiencies in the definition and phrasing of concepts and terms. Thus, the aspects of criminal regulation of activities in this field are mandatory in nature, while the sections on prevention and victim assistance do not carry the same weight, remaining at the level of recommendations and highlighting the importance of the actions that must be undertaken by the signatory states [6, p.1339].

While the Palermo Protocol is the legal instrument that has served as the basis for efforts to harmonize legislation on human trafficking, *the Istanbul Declaration* plays this role in the field of organ trafficking. The Declaration is the result of the summit organized in April 2008 by the Transplant Society (SDT) and the International Society of Nephrology (ISN) in Istanbul. During this summit, the 151 participants—including figures from the scientific and medical fields, the field of ethics, and the social sphere, as well as government officials—established the content of the declaration, which was subsequently approved by medical societies and organizations involved in organ transplantation and procurement.

Given that remarkable progress has been made in the fight against organ trafficking since the year this declaration was adopted, a Declaration Stewardship Group was established, and in 2018 the Declaration was revised to reflect medical, legislative, and social advances in the field of organ transplantation and procurement.

The declaration also defines human trafficking for the purpose of organ removal as "the recruitment, transportation, transfer, harboring, or receipt of persons, by means of the threat or use of force or other forms of coercion, through abduction, fraud, deception, abuse of authority or of a position of vulnerability, or through the offer or acceptance of payments or benefits to secure the consent of a person having control over another person, for the purpose of organ removal". This definition is derived from the definition of human trafficking in the Palermo Protocol. As noted above, human trafficking for the purpose of organ removal is a form of human trafficking as defined by these two international legal instruments.

According to the Declaration, organ trafficking may involve the following activities: "(a) The removal of organs from living or deceased donors without valid consent or authorization, or in exchange for financial gain or comparable benefits for the donor and/or a third party; (b) any transportation, handling, transplantation, or other use of such organs; (c) the offering or solicitation of any undue advantage by medical personnel, public officials, or employees of private-sector entities to facilitate or carry out such removals or uses; (d) soliciting or recruiting donors or recipients, where such acts are performed for financial gain or comparable advantages; or (e) attempting to commit, aiding, or abetting the commission of any of these acts".

Crucial to the fight against organ trafficking are the principles outlined in the Declaration, namely that trafficking in human organs and trafficking in persons for the purpose of organ removal must be prohibited and classified as crimes, as well as the requirement that each state must adopt legislation regulating organ procurement and transplantation

in accordance with international standards [7].

At the European level, with regard to organ transplantation and procurement, a particularly important instrument is *the European Convention on Biomedicine*, also known as *the Oviedo Convention*, adopted by the Council of Europe on April 4, 1997.

The Convention includes a chapter dedicated to organ procurement, namely Chapter 6, titled "*Procurement of Organs and Tissues from Living Donors for Transplantation*", which sets forth the circumstances under which organ procurement from living donors may take place, with consent being an essential element to which reference is made. Chapter 7 of the Convention is also important in combating organ trafficking, as it prohibits financial gain in organ transplantation.

Because, in addition to establishing principles and prohibitions, robust legal protection is also necessary, Chapter 8 of the Convention establishes the obligation of states to adopt a legislative framework with appropriate sanctions to be applied in the event of violations of the relevant regulations [8].

Twenty years after this convention, in 2014, the Council of Europe adopted a new convention, *the Convention against Trafficking in Human Organs*, the content of which essentially reflects the same principles already listed and existing in other documents adopted at the global and European e levels, such as the prohibition of organ harvesting from donors without their free and informed consent, or the prohibition of profits from organ transplant activities.

The Convention also includes a chapter titled "*Substantive Criminal Law*," listing the acts that states will take measures to classify as crimes [9].

II. Regulation of Human Trafficking for the Purpose of Organ Removal and Organ Trafficking in Romania and the Republic of Moldova. Based on the international instruments mentioned above, states have adopted regulations regarding human trafficking and regulations regarding organ trafficking. Of particular importance for this study is the manner in which human trafficking for the purpose of organ harvesting is regulated, as there are no uniform regulations; instead, criminal provisions are contained either in the criminal code or in special and extra-criminal laws.

Legislative fragmentation regarding organ trafficking is evident in Romania's legal system.

For the first time in the Romanian legal system, human trafficking was regulated by Law No.678/2001, published in the Official Gazette of Romania, Part I, No.783 of December 11, 2001. The law dedicated a chapter to offenses in this field, divided into two sections: Offenses Related to Human Trafficking and Offenses Related to Human Trafficking [10].

Scholarly literature has noted that this legislative act, although it no longer includes offenses in the field of human trafficking or a definition of the concept of exploitation, remains "the primary criminal policy instrument regarding human trafficking," continuing to contain procedural provisions, regulations on victim protection, international cooperation, and the institutions responsible for addressing human trafficking [1, p.177].

With the entry into force of the new Criminal Code on February 1, 2014, offenses related to human trafficking were regulated under the provisions of the new Criminal Code.

As stated in the explanatory memorandum to the new Criminal Code, its adoption aimed to create a coherent legislative framework in criminal matters, avoiding unnecessary overlaps between existing provisions in the current Criminal Code and in special laws.

Another objective of the new code was to simplify substantive law provisions, with the aim of facilitating their uniform application, which would lead to the expeditious res-

olution of cases by the judicial authorities. Furthermore, the new Criminal Code was designed to transpose European Union regulations into national law and to harmonize the new criminal law with existing regulations in European countries, with a particular emphasis on ensuring compliance with requirements grounded in the fundamental principles of criminal law and respect for human rights [11].

Chapter VII of the new Criminal Code covers offenses related to the trafficking and exploitation of vulnerable persons, incorporating into this chapter provisions that were in force prior to the Code's adoption under Law No.678/2001 and Government Emergency Ordinance No.194/2002.

According to Article 210 of the Criminal Code, human trafficking is committed through: "the recruitment, transportation, transfer, harboring, or receipt of a person for the purpose of exploiting that person, committed: a) through coercion, abduction, deception, or abuse of authority; b) by taking advantage of that person's inability to defend themselves or express their will, or of their state of obvious vulnerability; c) by offering, giving, accepting, or receiving money or other benefits in exchange for the consent of the person who has authority over that person" [12].

Article 211 of the Criminal Code specifically criminalizes the trafficking of minors, carried out through the following alternative means: "The recruitment, transportation, transfer, harboring, or receipt of a minor for the purpose of exploitation is punishable by imprisonment for a term of 7 to 15 years and the deprivation of certain rights" [12].

The explanatory memorandum noted that the provisions criminalizing trafficking in persons, minors, and migrants had been reorganized for easier understanding and better alignment with other criminal provisions. However, it was acknowledged that no substantial changes had been made to the legal texts. The specialized literature has rightly noted the establishment of a more lenient penalty regime; however, this is a characteristic of all penalties in the Criminal Code that entered into force on February 1, 2014 [1, 179 p].

However, the specific sentencing guidelines for the crime of human trafficking have changed over time. Thus, while at the time the current Criminal Code was adopted the crime was punishable by imprisonment for 3 to 10 years, the current penalty is 5 to 15 years.

Regulations on human trafficking and child trafficking have been developed around the concept of exploitation, as defined by Article 182 of the Criminal Code. Exploitation of a person means: "a) forcing a person to perform labor or provide services;b) keeping a person in a state of slavery or other similar forms of deprivation of liberty or servitude; c) forcing a person into prostitution, into pornographic acts for the purpose of producing and distributing pornographic materials, or into other forms of sexual exploitation;d) forcing a person to beg; e) the illegal removal of human organs, tissues, or cells; f) forcing a person to commit acts provided for by criminal law" [12].

It is important for this study to note that the law defines "*the illegal*" removal of human organs, tissues, or cells as a form of exploitation. To determine whether a removal is illegal, it is necessary to understand the circumstances under which such removal is considered unlawful. In the following, we will present the framework of regulations regarding organ transplantation and removal, again a special law.

Following Romania's ratification of *the Council of Europe Convention on Action against Trafficking in Human Beings* (through Law No.300/2006), a new criminal offense was introduced: the use of services provided through the exploitation of a trafficked person (an offense required by Article 19 of the Convention). For example, the provision will apply to a person who agrees to receive an organ transplant, knowing that it was illegally

harvested from a victim of human trafficking, or to a person who agrees to use the forced labor imposed on such victims.

At the time the new Criminal Procedure Code was adopted, it was found that there were approximately 300 special or extra-criminal laws containing criminal provisions, with many overlapping provisions and discrepancies in penalties, even though the punishable acts were similar. Given the incorporation of certain provisions criminalizing specific acts into the Criminal Code, some criminal provisions in special laws were repealed as a result of the regulations introduced in the Criminal Code [13].

In this regard, Article 94 of Law No.187/2012, the law implementing the new Criminal Code, provided that Law No.678/2001 on the prevention and combating of human trafficking is amended, regarding the terms of the law, it is stated that as of the entry into force of the new Criminal Code: "a) 'trafficking in persons' means the acts provided for in Articles 210 and 211 of the Criminal Code; b) 'exploitation of a person' means the activities provided for in Article 182 of the Criminal Code; c) 'victim of human trafficking' means a natural person who is the passive subject of the acts provided for in Articles 210, 211, 264, and 374 of the Criminal Code or of an attempt to commit any of these acts, regardless of whether or not they participate in the criminal proceedings as an injured party". Consequently, the law provided for the repeal of Articles 12, 13, 14^1, and 15-19 of Law No.678/2001 [14].

It should be noted that the current Criminal Code also contains a provision which, although included in Chapter III—Offenses against Religious Freedom and Respect for the Deceased—regulates the illegal removal of tissues or organs. According to Article 384, "the unauthorized removal of tissues or organs from a corpse is punishable by imprisonment for a term of 6 months to 3 years or by a fine".

In addition to the above-mentioned regulations regarding human trafficking for the purpose of organ harvesting, Romanian legislation includes regulations on organ transplantation and harvesting. From a historical perspective of legislative regulations in Romanian law, as outlined at transplantation and organ removal were first regulated—albeit briefly—by Law No.3/1978 on public health care.

The law was repealed by the provisions of Law No.2/1998 on the procurement and transplantation of human tissues and cells, a law considered the first modern transplantation law in Romania [15].

Chapter IV of the law, titled "*Penalties*", provided that failure to comply with the law's provisions would result in disciplinary, financial, civil, administrative, or criminal liability, as applicable, without a clear distinction between the types of liability. The same chapter specified which violations of the law constituted criminal offenses, also establishing the specific limits of the penalties [16].

This has now been replaced by Title VI, "*The Procurement and Transplantation of Human Organs, Tissues, and Cells for Therapeutic Purposes*", of the Law No.95/2006 on Health Care Reform, which includes a detailed chapter on the transplantation of cells and tissues, and the regulations regarding organ transplantation have been updated. Law No.95/2006 of April 14, 2006, on health care reform is currently the framework legislation that regulates and penalizes offenses related to organ transplantation. These are set forth in Chapter V of the law, a chapter titled "Penalties". It can be observed that, although the chapter bears this title, it actually covers acts criminalized as offenses; the title appears to have been retained from the previous Law No.2/1998, in which this designation encompassed all possible types of sanctions for violations of legal regulations.

In its current form, Chapter V of Law No.95/2006 contains the following provision:

– Art. 154 (1): "The removal or transplantation of organs, tissues, or cells of human origin from living donors without consent given in accordance with the law constitutes a criminal offense and is punishable by imprisonment for a term of 2 to 7 years and the deprivation of certain rights. (2) An attempt is punishable.

– Art. 155: Taking a sample when doing so compromises a forensic autopsy requested in accordance with the law constitutes a crime and is punishable by imprisonment for a term of 6 months to 3 years or by a fine.

– At. 156 (1): The act of donating human organs, tissues, or cells for the purpose of obtaining material gain, for oneself or for another, constitutes a criminal offense and is punishable by imprisonment for a term of 3 months to 2 years or by a fine. (2) Coercing a person to donate human organs, tissues, or cells constitutes a criminal offense and is punishable by imprisonment for a term of 2 to 7 years and the deprivation of certain rights. (3) The publication or dissemination of advertisements regarding the donation of human organs, tissues, or cells, where such donation is intended to obtain material benefits for oneself or for another person, constitutes a criminal offense and is punishable by imprisonment for a term of 6 months to 3 years or by a fine.

– Art. 157 (1): Organizing or performing the procurement of human organs, tissues, or cells for transplantation, with the intent of obtaining material gain for the donor or the organizer, constitutes a criminal offense and is punishable by imprisonment for a term of 2 to 7 years and the deprivation of certain rights. (2) The purchase of human organs, tissues, or cells for the purpose of resale is also punishable by the penalty provided for in paragraph (1). (3) An attempt to commit this offense is punishable.

– Art. 158 (1): The importation into or exportation from the country of human organs, tissues, or cells without a special authorization issued by the National Transplant Agency constitutes a criminal offense and is punishable by imprisonment for a term of 2 to 7 years and the deprivation of certain rights. (2) An attempt is punishable" [17].

To understand that fragmentation within Romania's legal system is not unique, another example of legislative fragmentation is that of the Republic of Moldova's legislation. The law regulating human trafficking in the Republic of Moldova is Law No.241/2005, published on December 9, 2005, in the Official Gazette Nos. 164-167.

In light of the above, namely the importance of understanding legislative terms and concepts, Article 2 of the Law No.241/2005 defines the following main terms:

1) "*Human trafficking*: the recruitment, transportation, transfer, harboring, or receipt of persons, by means of the threat or use of force or other forms of coercion, through abduction, fraud, deception, abuse of power or of a position of vulnerability, or by giving or receiving payments or benefits of any kind to obtain the consent of a person having control over another person, for the purpose of exploitation;

2) *Child trafficking*: the recruitment, transportation, transfer, harboring, or receipt of a child for the purpose of exploitation, even if these acts are not carried out using any of the means specified in paragraph 1);

3) *Exploitation of a person:* abuse of a person for the purpose of obtaining a profit, namely: a) compelling a person to perform certain work or provide services through the use of force, threats, or other means of coercion, contrary to legal provisions regarding working conditions, wages, health, and safety; b) keeping a person in slavery, subjecting them to practices similar to slavery, or using other methods to deprive them of their liberty; c) forcing a person into prostitution, to participate in pornographic performances for the purpose of producing, distributing, or circulating such material by any means, or to acquire, sell, or possess pornographic materials, or to engage in other forms of sexual

exploitation; d) forcing a person to undergo the removal of organs or tissues for transplantation or the removal of other parts of the human body; e) using a woman as a surrogate mother or for reproductive purposes; f) abusing the rights of a child for the purpose of illegal adoption; g) using a person in armed conflicts or in illegal military formations; h) use in criminal activities; i) forcing a person to beg; j) selling a person to another person; k) forcing a person to engage in activities that violate fundamental human rights and freedoms".

Article 3 of the Law No.241/2005 establishes the legal framework governing the prevention and combating of human trafficking and the protection of victims. This legal framework is provided by the Constitution of the Republic of Moldova, the international treaties to which the Republic of Moldova is a party, Law No.241/2005, as well as other normative acts regulating relations in this field. The wording acknowledges, with regard to the legislation of the Republic of Moldova, the existence of fragmented regulations included in numerous normative acts [18].

Although not explicitly mentioned in the legal framework for combating human trafficking, important regulations are found in the Criminal Code of the Republic of Moldova. This is only natural, as the Criminal Code is the primary law that defines crimes within every legislative system.

Article 165 of the Criminal Code of the Republic of Moldova defines human trafficking as follows: "(1) The recruitment, transportation, transfer, harboring, or receipt of a person for the purpose of commercial or non-commercial sexual exploitation, forced labor or services, slavery or conditions similar to slavery, use in armed conflicts or criminal activities, or the removal of organs or tissues for transplantation, committed through: a) the threat or use of physical or psychological violence not life-threatening or harmful to the person's health, including through abduction, the confiscation of documents, and servitude, for the purpose of recovering a debt whose amount is not reasonably established; b) deception; c) abuse of a position of vulnerability or abuse of power, or the giving or receiving of payments or benefits to obtain the consent of a person who has control over another person, is punishable by imprisonment for a term of 7 to 15 years". It is also important to note that the article establishes special limits on the penalties. Furthermore, the following paragraphs regulate aggravated forms of the offense, as well as a special ground for exemption from punishment "*for the victim regarding offenses committed by her in connection with her procedural status, if she has agreed to cooperate with the criminal investigation authority in the given case*".

Furthermore, Article 206 of the same Criminal Code criminalizes child trafficking. This consists of: "(1) The recruitment, transportation, transfer, harboring, or receipt of a child, as well as the giving or receiving of payments or benefits to obtain the consent of a person having control over the child, for the purpose of: a) sexual exploitation, whether commercial or non-commercial, in prostitution or in the pornography industry; b) labor or forced service; c) slavery or conditions similar to slavery, including in the case of illegal adoption; d) use in armed conflicts; e) use in criminal activities; f) removal of organs or tissues for transplantation; g) abandonment abroad. The specific range of punishment is imprisonment for 10 to 15 years".

One key difference between the legal frameworks of the Republic of Moldova and Romania is the inclusion in the Criminal Code of the Republic of Moldova of a provision that criminalizes the removal of human organs and tissues without the donor's freely given consent.

The heading of the article is "Coercion of a person to donate organs or tissues for

transplantation", and the acts criminalized by the law consist of: "(1) Coercing a person to donate organs or tissues for transplantation or for other purposes, committed through the use of violence or the threat of violence, is punishable by imprisonment for a term of 2 to 5 years, with deprivation of the right to hold certain positions or to engage in certain activities for a term of up to 3 years. (2) The same act committed against a person whom the offender knew with certainty to be in a state of helplessness or in material or other dependence on him shall be punished by imprisonment for a term of 3 to 7 years, with deprivation of the right to hold certain positions or to engage in certain activities for a term of 2 to 5 years. 1. The degree of harm caused by crimes against a person's life and health stems from the very nature of the social values that have been harmed or endangered. The mechanism for determining the degree of harm caused by the crime is stipulated in Article 15 of the Criminal Code. 2. The immediate legal object consists of social relations whose existence and normal functioning depend on the protection of a person's life or health. 3. The objective aspect of the offense is realized by compelling a person to undergo the removal of organs or tissues for transplantation or other purposes, committed through the use of violence or the threat of its use. The regulations are set forth in Law No.473-XIV of 25.06.1999 on the transplantation of human organs and tissues (Official Gazette No.94-95/474 of 26.08.1999) and Ministry of Health Order No.297 of 16.12.1999 on the implementation of the Law on the Transplantation of Human Organs and Tissues in the Republic of Moldova (Official Gazette No.29-30/99 of 16.03.2000). 4. According to existing regulations, the removal of organs or tissues for transplantation is permitted only if the donor has freely and voluntarily expressed their wish to do so in writing. 5. The victim of this crime may be any person selected by the perpetrator as a donor. The removal of organs and tissues from minors, or from persons suffering from AIDS, venereal diseases, or other infectious diseases that pose a danger to the life and health of the recipient, is not permitted. 6. Coercing a person into the removal of organs or tissues for transplantation involves the use of violence or the threat of its use" [19].

Another difference from Romanian legislation is that in the Republic of Moldova, Law No.42/2008 on the transplantation of human organs, tissues, and cells – stands as a special law, whereas regulations on transplantation and procurement are not conceived as parts of a special law in the field of health. However, as we noted in our analysis of Romanian regulations on organ transplantation and procurement, Law No.2/1998 was also conceived as a law regulating transplantation and procurement – a special law in this field.

According to Law No.42/2008, Article 27 criminalizes the pursuit of financial gain in the Republic of Moldova, while Article 28 criminalizes trafficking in human organs, tissues, and cells.

Article 27 prohibits the derivation of financial gain from the donation of human organs, tissues, or cells. However, it is not precluded that donors may receive compensation strictly limited to covering expenses and inconveniences, namely: "a) compensation for living donors in connection with loss of income and other justified expenses caused by the donation or related medical examinations; b) reimbursement of justified expenses for legal medical services or technical services related to the donation". Furthermore, the law stipulates that the donation and transplantation of organs, tissues, and cells may not be the subject of a material transaction. It is also prohibited to promote the need for organ, tissue, and/or cell transplantation for the purpose of proposing or obtaining financial profits or corresponding benefits.

Article 28 of the same legislative act prohibits trafficking in human organs, tissues,

and cells; however, it reiterates the wording of the preceding article, explicitly stating once again the prohibition on deriving financial gain or other benefits from trafficking in the human body and its parts.

The text expressly criminalizes the trafficking of human organs, tissues, and cells, and regarding its punishment, it refers to the provisions of criminal law [20].

Conclusions. An analysis of the regulations governing human trafficking for the purpose of organ harvesting, as well as organ trafficking, reveals distinct regulations regarding their specific activities. We believe that current international instruments, as well as national regulations that have been aligned with the principles set forth in these instruments, have not achieved their intended purpose. A considerable time has passed since the initial principles and regulations were established, yet the phenomenon is far from being understood and controlled. We cannot ignore the critical views regarding current regulations and must agree that a new international instrument is needed to combat organ trafficking. This instrument should take into account the shortcomings identified over time in understanding and regulating the phenomenon.

Regulations governing human trafficking for the purpose of organ harvesting and organ trafficking should be consolidated into a single regulatory framework, as these are "both manifestations of the organ shortage", and "treating human trafficking for the purpose of organ harvesting as a subset of human trafficking overlooks important differences" [6, p.1342].

THE THEORETICAL AND PRACTICAL APPROACH TO THE INSTITUTION OF DETENTION THROUGH THE LENS OF THE PURPOSE AND FUNCTIONS OF CRIMINAL LAW IN THE REPUBLIC OF MOLDOVA

Ana ZABULICA,
Head of Human Resources Department,
"Alecu Russo" State University of Bălţi,
PhD student,
"Ștefan cel Mare" Academy,
Republic of Moldova
ORCID: 0009-0000-1983-3705

Abstract

The freedom of any human being is a right guaranteed by the state under the supreme law. No one may be deprived of their freedom, except under the exhaustive conditions provided by law, because: „Libertas inaestimabilis res est". The parallel between freedom and the limitation of this right is drawn through the institution of detention. The Constitution of the Republic of Moldova stipulates, in Art. 25 para. (2), inter alia, that detention is permitted only in cases and in accordance with the procedure provided by law. The institution of detention plays an essential role in achieving the purpose of criminal law.

The article analyzes the legal nature of detention, its correlation with the functions of criminal law and the way in which it is applied in practice. Both theoretical aspects and practical issues are highlighted, in the context of respect for personal liberty.

Keywords: freedom, detention, probable cause, crime, reasonable suspicion.

ABORDAREA TEORETICO-PRACTICĂ A INSTITUȚIEI REȚINERII PRIN PRISMA SCOPULUI ȘI A FUNCȚIILOR DREPTULUI PENAL ÎN REPUBLICA MOLDOVA

Abstract

Libertatea ființei umane este un drept garantat de stat prin legea supremă. Nimeni nu poate fi lipsit de libertatea sa, doar în condițiile exhaustive prevăzute de lege, căci: „Libertas inaestimabilis res est". Paralela între libertate și limitarea acestui drept este trasată prin intermediul instituției reținerii în mod imperativ. Constituția Republicii Moldova stipulează la Art. 25 alin. (2) inter alia că reținerea este permisă numai în cazurile și în conformitate cu procedura prevăzută de lege. Instituția reținerii are un rol esențial în realizarea scopului dreptului penal.

Articolul analizează natura juridical a reținerii, corelația acesteia cu funcțiile dreptului penal și modul în care este aplicată în practică. Sunt evidențiate atât aspectele teoretice, cât și problemele practice, în contextul respectării libertății persoanei.

Cuvinte-cheie: libertate, reținere, motive verosimile, infracțiune, rezonabilitatea suspiciunii.

Introduction. The theoretical and practical approach to the institution of detention through the lens of the purpose and functions of criminal law in the Republic of Moldova represents a particularly important aspect in the context of strengthening the rule of law and harmonizing the national legislation of the Republic of Moldova with European standards. The institution of detention is of special importance and constitutes a direct interference with the fundamental right to liberty, as a primary principle in a state governed

by the rule of law. Therefore, an in-depth analysis of the subject is required, both from a theoretical and practical perspective. The research examines the institution of detention from the perspective of the purpose and functions of criminal law, as well as identifies the existing issues in its application.

The present research aims to determine the following aspects:

- Analysis of the normative framework governing the institution of detention in the Republic of Moldova;
- Examination of the purpose of detention;
- Identification of the functions of criminal law achieved through the application of the institution of detention;
- Analysis of the legal conditions and grounds for the application of detention;
- Examination of judicial practice and the problems encountered in the application of detention;
- Identification of possible legislative gaps and inconsistencies with international standards (e.g., the ECHR);
- Formulation of *de lege ferenda* proposals for improving the regulation of the institution of detention.

Methods and materials applied. Within this study, general scientific methods were used, such as the systemic, comparative, logical, historical, and analytical methods, which allowed for the examination of the institution of detention from a complex perspective, highlighting its importance through the lens of the purpose and functions of criminal law, and subsequently enabling the formulation of well-grounded conclusions on the subject addressed.

The legal framework of the analyzed matter includes: the Constitution of the Republic of Moldova; the Criminal Code of the Republic of Moldova; the Criminal Procedure Code of the Republic of Moldova; the Law on the Status of the Police; the Law on Special Investigative Activity; the European Convention on Human Rights; the case law of the European Court of Human Rights; the International Covenant on Civil and Political Rights; and UN standards regarding deprivation of liberty.

The research is based on the study of theoretical, legislative, and normative materials, as well as published sources regarding national practice and the case law of the European Court of Human Rights. The obtained results provide the opportunity to complement and further develop the ideas established in previous studies dedicated to detention. Additionally, within the research, statistical reports prepared by the National Administration of Penitentiaries regarding persons in pre-trial detention held in penitentiary institutions were analyzed.

Discussions and results obtained. The institution of detention represents an essential pillar in a state governed by the rule of law, as it ensures the necessary balance between the public interest in combating crime and the protection of fundamental human rights and freedoms. It provides state authorities with a legal instrument for prompt and necessary intervention in order to guarantee and maintain social balance and to delineate rights and obligations in accordance with the law.

Based on the assertion that „Everyone has the right to life, *liberty* and security of person", as stipulated in the Universal Declaration of Human Rights (adopted and proclaimed on December 10, 1948, by the UN General Assembly, Art. 3), it is emphasized that freedom is an essential social value promoted, developed, and protected by legal norms, yet it is not absolute, but relative [12]. Individual liberty is a relative right in situations where it is limited as a consequence of legal liability for a committed act.

Freedom cannot be viewed separately from responsibility, since the exercise of individual rights implies respect for legal norms and for the rights of others. In the absence of this correlation, liberty risks becoming distorted, affecting the rule of law and social balance. It is also necessary to mention that liberty can be approached from two perspectives: a general one (the possibility of action and movement) and an individualized one, as a right regulated by legal norms, hence the concept of the inviolability of the person.

Individual liberty (*status libertatis*), as a primary objective, is addressed in this study through the institution of detention, since above any individual liberty stands the safety and protection of society. Liberty as a legal concept has attracted interest over the years and has been examined and regulated in various normative acts. Among the most relevant for this study are: The Constitution of the Republic of Moldova, in Chapter II, enshrines fundamental rights and freedoms, reiterating the importance of guaranteeing the protection of fundamental social values, which are also reflected in the purpose of criminal law, namely, the protection of the individual, society, and the state [1]. The author Gheorghe Gladchi in his work "*Criminal Law. General Part*", states that the purpose of criminal law is determined by the need to protect social values and the legal order against crimes and to prevent the commission of new offenses [14]. If we were to specify the three pillars upon which the purpose of criminal law is based, we would move from the particular to the general: from the individual to society and then to the state. The Criminal Code of the Republic of Moldova, in Article 2, stipulates: (1) Criminal law protects persons from crimes; a person's rights and freedoms; property; the environment; constitutional order; the sovereignty, independence, and territorial integrity of the Republic of Moldova; the peace and security of humanity as well as the rule of law in its entirety. (2) Criminal law also aims to prevent the commission of new crimes. Thus, the purpose of protection against crime, including the protection of the individual and their rights and freedoms, is achieved through the institution of detention [2]. The legislation of the Republic of Moldova does not exhaustively specify the categories of state representatives who may detain a person. The detention of an offender represents a right for citizens, not an obligation; however, for persons entrusted with maintaining public order, it constitutes a duty.

The purpose of criminal law and its relevance to the institution of detention are fundamental and consist in protecting the individual, society, and the state against crime, as well as ensuring that those who commit offenses are held accountable proportionally to the act committed. Based on this purpose, we distinguish: the protection of the individual; the protection of society; and the protection of the state. According to Article 37 of the Criminal Code, an act provided for by criminal law does not constitute an offense if it is committed for the purpose of detaining a person who has committed a crime and handing them over to law enforcement authorities [2]. Through the provisions stipulated in the Criminal Code, the legislator emphasizes the social approval of detaining a person who has committed a crime, even if harm is caused to the detained individual. This social approval, as reflected in the legal norm, allows citizens to act actively and responsibly in preventing further crimes and to participate in apprehending offenders, demonstrating civic responsibility. In cases of prompt and proper action, evidence at the scene of the crime may be preserved intact, ensuring the proper application of criminal sanctions in accordance with the committed act. Moreover, further offenses may be prevented.

Authors Maria Orlov and Ștefan Belecciu argue that responsibility means the conscious awareness of what is being done, why it is being done, and what the possible consequences of that action are [18]. Responsibility implies assuming one's actions and their consequences – the point of intersection between the two. A conscious and responsible

society could reduce the number of crimes and ensure lasting security based on mutual respect, education, and active citizen involvement. However, indifference or negligence often leads to the commission of new offenses and an increase in criminality. Typically, awareness of the risks involved in promptly intervening to detain an offender varies from person to person: some may act courageously and assume responsibility to intervene, while others may refrain from action out of fear. The assumption of responsibility must align with an individual's courage and willingness to contribute to society; however, for law enforcement representatives, it is a duty arising from their professional responsibilities.

According to the law, any person suspected of committing a crime may be detained only if the conditions established by law are met. ***The purpose of criminal law***, as reflected in the case law of the Supreme Court of Justice (SCJ) and in legislation, is to protect the individual, society, and the state against crime. It aims at the fair application of the law, so that offenders are punished according to their guilt, while innocent persons are not held liable. At the international level, the Republic of Moldova undertakes to respect the international treaties to which it is a party, and in cases where inconsistencies arise between international human rights treaties and domestic laws, international regulations take precedence.

With direct reference to the subject addressed, the European Convention on Human Rights, in Article 5, stipulates the right to liberty and security [9]. This right is not absolute but relative; thus, when the limits permitted by law are exceeded, the institution of detention intervenes and restricts the individual's liberty and security. The limitation of liberty occurs through the detention of a person who has committed an offense, while security may be restricted through harm caused to the detained person at the moment of detention. The purposes of criminal law aim at protecting supreme values such as: the protection of the individual and their rights and freedoms, property, the environment, public order, state security, and the entire legal order, as well as the ***prevention of crime.*** The prevention of crime comprises two important vectors: first, preventing the commission of new offenses, and second, discouraging individuals from engaging in acts that fall under criminal law. Thus, we distinguish between *general prevention*, which deters members of society from committing crimes through the application of criminal sanctions, and *special prevention*, namely the detention of a person who has committed an offense and preventing them from committing further crimes. In this way, the institution of detention directly contributes to achieving the purpose of criminal law, being a mechanism of rapid and effective intervention. According to Article 2 para. (1) of the Criminal Code, the purpose of criminal law is to protect against crimes the individual, their rights and freedoms, property, the environment, the constitutional order, sovereignty, independence and territorial integrity of the Republic of Moldova, peace and security of humanity, as well as the entire legal order. Therefore, the purpose of criminal law merges with its functions [2].

The functions of criminal law and their reflection in the institution of detention represent a set of actions manifested through the role of ensuring the rule of law, preventing the commission of new crimes, and guaranteeing the efficient conduct of criminal proceedings. At the same time, detention constitutes a means of legal coercion that must be applied with strict respect for fundamental rights and freedoms. It should be noted that the functions of criminal law are characterized by their scope of applicability, for example:

- *Protective function*, which ensures the safeguarding of social values and social relations against crime by establishing penalties for offenders;
- *Preventive function*, which consists in the prevention of the commission of new

offenses both by individuals who have previously committed criminal acts and by those who might or are predisposed to commit crimes. It should be noted that the preventive function establishes a form of social control over individual conduct and aims to reduce and discourage the occurrence of criminal acts;

- *Encouraging function*, which is particularly relevant in the context of detention, as it motivates civil society to contribute to maintaining the rule of law (including through personal involvement in apprehending offenders) and to preventing crime, while also strengthening trust in competent authorities and encouraging individuals to adopt lawful behavior by becoming aware of the legal consequences of illicit acts;

- *Regulatory function*, which consists of legal norms that explicitly establish rules of conduct, both prohibitive and permissive;

- *Educational function*, which aims to form and consolidate conduct consistent with legal norms by raising legal awareness within society, so that the institution of detention has not only a coercive character but also a preventive and formative one, encouraging both individuals and society to understand the importance of respecting the law and the consequences of its violation;

- *Repressive function*, which involves the application of coercive measures against individuals who have committed crimes in order to restore the disrupted legal order, sanction unlawful conduct, and prevent its recurrence. In this regard, the institution of detention serves as a legal instrument ensuring the prompt reaction of society/the state to criminal acts and immediate intervention in apprehending offenders, facilitating their criminal liability.

By reiterating the importance of each of the functions mentioned above, we highlight the mechanism of criminal law in achieving the protection of fundamental social values and ensuring the rule of law, operating as a unified and interdependent system.

Analysis of the Conditions and Legal Grounds for the Application of Detention from the Perspective of Article 37 of the Criminal Code of the Republic of Moldova. The provision stipulates that: " An act set forth in criminal law and committed in order to seize a person who has committed a crime and surrender them to law enforcement bodies shall not be considered a crime" [2].

The legislator highlights the following aspects: 1. The social approval of the detention of a person who has committed a crime; 2. Detention does not constitute an offense if its purpose is to hand the person over to law enforcement authorities; 3. The prevention of the commission of new offenses by the detained person. The detention of an offender is an absolutely necessary element in the fight against crime.

The author, Xenofon Ulianovschi, states that: "the detention of a person who has committed an offense is understood as the actions of citizens involving the causing of harm to that person in connection with their active resistance and their refusal to be brought before the competent state authorities" [21]. The author's opinion highlights the possibility of causing harm to the detained person; we support this idea only in the context where the harm is the result of a necessary and proportionate action to immobilize the person.

Thus, causing harm is justified only if:

- There is an evident criminal act;
- The person offers real physical resistance;
- There are no other less harmful means to carry out the detention;
- The action is proportional to the concrete danger of the situation.

According to certain studies [22], the detention of persons who have committed of-

fenses is, to a large extent, carried out by the victims themselves. In such circumstances, they detain the individuals and bring them to law enforcement authorities. The detention of an offender does not constitute an obligation but a subjective right of every person. Indifference leads to an increase in criminality and to violations of the rule of law.

According to Article 168 para. (1) of the Criminal Procedure Code, anyone has the right to apprehend and forcibly bring to the police or another public authority a person caught in the act of committing a crime or who has attempted to hide or flee immediately after committing the offense [3].

For police officers, the detention of an offender is a direct obligation arising from their functional duties, and failure to fulfill or improper fulfillment thereof entails disciplinary or even criminal liability in certain situations. In accordance with the provisions of the Law on Police Activity and the Status of the Police Officer No.320 of 27.12.2012 (with subsequent amendments and additions), it is stipulated that every police officer, throughout the entire territory of the country, regardless of the position held, location, whether on duty or off duty, if they become aware of circumstances or acts that endanger the rule of law, the life or health of persons, or other social values, is obliged to notify the nearest police subdivision and "*to take all possible measures*" to prevent and stop the offense or contravention and to identify the offender, locate eyewitnesses, and secure the scene where the event occurred [5].

The authors Tudor Osoianu and Mihaela Vidaicu, note that one of the most problematic measures taken in exceptional cases by the police, is the detention of a person suspected of committing a crime. The efforts made by authorities to improve the legal framework regarding detention, the adoption of new laws and regulations, as well as their amendment and supplementation, are not sufficient to ensure the effective realization of rights [19].

The theoretical approach to the institution of detention, through the perspective of the purpose and functions of criminal law in the Republic of Moldova, is outlined in legal norms, which provide for its intervention to ensure the proper conduct of detention and aims to preserve the integrity of the person who has committed the criminal act and the scene of the crime, as well as to prevent the commission of other offenses. In contrast, the practical approach to the institution of detention is not fully clarified, being marked by certain gaps and difficulties in application, generated both by the non-uniform interpretation of legal norms and by the challenges faced by criminal investigation bodies in ensuring a balance between procedural efficiency and the guarantee of fundamental human rights. In practice, the institution of detention raises a number of issues related to the effective application of criminal law norms. One of the main difficulties lies in the assessment of the grounds for detention, which, although provided by law, allow for a certain margin of discretion both on the part of civil society and criminal investigation bodies. This discretion may generate the risk of abuses or unjustified actions, especially in situations where there is insufficient evidence to substantiate a reasonable suspicion.

On the one hand, Article 37 of the Criminal Code stipulates that: "an act set forth in criminal law and committed in order to seize a person who has committed a crime and surrender them to law enforcement bodies shall not be considered a crime", thus providing the possibility to detain a person who has committed an offense; on the other hand, in practice, deficiencies are sometimes observed in the respect of the guarantees and rights of the detained person [2].

However, it should be noted that priority is given to the act of detaining the person who has committed the offense at that moment, *rather than* to the right to liberty guar-

anteed by the state to the offender. The interests of an individual who has committed a criminal act are subordinated to the general interest of societal security, and the person carrying out the detention must assess the factual situation firmly and correctly. Although the institution of detention is well defined at the theoretical and normative levels, its efficiency and legitimacy depend essentially on how it is applied in practice. Therefore, a more rigorous correlation between legal norms and practical realities is necessary in order to ensure a fair balance between the public interest in combating crime and the protection of fundamental individual rights.

Judicial practice highlights the importance of complying with the standards of the European Convention on Human Rights. The Republic of Moldova has been convicted in numerous cases for violations of the right to liberty and security, which reveals the need to improve internal mechanisms. Since September 12, 1997, the European Court of Human Rights (ECHR) has been able to examine applications lodged against the Republic of Moldova. Thus, it has now been 29 years since the European Court of Human Rights has been examining cases against the Republic of Moldova. A synthesis of convictions carried out by the Legal Resources Centre (LCRM) shows that 568 judgments have been delivered, in which 730 violations of the European Convention on Human Rights were found. Almost one third of these violations – 229 out of 730 – concern the right to a fair trial. Other violations identified by the ECHR include the prohibition of torture (23.4%); the right to liberty and security (14.5%); the right to an effective remedy (8.9%); detention in poor conditions (6.6%); and ill-treatment (5.4%). In this context, 14.5% – representing violations of the right to liberty and security – can still be considered a significant proportion, indicating that the Republic of Moldova faces deficiencies in this area.

The main causes of convictions at the ECHR involving the Republic of Moldova refer to violations of Article 5 §1 – namely, the lack of reasonable suspicion, where detention was not based on sufficient evidence. According to the Guide on Article 5 of the Convention – Right to Liberty and Security: "1. Everyone has the right to liberty and security of person. No one shall be deprived of his liberty save in the following cases and in accordance with a procedure prescribed by law: (c) the lawful arrest or detention of a person effected for the purpose of bringing him before the competent legal authority on reasonable suspicion of having committed an offense or when it is reasonably considered necessary to prevent his committing an offense or fleeing after having done so" [10].

According to the wording of the provision, we derive the idea that a person may be deprived of the right to liberty if there are plausible reasons to suspect that they have committed an offense, or when there are reasonable grounds to believe it is necessary to prevent them from committing an offense or fleeing after committing one. Thus, priority is given to the administration of justice and the protection of social values, while detention may be ordered only where there are clear and well-justified grounds, based on objective and verifiable data. Therefore, detention is an exception to the general rule. In this regard, particular importance is given to the notion of "plausible reasons", which implies the existence of a reasonable suspicion based on solid evidence. A person may be detained at the moment of committing the offense or immediately thereafter, if all evidence demonstrates the involvement of the detained person in the commission of the criminal act.

A study conducted by Daniel Goinic and Vladislav Gribincea (Violations found by the ECHR in respect of the Republic of Moldova, 12 September 1997 – 11 September 2022) highlights statistics regarding violations of *the right to liberty and security* (Article 5 ECHR) – approximately 106 violations (14.5%) [15]. Thus, even though the Republic of Moldova has been condemned by the ECHR in this area, the subject remains relevant and does not lose

its importance.

Several important cases against the Republic of Moldova addressing the subject matter, namely Article 5 of the Convention – the right to liberty and security, include: **Șarban *v. Moldova*** (Application No.3456/05), 4 October 2005, judgment final on 04.01.2006 – allegation of a violation of Article 5 § 3 (insufficient reasons invoked by the courts when applying pre-trial detention and decisions taken by a judge without competence to order his release); ***Becciev v. Moldova*** (Application No.9190/03), 4 October 2005, judgment final on 04.01.2006 – allegation of a violation of Article 5 § 3 (insufficient reasons invoked by the courts when applying pre-trial detention) and Article 5 § 4 (refusal to hear a witness); ***Cebotari v. Moldova*** (Application No.35615/06), 13 November 2007, judgment final on 13.02.2008 – allegation of a violation of Article 5 (the applicant alleged that detention was used for abusive purposes); ***Leva v. Moldova*** (Application No.12444/05), judgment final on 15 December 2009 (the applicants complained under Article 5 § 1 of the Convention that they had been unlawfully deprived of liberty).

The analysis of the case-law of the ECHR highlights that the main causes of the Republic of Moldova's convictions in matters of detention derive from the formal or insufficiently reasoned nature of decisions, the lack of effective procedural safeguards, and inadequate conditions of detention. These deficiencies indicate the existence of systemic problems in the application of the institution of detention, which affect the balance between the need to ensure the proper conduct of criminal proceedings and the respect for fundamental human rights. In the case-law of the ECHR, the notion of the reasonableness of suspicion or plausible grounds to suspect that the person in respect of whom a detention decision is taken has committed an offense is frequently applied. This is assessed on the basis of facts or information capable of convincing an objective observer that the individual concerned may have committed the offense.

Another analysis of data carried out on the basis of statistical reports provided by the National Administration of Penitentiaries of the Republic of Moldova demonstrates the dynamics of persons in pre-trial detention held in penitentiary institutions: 1) 01.01.2024 – 325; 2) 31.12.2025 – 504; 3) 31.03.2026 – 558.

The analysis of statistical data highlights an upward trend, indicating a fluctuating evolution in the number of persons held in pre-trial detention in penitentiary institutions of the Republic of Moldova. This dynamic reflects both variations in the criminal phenomenon and the particularities of criminal policy and judicial practice in the application of detention measures. The institution of detention is of particular importance in a state governed by the rule of law, representing one of the essential measures that ensures the prevention of a person from evading criminal prosecution or trial, as well as preventing the commission of other offenses. It must be applied with strict respect for legal guarantees and fundamental human rights. A relevant example illustrating the practical role of the institution of detention is the recent case of a detainee serving a sentence in Penitentiary No.2 – Lipcani, who escaped on the night of 5 to 6 April 2026. The escape occurred from an open-type sector located outside the guarded perimeter and was discovered during routine checks [2].

The prompt reaction of the authorities – including the National Administration of Penitentiaries, the Briceni Police Inspectorate, and the "Lipcani" Border Police Sector – led to the immediate launch of search operations, including the use of modern surveillance tools such as drones. Within just a few hours, the escaped person was located near the village of Beleavinți and was detained without incident. This case concretely illustrates the function of the institution of detention in restoring the violated rule of law and bring-

ing the individual back under state authority. It also highlights the operational nature and the need for rapid intervention by competent authorities in escape situations in order to prevent potential social risks. At the same time, the act of escape entails criminal liability, being incriminated under Article 317 of the Criminal Code of the Republic of Moldova, which justifies the application of new procedural measures, including the detention of the person for the purpose of documenting the committed offense [2]. In conclusion, the institution of detention not only serves as a means of legal coercion but also constitutes an indispensable mechanism for protecting public order, demonstrating its effectiveness in concrete situations such as the one analyzed.

Conclusion. In conclusion, the institution of detention represents an essential instrument aimed at protecting the rule of law and fundamental social values by detaining individuals who have committed offenses. However, the practical importance of the institution of detention must be strictly correlated with compliance with procedural guarantees and fundamental human rights, as any deviation may affect not only the legality but also the fairness of the entire criminal process. The subject addressed highlights the existence of significant dysfunctions in the application of detention, such as its excessive use, failure to comply with legal time limits, or its transformation into an instrument of psychological pressure. Such practices contradict fundamental principles, including the presumption of innocence and the right to defense, and are incompatible with the requirements of a fair trial, as also established in the case-law of the European Court of Human Rights, which requires that any deprivation of liberty be lawful, necessary, and proportionate.

Although the existing legal framework generally provides adequate benchmarks, problems arise at the level of its interpretation and application. In this regard, a critical and coherent approach is required, aimed at standardizing judicial practice and strengthening control mechanisms. The role of courts, prosecutors, and oversight bodies thus becomes decisive in preventing abuses and ensuring respect for the rights of detained persons.

From *de lege ferenda* perspective, several proposals may be formulated, including: further clarification of the grounds for detention in order to reduce the margin of interpretation; informing society regarding the necessity of active involvement, to the extent possible (taking into account health status, correct assessment of factual and legal circumstances, etc.) in the detention of a person who has committed an offense; promoting training sessions for law enforcement bodies regarding detention cases, including clarification of situations of unlawful or abusive detention; developing effective mechanisms for monitoring compliance with the rights of detained persons; and creating an institution for monitoring and reporting detention cases, either by representatives of civil society (to identify the degree of public involvement) or by state authorities, which would track the entire trajectory from the moment of factual detention until the final resolution of each case.

The institution of detention is an indispensable instrument of criminal law, contributing to the realization of its purpose and functions. However, its effectiveness depends on strict compliance with the principles of legality, proportionality, fairness, and respect for fundamental rights. A balanced approach between the need to combat crime and the protection of individual liberty is essential for the functioning of a criminal justice system in accordance with both national and international legal standards.

DELIMITATION OF THE OFFENSE OF INDUCEMENT, DETERMINATION OR FACILITATION THE PROVISION OF ONLINE SEXUAL SERVICES FROM HUMAN TRAFFICKING AND INVOLVING A CHILD IN PORNOGRAPHIC PERFORMANCES

Dan FURCULIȚA,
PhD Student,
State University of Moldova,
Trainee, National Institute of Justice,
Candidate for the Position of Prosecutor
ORCID: 0009-0004-2928-5705

Abstract

Online streaming, or more recently live streaming (in real time), viewed as an expression of digital sexuality, came under the scrutiny of the criminal law of the Republic of Moldova following the amendments adopted in 2022 and entered into force in 2023 to the Criminal Code through the introduction of Art. 2201, which sanctions acts of inducement, determination or facilitation the provision of online sexual services. The new regulation generated a series of discussions and ambiguities regarding its practical application, especially from the perspective of official legal qualification.

One aspect that needs clarification in this context is the delimitation of this offense from other criminal acts. The very text of Art. 2201 of the Criminal Code expressly establishes the delimitation of the offense of inducement, determination or facilitation the provision of online sexual services from other criminal acts [...] "if the act does not meet the elements of trafficking in human beings or child pornography".

More recently, as a result of the latest amendments to the Criminal Code in 2026, the legislator removed the reference to child pornography and introduced the offense of participation of a child in pornographic performances – Art. 2084 Criminal Code of Republic of Moldova.

Keywords: online streaming, sexual services, pornographic performances, delimitation, trafficking, sexuality.

DELIMITAREA INFRACȚIUNII DE ÎNDEMN, DETERMINARE SAU ÎNLESNIRE LA PRESTAREA SERVICIILOR SEXUALE ONLINE DE TRAFICUL DE FIINȚE UMANE ȘI PARTICIPAREA UNUI COPIL LA SPECTACOLE PORNOGRAFICE

Abstract

Streaming-ul online sau mai recent streaming-ul live (transmisia în direct), privit ca o formă de manifestare a sexualității digitale, a intrat în sfera de reglementare a legii penale a Republicii Moldova ca urmare a modificărilor operate în anul 2022 și intrate în vigoare în anul 2023 în Codul penal, prin introducerea Art. 2201, care sancționează faptele de îndemn, determinare sau înlesnire la prestarea serviciilor sexuale online. Noua reglementare a generat un șir de discuții și neclarități privind aplicarea sa în practică, în special din perspectiva calificării juridice oficiale.

Un aspect ce necesită a fi clarificat în acest context îl constituie delimitarea acestei infracțiuni de alte fapte. Însăși în textul dispoziției prevăzute la Art. 2201 Cod penal este prevăzută în mod expres delimitarea infracțiunii de îndemn, determinare sau înlesnire la prestarea serviciilor sexuale online de alte fapte [...] „dacă fapta nu întrunește elementele traficului de ființe umane sau ale pornografiei infantile".

Mai nou, în urma modificărilor recente operate la Codul penal în anul 2026, legiuitorul a exclus referirea la pornografia infantilă și a introdus infracțiunea de participare a copilului la spectacole pornografice – Art. 2084 Cod penal Al Republicii Moldova.

Cuvinte-cheie: streaming-ul online, servicii sexuale, spectacole pornografice, delimitare, trafic, sexualitate.

Introduction. The offense provided for by Art. 220[1] of the Criminal Code of the Republic of Moldova, hereinafter (CC RM), was introduced into the criminal law as a result of the adoption and entry into force of Law No.316 of 17 November 2022 "*for the amendment of certain normative acts (ensuring the rights of victims in cases of offenses concerning sexual life and domestic violence)*". In the explanatory note to Draft Law No.316 of 16 November 2022 was stated the need to amend the national regulatory framework to new challenges regarding activities carried out in the online environment, highlighting the conceptual and legal aspects of online sexual activities [1].

The Special Part of the CC RM regulates a wide range of offenses covering the entire spectrum of protection of social relations, and in this sense, the offense provided for in Art. 220[1] CC RM presents well-established individual structural particularities, these being grounded in its constitutive elements: object, objective side, subject and subjective side, as well as in the modes of commission.

Thus, the Moldovan legislator in the very text of Art. 220[1] CC RM, excluded any type of confusion or overlap of criminal norms in the process of legal qualification, clearly delimiting this rule from the offense of trafficking in human beings (Art. 165 CC RM), or from the offense of participation of a child in pornographic performances (Art. 208[4] CC RM), a recently introduced offense in criminal law by Law No.5 of 12 February 2026, within a legislative effort dedicated to the prevention and countering of the sexual exploitation and abuse of minors. While in the case of trafficking in human beings we already have a consolidated doctrine and judicial practice, then in the case of the offense provided for by Art. 208[4] CC RM we are placed within a new and unexplored legal framework.

In the present study we will refer, distinctly, to the offense of participation of a child in pornographic performances, an aspect that gives this scientific undertaking additional topicality. In any case, the present research has as its central point the examination of the norm provided for by Art. 220[1] CC RM, especially in terms of its delimitation from other offenses, given that the legal text of the said norm expressly establishes the limits of the extension of the norm.

Methods and materials applied. The scientific undertaking within this research is grounded, first and foremost, on comparative analysis of the delimitation of the offense of inducement, determination or facilitation of online sexual services from other criminal acts. At the same time, was used the method of documentary and systemic analysis of relevant legal acts, being examined primarily the provisions of the Criminal Code and the information note to the draft law on the amendment of certain normative acts (prevention and countering of sexual exploitation and sexual abuse committed against children), in correlation with the international instruments relevant to the scientific undertaking. Thus, the Directive 2011/93/EU of the European Parliament and of the Council of 13 December 2011 on combating the sexual abuse and sexual exploitation of children and child pornography, and replacing Council Framework Decision 2004/68/JHA has been relied upon, as well as a series of international instruments, such as:

– Convention for the Suppression of the Traffic in Persons and of the Exploitation of the Prostitution of Others, approved by General Assembly resolution 317 (IV) of 2 December 1949;

– Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children, supplementing the United Nations Convention against Transnational Organized Crime, adopted by the United Nations General Assembly by Resolution A/RES/55/25 of 15 November 2000;

– Council of Europe Convention on Action against Trafficking in Human Beings of

16 May 2005;

– Optional Protocol to the Convention on the Rights of the Child on the Sale of Children, Child Prostitution and Child Pornography, adopted by the United Nations General Assembly by Resolution A/RES/54/263 of 25 May 2000;

– Council of Europe Convention on the Protection of Children against Sexual Exploitation and Sexual Abuse. Lanzarote, 25 October 2007;

– Convention on the Rights of the Child, adopted by the United Nations General Assembly on 20 November 1989.

Discussion and results obtained. In the following, we will proceed to examine the main benchmarks for delimiting the offense of inducement, determination or facilitation the provision of online sexual services by reference to each of the aforementioned offenses, distinctly and in logical succession, for a clear and coherent understanding of the differentiation criteria.

In the architecture of modern criminal law, trafficking in human beings is not merely an offense, but an absolute denial of human freedom and dignity, an offense firmly condemned by a series of international instruments, in particular: *the Convention for the Suppression of the Traffic in Persons and of the Exploitation of the Prostitution of Others, adopted by the United Nations General Assembly by Resolution 317 (IV) of 2 December 1949*, a document that established an imperative standard for the protection of human dignity, imposing on states the obligation to sanction any form of exploitation, regardless of any manifestation of the victim's consent [2]; *the Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children, supplementing the United Nations Convention against Transnational Organized Crime, adopted by the United Nations General Assembly by Resolution A/RES/55/25 of 15 November 2000*, an act which innovatively enshrined in its text the expression "trafficking in persons", indicating recruitment, transportation, transfer, sheltering or fostering of a person, by means of the threat or use of force or other forms of coercion, of abduction, of fraud, of deception, of the abuse of power or of a position of vulnerability or of the giving or receiving of payments or benefits to achieve the consent of a person having control over another person, for the purpose of exploitation [3]; *the Council of Europe Convention on Action against Trafficking in Human Beings, concluded on 16 May 2005*, a document that brought about a shift in conceptions in the field of trafficking in human beings, by moving from the strict need to hold persons criminally liable to a model centered on trafficking prevention and the protection of fundamental rights, establishing rigorous obligations for states in identifying and assisting victims of trafficking in human beings [4].

In the criminal law of the Republic of Moldova, the offense of trafficking in human beings is regulated by Art. 165 CC RM an offense that has a complex character and provides several alternative normative modes of realization of the objective side.

Thus, the objective side of the offense provided for by Art. 165 CC RM is expressed in the prejudicial act that includes two actions (inactions) of an alternative character, namely: the main action and the adjacent action or inaction. The main action has the following alternative normative modalities: recruitment, transportation, transfer, sheltering, fostering.

The main action, under any of the modalities set out above, must be accompanied by the adjacent action or inaction, in any of its forms, which are specified in the above-mentioned article, for example: a) use of violence not dangerous to person's life and health or threat of using violence; b) kidnapping; c) seizure, concealment, damage or destruction of documents; d) holding in servitude in order to return a debt; e) threat of disclosing con-

fidential information to the victim's family or to other natural or legal persons; f) fraud; g) abuse of vulnerability or abuse of power, giving or receiving of payments or benefits in order to achieve the consent of a person having control over another person [5]. All these modalities are directed against an adult person, with or without consent thereof, for the purpose of commercial or noncommercial sexual exploitation, by forced labor or services, for beggary [...].

From examining the structure of the objective side of the offense of trafficking in human beings, we identify the central element without which it would not be possible to qualify the act as an offense, namely: that the acts set out in the disposition of Art. 165 CC RM be directed at a victim (an adult person) "with or without that person's consent", which represents the central element in delimiting the offense provided for by Art. 220^1 CC RM from the offense of trafficking in human beings – the victim's consent.

Therefore, in the case of the offense of inducement, determination or facilitation the provision of online sexual services, the victim freely consents to the provision of such services, whereas in the case of the offense of trafficking in human beings, even if, at first sight, the victim expresses consent to carry out certain activities, in reality the consent is vitiated. In such a case, the victim's consent is irrelevant, because it is affected by coercion or by other non-aggressive recruitment methods, taking one of the forms provided for in para. (1) lets. a)-g) and para. (2) lets. f), g) of Art. 165 CC RM.

In the following, while maintaining the rigor of the reasoning, we shall resort to the jurisprudential guidelines provided by the Supreme Court of Justice (hereinafter SCJ), which are intended to ensure a uniform and correct application of the law. Although there are currently no express guidelines from the SCJ concerning the offense of inducement, determination or facilitation of online sexual services, the Court has ruled on the offense of pimping (Art. 220 CC RM), the benchmarks of which may be relied upon in the present doctrinal analysis, given that the offense of pimping is a related and connected legal institution.

Thus, according to Plenary Decision No.37 of the Supreme Court of Justice of the Republic of Moldova "regarding the practice of applying legislation in cases concerning trafficking in human beings and trafficking in children" of 22 November 2004, as subsequently amended, the Court established that: in the process of delimiting the offense of trafficking in human beings from the offense of pimping, the following aspects should be taken into account:

– First, the difference results from the generic legal object of the two incriminations, that is, the social values protected. Thus, in the case of the offense of trafficking in human beings, protection concerns the freedom of will and action of the person, whereas in the case of the offense of pimping, the emphasis is placed on the protection of social relations concerning social coexistence, grounded in the protection of public morals, as well as ensuring the lawful means of subsistence.

– Second, another important criterion in delimitation is the manner of commission of the act; trafficking in human beings necessarily involves the use of coercive means or methods assimilated to them. Where a person, without resorting to coercive means, induces or facilitates prostitution, or gaining benefits from practicing prostitution by another person, that person commits the offense of pimping, provided for by Art. 220 CC RM [6, p. 11].

At the same time, the Court emphasized that the offense of pimping is an autonomous offense, yet in certain situations it may fall within the sphere of applicability of the offense of trafficking in human beings, or they may even coexist. Thus, where initial acts

of pimping are followed by the application of coercive means against the same person, will be retained a real concurrence of offenses between pimping and trafficking in human beings. The findings of the Supreme Court of Justice are of particular relevance because they supplement what we stated at the beginning of the examination of this aspect, namely that the principal element in delimiting trafficking in human beings from pimping / inducement, determination or facilitation the provision of online sexual services must, *in concreto*, be assessed in terms of the role of the victim's consent.

Another element of delimitation between the offense of inducement, determination or facilitation the provision of online sexual services and the offense of trafficking in human beings lies in the configuration of the subjective side of the offense, more precisely in the purpose of the offense (the purpose of committing the offense).

Thus, in the case of the offense provided for by Art. 220[1] CC RM, the purpose is a special one and consists in obtaining, directly or indirectly, income from the victim's provision of online sexual services, whereas in the case of the offense of trafficking in human beings, the purpose is much broader and more complex.

In this regard, within the configuration of the subjective side of the offense provided for by Art. 165 CC RM, there is present the purpose of the main action, which concerns the purpose of commercial or non-commercial sexual exploitation, exploitation through forced labor or services, begging, etc., as well as the purpose of the adjacent action, which is expressed in: the purpose of repaying a debt, the purpose of obtaining the consent of a person who has control over another person; the purpose of ensuring the victim's subordination.

After analyzing the main elements of delimitation between the offense of inducement, determination or facilitation the provision of online sexual services and trafficking in human beings, we shall next examine the offense of participation of a child in pornographic performances, with a view to delimiting it from the offense provided for by Art. 220[1] CC RM.

Offenses directed against children, especially their involvement in activities of a sexual nature, have consistently represented a major concern both nationally and internationally. This need for protection has generated a complex legal framework, made up of a series of international and national normative acts that guarantee the rights and safety of the child, such as:

– *Optional Protocol to the Convention on the Rights of the Child on the Sale of Children, Child Prostitution and Child Pornography*, adopted by the United Nations General Assembly by Resolution A/RES/54/263 of 25 May 2000, an international act that represents an essential legal instrument for the protection of minors. Its major importance lies in defining the notions of: a) sale of children; b) child prostitution; c) child pornography. The need for this act was dictated by the obligation of the signatory states to prevent and criminalize exploitative activities that harm human dignity [7];

– *Council of Europe Convention on the Protection of Children against Sexual Exploitation and Sexual Abuse*. Lanzarote, 25 October 2007. This convention is the international model for the improvement of the domestic legislation of the Republic of Moldova, and represents one of the first and most important international treaties establishing the various forms of sexual exploitation and abuse of children [...] [8];

– *Convention on the Rights of the Child*, adopted by the United Nations General Assembly on 20 November 1989, which is the most important international act recognizing the child as a subject of rights, not merely as an object of protection [9].

As noted above, the offense of participation of a child in pornographic performances

represents a recent incrimination introduced into the criminal legislation of the Republic of Moldova, an offense included by Law No.5 of 12 February 2026, in the context of strengthening mechanisms for the prevention and countering of sexual abuse and exploitation of minors.

A *fortiori*, in order to understand the need for legislative intervention, it is necessary to analyze the information note to the draft law on the amendment of certain normative acts (prevention and countering of sexual exploitation and sexual abuse committed against children). Thus, the supplementation of the legal framework with new provisions was grounded in the objectives of ensuring the harmonization of criminal legislation with international standards concerning the countering of sexual abuse and online sexual exploitation of children.

In concreto, according to the information note, the legislative amendments have as their final objective the implementation of action No.212 from the Government Action Plan for 2024, approved by Government Decision No.887/2023, as well as action No.35 within Chapter 23 "Judicial system and fundamental rights" of the National Action Plan for the accession of the Republic of Moldova to the European Union for the years 2024-2027, aiming at the transposition of Directive 2011/93/EU of the European Parliament and of the Council of 13 December 2011 on Combating the Sexual Abuse and Sexual Exploitation of Children and Child Pornography and replacing Council Framework Decision 2004/68/JHA [11].

Although the information note should contain all the most relevant aspects regarding the need to supplement the Criminal Code and describe in detail the constitutive elements of the offense of participation of a child in pornographic performances, in fact this information note only highlights, at a general level, the need to implement the Directive of the European Parliament and of the Council on Combating the Sexual Abuse and Sexual Exploitation of Children and Child Pornography and replacing Council Framework Decision 2004/68/JHA [10]. However, the act *inter alia* indicates that the criminalization in a single article of all acts referring to pornographic performances involving a child will position this norm as a special one in relation to the other offenses against minors, thus facilitating the work of practitioners in the qualification of such acts [11].

Under these circumstances, in order to carry out a comprehensive analysis and ensure compliance with the scientific approach of the present work, we shall next examine the incriminating norm provided for by Art. 208^4 CC RM, and then, through logical interpretation, the main criteria for delimitation from the offence provided for by Art. 220^1 CC RM will be elucidated.

Thus, Art. 208^4 para. (1) CC RM provides for several normative modalities of realizing the objective side. In turn, the objective side of the offense provided for by Art. 208^4 CC RM is expressed in the prejudicial act characterized by the action of: instigating a child to participate in pornographic performances; recruiting a child to participate in pornographic performances; exploiting a child for this purpose in any other way; as well as deriving benefits from such acts. The objective side of the offense provided for by Art. 208^4 para. (2) CC RM consists in the prejudicial act expressed through the action of coercing a child to participate in pornographic performances.

As follows from the provisions of Art. 132^5 CC RM, a pornographic performance means the live exhibition, addressed to a specific audience, including through information and electronic communication technologies, of a child engaged in explicit sexual conduct, whether real or simulated, or of a child's sexual organs, primarily for sexual purposes [5].

According to Art. 220^1 para. (1) CC RM, the inducement, determination or facilitation

the provision by another person of online sexual services consists in the presentation of the person engaged in explicit sexual activities or in the display of sexual organs, transmitted as video images via information technologies or electronic communications.

Thus, we establish that in the case of the offense provided for by Art. 220[4] CC RM, in addition to the text of the legal provision itself, the General Part of the CC RM also includes the notion of pornographic performance, which is intended to serve as an essential benchmark in the qualification of the act, a feature that is absent in the case of the offence provided for by Art. 220[1] CC RM.

The acts provided for in paras. (1) and (2) of Art. 280[4] CC RM are directed against the victim who has the status of "child". The interpretation of this status must be carried out in accordance with international legal instruments. Thus, according to Art. 2 letr. (a) of Directive 2011/93/EU, the notion of "child" means any person below the age of 18 years [10]. In the same sense, Art. 1 of the Convention on the Rights of the Child, adopted by the United Nations General Assembly on 20 November 1989, establishes that a "child" means every human being below the age of eighteen years unless under the law applicable to the child, majority is attained earlier [9]. Under these conditions, it follows that the victim of the offense provided for by Art. 208[4] CC RM is the natural person who, at the time of instigation or recruitment [...] has not yet attained the age of 18. At the same time, the legislator provided for in letr. a) para. (3) Art. 208[4] CC RM the aggravated form, in the situation where the actions provided for in para. (1) or (2) are committed against a person who has not reached the age of 14 years.

Moreover, from the standpoint of the victim's consent, in the case of the offense provided for by art. 208[4] CC RM, it does not have legal relevance, given that the victim has the status of "child". Thus, even in the event of the victim's consent to be involved in such activities, it cannot produce legal effects in terms of the qualification of the act, being devoid of validity, viewed from the perspective of the need to ensure enhanced protection of minors.

Conclusions. In the process of legal qualification of the act, it is essential to elucidate the totality of objective and subjective signs that determine the classification of a prejudicial act as a particular offense provided for in the Special Part of the CC RM. From this perspective, the offense of inducement, determination or facilitation the provision of online sexual services, at the time of its introduction into criminal law as a result of the adoption and entry into force of Law No.316 of 17 November 2022, represented a legislative novelty that generated the need to clearly outline the scope of its application.

In this context, the delimitation of this offense from other criminal acts is essential. As regards delimitation from the offense of trafficking in human beings, we establish essential differences from the standpoint of the validity of the victim's consent, as well as the pursued purpose.

Thus, in the case of the offense of trafficking in human beings, the purpose is a complex one, materialized in commercial or non-commercial sexual exploitation, exploitation through forced labor or services, begging [...]. Whereas in the case of the offense provided for by Art. 220[1] CC RM, a decisive role in qualification is played by establishing the victim's consent, or, if it is absent or has been found to be vitiated by certain circumstances, we are within the sphere of trafficking in human beings.

With regard to the delimitation of the offense of inducement, determination or facilitation the provision of online sexual services from the offense provided for by Art. 208[4] CC RM – participation of a child in pornographic performances – essential delimitations were established, especially from the standpoint of the status of the victim of the offense:

if in the hypothesis of the offense provided for by Art. 220[1] CC RM the victim is an adult person who freely consents to the provision of services and the consent is valid, then in the case of the offense provided for by Art. 208[4] CC RM, the victim is a "child", whose consent is devoid of legal relevance.

DEROGATION FROM OBLIGATIONS UNDER THE EUROPEAN CONVENTION ON HUMAN RIGHTS DURING MARTIAL LAW: LIMITS OF PERMISSIBILITY AND STATE PRACTISE

Uliana KUZENKO,
PhD Candidate, Associate Professor
Department of Law,
Academician I.M. Lutskyi, King Danylo University,
Ivano-Frankivsk, Ukraine
ORCID: 0000-0002-3978-5007

Abstract

The article provides a comprehensive analysis of the institution of derogation from international legal obligations under the European Convention on Human Rights in the context of martial law as a specific legal mechanism for limiting human rights and freedoms. The content and legal nature of derogation in accordance with Article 15 of the Convention are revealed, its place within the system of international human rights protection is determined, as well as its correlation with the general principles of international law.

The conditions for the lawful application of derogation are analyzed, in particular the existence of a public emergency threatening the life of the nation, as well as the criteria of necessity, proportionality, and compliance of the measures with other international obligations of the state. Special attention is paid to the determination of the list of rights that are non-derogable even during martial law, as well as to the guarantees of their protection.

The article examines the practice of states in applying derogation and analyzes the approaches of the European Court of Human Rights to assessing the legality of such measures, in particular through the prism of the "margin of appreciation" doctrine. Trends in the development of international practice are identified, and the main risks of abuse of the derogation mechanism are outlined. The necessity of maintaining a balance between national security interests and the protection of fundamental human rights is substantiated, as well as the importance of strengthening international control over the application of derogation measures in the context of contemporary global challenges.

Keywords: derogation, human rights, European Convention on Human Rights (ECHR), martial law, proportionality, margin of appreciation.

DEROGAREA DE LA OBLIGAȚIILE PREVĂZUTE DE CONVENȚIA EUROPEANĂ A DREPTURILOR OMULUI ÎN TIMPUL LEGII MARȚIALE: LIMITELE ADMISIBILITĂȚII ȘI PRACTICA STATELOR

Abstract

Articolul oferă o analiză amplă a instituției derogării de la obligațiile juridice internaționale prevăzute de Convenția Europeană a Drepturilor Omului, în contextul legii marțiale, ca mecanism juridic specific de limitare a drepturilor și libertăților fundamentale ale omului. Sunt evidențiate conținutul și natura juridică a derogării în conformitate cu Articolul 15 al Convenției, fiind determinat locul acesteia în sistemul internațional de protecție a drepturilor omului, precum și raportul său cu principiile generale ale dreptului internațional.

Sunt analizate condițiile aplicării legale a derogării, în special existența unei situații excepționale care amenință viața națiunii, precum și criteriile necesității, proporționalității și compatibilității măsurilor adoptate cu celelalte obligații internaționale ale statului. O atenție deosebită este acordată identificării drepturilor care nu pot face obiectul derogării nici în perioada legii marțiale, precum și garanțiilor de protecție a acestora.

Articolul examinează practica statelor în aplicarea derogării și analizează abordările adoptate de Curtea

Europeană a Drepturilor Omului în evaluarea legalității unor asemenea măsuri, în special prin prisma doctrinei marjei de apreciere. Sunt identificate tendințele de dezvoltare a practicii internaționale și sunt evidențiate principalele riscuri de abuz ale mecanismului derogării. Totodată, este argumentată necesitatea menținerii unui echilibru între interesele de securitate națională și protecția drepturilor fundamentale ale omului, precum și importanța consolidării controlului internațional asupra aplicării măsurilor derogatorii în contextul provocărilor globale contemporane.

Cuvinte-cheie: derogare, drepturile omului, Convenția Europeană a Drepturilor Omului (CEDO), lege marțială, proporționalitate, marjă de apreciere.

Introduction. In the context of armed conflicts, military aggression, and other emergency situations, states are objectively faced with the necessity of applying special legal mechanisms aimed at ensuring national security and maintaining public order. One of such mechanisms is derogation from international legal obligations in the field of human rights, as provided for in Article 15 of the European Convention on Human Rights, which allows states to temporarily depart from certain obligations in the event of a public emergency threatening the life of the nation [1].

At the same time, the application of derogation is accompanied by a number of complex theoretical and practical issues. First and foremost, this concerns the determination of the criteria of a "public emergency" that justifies the need for derogation, as well as the establishment of the limits of permissible restrictions on human rights and freedoms. Of particular relevance is the issue of compliance with the principles of necessity, proportionality, and non-discrimination in the implementation of derogation measures.

An additional level of complexity arises from the need to ensure a balance between the interests of state security and the obligation to guarantee fundamental human rights, particularly those that are non-derogable even in situations of emergency or martial law. In this context, the case law of the European Court of Human Rights plays a special role, as it develops the criteria for assessing the legality of derogation and defines the scope of state discretion.

The relevance of this study is also contemporary challenges related to armed conflicts, particularly in Ukraine, which highlights the issue of the legality and effectiveness of the application of the derogation mechanism. This, in turn, requires a comprehensive scholarly analysis of both the theoretical foundations of the institution of derogation and the practice of its application in both international and national legal systems.

Article 15 of the European Convention on Human Rights provides for the possibility of a temporary derogation by states from their international legal obligations in the event of war or another public emergency threatening the life of the nation. Such a mechanism is an exceptional legal instrument aimed at ensuring an effective response of the state to crisis circumstances that threaten its existence or the functioning of democratic institutions [2].

By its legal nature, derogation does not mean a complete release of the state from its international obligations, but only allows their temporary limitation within strictly defined limits. It represents a special legal regime that differs from ordinary restrictions on human rights, as it is applied exclusively in situations of emergency and in the presence of objective necessity.

The application of derogation is subject to a number of clearly defined conditions, which are formulated both in the Convention itself and in the practice of the European Court of Human Rights. These include:

- The existence of a public emergency that genuinely threatens the life of the nation;
- The necessity of the measures taken, which must be justified and proven;

- The proportionality of restrictions, meaning a balance between the measures applied and the intended aim;

- Compliance of derogation measures with other international legal obligations of the state [3].

An important element of the legal regime of derogation is also its procedural aspect, in particular the obligation of a state to notify the Secretary General of the Council of Europe about the introduction of derogation, its grounds, and the scope of the measures applied. This ensures international oversight of compliance with the requirements of the Convention and prevents potential abuses.

Particular importance is attached to the provision concerning so-called "non-derogable rights", which cannot be restricted even during a state of war or emergency. These include, in particular, the right to life (except in cases of lawful acts of war), the prohibition of torture and inhuman or degrading treatment or punishment, the prohibition of slavery and forced labour, as well as the principle of nullum crimen sine lege (no punishment without law). These rights are absolute in nature and form the foundation of the international legal order.

Thus, derogation is a complex legal institution that combines elements of flexibility and limitation, allowing the state to adapt its legal regime to emergency conditions while preserving fundamental human rights guarantees. Its application requires strict compliance with established international legal standards and is subject to the supervision of international institutions, primarily the European Court of Human Rights.

The European Court of Human Rights, in its case law, has developed a set of criteria used to assess the legality and justification of derogation from obligations under the European Convention on Human Rights. These criteria are of fundamental importance for determining the limits of permissible restrictions on human rights in situations of emergency or martial law [3].

The primary requirement is the establishment of the existence of a "public emergency threatening the life of the nation". The European Court of Human Rights interprets this concept as an exceptional crisis situation affecting the whole population or a significant part of it and posing a real threat to the functioning of state authorities. At the same time, the state must demonstrate the existence of such a threat by providing sufficient justification, rather than merely making a formal reference to emergency circumstances.

The second important criterion is the principle of necessity, according to which the measures taken by the state must be objectively justified by the specific situation. The European Court of Human Rights examines whether the state genuinely lacked alternative, less restrictive means of achieving the intended aim [3]. Thus, derogation cannot be used as a universal instrument, but only as a measure of last resort in response to exceptional circumstances.

The third key element is the principle of proportionality, which requires a reasonable balance between the restriction of human rights and the legitimate aim pursued by the state. The Court assesses whether the measures applied exceed what is strictly necessary and whether they result in excessive interference with individual rights and freedoms. It is also important that proportionality be maintained both in terms of the substance of the restrictions and their duration.

In addition to the aforementioned criteria, the European Court of Human Rights applies the doctrine of the "margin of appreciation", which grants states a certain degree of discretion in choosing measures to respond to emergency situations. At the same time, such discretion is not unlimited, as the Court exercises supervision to ensure that states

do not exceed the permissible limits of interference with human rights. In particular, it is assessed whether derogation measures comply with the principles of the rule of law, non-discrimination, and due process.

Thus, the limits of permissible derogation are determined through a combination of substantive and procedural criteria developed in the case law of the European Court of Human Rights. Compliance with these criteria is a necessary condition for maintaining a balance between the interests of state security and the protection of human rights guarantees, even in periods of emergency.

The case law of the European Court of Human Rights plays a crucial role in defining the content and limits of the application of derogation under Article 15 of the European Convention on Human Rights, shaping established approaches to assessing its legality, necessity, and proportionality. One of the earliest and most fundamental cases in this field is *Lawless v. Ireland* (1961), in which the Court recognized that the activities of the Irish Republican Army constituted a real threat to national security, thereby meeting the criterion of a "public emergency threatening the life of the nation". In this context, detention without trial was considered permissible; however, the Court emphasized the exceptional nature of derogation and the necessity of its proper justification [4].

The further development of approaches to assessing derogation can be observed in *A. and Others v. the United Kingdom* (2009), where the European Court of Human Rights found that although the threat of terrorism could justify the application of derogation, the specific measures adopted by the state were disproportionate and discriminatory [5]. In particular, detention without judicial control was applied exclusively to foreign nationals, which violated the principles of equality and non-discrimination. This judgment underscored that even in situations of emergency, the state must not exceed the limits imposed by the principle of proportionality.

In cases against Turkey, in particular *Aksoy v. Turkey* (1996), the Court formulated an important position regarding the absolute nature of certain rights, emphasizing that the prohibition of torture cannot be restricted under any circumstances, even during a state of emergency. These judgments also highlight the necessity of ensuring effective safeguards against abuse, including judicial oversight and access to legal assistance [6].

The contemporary stage in the development of derogation practice is associated with the application of this mechanism in the context of armed conflicts, particularly in Ukraine. Ukraine first exercised its right of derogation in 2015 in response to armed aggression, notifying a derogation from certain provisions of the Convention. Following the full-scale invasion in 2022, the state again applied derogation, which has necessitated an assessment of the compliance of such measures with the criteria established in the case law of the European Court of Human Rights. In this context, the Court, in inter-state cases, in particular Ukraine v. Russia, pays attention not only to the fact of derogation but also to whether the state complies with the principles of proportionality, necessity, and respect for non-derogable human rights.

In general, the case law of the European Court of Human Rights demonstrates that derogation is recognized as a permissible but exceptional instrument for responding to emergency situations. The Court acknowledges that states are granted a certain margin of appreciation; however, it exercises supervision to ensure that such discretion does not lead to arbitrary or disproportionate restrictions of human rights. Thus, even under conditions of martial law, the state is obliged to act within the framework of international legal standards, ensuring a balance between national security interests and the protection of fundamental rights and freedoms.

The practice of applying derogation from international legal obligations under the European Convention on Human Rights indicates its widespread use by states as a tool for responding to emergency situations that threaten national security or public order. Most often, derogation is applied in the context of counter-terrorism measures, global crises, including the COVID-19 pandemic, as well as during armed conflicts [8].

For instance, the United Kingdom has used the mechanism of derogation in response to terrorist threats, introducing measures such as prolonged detention without judicial control. Such practices have been subject to scrutiny by the European Court of Human Rights, which has emphasized the necessity of adhering to the principles of proportionality and non-discrimination [5].

France applied derogation following the terrorist attacks of 2015, introducing a state of emergency that entailed the expansion of law enforcement powers and the restriction of a number of rights and freedoms [2]. This led to debates regarding the limits of permissible state interference in the sphere of human rights.

Turkey has extensively utilized the mechanism of derogation, particularly in the aftermath of the attempted coup d'état in 2016, which was accompanied by substantial restrictions on rights and freedoms, including prolonged detentions and limitations on freedom of expression. The case law of the European Court of Human Rights concerning Turkey underscores the imperative of strict oversight to ensure compliance with fundamental human rights standards [6].

During the COVID-19 pandemic, a number of states, including Latvia, Romania, Armenia, and Moldova, notified derogations in connection with the introduction of restrictions on freedom of movement and assembly. These measures were justified by the need to protect public health; however, their implementation required compliance with the principles of temporariness, necessity, and proportionality [3].

The practice of Poland demonstrates a different approach: although the state introduced significant restrictions on rights during the pandemic, it did not carry out a formal derogation in accordance with Article 15 of the Convention. This has sparked academic debate regarding the legality of imposing restrictions without official notification of derogation and raised questions about the necessity of strict compliance with the procedural requirements of the Convention [3].

Georgia applied derogation in response to threats to national security, particularly in the context of armed conflict and internal crisis situations [8]. In doing so, the state justified the necessity of such measures by the need to protect territorial integrity and stability, which corresponds to the general approaches established in international practice.

Spain, in turn, has repeatedly faced challenges related to terrorist activity and political crises, particularly in the context of events in Catalonia. Although the state has not always applied formal derogation, it has used domestic mechanisms for restricting rights, which has also become a subject of discussion regarding the correlation between national measures and international human rights standards [2].

Particular importance is attached to the practice of applying derogation in situations of armed conflict, especially in Ukraine, which first exercised the right to derogate from certain provisions of the Convention in 2015, and after the full-scale invasion in 2022 expanded the scope of derogation measures [7]. This confirms the relevance of the institution of derogation in contemporary conditions and, at the same time, underscores the necessity of strict compliance with international standards.

Overall, state practice demonstrates the universality of derogation as a legal instrument for responding to emergency situations. At the same time, it reveals the existence of risks associated with the potential abuse of this mechanism, particularly in cases where

restrictions on human rights exceed what is necessary or is applied without proper justification. In this context, the role of the European Court of Human Rights is of decisive importance, as it ensures the maintenance of a balance between the interests of state security and the protection of human rights [3].

Conclusions. Derogation is an important instrument of international law that enables states to respond effectively to emergency situations, including armed conflicts and other threats to national security. At the same time, this mechanism has an exceptional character and may be applied only within strictly defined limits established by the European Convention on Human Rights and further elaborated in the case law of the European Court of Human Rights.

The main criteria for the admissibility of derogation include the existence of a real and substantiated threat to the life of the nation, the objective necessity of the measures applied, their proportionality to the legitimate aim pursued, as well as the unconditional respect for non-derogable human rights, which cannot be restricted under any circumstances. Particular importance is also attached to compliance with procedural requirements, including the obligation of states to properly notify international institutions of derogation measures.

The practice of the European Court of Human Rights clearly demonstrates that even in situations of emergency or martial law, states are not released from their international legal obligations. While recognizing a certain margin of appreciation for states, the Court exercises control over compliance with the principles of the rule of law, non-discrimination, necessity, and proportionality, thereby preventing arbitrary restrictions of human rights.

In the context of the growing number of global challenges, including armed conflicts and security crises, the institution of derogation is gaining particular relevance. This necessitates further improvement of its application mechanisms, strengthening of international oversight, and the development of unified approaches to determining the limits of permissible restrictions on human rights, which will contribute to preventing abuses and ensuring a proper balance between state interests and the protection of human rights.

Abstract

Within the legal framework of the rule of law, the principle of legality in criminal law serves as a fundamental safeguard, as it makes the legitimacy of criminal intervention contingent upon the existence of a pre-established, clear, and predictable legal provision, thereby ensuring the effective protection of the individual against arbitrary punishment. This principle is not limited to the mere formal existence of a written criminal law, but necessarily presupposes compliance with certain quality standards of the law, without which its correct application becomes, without a doubt, impossible. In this sense, the quality of criminal law provisions constitutes „a sine qua non" condition for the effective realization of the legality of criminalization and for guaranteeing legal certainty for those subject to the law.

In this study, we aim to examine, from both a doctrinal and jurisprudential perspective, the quality standards of criminal law provisions through the lens of the principle of legality of criminalization, with an emphasis on their importance in the process of the legal-criminal classification of acts.

This approach aims to highlight the risks posed by unclear criminal law provisions, as well as to emphasize the obligation to interpret the law strictly and restrictively, as a fundamental guarantee of respect for criminal legality in a state governed by the rule of law.

Keywords: criminal legality, quality standards of norms, accessibility, clarity, predictability, strictness of the law.

EXIGENȚELE DE CALITATE ALE NORMEI DE INCRIMINARE CA EXPRESIE A PRINCIPIULUI LEGALITĂȚII PENALE

Abstract

În arhitectura normativă a statului de drept, principiul legalității incriminării dobândește valoarea unei garanții fundamentale, întrucât condiționează legitimarea intervenției penale de existența unei norme prestabilite, clare și previzibile, asigurând astfel protecția efectivă a individului împotriva arbitrariului sancționator. Acest principiu nu se reduce doar la simpla existență formală a unei norme penale scrise, ci presupune, în mod necesar, respectarea unor standarde de calitate ale legii, fără de care aplicarea sa corectă devine fără dar și poate imposibilă. În acest sens, calitatea normelor penale constituie o condiție "sine qua non" pentru realizarea efectivă a legalității incriminării și pentru garantarea securității juridice a destinatarilor legii.

Ne propunem în prezentul studiu examinarea, din perspectivă doctrinară cât și jurisprudențială, a

standardelor de calitate ale normelor penale prin prisma principiului legalității incriminării, cu accent pe importanța acestora în procesul de calificare juridico-penală a faptelor.

Demersul urmărește evidențierea riscurilor pe care le generează normele penale lipsite de claritate, precum și reliefarea obligației de interpretare strictă și restrictivă a legii, ca garanție fundamentală a respectării legalității penale într-un stat de drept.

Cuvinte-cheie: legalitate penală, standarde de calitate ale normei, accesibilitatea, claritatea, previzibilitatea, strictețea legii.

Introduction. The concept of legal certainty in criminal law was developed by the distinguished Italian criminologist and criminal law scholar Cesare Beccaria in his seminal work „Dei delitti e delle pene". In the author's view: „If the interpretation of laws constitutes an evil, it is evident that another evil is their obscurity, which necessarily entails interpretation; and this evil will be all the greater if the laws are written in a language foreign to the people, thus placing them at the mercy of a few individuals, since they cannot judge for themselves what will be the fate of their freedom or that of their fellow citizens, in a language that transforms a solemn and public document into one that is almost private and domestic. What are we to think of people, considering that this was the long-standing custom of a large part of cultured and enlightened Europe? The greater the number of those who will understand and hold in their hands the sacred code of laws, the rarer crimes will become, for there is no doubt that ignorance and uncertainty regarding punishments increase the power of passions" [1, p.19].

In this context, the renowned criminal law scholar F. Carrara states: „No one can be attributed with the intent to violate a law that either does not exist or is unknown to them. Therefore, an act cannot constitute a crime if the law prohibiting it has not been enacted and promulgated" [3, p. 36].

The principle of legality of criminalization is enshrined in the first part of Article 22 of the Constitution of the Republic of Moldova: „No one shall be convicted for acts or omissions that, at the time of their commission, did not constitute a criminal offense. "The Criminal Code enshrines the principle of legality in Article 3 para. (1): "No one may be found guilty of committing a crime or subjected to criminal punishment except on the basis of a court decision and in strict accordance with criminal law".

In fact, the accessibility, clarity, and predictability of criminal law provisions are not merely requirements of legislative technique, but genuine safeguards of individual liberty, since only a comprehensible and predictable law enables individuals to adjust their conduct and anticipate the criminal legal consequences of their actions. In the absence of sufficiently precise, unambiguous rules, the application of criminal law risks becoming arbitrary, affecting both the fairness of the legal classification of the act and the legitimacy of the state's punitive response [17, p.141].

Legal classification is inextricably linked to the nature of the criminal law provisions that describe the constituent elements and characteristics of the offense. The precise subsumption of the harmful act under the provisions of criminal law within the legal classification, regardless of whether it is official or unofficial, is possible only to the extent that the criminalization provisions are drafted in full accordance with the quality criteria arising from *the principle of legality of criminalization.*

Methods and materials applied. The scientific nature of this paper is characterized by the use of a methodology that combines interdisciplinary approaches and critical analysis, ensuring a rigorous examination of the quality standards of criminal law.

The logical method plays a central role in this research, serving to systematize and

rationalize the analysis of key concepts such as the clarity of criminalization, accessibility, and the predictability of criminal law. Through this method, the interdependencies and causal relationships between the quality standards of criminal law and its enforcement mechanisms have been highlighted, facilitating the formulation of coherent and rigorously argued conclusions regarding the fairness and conceptual consistency of criminal regulations.

The *critical analysis method* was extensively applied to evaluate criminal law provisions, related legislation, and relevant case law. This critical analysis made it possible to identify vulnerabilities, gaps, and inconsistencies in the regulation and application of quality standards for criminal legality, as well as to assess their impact on judicial practice.

The comparative method was employed by examining Moldova's criminal legal framework in light of the standards established in the case law of the European Court of Human Rights, thereby enabling a comparison of national legislative provisions with the treaty requirements derived from the Court's judgments.

Discussions and results obtained. Based on the provisions of the Universal Declaration of Human Rights (hereinafter UDHR)[1], the principle of legality in criminal law is enshrined in Article 7(1), first sentence of the ECHR: "No one shall be held guilty of any criminal offense on account of any act or omission which did not constitute a criminal offense under national or international law at the time it was committed". In interpreting these provisions, the ECtHR, based on the principle of the evolving interpretation of the European Convention, has identified three criteria for the quality of criminal laws: *accessibility*, *clarity*, *and predictability*.

A ruling by the Constitutional Court stated: "To meet the three quality criteria- accessibility, predictability, and clarity – a legal norm must be formulated with sufficient precision to enable a person to determine their conduct and to reasonably foresee, based on the circumstances of the case, the consequences of that conduct. Otherwise, even though the law contains a legal rule that apparently describes the person's conduct in the given situation, the person may claim that they are unaware of their rights and obligations. Under such an interpretation, a rule that does not meet the criteria of clarity is contrary to Article 23 of the Constitution, which establishes the state's obligation to guarantee every person the right to know their rights" [11].

In the same vein, another decision of the Constitutional Court stated: "...any legislative act must comply with constitutional principles and norms, as well as with the requirements of legislative drafting, which are intended to ensure the clarity, foreseeability, predictability, and accessibility of the act. The law must regulate in a unified manner, ensure a logical-legal connection between the provisions it contains, and, in the case of legal institutions with a complex structure, provide for the elements that distinguish their particularities" [12].

The quality standards of the law, as established in the consistent case law of the European Court of Human Rights, constitute fundamental legal requirements of the rule of law, designed to guarantee legal certainty and the effectiveness of the principle of legality by imposing essential requirements.

In this context, ***the accessibility*** of the law refers to the effective public dissemina-

[1] In accordance with Article 11 of the UDHR: „Everyone charged with a criminal offense has the right to be presumed innocent until proven guilty according to law in a public trial in which all the guarantees necessary for his defense have been provided", and pursuant to paragraph (2): „No one shall be held guilty of any criminal offense for any act or omission that did not constitute a criminal offense under international or national law at the time it was committed. Furthermore, no heavier penalty shall be imposed than that which was applicable at the time the criminal offense was committed".

tion of legislative acts. Under the constitutional order, this requirement is fulfilled through the procedure for publishing the law, as regulated by Article 76 of the Constitution; publication in the Official Gazette constitutes the legal means by which the normative act is incorporated into the legal order and becomes enforceable against all legal subjects. Only from this moment on can it be legitimately presumed that the addressees of the norm have a real opportunity to become aware of its content. This allows for the invocation of the general presumption of knowledge of the law and confers upon the norm the character of an accessible law.

With regard to the requirement of accessibility, the Constitutional Court ruled "... that there is no doubt that the contested provisions meet the condition of accessibility. The Criminal Code is published in the Official Gazette, and the general public has access to it. So, the presumption of knowledge of the law applies, which stems from the general legal principle "*Nemo censetur ignorare legem*".

Consequently, the requirement of ***accessibility*** of a criminal law provision is met upon its publication in the Official Gazette, as publication constitutes the formal legal condition by which the provision becomes enforceable against all those to whom it is addressed. In this context, accessibility is presumed, and knowledge of the law is imputed to all legal subjects pursuant to the principle "*Nemo censetur ignorare legem*", such that the lack of effective information cannot be invoked to call into question the validity of the provision in terms of accessibility.

In the case of *Silver v. the United Kingdom*, the ECHR held that "...the law must be made available in an appropriate manner: the citizen must, in the specific circumstances, have sufficient guidance as to the legal rules applicable in a given situation. It is clear that the Prisons Act and the Regulations met this requirement, but the administrative orders and instructions were not published" [13].

It follows from this interpretation that the accessibility of criminal law is not limited to the publication of the Criminal Code, but necessarily entails the accessibility of all normative acts to which criminal law refers and which contribute to defining the legal content of a crime (elements of a crime). This finding is particularly relevant for offenses described by blanket criminal provisions, in which the content of the criminalization is determined by reference to other normative regulations. In these cases, the accessibility of the criminal provision is contingent upon the subject's actual ability to know the body of law that completes the „criminal significance of the offense". Therefore, in the case of these offenses, it must be verified whether the requirement of accessibility is also met by the legal provisions set forth in other normative acts, to which the legislature refers for a complete description of the elements of the offense.

The second criterion is ***the clarity*** of the criminal law provision. Legal scholarship indicates that the quality of criminal law depends on the fulfillment of certain criteria regarding content and form, as outlined in the principles of legislative drafting; adherence to the rules of legislative drafting is the primary condition for ensuring the quality of criminal law [2, p. 155]. In another approach, the quality of the law presupposes that "its text sets forth the rules of law in a logical and coherent sequence, grammatically correct, in accordance with the requirements of the language..., in a clear and precise manner" [18, p.7].

Building on this idea, it is argued that strict adherence to the rules of legislative drafting constitutes an indispensable condition for maintaining the legislation in force in a proper "working order". Underestimating and oversimplifying this technique leads to numerous legislative and law enforcement errors, which result in a misinterpretation of the law and violations of legality [18].

Therefore, ***the clarity*** of a criminal law provision refers to the intrinsic quality of the legislative text and depends on how the provision is formulated. A criminal law provision is clear when:

• The terms used are intelligible, unambiguous, and correctly formulated in terms of the grammar, spelling, and semantics of the Romanian language;

• The wording of the provision allows for an understanding of the constituent elements of the offense, as well as the criminal penalties that may be imposed;

• The text is not contradictory, obscure, or excessively technical without normative explanation;

• There are no contradictions between general criminal provisions and special criminal provisions.

The third criterion of quality for a criminal law provision is ***predictability***. In general, the predictability of a criminal law provision is determined by the clarity of its wording. Legal doctrine clearly states that the quality of the law is an indispensable condition for the predictability and certainty of its application. A person's ability to anticipate the consequences of their conduct is (or, at least, should be) a determining factor in their choice of behavior [6, p. 3].

According to the Venice Commission, predictability does not merely require that the law be, as far as possible, adopted and made public before it enters into force and that its effects are foreseeable; it also implies that the rule must be formulated with sufficient precision and clarity to enable legal subjects to conform their conduct in accordance with its provisions. The necessary degree of predictability, however, depends on the nature of the law. In particular, this requirement is essential in the field of criminal law. The need to adopt precautionary measures before concrete dangers arise has become increasingly important; this development is legitimate, given the proliferation of risks, generated in particular by technological developments. Nevertheless, in areas where a preventive approach to regulation applies, such as risk law, the grounds for state intervention are formulated in considerably broader and more imprecise terms; however, the principle of the rule of law requires that the requirement of predictability not be set aside even in these areas [15].

Although inextricably linked to the quality of criminal laws, predictability refers to the ability of a legal norm to enable its addressee to reasonably anticipate the legal consequences of their conduct, based on the normative content of the law, supplemented, if necessary, by the consistent judicial interpretation of the courts.

A criminal law provision is ***predictable*** when:

• It allows the individual to identify the conduct relevant under criminal law, that is, the unlawful conduct described by the provision. The person can reasonably anticipate whether a certain act or omission entails criminal liability;

• A person can, if necessary, rely on the interpretation of the courts, in order to understand the content of the provision consistent (uniform) case law, and legal counsel. Predictability is not contingent upon absolute certainty in the wording of the criminal law provision, but also upon reasonable foreseeability, which may be ensured through legal guidance (interpretations or explanations). Therefore, predictability may result not only from the text of the criminal law provision, but also from the consistent and accessible case law existing regarding the provision.

With regard to the relationship between the clarity and predictability of criminal law provisions, we conclude that clarity is, first and foremost, an intrinsic requirement of the legislative text. It concerns the manner in which the criminal provision is formulated,

the degree of precision of the terms used, the internal coherence of the provision, and the absence of semantic or logical ambiguities. The assessment of clarity can be carried out ***ex ante***, that is, before the act is committed, through an abstract analysis of the statutory text, independent of specific situations of application.

It can be observed that foreseeability is linked to the actual ability of the person subject to criminal law to anticipate the criminal legal consequences of their conduct, in light not only of the text of the law, but also of judicial interpretation and established practice. The analysis of predictability is conducted ***ex post*** and ***in concreto***, taking into account the specific circumstances of the case, the normative context, and the degree of accessibility of relevant case law. Predictability concerns the ability to anticipate the state's punitive response, and not exclusively the abstract formulation of the legal norm.

Case Study: **58.** The Court accepts the view according to which a potential litigant is deprived of the possibility of reasonably foreseeing the conditions under which he or she would be held liable under Article 361 para. (1) of the Criminal Code when manufacturing, possessing, selling or using a forged official document that confers rights or releases from obligations and, respectively, the conditions under which he or she would be held liable under Article 361 para. (2) letter c) of the Criminal Code, where the same actions are committed in relation to a document of particular importance [...].

59. Due to the lack of clarity of the provision set out in Article 361 para. (2) letter c) of the Criminal Code of the Republic of Moldova, the choice between this provision and that contained in Article 361 para. (1) of the Criminal Code cannot be made by those competent to apply criminal law other than approximately, based on assessments devoid of objectivity.

60. The contested norm grants the courts a wide margin of discretion, which leads to the existence of judicial decisions containing diametrically opposed interpretations [...].

61. So, the Court observes that the relevant case-law has not developed, with regard to the impugned notion, a meaning capable of constituting an objective benchmark by reference to which its content may be assessed. The judge himself or herself is placed in difficulty, being required to choose between several possible alternatives, in the absence of a clear formulation of the norm and, implicitly, of the applicable sanctioning regime.

62. Consequently, Article 361 para. (2) letter c) of the Criminal Code is susceptible to an extensive interpretation to the detriment of the offender [...].

63. Therefore, in the absence of objective benchmarks, including normative ones, the attribution of particular importance to a document is left to the discretion of those applying criminal law, the litigant thus finding himself or herself in a state of legal uncertainty.

64. In conclusion, summarizing the *above*, the Court finds that the provisions of Article 361 para. (2) letter c) of the Criminal Code are drafted in an imprecise and unclear manner and confer upon the authorities applying them a wide margin of discretion. Consequently, they do not meet the standard of quality required of criminal law and are contrary to Articles 1 para. (3) and 22, read in conjunction with Article 23 para. (2) of the Constitution [7].

Clarity is a necessary but not sufficient condition for predictability. A rule may be clearly worded but applied in an unpredictable manner through expansive, creative, or inconsistent interpretations; conversely, a rule drafted in general terms may achieve a reasonable degree of predictability through consistent and accessible case law. Therefore, the quality of criminal law stems from the interaction between the clarity of the

normative text and the predictability of its application, both of which are indispensable for fulfilling the function of guiding conduct and for upholding the principle of legality in criminalization.

Case Study: **26.** The applicant complained of a violation of article 7 of the Convention [...]. He argued that the definition of the notion of a „medicinal product", as set out in article L. 511 of the Public Health Code, was extremely imprecise and left the courts a wide margin of appreciation [...].

27. The Commission, in essence, endorsed the applicant's point of view. It observed that, although the criteria developed by the Convention institutions in relation to other provisions may be transposed to the field of application of Article 7, that provision nonetheless requires a stricter application of those criteria [...].

31. The Court reiterates that it is a logical consequence of the principle of the general applicability of laws that their wording is not always precise. One of the standard legislative techniques is the use of general categories rather than exhaustive lists. The need to avoid excessive rigidity and to adapt to changing circumstances means that many laws are inevitably couched in terms which are, to a greater or lesser extent, vague. The interpretation and application of such provisions depend on practice.

35. [...] the scope of the notion of foreseeability depends to a considerable degree on the content of the text in question, the field it is intended to cover, and the number and status of those to whom it is addressed. A law may satisfy the requirement of foreseeability even where the person concerned must seek legal advice in order to assess, to a reasonable degree, the consequences of a given action. This is particularly true in the case of persons engaged in a professional activity, who are accustomed to exercising a higher degree of caution. With the benefit of appropriate legal advice, Mr Cantoni, who was moreover the manager of a supermarket, ought to have assessed, at the relevant time, that, having regard to the established case-law of the Court of Cassation and of certain lower courts, there existed a real risk of prosecution for the unlawful sale of medicinal products [...].

36. Consequently, there has been no violation of article 7 of the Convention [8].

In the above case, the Court reaffirmed that the principle of legality in criminal law, as enshrined in Article 7 of the Convention, requires that offences be defined with sufficient clarity and foreseeability, without, however, excluding the use of general terms or the legislative technique of categorisation. The requirement of foreseeability is satisfied where the norm, interpreted in the light of the relevant case-law and, if necessary, with the assistance of legal advice, enables the individual to foresee, to a reasonable degree, the criminal consequences of his or her conduct. The existence of areas of uncertainty at the margins of the application of a provision is not, in itself, incompatible with article 7, provided that the legal framework offers sufficient guidance for the regulation of conduct and the avoidance of arbitrariness.

Case Study: **38.** Mr Kokkinakis challenged the wording of Article 4 of Law No.1363/1938. He criticised the absence of any description of the "objective content" of the offence of proselytism. He considered that this omission was deliberate, as it would allow any form of conversation or communication of a religious nature to be subsumed under that provision. The applicant pointed to the risk of an "extensibility" of the vague notions employed by the legal text, both on the part of the police and, often, on the part of the courts, such as the expressions "in particular" and "indirect attempt" to interfere with the religious beliefs of others [...].

40. The Court has already emphasised that the wording of many statutory provi-

sions is not absolutely precise. The need to avoid excessive rigidity and to keep pace with evolving circumstances means that many laws are inevitably couched in terms which, to a greater or lesser extent, are vague (see, for example, mutatis mutandis, the judgment in *Müller and Others v. Switzerland* of 24 May 1988, Series A No.133, p.20, § 29). Criminal law provisions relating to proselytism fall within this category. The interpretation and application of such norms depend on practice.

In the present case, there existed a body of consistent domestic case-law (see paragraphs 17-20 above). This case-law, which had been published and was accessible, supplemented the wording of Article 4 and was such as to enable Mr Kokkinakis to regulate his conduct in this field [9].

In a manner similar to the *Cantoni* case, in *Kokkinakis* the Court held that, although criminal norms may be formulated in general and even vague terms, the requirement of foreseeability is satisfied where their interpretation and application are stabilised through consistent, published, and accessible case-law. Thus, clarifying judicial practice may complement the normative text, providing individuals with sufficient guidance to regulate their conduct and to foresee, to a reasonable degree, the criminal consequences of their behaviour.

Case Study: **42.** The Court observes that, in the present case, the Government was not in a position to submit decisions of the domestic courts, whether of the Supreme Court of Justice or of lower courts, establishing that, prior to the judgment delivered in the present case, it had been explicitly held that acts of bribery committed by employees of companies with private capital constituted a criminal offence (see, mutatis mutandis, *Pessino v. France*, No.40403/02, § 34, 10 October 2006).

43. From the extensive application of criminal law it follows that, at least due to the absence of accessible and reasonably foreseeable case-law interpretation, the requirements of Article 7 cannot be regarded as having been satisfied in respect of an accused person. In the present case, the lack of prior case-law concerning the assimilation of acts of bribery committed by employees of a bank to those of "officials" and "other employees" of the institutions provided for in Article 145 of the Criminal Code results from the fact that the Government did not provide precedents in this regard. The action of legal doctrine in freely interpreting a legal provision cannot substitute for the existence of case-law. To reason otherwise would amount to disregarding the object and purpose of this provision, which is to ensure that no one is convicted arbitrarily. Moreover, the Court observes that the Government did not provide any example of doctrinal interpretation establishing the criminal liability of bank employees for acts of bribery.

44. Consequently, even as professionals who could have sought legal advice, it was difficult, if not impossible, for the applicants to foresee the reversal in the case-law of the Supreme Court of Justice and, therefore, to know that, at the time they committed their acts, these could entail a criminal sanction (*a contrario*, *Cantoni*, cited above, § 35, and *Coëme and Others*, cited above, § 150).

45. Furthermore, the Court notes that the appellate court expressly proceeded to an extensive application of criminal law (see above, § 11). The court of cassation did not intend to quash this part of the judgment. It merely found that the applicants fulfilled the conditions required to be recognised as perpetrators of the offence, thereby confirming the interpretation adopted by the appellate court.

48. In these circumstances, the Court considers that, in the present case, there has been a violation of article 7 § 1 of the Convention [14].

In the above case, the European Court found that the criminal provisions in ques-

tion were applied through a broad interpretation of the criminal provision, in the absence of consistent and accessible prior case law that would have predictably established the scope of the active perpetrators of the offense of accepting bribes. The lack of relevant judicial precedents capable of clarifying the meaning and scope of the criminal provision deprived the applicants of the possibility of reasonably anticipating the criminal consequences of their conduct, even if they had sought specialized legal advice. Under these circumstances, the Court held that the requirements of foreseeability and strict interpretation of criminal law, inherent in Article 7 § 1 of the Convention, had not been met, concluding that the criminal interference was incompatible with the principle of legality of criminal offenses.

With regard to the limits of assessing the quality criteria of criminal law provisions, it should be emphasized that the investigating officer, the prosecutor, and the court do not have the authority to rule on the lack of quality standards in a criminal law provision, or on its unclear, unpredictable, or inaccessible nature, for the purposes of constitutional review. Such an assessment falls within the exclusive jurisdiction of the Constitutional Court, by virtue of its role as the guarantor of the supremacy of the Constitution and of the conformity of the law with constitutional provisions. According to Article 134 (1) of the Constitution of the Republic of Moldova: "The Constitutional Court is the sole authority of constitutional jurisdiction in the Republic of Moldova", and according to Article 135(1) (a), it "...exercises, upon referral, constitutional review of laws and resolutions of Parliament, decrees of the President of the Republic of Moldova, resolutions and ordinances of the Government, as well as international treaties to which the Republic of Moldova is a party".

In the event that, during criminal proceedings, serious doubts arise regarding the clarity, predictability, or accessibility of the applicable criminal provision, the only admissible legal mechanism is to refer the matter to the Constitutional Court, in accordance with the law, for a review of constitutionality. This also follows indirectly from the provisions of Article 7(31) of the Code of Criminal Procedure: "Upon the raising of an exception of unconstitutionality and the referral to the Constitutional Court, the court is not entitled to rule on the merits of the referral or on the conformity of the contested provisions with the Constitution, but is limited to verifying that the following conditions are met: a) the subject matter of the exception falls within the category of acts provided for in Article 135 (1) (a) of the Constitution; b) the exception is raised by one of the parties or its representative, or by the court on its own motion; c) the contested provisions are to be applied in the adjudication of the case; d) there is no prior decision of the Constitutional Court concerning the contested provisions".

So, we conclude that failure to meet the quality standards of a criminal law provision cannot be directly established by criminal investigation authorities or courts, but can only be declared, with *erga omnes* effect, by the Constitutional Court. Until such a decision is rendered, the criminal law provision produces its legal effects, and criminal investigation authorities and courts are obligated to give it effect through a strict and restrictive interpretation, in full compliance with the principle of legality in criminal law.

Consequently, the courts and complementary authorities (the investigative body and the prosecutor) are required to apply the criminal law in force, which is presumed to be constitutional, and to interpret it in accordance with the principle of legality, *without being able to determine on their own that the law is unconstitutional or that it lacks quality standards.*

At the same time, in our view, within the process of legally classifying crimes, *compliance with the principle of legality in criminal law imposes a „positive duty of interpretive*

diligence" on criminal investigation authorities, the prosecutor, and the court. This obligation manifests itself in the need for a rigorous assessment *of the quality of the applicable criminal provision*, in light of the requirements of clarity and predictability, which allow for the unequivocal identification of the constituent elements of the offense. In situations where the criminal provision is formulated in vague, unclear terms or imprecise expressions, susceptible to broad interpretations, judicial authorities must adopt a restrictive interpretation, in accordance with the requirements of criminal legality. Any unfavorable broad interpretation or application by analogy of criminal law is inadmissible, as it would lead to a violation of the provisions of Article 3(2) of the Criminal Code, which states: "*Unfavorable broad interpretation and application by analogy of criminal law are prohibited*".

In this regard, it may be asserted that the role of the authorities entrusted with the application of the law is not confined to the mechanical enforcement of statutory provisions, but rather entails a genuine function as guarantors of criminal legality, called upon to prevent normative imperfections from becoming a source of legal uncertainty and of interference with the fundamental rights of persons subject to criminal liability.

Conclusions. In light of the above, we conclude that the principle of legality in criminal law cannot be understood solely as a formal requirement for the existence of a written criminal law provision, but necessarily entails compliance with substantive standards of legal quality, without which criminal intervention loses its legitimacy in a state governed by the rule of law. Criminal legality is thus established as a principle with a complex content, encompassing accessibility, clarity, predictability, as well as the strict interpretation of the criminal provision.

The case law analyzed demonstrates that imprecisely formulated criminal provisions grant judicial authorities an excessive margin of discretion, favoring broad and unfavorable interpretations and the application of legal provisions by analogy, both of which are strictly prohibited in criminal law. Above all, the quality of the criminal law provision emerges as a sine qua non condition for the correct legal classification of offenses, for the predictability of the state's criminal response, and for the effective protection of the individual's fundamental rights. Compliance with the quality standards of the law is not an abstract ideal, but a concrete and permanent requirement of the rule of law, without which criminal law risks transforming from an instrument of social protection into a mechanism of legal uncertainty.

Abstract

The paper examines the methodology and practical aspects of using satellite imagery in law enforcement activities to identify and record traces of crimes. It elucidates the potential of contemporary remote sensing services and geographic information systems in the context of documenting destruction, fires, and environmental disasters precipitated by military aggression.

The text delineates the methodology for calculating the NDVI index, which is employed to monitor changes in vegetation cover, and the NDWI index, which is utilized to document the repercussions of flooding. The text employs the Kakhovka hydroelectric power plant as a case study to illustrate the destruction of this facility.

The paper emphasizes the technical nuances of data processing, particularly the necessity of incorporating reflection coefficients from satellite scene metadata to ensure the accuracy of calculations. The practical significance of the study is confirmed by examples of analysis of the occupied territories of the Kharkiv and Kherson regions, where, by comparing multispectral images, it was possible to establish facts of long-term land disuse and large-scale destruction (flooding) of civilian infrastructure.

Keywords: satellite imagery, spectral analysis, NDVI, NDWI, war crimes.

INVESTIGAREA IMAGINILOR SATELITARE CA METODĂ DE DEECTARE ȘI ÎNREGISTRARE A PROBELOR ACTIVITĂȚII CRIMINALE

Abstract

Articolul examinează metodologia și aspectele practice ale utilizării imaginilor satelitare în activitățile de aplicare a legii pentru identificarea și documentarea urmelor infracțiunilor. Sunt evidențiate posibilitățile serviciilor moderne de teledetecție și ale sistemelor informaționale geografice în contextul documentării distrugerilor, incendiilor și dezastrelor ecologice cauzate de agresiunea militară.

Textul prezintă metodologia de calcul a indicelui NDVI, utilizat pentru monitorizarea modificărilor în acoperirea vegetală, precum și a indicelui NDWI, folosit pentru documentarea consecințelor inundațiilor. Distrugerea centralei hidroelectrice de la Kahovka este utilizată ca studiu de caz pentru ilustrarea aplicării acestor metode.

Lucrarea evidențiază particularitățile tehnice ale procesării datelor, în special necesitatea utilizării coeficienților de reflectanță din metadatele scenelor satelitare pentru asigurarea acurateței calculelor. Relevanța practică a studiului este confirmată prin exemple de analiză a teritoriilor ocupate din regiunile Harkiv și Herson, unde, prin compararea imaginilor multispectrale, au fost stabilite cazuri de neutilizare îndelungată a terenurilor și distrugeri de amploare (inundații) ale infrastructurii civile.

Cuvinte-cheie: imagini satelitare, analiză spectrală, NDVI, NDWI, crime de război.

Introduction. Annually, law enforcement officials are increasingly tasked with the analysis of satellite imagery to address operational objectives. In this regard, it is noteworthy to mention a seminal episode in which the investigative team endeavored to identify the serial killer Elvis, who was active in the Kyiv region of Ukraine during the 2000s. To this end, the team meticulously studied NATO satellite images and determined the probable make and color of the vehicle in which the perpetrator was traveling [1]. In the context of russian aggression, law enforcement officials are compelled to engage in the analysis of satellite imagery to document war crimes, as physical access to the scene is frequently impracticable [2].

By analyzing satellite data, it is possible to determine:

– Destruction and locations of fires;
– Locations of large technical facilities;
– Construction sites;
– The appearance of new or degradation of old roads;
– Mass graves.

If the changes detected are properly documented, they can be used as evidence in criminal proceedings [3].

Consequently, law enforcement agencies are tasked with acquiring fundamental competencies in the utilization of satellite imagery, along with the automation of its processing and analysis.

The objective of the study is to elucidate the intricacies of the methodology employed in the analysis of satellite imagery during law enforcement operations, employing the Ukrainian territories as a case study.

A fundamental objective in the analysis of satellite imagery is the identification of alterations in a particular region over a designated interval. The following example, which analyzes satellite images of the village of Velykyi Vyselok in the Dvorichanska settlement community of the Kupianskyi district in the Kharkiv region, will elucidate this point. To accomplish this objective, we will utilize the services of mapflow.ai, planet.com, and gpxeditor.co.uk/map.

The Mapflow tool is a valuable asset in the analysis of object types and sizes within the specified area. A variety of available tools can be selected to perform such an analysis, such as downloading images from ready-made datasets or one's own satellite image (Fig. 1).

Fig. 1. Determining the data source for analysis

Subsequent to the selection of the relevant data source, the user must designate the elements and dimensions on the map to be identified. After a while, the results of the

service will be apparent, displaying the recognized objects. By clicking on these objects, the corresponding dimensions will be revealed (e.g., the size of buildings, the height of trees) (Fig. 2).

Fig. 2. Recognition results

Now, let's compare photos of the village taken in August 2021 and August 2025 using the planet.com service viewer (Fig. 3). The primary benefit of planet.com is that it generally allows for the tracking of changes in the area with a precision of up to a day, thereby facilitating more precise determination of the temporal context of criminal activities or other forms of transgression.

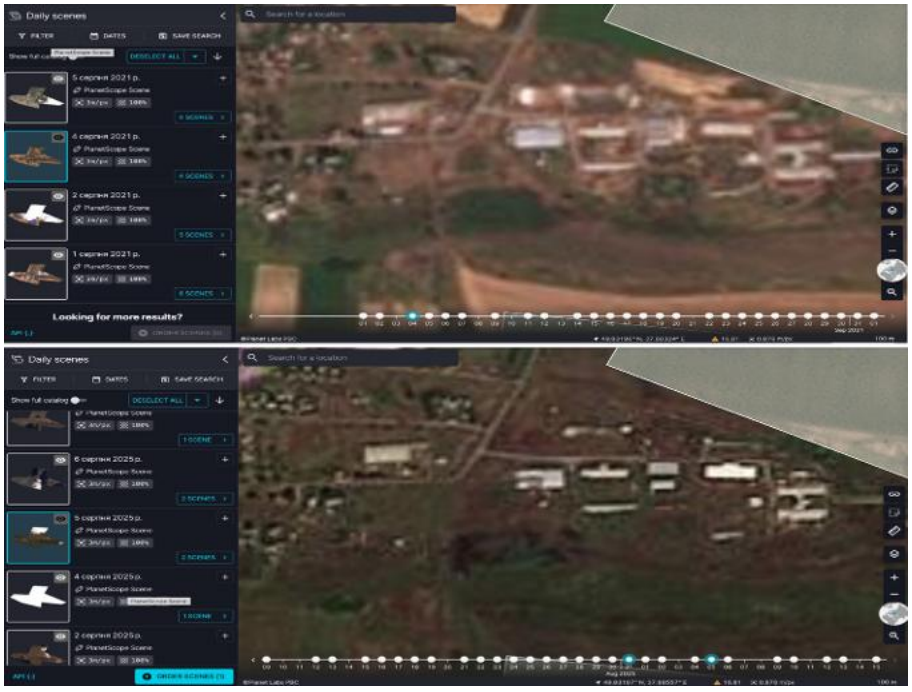

Fig. 3. Comparison of photographs

The image, even in its original state, reveals substantial destruction of buildings, unused agricultural land, and overgrown secondary roads and areas surrounding residential structures. This phenomenon is indicative of the magnitude of the crimes committed. However, to achieve a more comprehensive understanding of the situation, it is imperative to process images with higher resolution. These can be procured from specialized companies for a separate fee.

It is recommended that the following approach be considered as a less costly option for studying the area.

The initial step entails conducting an area study employing low-resolution images, with the understanding that these images are linked to a specific date.

In the event that the visual characteristics of the situation correspond to those depicted on high-resolution maps, it is imperative to undertake a more thorough examination of the area utilizing more precise input data. For this purpose, one may avail oneself of the website gpxeditor.co.uk/map (Fig. 4).

Fig. 4. Viewing a satellite image of the village of Pischane using gpxeditor.co.uk/map

The following indicators can be used to identify damage in aerial photographs (see Table 1) [4].

There is damage	Damage from above cannot be identified
The quarter has a lattice-like structure	The quarter looks like a pattern of typical geometric shapes
Clear outlines of buildings	The blurred nature of building edges
The roof is varied, the interior of the house is visible	The roof looks like a monochromatic geometric shape
Uneven texture	Uniform color and texture
Debris (craters) in the form of dots can be seen around the buildings	No debris (craters) visible

Table 1. Some indicators of damage

An alternative, effective method for identifying changes in the terrain is to analyze satellite images in different spectral ranges [5]. This method can be used to more clearly visualize the vegetation cover of territories, identify fire sites, new graves, flooded areas, etc.

A methodology for the analysis of satellite images within the spectral range involves the utilization of a combination of an aerial photography service provider and a mapping program. Aerial photographs can be obtained using the planet.com service (alternatively, xpress.maxar.com or browser.dataspace.copernicus.eu can be used, but in general the images will be of low quality), and QGIS can be used as a mapping program.

In order to perform spectral analysis of the images, it is necessary to export data from the satellite in at least four bands: green, blue, red, and infrared. Subsequent to loading the satellite data into QGIS, it is imperative to verify that the frequencies are accurately defined (green, blue, red) within the layer settings. In the event that the image is not displayed correctly on the map, the issue must be rectified.

Going forward, the Normalized Difference Vegetation Index (NDVI) will be used to calculate the characteristics of the vegetation cover of a particular area. The NDVI is a simple quantitative indicator of the amount of photosynthetically active biomass. The calculation of this index is performed using the following formula:

$$NDVI = \frac{NIR - Red}{NIR + Red},$$

where NIR is the reflective infrared region of the spectrum, and Red is the visible red region of the spectrum. The NDVI index is displayed using a standardized continuous gradient or discrete scale, with values ranging from -1 to +1.

In order to construct an NDVI layer within the QGIS environment, it is possible to utilize the raster calculator to formulate the relevant formula (see Figure 5).

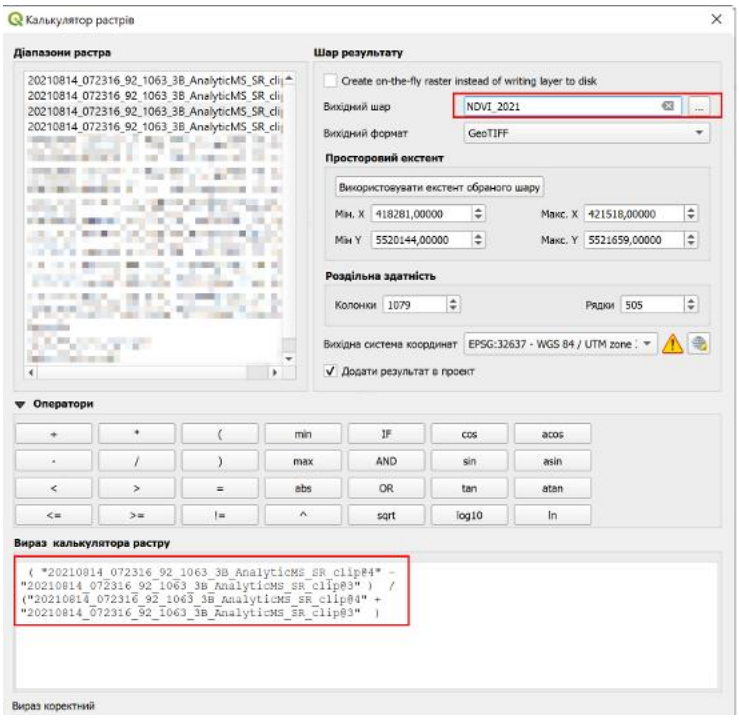

Fig. 5. Raster calculator

!

There are two important concepts in satellite imaging:

1) TOA Radiance (radiance at the upper boundary of the atmosphere) – the amount of energy (light) that reaches the satellite sensor from the Earth. It includes light reflected from the Earth's surface, atmospheric scattering, and solar illumination.

2) TOA Reflectance (reflection at the top of the atmosphere) – a normalized value that shows how much of the sunlight is reflected by the Earth's surface, without taking into account the intensity of solar illumination at the time of imaging. This is a dimensionless value, from 0 to 1, which is used to compare images taken at different times or under different lighting conditions.

When employing planet.com images for analysis, it is imperative to recognize that the initial satellite data (PlanetScope Scene) is presented in the form of radiance values. However, for the execution of NDVI calculations, the utilization of reflectance values is essential. In order to execute the conversion of radiance to reflectance, it is necessary to multiply each pixel value by a specific coefficient contained within the metadata (XML file) that is attached to the PlanetScope scene. Consequently, when calculating NDVI in a raster calculator, it is imperative that the value of each channel be multiplied by the coefficient found in the XML metadata. The following keywords should be used when searching: bandNumber>, followed by the channel number, and reflectanceCoefficient>, followed by the coefficient value in floating point format. Specifically, if the coefficient is specified as 4.120174226578556e-05 in the file, it should be multiplied by 00000.4120174226578556.

Furthermore, it is imperative to comprehend the allocation of numbers to each channel in a given scene during the process of calculation. For instance, according to the documentation provided by planet.com (docs.planet.com/data/imagery/planetscope/) for a 4-channel scene: Band 1 corresponds to the blue spectrum, Band 2 corresponds to the green spectrum, Band 3 corresponds to the red spectrum, and Band 4 corresponds to the near-infrared spectrum.

A comparison of the corresponding images and NDVI layers for them is shown in Fig. 6.

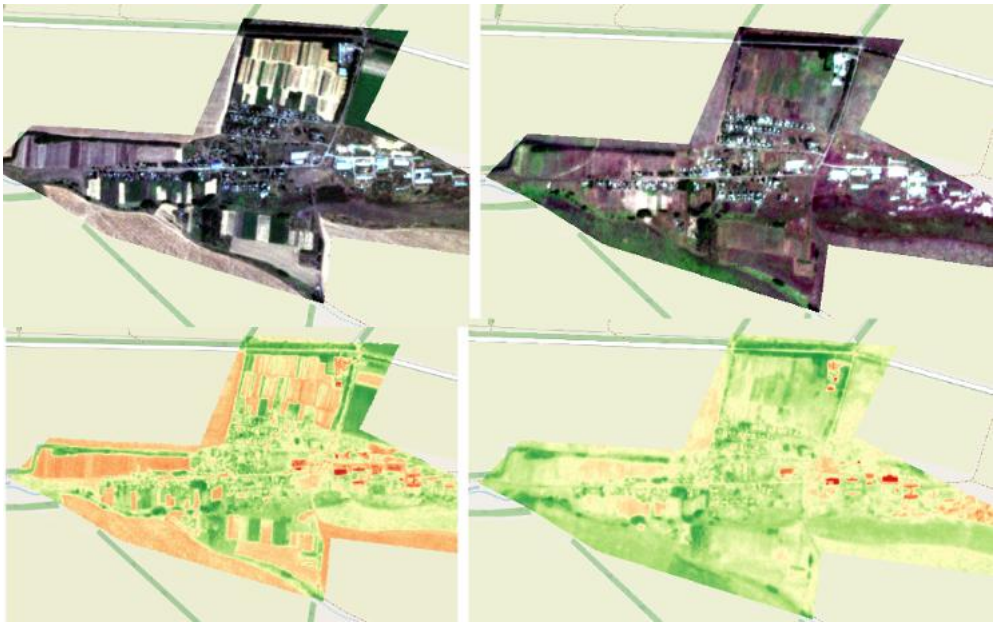

Fig. 6. Comparison of satellite images of the village of Velykyi Vyselok in August 2021 and August 2025

As evidenced by the images, the areas that were previously cultivated are now covered with green vegetation, indicating that the majority of the inhabitants have most likely departed from the village.

To ensure the highest degree of accuracy in the analysis of satellite images captured at brief intervals, the NDVI parameter must be calculated for each image. Subsequently, the discrepancy between the NDVI layers obtained from this process can be determined through the utilization of a raster calculator. The result of this manipulation is demonstrated in Figure 7. In this case, the analysis utilized aerial photographs of the village of Radkivka in the Kupiansky district of the Kharkiv region, captured at 10-day intervals in August 2025, as the input data. The layers formed for these images are displayed in the upper part of the figure, the corresponding NDVI layers are shown in the lower part, and the layer reflecting the difference between the constructed NDVI layers is located at the bottom.

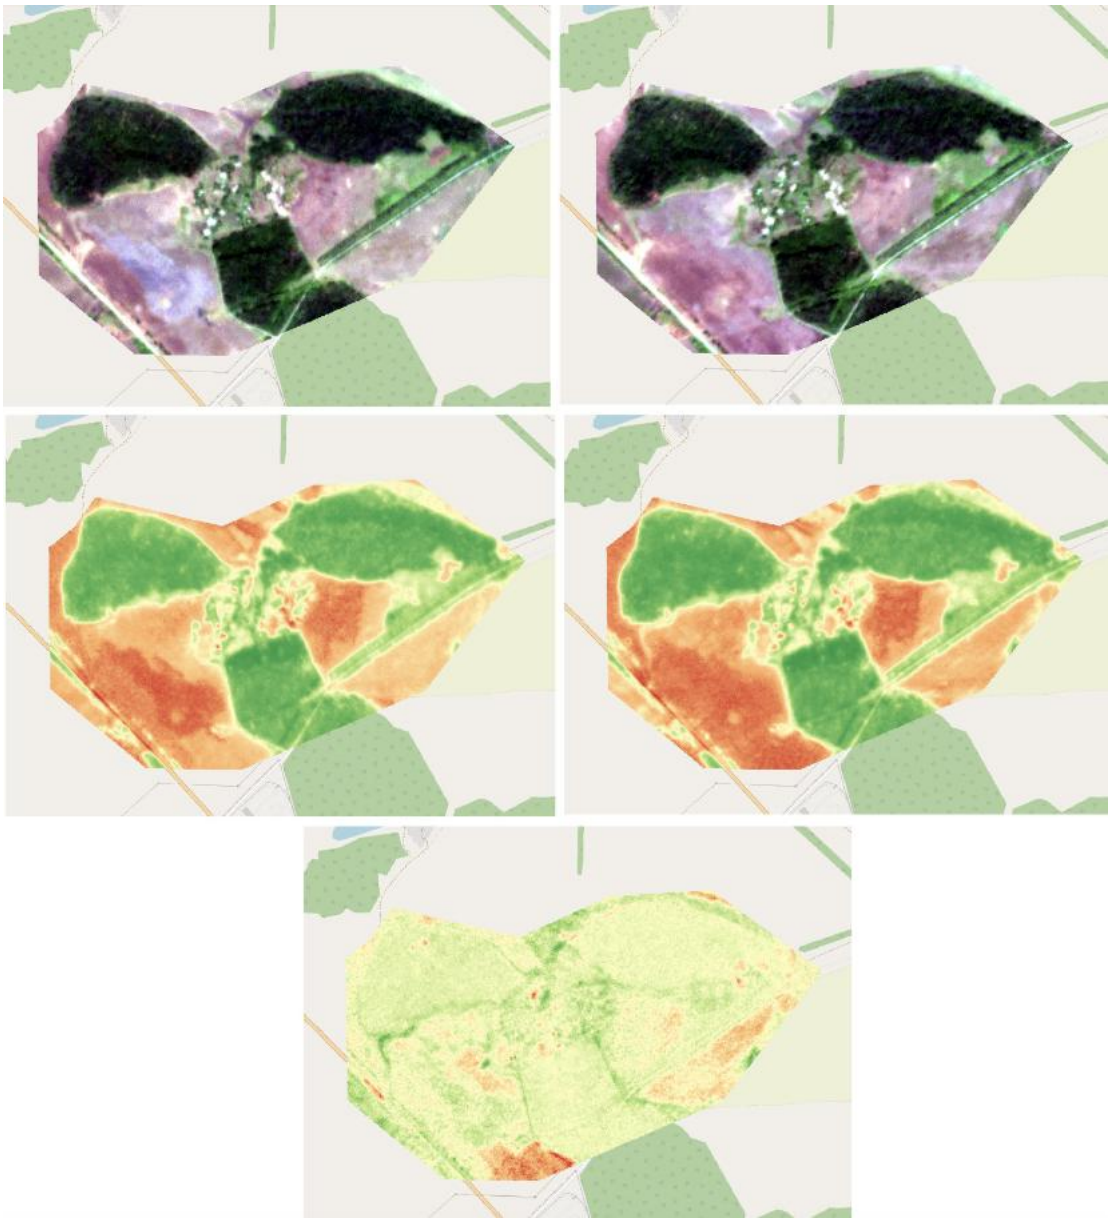

Fig. 7. Layer showing changes in vegetation cover over 10 days in an area of intense combat operations

To enhance the visibility of the variation in vegetation coverage, it is possible to render certain neutral colors of the layer transparent. Subsequent to these settings, the calculated changes can be displayed either in conjunction with the map layer or separately (Fig. 8).

Fig. 8. Visual representation of changes in vegetation cover

To study changes in the water surface, the NDWI (Normalized Difference Water Index) can be used, which is calculated using the following formula:

$$NDWI = \frac{Green - NIR}{Green + NIR},$$

where NIR is the reflective infrared region of the spectrum, and Green is the visible green region of the spectrum. These particular segments of the electromagnetic spectrum were selected for the formula because the water surface exhibits maximum reflection in the green spectrum and minimum reflection in the infrared spectrum. It is noteworthy that index values approaching 1 are indicative of elevated water content. A notable disadvantage of NDWI is its sensitivity to the presence of building structures, which can result in erroneous assessments of water bodies.

The NDWI index has been employed to document the repercussions of environmental crimes in southern Ukraine, attributable to the actions of the occupiers. To illustrate this phenomenon, we will analyze the consequences of the Kakhovka HPP dam's destruction on June 6, 2023. To do so, we will study aerial photographs from planet.com for June 5 and 6, 2023.

It is important to note that when displaying the difference on the layer, the NDWI index can be set to -0.1, thereby ensuring the visibility of only changes in the water cover [7–8]. Additionally, the transparency of neutral colors can be adjusted to display only changes in the water cover.

The calculation of NDWI indices for each satellite image, in conjunction with their differences (see Figure 9), has enabled the identification of flooded areas, which can then be documented in criminal procedural documents. The results of the calculations demonstrate the inundation of buildings, arable land, and structures.

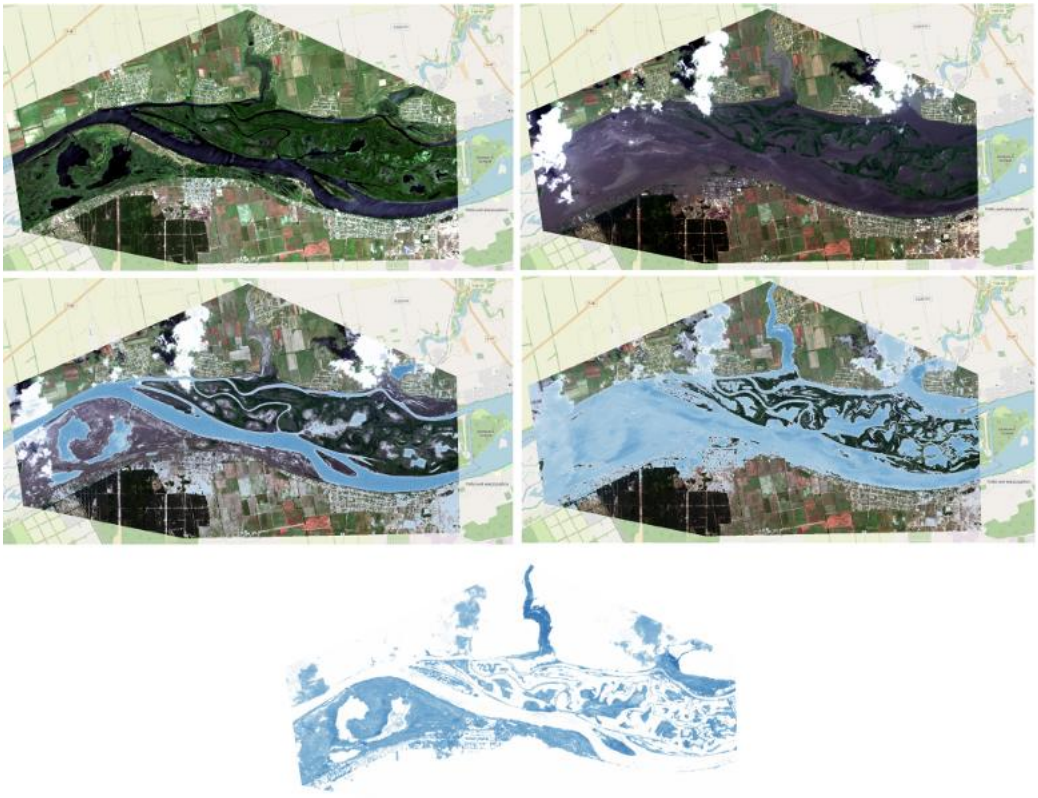

Fig. 9. The result of the Dnieper River overflowing after the Kakhovka Hydroelectric Power Plant dam was blown up

Among the promising areas for studying satellite images in law enforcement work, attention should be paid to the use of the Normalized Difference Middle InfraRed Index (NDMI; SWIR22 & SWIR16), Enhanced Vegetative Index 2 (EVI 2), and Nitrogen Reflectance Index (NRI) during investigations. To automate the process of spectral analysis and image comparison in QGIS, one may also utilize the Semi-Automatic Classification, Orfeo Toolbox, and Change Detection plugins. For instance, the Semi-Automatic Classification plugin facilitates the identification of typical objects on the map, the performance of classifications, the comparison of satellite images captured at varying temporal points, and the execution of numerous other calculations. The integration of these tools with artificial intelligence algorithms facilitates the effective analysis of voluminous digital data, thereby markedly reducing investigation time. Automated systems based on artificial intelligence have been demonstrated to possess the capability of detecting anomalies, such as changes in land use or damaged buildings, with a reasonable degree of accuracy. This capability serves to minimize the human factor during the analysis process.

The analysis of the territory can be also facilitated by the utilization of services that meticulously record the amount of artificial light reaching space from diverse geographical locations on the planet. One such tool is the Dark Light Viewer (https://gee-nightlights-474517.projects.earthengine.app/view/darklight-viewer). By conducting a com-

parative analysis, it is possible to track artificial light activity in specific areas at different time intervals (Fig. 10). In this particular instance, the presence of warm hues serves as an indication of a substantial decrease in artificial lighting subsequent to the commencement of the active phase of the russian invasion.

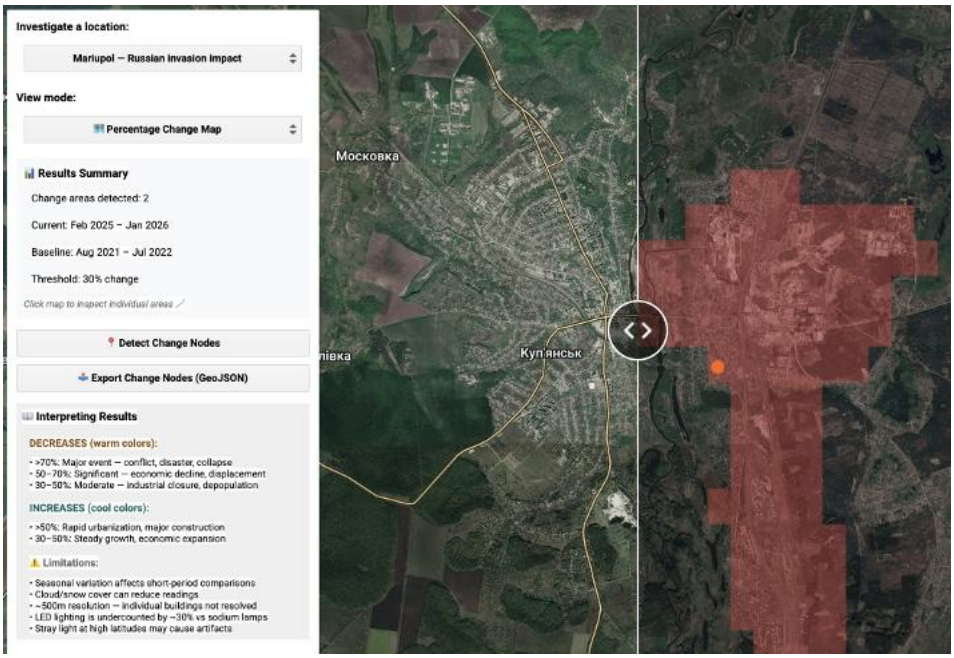

Fig. 10. Output from Dark Light Viewer

Conclusions. The utilization of satellite imagery in contemporary police work, particularly in the context of documenting war crimes and environmental crimes, constitutes a critically essential instrument. This technology enables the remote identification of destruction, burial sites, equipment locations, and other pertinent information in circumstances where physical access to the area is restricted. The utilization of satellite imaging services with a high frequency enables the monitoring of alterations with a precision of up to 24 hours. This facilitates the accurate determination of the temporal context in which criminal activities are perpetrated. The integration of spectral analysis with the NDVI vegetation index and the NDWI water index within geographic information systems (GIS) facilitates the creation of a visual record of changes in vegetation cover and flooding. This can offer significant evidentiary value in legal proceedings, contingent upon the existence of proper procedural documentation. The further development of the methodology necessitates the implementation of radar (SAR) and hyperspectral (HSI) sensing technologies, the widespread use of machine learning algorithms to automate the search for traces of crimes (including for the integration of textual information with relevant satellite images [9]), and strict compliance with international standards (the Berkeley Protocol) to ensure the legal admissibility of digital evidence in national and international courts.

DATA ANALYSIS IN CRIMINOLOGY: MODERN TOOLS FOR CRIME PREVENTION AND CONTROL

Iurie LARII,
PhD, University Professor,
Department of Criminal Law and Criminology,
"Ștefan cel Mare" Academy of the Ministry of Internal Affairs,
Republic of Moldova
ORCID: 0000-0003-4277-535X

Abstract

The digital transformation of society has brought about significant changes in the ways information relevant to crime prevention and crime control is collected, processed, and utilized. Data analysis has become one of the most important tools employed by law enforcement agencies, enabling the identification of crime patterns, the anticipation of criminogenic risks, and the optimization of decision-making processes.

This study examines the principal methods and modern data analysis tools used in criminology, with a particular focus on predictive systems, artificial intelligence, geospatial analysis, social network analysis, and machine learning technologies. The experiences of several countries, including the United States, Germany, the United Kingdom, and the Netherlands, are analyzed, along with the ethical, legal, and operational challenges associated with the use of these technologies.

The findings highlight that data analysis has become an indispensable instrument of modern criminology; however, its effectiveness depends on data quality, algorithmic transparency, and respect for fundamental human rights.

Keywords: data analysis, digital criminology, artificial intelligence, crime prevention, predictive policing.

ANALIZA DATELOR ÎN CRIMINOLOGIE: INSTRUMENTE MODERNE DE PREVENIRE ȘI COMBATERE A CRIMINALITĂȚII

Abstract

Transformarea digitală a societății a determinat o schimbare semnificativă în modalitățile de colectare, procesare și valorificare a informațiilor relevante pentru prevenirea și combaterea criminalității. Analiza datelor a devenit unul dintre cele mai importante instrumente utilizate de instituțiile responsabile de aplicarea legii, oferind posibilitatea identificării tiparelor infracționale, anticipării riscurilor criminogene și optimizării procesului decizional. Studiul examinează principalele metode și instrumente moderne de analiză a datelor utilizate în criminologie, cu accent asupra sistemelor predictive, inteligenței artificiale, analizei geospațiale, analizei rețelelor sociale și tehnologiilor de tip „învățare automată".

Sunt analizate experiențele unor state precum Statele Unite ale Americii, Germania, Regatul Unit și Țările de Jos, inclusiv provocările etice, juridice și operaționale asociate utilizării acestor tehnologii.

Concluziile evidențiază faptul că analiza datelor reprezintă un instrument indispensabil al criminologiei moderne, însă eficiența sa depinde de calitatea datelor, transparența algoritmilor și respectarea drepturilor fundamentale ale omului.

Cuvinte-cheie: analiza datelor, criminologie digitală, inteligență artificială, prevenirea criminalității, poliție predictivă..

Introduction. The profound transformations generated by the digital revolution have produced significant changes in almost all areas of social life, including the sphere of criminality and the institutional mechanisms designed for its prevention and control. The development of information technologies, the expansion of internet access, the exponential growth in the volume of data generated daily, and the emergence of new forms of social interaction have created unprecedented opportunities for criminological research and for the activities of law enforcement agencies. At the same time, these transformations have facilitated the emergence of new forms of crime characterized by increased complexity, high mobility, and the ability to transcend national borders with ease.

Within the context of the digital society, traditional methods of crime analysis often prove insufficient to address the challenges generated by the dynamics of contemporary criminal phenomena. Whereas criminological research in the past was primarily based on the analysis of official statistics and the retrospective interpretation of offences that had already occurred, the emphasis has increasingly shifted toward proactive methods aimed at the early identification of criminogenic risks and the anticipation of the evolution of criminal phenomena. This paradigm shift is driven by the development of data analysis technologies, which make it possible to process vast quantities of information and transform them into knowledge useful for substantiating strategic and operational decisions [1, pp. 3-15].

Data analysis has thus become one of the most important instruments of contemporary criminology. Through advanced statistical techniques, artificial intelligence algorithms, geographic information systems, and machine learning mechanisms, researchers and practitioners are able to identify criminal patterns, assess risk factors, and develop predictive models capable of contributing to the effective prevention and control of crime. The importance of these instruments is reflected in their ability to capitalize on highly diverse sources of information, including police databases, judicial records, socio-economic data, information originating from the online environment, and real-time data streams generated by modern digital infrastructures.

The relevance of this topic is determined by the need to adapt criminological research and law enforcement institutions to the realities of the information society. The growth of cybercrime, the expansion of online fraud, the use of social networks for criminal purposes, and the strengthening of the transnational dimension of organized crime require the adoption of modern tools for the analysis and interpretation of information. Under these conditions, data analysis no longer represents merely an auxiliary instrument for investigative activities; rather, it becomes a central element in the process of formulating public security policies and managing criminogenic risks.

The importance of this research is further supported by the increasing orientation of the scientific community toward the concept of evidence-based criminology. According to this approach, crime prevention and crime control measures must be grounded in empirical data and in the objective assessment of the effectiveness of institutional interventions. In this context, data analysis provides the methodological support necessary for identifying criminal trends, evaluating the impact of public policies, and optimizing intervention strategies [2, p. 4].

The purpose of the present study is to examine the role of data analysis in contemporary criminology and to highlight the principal modern instruments used for crime prevention and control. The research seeks to identify the advantages and limitations associated with the use of data-driven technologies, as well as to analyze relevant international experiences in this field.

Research methodology. From a methodological perspective, the research is based

on the application of both general and special scientific methods of investigation. The methods employed include analysis and synthesis, the comparative method, the systemic method, the logical method, and the documentary method. In addition, doctrinal sources, normative acts, institutional reports, and empirical studies relevant to the topic under examination have been utilized.

Discussions and results obtained. I. Data Analysis in Criminology: Conceptual and Methodological Delimitations.

1.1. The Concept of Criminological Data Analysis. Over the last decades, the development of information technologies and the accelerated digitalization of society have generated profound transformations in the field of criminological research. These changes have facilitated the emergence of new methods for collecting, processing, and interpreting information relevant to understanding criminal phenomena, leading to the consolidation of the role of data analysis in both scientific research and practical activities aimed at crime prevention and control. At present, data analysis is regarded as one of the most important components of modern criminology, being employed both in the theoretical study of criminal phenomena and in the activities of institutions responsible for law enforcement.

In a broad sense, criminological data analysis may be defined as the systematic process of collecting, integrating, organizing, processing, and interpreting information concerning crime, offenders, victims, criminogenic factors, and society's reaction to criminal phenomena. The primary purpose of this process is to identify patterns, relationships, and trends that make it possible to explain the mechanisms underlying criminal behavior and to substantiate effective measures for crime prevention and control [3, p. 7].

Specialized literature emphasizes that criminological data analysis goes beyond the traditional statistical approach, which is limited to describing criminal phenomena through quantitative indicators. Contemporary criminology seeks not only to identify the dimensions and structure of crime but also to explain the causes, conditions, and mechanisms that facilitate the emergence of criminal behavior. In this context, data analysis becomes an essential instrument for transforming fragmented information into knowledge useful both for scientific research and for decision-making processes [4, p. 16].

The development of this field is closely linked to the emergence of the concept of evidence-based criminology, which promotes the formulation of crime prevention and control policies on the basis of empirical data and scientific research findings. According to this approach, the effectiveness of institutional interventions must be assessed through objective methods of analysis and measurement, while decisions concerning resource allocation and the implementation of security strategies must be supported by verifiable information.

In practice, criminological data analysis employs information derived from a wide variety of sources. Among the most important are official crime statistics, police databases, records maintained by prosecution services and courts, information from the penitentiary system, victimization studies, sociological research, demographic and economic data, as well as information generated in the online environment. The integration of these sources enables the development of a multidimensional perspective on criminal phenomena and facilitates the identification of relationships between the individual, social, and situational factors that influence crime.

The importance of data analysis is further amplified by recent transformations in criminal phenomena. Globalization, the development of digital technologies, and the expansion of cyberspace have contributed to the emergence of new forms of crime characterized by high mobility, operational complexity, and the capacity to transcend national

borders. Under such conditions, traditional investigative and analytical methods become insufficient, making it necessary to employ instruments capable of processing large volumes of information and rapidly identifying patterns relevant to the prevention and suppression of criminal activities [5, pp. 21-22].

Consequently, criminological data analysis should not be viewed exclusively as a technical method of information processing but rather as a fundamental component of contemporary criminological research and modern security systems. The ability to transform data into relevant knowledge represents one of the essential prerequisites for the development of effective crime prevention and control policies in the digital society.

1.2. Types of Analysis Used in Criminology

The diversification of information sources and the development of data processing technologies have led to the emergence of distinct forms of analysis employed in criminological research and law enforcement activities. Specialized literature identifies four fundamental categories of analysis: descriptive analysis, diagnostic analysis, predictive analysis, and prescriptive analysis.

Descriptive analysis represents the basic level of the analytical process and aims to describe the characteristics of criminal phenomena. It answers the question "What happened?" and involves the use of statistical methods to highlight the frequency, distribution, and structure of crime. Through this form of analysis, it is possible to identify general trends in criminal phenomena, changes occurring over time, and differences existing between various regions or social groups [2, p. 46].

Diagnostic analysis seeks to identify the causes and conditions that have led to the occurrence of a particular criminal phenomenon. It attempts to answer the question "Why did it happen?" and employs statistical, sociological, and criminological methods to examine the relationships between crime and various risk factors. Diagnostic analysis occupies an important place in criminological research because it contributes to understanding the mechanisms underlying criminal behavior and facilitates the development of appropriate preventive measures.

Predictive analysis constitutes one of the most dynamic directions in the development of contemporary criminology. It employs mathematical models, statistical algorithms, and machine-learning techniques to estimate the probability of future criminal events. Its primary objective is not the exact prediction of human behavior but rather the identification of risks and trends that may contribute to crime prevention and to the optimization of decision-making processes [6, p. 14].

Finally, prescriptive analysis represents the most advanced form of data analysis. It goes beyond the forecasting stage and provides recommendations regarding the measures that should be adopted to achieve specific objectives. In criminology, prescriptive analysis may be used to evaluate various intervention scenarios and identify the most effective strategies for crime prevention and control [7].

These forms of analysis do not operate in isolation but rather complement one another within a complex process of research and evaluation. Together, they make it possible to move from the simple description of crime to the anticipation and effective management of criminogenic risks.

1.3. Big Data and Contemporary Criminology

The exponential growth in the volume of information generated within the digital society has facilitated the emergence of the concept of Big Data, which has become one of the most important research topics in contemporary criminology. The concept refers to the set of technologies and methods used for the collection, processing, and analysis of extremely large volumes of data characterized by high diversity and rapid rates of generation.

In the specialized literature, Big Data is commonly described through the model of five fundamental characteristics: volume, velocity, variety, veracity, and value. These characteristics demonstrate that modern data analysis is not limited to the quantity of available information but also involves assessing its quality, relevance, and usefulness for decision-making processes [8, pp. 15-2].

The application of the Big Data concept in criminology allows for the simultaneous integration of highly diverse information sources, including police databases, video footage, geolocation data, social media activities, economic information, and data generated by urban digital infrastructures. This capacity for integration contributes to the development of analytical models that are far more complex and accurate than those used in the past.

A major advantage of Big Data lies in its ability to identify correlations and patterns that cannot be detected through traditional statistical methods. Researchers are thus able to analyze a very large number of variables simultaneously and reveal complex relationships between social, economic, and criminogenic factors that influence the evolution of crime.

At the same time, the use of Big Data raises numerous methodological, legal, and ethical concerns. These include the risk of excessive information collection, difficulties in verifying data quality, the protection of privacy, and the possibility of reproducing biases already present in the datasets used to train algorithms. For this reason, contemporary literature emphasizes the necessity of developing effective mechanisms for the control and oversight of technologies based on Big Data within the field of law enforcement [9, pp. 3-30].

From the perspective of the development of digital criminology, Big Data represents one of the fundamental resources for the formulation of evidence-based public policies and for strengthening the capacity of institutions to prevent and combat crime in a social environment undergoing continuous transformation.

II. Modern Data Analysis Tools Used in Crime Prevention and Crime Control.

2.1. Geographic Information Systems (GIS) and Geospatial Crime Analysis. One of the most significant methodological innovations introduced into criminology during recent decades has been the use of Geographic Information Systems (GIS) for analyzing the spatial distribution of crime. The development of these technologies has made it possible to overcome the limitations of traditional statistics and has provided opportunities to examine criminal phenomena from the perspective of the relationship between crime and the environment in which it occurs.

The theoretical foundations of geospatial analysis originate in urban ecology and the theories of social disorganization developed by representatives of the Chicago School. According to these approaches, the distribution of crime is not random but is influenced by the characteristics of the social and physical environment. Subsequent research demonstrated that certain urban areas consistently concentrate high levels of criminal activity, a phenomenon commonly referred to as crime hotspots [3, pp. 45-60].

Geospatial analysis enables the identification of such areas with elevated criminogenic risk through the correlation of information concerning crime locations with data related to urban infrastructure, population density, economic development, population mobility, and other relevant variables. Through digital mapping and crime-mapping techniques, law enforcement agencies can visualize the geographical distribution of criminal phenomena and identify spatial patterns associated with different categories of offences.

A major advantage of GIS lies in its capacity to integrate and graphically represent large volumes of information originating from various sources. Statistical data can thus be

combined with socioeconomic, demographic, and urban planning information, facilitating the development of complex models for criminogenic risk assessment. In this manner, geospatial analysis goes beyond the mere cartographic representation of crime and becomes an instrument of strategic and operational evaluation.

2.2. Artificial Intelligence and Predictive Analysis. The development of artificial intelligence has generated one of the most significant methodological transformations in contemporary criminology. Machine-learning algorithms and automated data-processing technologies enable the identification of complex patterns of criminal behavior and the development of forecasts concerning the evolution of criminal phenomena.

Predictive analysis represents the process through which historical data and statistical algorithms are used to estimate the probability of future events. In the field of criminology, this method seeks to identify areas, time periods, or circumstances in which there is a high probability that criminal offences will occur [10, pp. 100-108].

The operation of predictive systems is based on the analysis of large volumes of information concerning previously recorded crimes. Algorithms identify regularities and relationships among different variables and generate models capable of estimating the level of risk associated with particular situations. Unlike traditional approaches, these systems are able to process thousands of variables simultaneously and update their assessments in real time.

Among the best-known applications of predictive analysis are PredPol and HunchLab, systems employed in various jurisdictions to anticipate the spatial distribution of crime and optimize police operational activities [6, pp. 21-25].

Supporters of these technologies argue that they contribute to the more efficient use of available resources and enable preventive activities to be directed toward areas and situations characterized by high criminogenic risk. Furthermore, predictive systems provide opportunities to identify trends that cannot be detected through conventional analytical methods.

2.3. Criminal Network Analysis. The increasing complexity of organized crime has led to the development of analytical methods capable of moving beyond the traditional approach focused exclusively on the individual offender. In this context, social network analysis has become one of the most important methods used for investigating modern criminal structures [11, pp. 5-7].

The fundamental premise of this method is that organized criminal activities result from interactions among individuals, groups, and organizations that form complex networks of relationships. Network analysis seeks to identify central actors, communication channels, and the mechanisms through which criminal activities are coordinated.

Through the use of specialized algorithms and graphical representations, researchers can visualize the structure of a criminal network and identify individuals who exert influence over other members. This approach makes it possible to overcome the limitations of traditional analyses and provides a more realistic perspective on the functioning of criminal groups.

Network analysis is frequently used in investigations involving drug trafficking, economic crime, human trafficking, and organizations engaged in terrorist activities. In many cases, identifying key actors within the network allows authorities to disrupt the functioning of the entire criminal structure.

The importance of this method is further amplified by the transnational nature of contemporary crime. Under conditions of globalization and digitalization, criminal groups develop extensive networks operating simultaneously across several states, and the analysis of relationships among participants becomes essential for understanding the mech-

anisms governing their activities [12].

2.4. Open-Source Intelligence Analysis. The expansion of the Internet and the development of digital platforms have generated enormous quantities of publicly available information. In this context, Open-Source Intelligence (OSINT) has become an indispensable instrument of modern criminological analysis and criminal investigations [13, pp. 25-50].

OSINT represents the process of collecting, verifying, and analyzing information derived from publicly accessible sources, including websites, social networks, public registries, open databases, media publications, and other digital resources. Unlike traditional intelligence-gathering methods, OSINT utilizes data that are legally available and can be obtained without the use of intrusive measures.

The importance of OSINT is particularly evident in the investigation of cybercrime, online fraud, violent extremism, and radicalization processes. The analysis of information published within the digital environment enables the identification of connections among individuals, organizations, and events, thereby facilitating the early detection of threats to public security [14].

III. International Practices Regarding the Use of Data Analysis in Crime Prevention and Crime Control. 3.1. The Experience of the United States of America. The United States of America is considered one of the pioneers in the use of data analysis within law enforcement activities. The development of modern systems of criminological analysis has been driven both by the scale of criminal phenomena and by the necessity of utilizing institutional resources efficiently in a context characterized by social and geographical diversity.

A landmark moment in this process was the implementation of the COMPSTAT (Computerized Statistics) system, developed within the New York Police Department during the 1990s. This system introduced an innovative management model based on the systematic analysis of crime data and the continuous evaluation of the performance of operational units. Through the use of updated information and geospatial analyses, COMPSTAT enabled the rapid identification of criminal trends and the adoption of operational measures tailored to existing circumstances [15, pp. 97-125].

A subsequent stage was represented by the development of predictive policing systems. Beginning in the 2000s, several police departments implemented instruments based on statistical algorithms and mathematical models capable of estimating the probability of crimes occurring within specific geographical areas and time intervals. Among the most well-known examples are PredPol and HunchLab, which utilize historical crime data to identify areas characterized by elevated criminogenic risk.

In recent years, U.S. law enforcement agencies have increasingly employed artificial intelligence, criminal network analysis, and similar instruments to prevent and combat cybercrime, financial fraud, and transnational organized crime. This evolution confirms the orientation of the American system toward security models based on the intensive use of data and the integration of digital technologies into operational and strategic processes.

3.2. The Experience of the United Kingdom. The United Kingdom represents one of the most relevant European examples regarding the integration of data analysis into policing activities and the process of developing public security policies. The development of this field is closely linked to the promotion of the concept of intelligence-led policing, which emphasizes the use of information and criminological analyses as the foundation of operational and strategic activities.

The British model assigns a central role to the process of collecting, evaluating, and

analyzing information related to criminality. In this context, the National Intelligence Model (NIM) has become the principal methodological framework used to coordinate analytical activities and support decision-making processes within police services [1, pp. 27-45].

A distinctive feature of the British experience is the emphasis placed on evidence-based criminology and on the continuous evaluation of the effectiveness of implemented measures. Law enforcement institutions systematically employ statistical analyses, impact assessments, and empirical research in order to identify the most effective crime prevention strategies.

Over the last decade, British authorities have invested significantly in the development of predictive analytical tools and in the use of artificial intelligence technologies. These instruments are used to identify individuals with heightened vulnerability to victimization, assess risks associated with domestic violence, and combat cybercrime.

At the same time, the authorities have developed complex oversight and auditing mechanisms designed to ensure compliance with the principles of legality and the protection of fundamental human rights.

3.3. The Experience of Germany. In Germany, the development of data analysis tools in the field of public security has been influenced by the need to combat organized crime, terrorism, and threats generated by cybercrime. Unlike the American model, which is characterized by a strong orientation toward predictive analysis, the German approach is distinguished by a pronounced emphasis on the protection of fundamental rights and on legal oversight of the use of digital technologies.

German authorities employ sophisticated information-analysis systems to identify risks associated with serious and organized crime. In recent years, several federal states (*Länder*) have implemented platforms based on artificial intelligence and predictive analysis, including the PRECOBS (Pre-Crime Observation System), designed to identify risks related to property crimes [6, pp. 21-33].

The use of these instruments has nevertheless generated intense debates concerning their compatibility with constitutional principles and personal data protection regulations. The influence of German constitutional jurisprudence and European standards regarding privacy protection has led to the development of strict mechanisms for the control and accountability of institutions utilizing data-analysis technologies.

The German experience highlights the importance of achieving a balance between the need to ensure public security and the obligation to respect the fundamental rights of individuals. From this perspective, the German model is frequently cited in the specialized literature as an example of integrating technological innovation within a rigorous legal framework.

3.4. The Experience of the Netherlands

The Netherlands is regarded as one of the most innovative European states in the field of using analytical technologies for crime prevention and control. The strategies implemented by Dutch authorities are characterized by an advanced integration of data analysis, artificial intelligence, and interinstitutional cooperation.

A relevant example is the use of predictive analysis systems for identifying financial fraud, economic crime, and other forms of criminality that significantly affect public interests. Dutch authorities have developed sophisticated mechanisms for integrating data derived from administrative, fiscal, and judicial sources with the aim of identifying risks and optimizing control activities.

At the same time, the Dutch experience also provides important examples concerning the limitations of data analysis. A case extensively discussed in legal and criminological literature is the SyRI (System Risk Indication) system, which was used to identify risks

of social welfare fraud. The decision of Dutch courts to restrict the use of this system highlighted the importance of respecting the principles of transparency, proportionality, and privacy protection in the implementation of predictive technologies.

Currently, the Netherlands promotes an approach based on the concept of responsible AI, which seeks to capitalize on the advantages offered by data analysis without compromising fundamental rights and freedoms. This orientation is consistent with broader European trends aimed at developing artificial intelligence governance models grounded in accountability and democratic oversight.

IV. Future Perspectives on the Implementation of Data Analysis in Law Enforcement Institutions of the Republic of Moldova. In recent years, the Republic of Moldova has recorded significant progress in the process of public administration digitalization and the development of information infrastructure. The implementation of electronic registries, the expansion of digital governmental platforms, and the strengthening of institutional interoperability mechanisms have created favorable conditions for the development of modern data analysis systems and for their utilization within law enforcement activities.

A particularly important role in this process belongs to the Ministry of Internal Affairs of the Republic of Moldova and its subordinate structures, which manage substantial volumes of information concerning crime, public order, and citizens' safety. The effective utilization of these data can contribute to improving the capacity to identify criminogenic risks, optimize operational activities, and support evidence-based public policies.

At present, criminological analysis conducted within law enforcement institutions is predominantly oriented toward the statistical assessment of criminal phenomena and the preparation of reports concerning the evolution of major crime indicators. Although such activities are indispensable for decision-making processes, international experiences demonstrate that the effectiveness of crime prevention and control can be significantly enhanced through the use of more advanced analytical instruments based on the integration and automated processing of large volumes of data.

A priority direction for development consists in strengthening the interoperability of information systems utilized by different public institutions. Given that information relevant to criminological analysis is dispersed across multiple administrative, judicial, and operational databases, the creation of efficient mechanisms for data exchange and integration represents an essential prerequisite for developing modern analytical capacities. The experience of European states demonstrates that database interoperability contributes to the faster identification of connections among different criminal phenomena and facilitates the adoption of effective preventive measures.

Another strategic direction concerns the development of geospatial crime analysis. The implementation of GIS technologies within policing activities would make it possible to identify areas characterized by elevated criminogenic risk, assess the territorial distribution of various categories of offences, and optimize the planning of operational activities. In the context of urbanization and increasing population mobility, such instruments can contribute to a more efficient use of available resources and enhance the responsiveness of institutions responsible for maintaining public order.

Looking ahead, considerable potential also exists in the use of artificial intelligence technologies and predictive models. Although the implementation of such systems requires substantial investments and the development of an appropriate regulatory framework, international experience demonstrates that they can facilitate the identification of criminal trends and the assessment of risks associated with different forms of criminality. At the same time, the use of such instruments must be accompanied by clear legal safeguards concerning the protection of personal data, algorithmic transparency, and respect

for fundamental human rights.

The success of the modernization process, however, depends not only on the existence of technological infrastructure but also on the development of human capital. In this regard, one of the principal challenges facing the Republic of Moldova is the training of a new generation of specialists capable of combining criminological knowledge with competencies in data analysis, statistics, information technology, and artificial intelligence. In specialized literature, this professional category is frequently associated with the concept of the "criminological analyst", a role that is becoming increasingly important within modern law enforcement institutions.

Furthermore, the development of data analysis capacities must be accompanied by strengthened international cooperation. The participation of the Republic of Moldova in joint projects with organizations such as Europol, CEPOL, and INTERPOL can facilitate the transfer of expertise, access to best practices, and the development of modern mechanisms for information exchange concerning transnational crime.

In conclusion, data analysis represents not merely a technological innovation but a profound transformation of contemporary criminological paradigms. In the context of the expansion of the digital society and the increasing complexity of criminal phenomena, the capacity to transform data into relevant knowledge becomes one of the essential strategic resources for ensuring public security and for developing effective, sustainable, and future-oriented criminological policies.

NATIONAL AND INTERNATIONAL LEGAL PARTICULARITIES OF THE CRIMINAL INVESTIGATION OF CUSTOMS OFFENCES COMMITTED THROUGH POSTAL SHIPMENTS

Albert ANTOCI,
PhD, Associate Professor,
"Ştefan cel Mare" Academy of the Ministry of Internal Affairs,
ORCID: 0000-0001-6304-2046

Alexandru-Stelian SPÎNU,
PhD Student,
University of European Studies of Moldova (USEM)
ORCID: 0009-0005-8151-7320

Abstract
This paper provides a comprehensive analysis of the procedural and criminal aspects concerning the investigation of customs-related offences committed through postal consignments. It emphasises how the use of postal and international courier infrastructures facilitates the diversification and evolution of smuggling practices, allowing offenders to operate at increasingly sophisticated levels.
The study further outlines the procedural framework regulating the investigation, evidence collection, and documentation of customs offences perpetrated via postal shipments, while addressing the balance between enforcement measures and the protection of fundamental rights under domestic and international law.
Keywords: smuggling, customs-related offences, postal consignments, customs control, global logistics, fundamental rights, criminal procedure.

PARTICULARITĂȚI LEGISLATIVE NAȚIONALE ȘI INTERNAȚIONALE ALE INVESTIGĂRII PROCESUAL-PENALE A INFRACȚIUNILOR VAMALE COMISE PRIN INTERMEDIUL TRIMITERILOR POȘTALE

Abstract
În acest articol este efectuată și prezentată o analiză generală al procesului de investiagre a infracțiunilor vamale ce sunt comise prin intermediul trimiterilor poștale. Este evidențiat modul în care utilizarea infrastructurilor poștale și a serviciilor internaționale de curierat facilitează diversificarea și evoluția practicilor de contrabandă, permițând autorilor să acționeze la niveluri tot mai sofisticate.
Studiul conturează, totodată, cadrul procesual care reglementează activitățile de investigare, administrare a probelor și documentare a infracțiunilor vamale săvârșite prin trimiteri poștale, abordând în același timp echilibrul necesar între măsurile de aplicare a legii și protecția drepturilor fundamentale, atât în dreptul intern, cât și în dreptul internațional.
Cuvinte-cheie: contrabandă, infracțiuni vamale, trimiteri poștale, control vamal, logistică globală, drepturi fundamentale, proces penal.

Introduction. In the context of the accelerated development of trade and the expansion of global courier networks, the risk of customs offences being committed through postal shipments has increased considerably. These offences fall within the sphere of cross-border criminality and have significant consequences not only for the economic

security of the state but also for the international legal order. Through postal and courier networks, criminal groups resort to sophisticated mechanisms for concealing prohibited goods or goods subject to customs duties such as excisable products, narcotic substances, counterfeit goods, or items subject to restriction regimes. In this way, the form of committing offences through postal shipments has taken shape, adapted to new technological and logistical realities, which transform legitimate infrastructures into instruments of unlawful activity.

Research methodology is based on the use of classical legal-scientific analysis methods, including logical and grammatical analysis, synthesis, deduction and induction, observation, and comparison. Following examination of relevant materials encompassing national and international normative acts, specialist doctrine, court jurisprudence, and other related sources corresponding conclusions and recommendations were formulated, designed to reflect the research findings and the proposed directions.

Discussion and results applied. In the context of contemporary globalisation, national borders have lost their traditional rigidity, economic and commercial barriers have been largely abolished, and the circulation of information now occurs with unprecedented speed through a simple technological gesture. This opening of markets and the free movement of goods and persons, although generating considerable economic benefits, simultaneously creates fertile ground for the proliferation of criminal phenomena.

As Pino Arlacchi, former Executive Director of the United Nations Office for Drug Control and Crime Prevention, stated at the tenth UN Congress on the Prevention of Crime and the Treatment of Offenders: "*there have never been so many economic opportunities for so many people, but, equally, there have never been so many ways for criminal organisations to exploit the system in their own interest*" [1].

Law No.39/2016 of the Republic of Moldova defines a *postal item* as: "*an item bearing an address to which it is to be delivered by the postal service provider. This category includes correspondence items, as well as printed matter (books, catalogues, newspapers, periodicals) and postal parcels containing goods with or without commercial value*", and an *international postal item* as: "*a postal item dispatched from the territory of the Republic of Moldova to an address not located on its territory, or dispatched from outside the Republic of Moldova to an address located on its territory*" [2].

The second paragraph of the above-cited law prohibits the inclusion in all categories of postal items of the following objects:

"(a) Narcotic drugs and psychotropic substances, as defined by the International Narcotics Control Board (INCB);

(b) Obscene or immoral objects;

(c) Counterfeit and pirated objects;

(d) Other import or circulation objects that are prohibited in the country of destination;

(e) Objects which, by their nature or packaging, may present a danger to agents or the general public, or which may stain or damage other postal items, postal equipment or property belonging to third parties;

(f) Documents bearing the character of current and personal correspondence exchanged between persons other than the sender and the addressee or persons residing with them;

(g) Hazardous goods;

(h) Explosive devices and inert military equipment, including inert grenades, inert shells and other analogous items, as well as imitations of such devices and items;

(i) Live animals" [2].

Emergency Ordinance No.13/2013 of Romania contains the definition of a postal item, identified as: "*an addressed item in the final form in which it is to be transported and delivered to the address indicated by the sender. In addition to correspondence items, this category includes, for example, books, catalogues, newspapers, periodicals, postal parcels containing goods with or without commercial value, and paper-based postal money orders*", using the terms: "*international postal item a postal item dispatched from the territory of Romania to an address not located on that territory, or dispatched from outside the territory of Romania to an address located on that territory, and a postal item dispatched from outside the territory of Romania to an address not located on that territory, but in transit through the territory of Romania*", and "*intra-Community postal item an international postal item dispatched from the territory of Romania to an address on the territory of another Member State of the European Union, or dispatched from an address on the territory of another Member State of the EU to an address on the territory of Romania, and a postal item dispatched from the territory of one Member State of the European Union to an address on the territory of another Member State of the European Union, but in transit through the territory of Romania*"[3].

That act expressly stipulates that: "*The following acts constitute contraventions, unless committed under such conditions as to constitute, according to criminal law, offences: (c) postal items consisting of goods whose transport is prohibited by legal provisions, even if only over a portion of the route*" [3].

The basis for including these provisions was Directive 97/67/EC of the European Parliament and of the Council of 15 December 1997, which establishes common rules for the development of the internal market of postal services and the improvement of the quality thereof, subsequently amended by Directive 2002/39/EC of 10 June 2002, intended to consolidate the gradual opening of the postal sector to competition, bearing in mind that this regulation was subsequently revised by Directive 2008/6/EC of the European Parliament and of the Council of 20 February 2008 [4], which aims at completing the liberalisation of the postal services market in the European Union.

Under European Union law, the offence of smuggling is analysed primarily through the lens of the protection of the Union's financial interests (the so-called *PIF: Protection des Intérêts Financiers*), regulated by:

• The PIF Convention of 26 July 1995 and Directive (EU) 2017/1371 [5] on the fight against fraud to the Union's financial interests by means of criminal law;

• The Union Customs Code (Regulation (EU) No. 952/2013) [6], which establishes customs declaration obligations and the legal regime for goods introduced into or removed from the customs territory of the Union;

• Directive 2008/6/EC [7] on the complete liberalisation of the postal services market, which introduces the obligation for Member States to guarantee the security of international postal flows and cooperation with customs authorities.

The European Union is the world's largest importer and exporter of goods, managing an internal market of almost 500 million inhabitants. Customs legislation is fully harmonised and provides a stable and comprehensive legal system aimed at ensuring the correct and uniform application of the Union's autonomous and international rules, and establishing the obligations and rights of customs administrations and economic operators in a common and transparent manner [8].

In 1990, the World Trade Organization developed a set of release procedures designed to accelerate the clearance of low – or negligible-value goods at the border, which were transported primarily by courier services and express mail [9].

At that time, the guidelines operated on the principle of information provided by the operator to customs authorities prior to the arrival of goods. The guidelines were revised

in 2014 to reflect revisions made to the Kyoto Convention and a number of other developments, and again in 2018 [10].

The need had already emerged for customs to assume greater and broader responsibilities in areas such as security, trade fraud, illicit trafficking in drugs and weapons, money laundering, cybercrime, smuggling, environmental crime, and transnational organised crime.

The accelerating pace of digital transformation of economies and businesses – where information technology, mobile technology, the Internet, and electronic payment systems have transformed the way businesses and consumers buy and sell goods – has further compounded this challenge.

Postal authorities, on the other hand, generally accept customs declarations in paper form, which makes electronic and advance information impractical.

The postal situation is acknowledged in the guidelines, which specifically indicate that postal shipments for which information is provided in a non-electronic format and is supplied after arrival should nonetheless benefit from prompt, if not immediate, release. The need to develop more advanced mechanisms has, however, been emphasised. At the same time, the wealth of information available to e-commerce operators is recognised and continued cooperation is recommended.

According to international protocols, most private postal services have standard logistics which offenders intentionally exploit to their advantage. When a postal package begins its journey from the originating post office, it passes through a physical screening process, as shown in Fig. 1. There is little or no authentication involved in subsequent stages. Depending on the destination, the package is sent to a sectional distribution centre for local distribution or from there to the national distribution centre for interstate deliveries.

Most transfers are made by road using trucks, with the exception of postal items and express deliveries. A similar situation occurs in imports and exports, where the large volume of goods does not permit authentication.

Although packages are tracked throughout the entire process, the contents are not checked for counterfeits, adulterated substances, or illegal items, except for the physical check at origin. In order to achieve a more advanced level of surveillance of the postal parcel dispatch process, the following action model is proposed, which would facilitate the possibility of identifying possible manipulations in the postal lifecycle when packages are transferred between the sectional distribution centre, the national distribution centre, consolidation facilities, and import/export terminals, including for the purpose of identifying possible prohibited objects or substances that may be contained in the postal item [11].

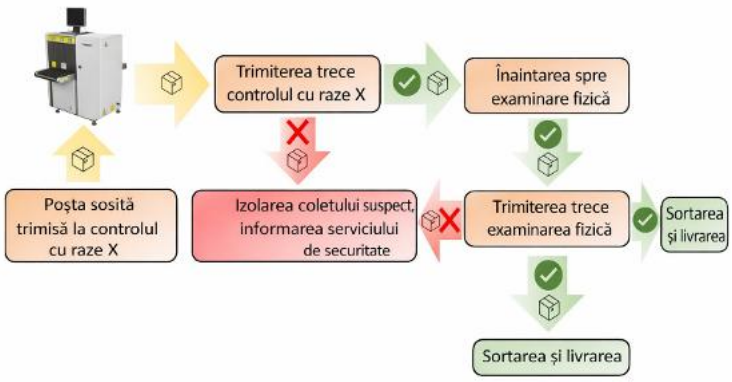

Fig. 1. The current filtering process followed by most postal services, which does not rely on any quantitative information.

Fig. 2. The lifecycle of mail from origin to destination, which may proceed through different modes

Pursuant to Article 30 of the Constitution of the Republic of Moldova [12], the state guarantees the inviolability of the secrecy of correspondence, regardless of its form letters, telegrams, postal items, telephone conversations, or other lawful means of communication. This constitutional guarantee reflects the commitment of the authorities to protect the sphere of private life and to prevent any arbitrary interference with persons' communications. In this regard, the criminal procedure legislation of the Republic of Moldova enshrines the same principle of the inviolability of correspondence. According to Article 14(1) of the Code of Criminal Procedure, the state guarantees: "*The right to the secrecy of letters, telegrams, other postal items, telephone conversations and other lawful means of communication is guaranteed by the state. In the course of criminal proceedings, no one may be deprived of or restricted in this right*" [13].

However, the right to the secrecy of correspondence does not have an absolute character, but rather a relative one, and may be restricted under certain conditions expressly provided by law. In accordance with the provisions of Article 138[1] of the Code of Criminal Procedure of the Republic of Moldova [13], the restriction of this right is permissible only where such a measure is necessary for the protection of national security, the economic well-being of the state, public order, or for the purpose of preventing and combating offences.

Moreover, the protection of the secrecy of correspondence is also enshrined in Article 8 of the European Convention on Human Rights, which guarantees every person the right to respect for their correspondence. Nevertheless, the European provision permits the interference of authorities in the exercise of this right where the measure is provided for by law, pursues a legitimate aim, and constitutes a necessity in a democratic society in particular for the protection of national security, public safety, public order, and the prevention of criminal acts, as well as for the protection of the rights and freedoms of others.

Reference has been made to these provisions with the purpose of noting that both national legislation and European Union legislation guarantee the inviolability of the secrecy of correspondence, which includes postal items, while providing that this right is not absolute, given that in cases where the presence of an offence is established by the competent authorities, it may be restricted in order to conduct an investigation aimed at countering the unlawful act, identifying the perpetrators, and sanctioning them within the limits of their culpability.

From a legal perspective, customs offences committed through postal shipments

fall within the category of acts aimed at evading customs control and avoiding payment of the fiscal obligations associated with goods introduced into the country. Under the criminal law of the Republic of Moldova, these are most commonly classified generally as smuggling offences.

Unlike classic smuggling, which involves the unauthorised physical crossing of a border, postal customs offences manifest through the use of a lawful transport channel (the postal service) for the purpose of concealing the illicit nature of the dispatched goods.

These may take the form of:

– The introduction into the territory of the state of goods without customs declaration;

– Undervaluation of the declared goods;

– Falsification of documents accompanying parcels;

– Dispatch by post of goods subject to import/export prohibitions.

It is evident that the use of postal networks for illicit activities marks a shift of smuggling from the physical space to the logistical and electronic domain. Although the modalities have modernised, the essence of the act the evasion of customs control remains the same.

This evolution necessitates the adaptation of legislation to reflect the reality of digital commercial operations and to enable the effective identification and sanctioning of perpetrators. Simultaneously, this fact underscores the need to implement, in both the criminal procedure and customs legislation at national level and that of the European Union provisions expressly regulating the procedural actions undertaken for the investigation and documentation of offences committed through postal shipments.

At present, for the investigation of customs offences committed through postal shipments, where information exists indicating the presence of a prohibited item in the postal shipment, procedurally both special investigative measures and procedural measures are carried out, including: the retention, examination, delivery, search, or seizure of postal items belonging to persons implicated in the case.

Postal units retain postal items containing objects, materials, and substances prohibited from dispatch at the location where these are detected.

Items containing prohibited objects are in no case dispatched to their destination, delivered to addressees, or returned to their origin. If prohibited objects are discovered in items in transit, the latter will be retained and processed by the universal postal service provider in accordance with legislation. When prohibited objects are identified at the time of transport, the universal postal service provider is authorised to extract these objects from the item and to process them in accordance with legislation, while the remainder of the item is dispatched to its destination, accompanied by information regarding the removal of the inadmissible object.

Regarding the detection and retention of such postal items, postal service providers notify the competent law enforcement authorities. Officials of the competent state authority carry out, in the presence of the head of the postal unit, the confiscation of prohibited objects and substances in accordance with the provisions of the normative framework of the Republic of Moldova [14].

The provisional storage of such postal items is carried out at post offices, with the maintenance of records and the preservation of their integrity. Access by unauthorised persons to these items is excluded.

Consequently, once a postal item arrives at the post office, it is temporarily withdrawn from circulation; the head of the postal institution is obliged to immediately notify the criminal investigation body which presented the ordinance, confirming the retention of the postal items indicated in the authorisation act.

The concept of "*retention of a postal item*" is understood as the procedural action carried out by the head of the post office, on the basis of a ruling by the investigating judge authorising this special investigative measure. It consists of the suspension, at the level of the postal institution, of correspondence dispatched or received by persons who are suspects or accused, where there are reasonable grounds to believe that the respective items may contain information or objects with evidentiary value in a criminal case concerning one or more serious, particularly serious, or exceptionally serious offences [15, pp. 104-105].

Thus, the retention of postal items constitutes an exceptional procedural measure, designed to obtain relevant evidence in complex cases, being subject to judicial authorisation and to the review of legality exercised by the investigating judge, in order to guarantee respect for the right to private life and the secrecy of correspondence as provided by law and by the European Convention on Human Rights.

Conclusions. We conclude that the phenomenon of customs offences committed through postal items highlights a transformation of classic smuggling, adapted to the economic, logistical, and technological realities of the digital age. The use of postal channels lawful transport mechanisms for the dispatch of prohibited goods or goods subject to customs duties constitutes a modern form of evasion of state control, characterised by concealment, fragmentation of shipments, and the use of advanced means of communication.

The existing normative framework, although coherent at national and European level, requires uniform application adapted to the new operational realities. The legislation of the Republic of Moldova, Romania, and the European Union clearly establishes the legal regime of postal items and the applicable prohibitions; however, the practical effectiveness of these norms depends on the degree of cooperation between customs authorities, criminal investigation bodies, and postal operators.

An essential element is ensuring the balance between the efficiency of criminal investigation and the protection of the fundamental rights of the person. Constitutional and conventional guarantees regarding the secrecy of correspondence and the right to private life require that measures which by their very nature affect the general principles of criminal procedure such as the retention, opening, seizure, or search of postal items be ordered exclusively under the conditions strictly provided by law, with prior judicial authorisation and justification proportionate to the objective pursued. Accordingly, the „retention of a postal item" must be regarded as an exceptional procedural measure, subordinate to the principle of legality and subject to rigorous judicial review, in order to prevent the abuse of power and to guarantee compliance with the standards set out in Article 8 of the European Convention on Human Rights.

In procedural terms, it is necessary to consolidate the chain of custody of evidence obtained, to clarify the terminology of procedural acts, and to supplement the legal framework with precise concepts regarding the seizure of prohibited objects and the concurrent application of contravention or criminal procedure legislation. Postal operators, as technical participants in the criminal process, must possess clear internal procedures regarding the identification, reporting, and storage of suspicious items, in full accordance with criminal procedure norms.

Therefore, only a unitary legal-procedural approach, founded on the principles of legality, proportionality, and international cooperation, can guarantee the effectiveness of criminal investigations and the equitable protection of fundamental rights in this new form of cross-border economic criminality.

CAPABILITIES OF FINGERPRINT AND TRACEOLOGICAL EXAMINATIONS AND PARTICULARITIES OF THEIR APPOINTMENT IN THE INVESTIGATION OF PROFIT-MOTIVATED CRIMINAL OFFENSES COMMITTED UNDER MARTIAL LAW IN UKRAINE

Volodymyr KOVALENKO,
PhD Candidate, University Professor,
Senior Researcher, Research Laboratory
on the Problems of Forensic Support and Forensic Expertology,
Educational and Scientific Expert-Criminalistic Institute,
National Academy of Internal Affairs, Kyiv, Ukraine
ORCID: 0000-0001-5310-2092

Abstract

The article is devoted to highlighting the capabilities of forensic dactyloscopic and traceological examinations and the specific features of their appointment during the investigation of profit-motivated criminal offenses committed under the conditions of the legal regime of martial law in Ukraine.

It is noted that, given the difficulties in conducting certain investigative (search) actions due to the constant shelling of the territory of Ukraine by the aggressor state, a significant role in establishing circumstances relevant to criminal proceedings is assigned to forensic examinations.

It has been established that forensic dactyloscopic and traceological examinations play a significant role in determining the circumstances of such profit-motivated criminal offenses committed under the conditions of the legal regime of martial law as: theft (Part 4 of Article 185 of the Criminal Code of Ukraine); robbery; violent robbery; extortion; fraud; violent unlawful taking of a vehicle for profit-motivated purposes; unlawful deprivation of liberty or abduction; intentional homicide committed for profit-motivated reasons; and intentional homicide committed by order.

Their results depend on the quality of the materials provided to the experts and on the correctness of the formulation of the questions submitted for expert examination. The article presents typical circumstances that may be established with their assistance, the materials that should be submitted to experts and lists of typical questions posed for resolution by these examinations.

The conduct of forensic traceological examinations using 3D models of objects is considered promising. It is emphasized that, for the purpose of such examinations, experts may be provided with a digital 3D model of a volumetric trace produced by laser 3D scanning and a 3D model of the probable trace-forming object, or the object itself in its physical form.

Keywords: profit-motivated criminal offense, pre-trial investigation, criminal proceedings, forensic dactyloscopic examination, forensic traceological examination, objects of examination, expert.

CAPABILITĂȚILE EXPERTIZELOR DACTILOSCOPICE ȘI TRASEOLOGICE ȘI PARTICULARITĂȚILE DISPUNERII ACESTORA ÎN INVESTIGAREA INFRACȚIUNILOR CU SCOP DE PROFIT COMISE ÎN CONDIȚII DE LEGE MARȚIALĂ ÎN UCRAINA

Abstract

Articolul este dedicat evidențierii capacităților expertizelor criminalistice dactiloscopice și traseologice, precum și particularităților desemnării acestora în cadrul investigării infracțiunilor cu scop de profit săvârșite în condițiile regimului juridic al legii marțiale în Ucraina.

Se menționează că, având în vedere dificultățile întâmpinate în efectuarea anumitor acțiuni de urmărire penală (investigative și de căutare) cauzate de bombardamentele constante asupra teritoriului Ucrainei de către statul agresor, un rol semnificativ în stabilirea circumstanțelor relevante pentru procesul penal revine expertizelor criminalistice.

S-a stabilit că expertizele dactiloscopice și traseologice au o importanță deosebită în determinarea circumstanțelor unor infracțiuni cu scop de profit comise în condițiile legii marțiale, precum: furtul, tâlhăria, tâlhăria calificată, extorcarea, frauda, luarea ilegală a unui vehicul în scop de profit, privarea ilegală de libertate sau răpirea, omorul intenționat săvârșit din motive de profit și omorul intenționat săvârșit la comandă.

Rezultatele acestora depind de calitatea materialelor furnizate experților și de corectitudinea formulării întrebărilor adresate spre examinare. Articolul prezintă circumstanțele tipice care pot fi stabilite cu ajutorul acestor expertize, materialele ce trebuie înaintate experților, precum și exemple de întrebări standard utilizate în practica expertală.

Se consideră promițătoare efectuarea expertizelor traseologice prin utilizarea modelelor tridimensionale ale obiectelor. În acest sens, experților le pot fi furnizate modele digitale 3D ale urmelor volumetrice obținute prin scanare laser, precum și modele 3D ale obiectului presupus a fi format urma sau obiectul fizic propriu-zis.

Cuvinte-cheie: infracțiune cu scop de profit, investigație preliminară, procedură penală, expertiză dactiloscopică criminalistică, expertiză traseologică criminalistică, obiecte ale expertizei, expert.

Introduction. Immediately after the beginning of the full-scale invasion of Ukraine by the Russian Federation, martial law was introduced by the Presidential Decree of 24 March 2022 No.54/2022 and has since been regularly extended. At present, it remains in force until 4 May 2026. This legal regime provides for a number of restrictions on the constitutional rights and freedoms of citizens (including limitations on citizens' presence in public places during specified hours (curfew), enhanced control over the movement of individuals and vehicles, mobilization measures, etc.), which has led to a certain decrease in the commission of such profit-motivated criminal offenses as theft, robbery, and violent robbery. However, their number currently remains consistently high. At the same time, the number of fraud offenses has increased significantly, especially those committed in "remote forms," which is explained by the rapid digitalization of the population and the minimization of the need for offenders to physically move within populated areas.

Shortly after the introduction of the legal regime of martial law in Ukraine, amendments were made to the Criminal Code of Ukraine, according to which liability for such profit-motivated crimes as pillage (Article 432 of the Criminal Code of Ukraine) was strengthened. In addition, the legislative amendments modified the corpus delicti of such criminal offenses as theft (Part 4 of Article 185 of the Criminal Code of Ukraine); robbery (Part 4 of Article 186 of the Criminal Code of Ukraine); violent robbery (Part 4 of Article 187 of the Criminal Code of Ukraine); extortion (Part 4 of Article 189 of the Criminal Code of Ukraine); fraud (Part 3 of Article 190 of the Criminal Code of Ukraine); and misappropriation, embezzlement of property or its acquisition through abuse of office (Part 4 of Article 191 of the Criminal Code of Ukraine) [1]. The aforementioned criminal offenses were supplemented with a qualifying feature – commission using the conditions of martial law or a state of emergency, which entails more severe sanctions. It should be noted that national judicial practice has followed the path of applying this qualifying feature to virtually all thefts, robberies, violent robberies, extortions, and frauds committed during the period of the legal regime of martial law, regardless of the place and the specific circumstances of the act [2, p.283]. Despite considerable criticism of this policy in academic circles, this approach was ultimately upheld by the Supreme Court of Ukraine [3].

Given the difficulties in conducting certain investigative (search) actions due to the constant shelling of the territory of Ukraine by the aggressor state, a significant role in establishing circumstances relevant to criminal proceedings is assigned to forensic examinations.

Discussions and results obtained. As the study of judicial and investigative practice shows, within the same criminal proceedings concerning profit-motivated criminal offenses committed under the conditions of the legal regime of martial law, multiple forensic examinations are usually appointed. This is due to the large number of traces and physical evidence contained in the materials of criminal proceedings, as well as the specific nature of the circumstances that must be established during their pre-trial investigation.

Let us consider certain types of forensic examinations that are of the greatest importance for establishing the circumstances of the aforementioned criminal offenses.

A dactyloscopic examination is usually appointed during the investigation of such profit-motivated criminal offenses as theft; robbery; violent robbery; extortion; fraud; violent unlawful taking of a vehicle for profit-motivated purposes; unlawful deprivation of liberty or abduction; intentional homicide committed for profit-motivated reasons; and intentional homicide committed by order, etc., when fingerprints are detected on objects related to the event under investigation.

With its assistance, during the investigation of profit-motivated criminal offenses, the following circumstances may be established: the fact of a particular person's presence in a specific place and contact with certain objects (that is, establishing the possible role of each participant in the criminal offense); determining the number and personal composition of persons who participated in the commission of the criminal offense; establishing individual characteristics of the hands of the persons whose traces were detected at the scene, etc.

The expert should be provided with traces of papillary patterns collected at the scene (preferably seized together with the objects on which they are located or may be located), their copies on fingerprint lifting film, casts from three-dimensional traces or scale photographs of the traces, images of papillary patterns contained in the materials of previously conducted examinations, etc., as well as fingerprint cards of the persons being examined, prepared in accordance with Part 3 of Article 245 of the Criminal Procedure Code of Ukraine.

The following questions may be submitted for resolution by a dactyloscopic examination: Are there any fingerprints on the given object and, if so, are they suitable for personal identification? Were the fingerprints left by a specific person? (the full name of the person or persons whose fingerprint cards have been provided to the expert should be indicated).

If the person who likely left the traces at the scene of the criminal offense has not yet been identified, the following questions may be submitted for resolution by a dactyloscopic examination: Which hand and which fingers left the traces? What particular features characterize the hands of the person who left the traces (absence of fingers, presence of scars, dermatological skin conditions, etc., and which exactly)? Which areas of the palm surface left the traces? (This question is posed only in cases where palm prints have been recovered from the scene). As a result of what action was the trace left (grasping, touching, etc.)?

Answers to these questions make it possible to establish details of the mechanism of trace formation during the commission of the criminal offense, as well as to refute possible statements by the suspect claiming that the traces were left at the scene for reasons unrelated to the commission of the criminal offense.

Traceological examination. This type of examination is divided into several subtypes or varieties and is most often appointed during the investigation of such profit-motivated criminal offenses as theft (Part 4 of Article 185 CC of Ukraine); robbery (Parts 2 and 4 of Article 186 CC of Ukraine); violent robbery (Part 4 of Article 187 CC of Ukraine); extortion

(Part 4 of Article 189 CC of Ukraine); unlawful taking of a vehicle (for profit-motivated purposes – Part 1 of Article 289 CC of Ukraine); unlawful deprivation of liberty or abduction (Part 2 of Article 146 CC of Ukraine); intentional homicide committed for profit-motivated reasons (Clause 6, Part 2 of Article 115 CC of Ukraine) and intentional homicide committed by order (Clause 11, Part 2 of Article 115 CC of Ukraine), etc., depending on the objects available to the investigator.

Traceological examination of human foot and footwear traces. The main tasks of this examination are the identification of a person based on traces of bare feet, socks, or footwear, as well as the resolution of diagnostic tasks related to establishing the peculiarities of a person's movement, the size of footwear, etc. [4].

During the investigation of the aforementioned profit-motivated criminal offenses, a traceological examination may allow establishing the fact that several footwear traces were left by the same person (including those recovered from the scenes of different crimes), obtaining information about the characteristics of a person's gait, defects of the feet, determining the number of persons whose traces were left at the scene, which may indicate the group nature of the criminal offense, differentiating the "roles" of the participants in the criminal offense, and identifying the specific footwear worn by the person at the time of committing the criminally punishable act, etc. [5, p. 68].

When the object of examination is a cast or impression of a footwear trace, the expert, in addition to this trace, should be provided with the footwear seized from the suspect in accordance with Articles 160-168 of the Criminal Procedure Code of Ukraine. The footwear is submitted for examination in the condition in which it was discovered. If the investigator becomes aware that the footwear was used (worn) or repaired after the event and before its seizure, the expert must be informed of this circumstance.

In such a case, the following question is submitted for resolution by the examination: Was the footwear trace detected at the scene (or at several scenes) left by the footwear submitted for examination and seized from ... (full name)?

Traceological examination of vehicle traces. Vehicles may be used as means of transportation and/or for the carriage of goods during the commission of various profit-motivated criminal offenses. Moreover, the same vehicle may be used continuously – during the preparation, commission, and concealment of the crime – or only in particular stages (only for preparation, only during the commission of the crime, or only after its commission). Depending on this, the involvement of the driver in the committed offense, his or her awareness of criminal intentions and the connection with other members of the criminal group may be determined [6].

As the study of judicial and investigative practice shows, traces of the running gear of vehicles (usually tires) are most often collected during the inspection of the scene in criminal proceedings concerning theft (Part 4 of Article 185 of the Criminal Code of Ukraine); robbery (Parts 2 and 4 of Article 186 of the Criminal Code of Ukraine); violent robbery (Part 4 of Article 187 of the Criminal Code of Ukraine); and extortion (Part 4 of Article 189 of the Criminal Code of Ukraine).

The main tasks of the traceological examination of vehicle traces in such criminal proceedings are the identification (individualization) of a specific vehicle based on its parts and traces left at the scene of the criminal offense; diagnostic tasks (establishing the properties and condition of vehicles); and situational tasks (establishing the mechanism of trace formation and the mechanism of interaction between the vehicle and other objects, etc.) [4].

If tire traces of a vehicle have been collected at the scene, the following questions

should be submitted for resolution by a traceological examination: What model of tire left the traces? On which types (classes or models) of vehicles can tires of this model be installed?

If the vehicle has been identified, the following questions should be submitted for resolution by the examination: Were the traces collected at the scene left by this vehicle? Were the traces collected at different scenes left by the same vehicle?

In addition to the vehicle traces collected at the scene, the expert should be provided with the tires (or wheels as assemblies) seized from the vehicle that was likely used in the commission of the criminal offense. At the same time, the expert must be informed of the position in which each of the submitted wheels was installed (front, rear, right, or left) [5, p. 73].

Traceological examination of locking and security (control) devices is most often appointed during the investigation of such profit-motivated criminal offenses as theft (Part 4 of Article 185 of the Criminal Code of Ukraine).

The main tasks of this examination are establishing the fact and method of unlocking (overcoming) a locking device, determining the types of objects used for this purpose, identifying these objects, and, in the case of seals, additionally establishing the fact of their reattachment and identifying the sealing pliers, etc.

Most often, the objects of such an examination are a lock recovered from the scene and/or its locking mechanism (depending on the design of the lock). As is known, a lock may be either unlocked or broken. A lock should be considered broken if it has lost its ability to lock, that is, when its parts and mechanisms have been significantly damaged or destroyed as a result of mechanical, chemical, or thermal impact. A lock may be unlocked using the original key, its duplicate, a picked key, or a foreign object. Such a foreign object may include a lock pick (a specially manufactured tool) or an ordinary household item used accidentally (a nail, a pin, etc.). A lock pick may be either homemade (a thief's tool) or industrially manufactured. When a foreign object is used, the lock usually remains functional and capable of locking [7, p.180].

The recovered lock (as an assembly) or its locking mechanism (depending on the design of the lock) must be submitted for traceological examination in the condition in which it was discovered at the scene and seized. It is prohibited to insert any objects into the keyhole (including the original keys) or to perform any other manipulations with the lock prior to its forensic examination.

The following questions should be submitted for resolution by the examination: Is the lock mechanism functional? If not, what is the nature of the malfunction? Was the lock unlocked using a foreign object (a lock pick, a selected key, or a forged key)? By what method was the lock unlocked (or broken)? [4]. By what method was the lock damaged? Were the locks submitted for examination (recovered from different crime scenes) unlocked (or broken) in the same manner? In what state (locked or unlocked) was the lock at the moment it was damaged? Does the original key bear any features characteristic of the production of its copy or cast? [8, p.152].

If tools resembling lock picks are seized from a suspect, these objects must also be submitted for the examination in question. In this case, the following questions should be submitted to the experts: Is it possible to unlock this lock using the tool (object) seized from ... (full name)? Was the lock recovered during the inspection of the scene (date, location) unlocked using the objects seized from ... (full name)? [4].

Traceological examination of seals and other control devices is usually appointed during the investigation of such profit-motivated criminal offenses as theft (Part 4 of Ar-

ticle 185 of the Criminal Code of Ukraine) (most often theft of cargo transported by rail, sea, or road transport).

At the stage of the pre-trial investigation, when the persons suspected of committing the criminal offense have not yet been identified, the expert examination of seals and other control devices should be aimed at obtaining information of both a diagnostic and identification nature regarding the fact and method of opening and reattaching seals or other control devices discovered during the inspection of the scene.

The objects of such an examination include: (a) the sealing and locking device itself and its parts recovered from the scene; (b) tools and instruments used by offenders to remove sealing locks; (c) comparative samples of new sealing and locking devices and those opened using standard tools; (d) standard tools (pliers with pointed jaws and cable cutters) used for removing sealing and locking devices [9, p. 15].

To solve diagnostic tasks, the seal recovered from the scene is provided to the expert, and the following questions are submitted for resolution by the examination: Was the seal opened and then crimped again after its initial crimping with sealing pliers? By what method and with the use of which tool was the seal opened and re-crimped? With a tool of what type was the seal opened? Is it possible to remove from this seal the material used for sealing (wire, twine, cord) without violating its integrity? What is the content of the numerical and alphabetical markings on the contact surfaces of the seal? Were the sealing procedures properly followed when this seal was applied? By what method was this control device unlocked (removed) and returned to its place? Were the seals crimped using the same sealing pliers?

If the person suspected of committing the criminal offense has been identified and sealing pliers, pointed-jaw pliers, cable cutters, etc. have been seized from that person, they must be submitted to the expert together with the seal. In addition, in order to ensure the possibility of conducting experimental tests, the expert should be provided with 10-15 uncrimped seals similar to those under examination, as well as samples of the materials (wire, twine, cord) used during sealing [4].

Traceological examination of burglary tools may be appointed during the investigation of theft (Part 4 of Article 185 of the Criminal Code of Ukraine) if traces of forced entry into a barrier (doors, windows, bars, walls, etc.) are discovered during the inspection of the scene.

The main tasks of this examination are: establishing the specific item or the type (characteristic features) of a tool, instrument, or device based on the traces of its action; determining the mechanism (method) of the break-in (or other action), the direction in which the barrier was forced (from the inside or from the outside), the type (kind) of object that left the trace, the method of its manufacture, etc. [4].

During the investigation of theft, the following main questions may be resolved by this examination: Was the break-in committed using one or several tools? With a tool of what type was the break-in committed? By what method was the object separated (cutting, chopping, sawing, drilling, etc.)? From which side (internal or external) was the barrier (wall, window, bars, etc.) forced? Were the traces of forced entry recovered from different scenes left by the same tool?

In the event that a suspect is detained and tools (instruments) that were likely used to force the barrier are seized from that person, the following question is submitted for resolution by the examination: Was the barrier (or barriers) forced using this particular tool (instrument)?

For examination, the expert is provided with objects or their parts bearing traces of

forced entry, as well as the protocol of the scene inspection with a photo table and video recording materials.

If the objects of examination are traces of drilling, sawing, or crushing, the expert should also be provided with shavings, chips, or sawdust found at the scene, and their location relative to the barrier or other object should be indicated. If the circumstances of the proceedings indicate that such particles could have been formed not only by the tools being examined, the expert should be informed of this [8, p. 162].

The conduct of forensic traceological examinations using 3D models of objects is considered promising. For the purpose of such examinations, experts may be provided with a digital 3D model of a volumetric trace produced by means of laser 3D scanning and a 3D model of the probable trace-forming object, or the object itself in its physical form. In the latter case, the expert must produce a 3D model of the submitted physical object using 3D scanning and/or create experimental impressions and generate 3D models of the experimental traces.

During the examination, 3D models of the trace submitted for analysis and the experimental trace may be compared with each other, as well as 3D models of the trace submitted for analysis and the contact surface of the trace-forming object. The second type of examination may be applied only to static traces. For its implementation, it is necessary, using appropriate software, to invert the normal of the 3D model of the trace (that is, to "turn it inside out"), as a result of which the model becomes a direct representation of the trace-forming surface, allowing a direct comparison between the models of the trace and the probable trace-forming object.

The following questions may be submitted to the expert entrusted with conducting this examination: Is the trace collected during the inspection of the scene and copied by means of 3D scanning suitable for identification? If so, was this trace left by the object seized during the pre-trial investigation (and recorded by means of 3D scanning)? [10, p. 271].

It should be noted that in the countries of the European Union semi-automated systems (hardware and software complexes) designed for conducting such examinations are already in operation. For example, the Laboratory Imaging s.r.o. (known in Ukraine for the widely used ballistic identification systems – BalScan) also produces the systems ToolScan and ToolScan R360, which allow the creation, examination, and comparison of digital 3D models of volumetric traces produced by tools of various types and purposes in both manual and automated modes [11].

Conclusions. In summary, it should be noted that forensic dactyloscopic and traceological examinations play a significant role in establishing the circumstances of such profit-motivated criminal offenses committed under the conditions of the legal regime of martial law as theft (Part 4 of Article 185 of the Criminal Code of Ukraine); robbery (Parts 2 and 4 of Article 186 CC of Ukraine); violent robbery (Part 4 of Article 187 CC of Ukraine); extortion (Part 4 of Article 189 CC of Ukraine); fraud (Part 3 of Article 190 CC of Ukraine); violent unlawful taking of a vehicle for profit-motivated purposes (Parts 2 and 3 of Article 289 CC of Ukraine); unlawful deprivation of liberty or abduction (Part 2 of Article 146 CC of Ukraine); intentional homicide committed for profit-motivated reasons (Clause 6, Part 2 of Article 115 of the CC of Ukraine) and intentional homicide committed by order (Clause 11, Part 2 of Article 115 CC of Ukraine), etc. Their results depend on the quality of the materials provided to the experts and on the correctness of the formulation of the questions submitted for resolution by the examinations.

The conduct of forensic traceological examinations using 3D models of objects is considered promising. For the purpose of such examinations, experts may be provided

with a digital 3D model of a volumetric trace produced by means of laser 3D scanning and a 3D model of the probable trace-forming object, or the object itself in its physical form. In the latter case, the expert must produce a 3D model of the submitted physical object using 3D scanning and/or create experimental impressions and generate 3D models of the experimental traces.

Abstract
Identity imposture represents one of the major threats to border security, having direct implications for combating illegal migration, transnational crime, and terrorism. The purpose of this research is to analyze identity imposture as a major risk to border security, as well as to identify effective methods for detecting and preventing this phenomenon.
The research is based on methods of legal-dogmatic analysis, normative analysis of the applicable national legislation, and the examination of operational practices used in border control. The main results highlight that advanced document verification, the use of biometric technologies, and the operation of integrated information systems constitute essential tools for identifying attempts of identity imposture, while interinstitutional cooperation, information exchange, and continuous professional training of border personnel significantly contribute to reducing the associated risks.
Keywords: border security, identity imposture, border control, document fraud, biometric identification.

IMPOSTURA IDENTITARĂ CA RISC LA FRONTIERĂ: METODE DE IDENTIFICARE ȘI PREVENIRE

Abstract
Impostura identitară reprezintă una dintre principalele amenințări la adresa securității frontierei, având implicații directe asupra combaterii migrației ilegale, criminalității transfrontaliere și terorismului. Scopul cercetării constă în analiza imposturii identitare ca risc major pentru securitatea frontierei, precum și în identificarea metodelor eficiente de detectare și prevenire a acestui fenomen.
Cercetarea se bazează pe metode de analiză juridico-dogmatică, analiză normativă a legislației naționale aplicabile și examinarea practicilor operaționale utilizate în controlul de frontieră. Principalele rezultate evidențiază faptul că verificările documentare avansate, utilizarea tehnologiilor biometrice și funcționarea sistemelor informatice integrate constituie instrumente esențiale pentru identificarea tentativelor de impostură identitară, iar cooperarea interinstituțională, schimbul de informații și formarea profesională continuă a personalului de frontieră contribuie semnificativ la reducerea riscurilor asociate.
Cuvinte-cheie: securitatea frontierei, impostura identitară, controlul de frontieră, frauda documentară, identificare biometrică.

Introduction. Border security represents one of the fundamental pillars of national and regional security, playing the role of protecting territorial integrity, preventing unauthorized access to a state's territory, and combating transnational threats. In the context of globalization and the increase in international mobility, flows of persons and goods have grown considerably, generating additional challenges for border authorities. These challenges are not limited to human trafficking or smuggling, but also include identity-based threats, such as identity imposture, which can seriously undermine the effectiveness of security systems. Identity imposture refers to the use of false identities, assuming the identity of another person, or the substitution of persons in order to circumvent border control, thereby facilitating illegal activities such as clandestine migration, human trafficking, smuggling, and, in extreme cases, terrorism.

The relevance of this topic is also confirmed by recent geopolitical developments. Following the outbreak of the war in Ukraine in February 2022, the Republic of Moldova received over 300,000 refugees within a short period, which required an immediate adaptation of control procedures and generated unprecedented pressure on the capacity for identity verification at border crossing points. In this context, the Council of the European Union authorized the signing of the Agreement between the European Union and the Republic of Moldova on the operational activities carried out by the European Border and Coast Guard Agency (Frontex) on the territory of the Republic of Moldova, signed on 17 March 2022 and applied on a provisional basis from the same date [1]. The Agreement allowed, for the first time, the deployment of Frontex teams outside the territory of the European Union under the Agency's new consolidated mandate, providing direct support to Moldovan authorities in screening, registration, and identity verification activities.

In recent decades, the complexity of border threats has grown alongside technological development and the sophistication of fraudulent methods. Falsified documents are becoming increasingly difficult to detect by traditional means, and persons attempting to cross the border using false identities are becoming ever better prepared to evade controls. The Frontex Annual Risk Analysis for 2025-2026 expressly draws attention to the fact that fraudulent documents, visa abuse, and the increase in traffic through less-controlled airports represent a continuously growing challenge at air borders, and that organized criminal groups are becoming increasingly agile, using digital tools, drones, and false documents to circumvent border control [2]. In this context, identity imposture can no longer be regarded merely as an administrative or legal infringement; it represents a major risk to state security, with direct implications for the capacity of authorities to maintain control and safety at the border.

The authorities responsible for border security are thus faced with the need to implement control procedures that are effective, rapid, and adaptable to new forms of identity fraud. These procedures include detailed document checks, advanced biometric technologies, integrated information systems, and national and international databases for verifying the identity of persons. Biometric technologies, such as facial recognition, fingerprinting, and iris scanning, have become essential tools for the rapid identification of persons attempting to cross the border under a false identity or using documents belonging to other persons. At the same time, integrated information systems allow for the rapid exchange of information between authorities and between states, facilitating the identification of cross-border criminal networks and the prevention of illegal activities.

Beyond the technological aspects, identity imposture also requires a complex institutional and operational approach. Interinstitutional cooperation, the constant exchange of information, and the continuous training of border personnel are essential elements for reducing the risk of identity fraud. Risk assessment and behavioral analysis of persons

crossing the border are also important methods that allow authorities to identify anomalies and react preventively. In this regard, identity imposture may be viewed not only as a technical problem, but also as a multidimensional phenomenon involving human, technological, and organizational factors.

Recent studies emphasize that identity imposture is often part of a broader system of organized cross-border criminality. The persons involved may be supported by well-structured networks that provide false documents, training on border control procedures, and logistics for illegal crossings. This organizational dimension structures the risk in a systemic manner, demonstrating that the mere checking of documents is no longer sufficient. In this context, the need emerges for an integrated approach that combines modern technologies, standardized procedures, behavioral analysis, and institutional cooperation.

Purpose of the research. The present article aims to analyze identity imposture as a major border risk, to identify the main detection methods, and to examine the strategies for preventing and reducing this risk. The main objective is to highlight the importance of adopting an integrated and proactive perspective that combines technological, methodological, and organizational solutions. In this way, the article seeks to consolidate the capacity of authorities to maintain border security and to respond effectively to the challenges generated by identity imposture.

Discussions and results obtained. I. Theoretical Framework and Review of the Specialized Literature. "*The impostor is defined as a person who presents themselves as another person*" [3, p.2]. In addition to this general definition, the specialized literature also employs formulations such as "impostor, assumed identity, altered appearance," which capture the operational dimension of the phenomenon under analysis.

The analysis of identity imposture as a border risk requires, first and foremost, a conceptual clarification of the main notions used in doctrine and in security practice, as well as an examination of how these are addressed in the specialized literature. The field of border security lies at the intersection of several branches of knowledge, criminal law, administrative law, national security, and migration management, which determines a heterogeneous and, at times, fragmented approach to identity-related phenomena.

In the specialized literature, border security is generally defined as the totality of legal, institutional, and operational measures aimed at protecting the territorial integrity of the state and preventing unauthorized access to its territory. Most authors emphasize the multidimensional nature of border security, noting that it is not limited to the physical control of the border, but also includes informational, technological, and human components. In this context, the identity of a person represents a central element of the control mechanism, as the correct establishment of identity constitutes the prerequisite for any legal decision regarding the permission or refusal of border crossing.

From a typological standpoint, identity imposture manifests itself in border practice in several forms. The first category consists of imposture through physiognomic resemblance (look-alike fraud), in which the impostor presents an authentic document belonging to another person with similar features. A second category includes identity substitution through authentic documents fraudulently obtained on the basis of previously forged supporting documents (e.g., counterfeit birth certificates), while a third category concerns the use of false or falsified documents, either through the material alteration of an authentic document or through its complete counterfeiting. ICAO Doc 9303 standards provide specific technical security elements, the Machine Readable Zone (MRZ), the biometric chip storing the facial image and, optionally, fingerprints, as well as the electronic signature verified through the Public Key Directory, precisely to limit the possibility of

counterfeiting and to enable the automated authentication of the document [4].

The concept of identity imposture is addressed in doctrine, as a rule, indirectly, being analyzed either in connection with document forgery or in the context of identity fraud or organized cross-border criminality. Some authors treat identity imposture predominantly as a matter of document authenticity, placing emphasis on material falsification and the security features of identity documents. This approach, although technically relevant, proves insufficient to explain situations in which the documents are authentic but used by persons who are not their lawful holders. Other authors extend the analysis to the behavioral and operational dimension of identity imposture, highlighting the role of person substitution and the fraudulent assumption of a real identity.

The specialized literature highlights the fact that this type of imposture frequently occurs in situations where there is a partial physiognomic resemblance between the impostor and the document holder, or in cases where the holder's appearance has undergone significant changes over time as a result of aging, surgical interventions, medical conditions, or other factors. In these situations, travel documents, although technically authentic, no longer faithfully reflect the current identity of the holder, which significantly complicates the border control process.

International literature, including guidelines developed by organizations such as the International Civil Aviation Organization (ICAO) and the European Border and Coast Guard Agency (Frontex), emphasizes the importance of using biometric methods and behavioral assessment in the process of identifying persons. These sources also highlight the limitations of control based exclusively on the examination of travel documents, in the absence of clear procedures regarding their renewal in cases of changes to the holder's physical appearance. From a legislative perspective, comparative studies reveal significant non-uniformity across national regulations concerning the obligation of a person to renew their travel document in the event of a change in physiognomy. While some states expressly provide for this obligation, others limit themselves to general provisions concerning the validity of the document, without detailing the specific circumstances requiring the issuance of a new one. This lack of normative clarity is identified by numerous authors as a risk factor that facilitates the fraudulent use of authentic documents and creates major difficulties for control authorities.

Research focused on law enforcement practice highlights the fact that the absence of objective legal criteria regarding mandatory physiognomic changes forces border officers to make operational decisions within a limited timeframe, assuming legal and professional risks. In the absence of clear regulations, the assessment of identity remains largely dependent on the professional experience and individual evaluation capacity of the control officer.

Taken as a whole, the analysis of the existing literature highlights the fact that, although identity imposture is recognized as a major border risk, the current doctrinal and normative framework does not provide unified and integrated solutions for managing the situations generated by the fraudulent use of authentic documents, particularly in the context of changes to the holder's appearance. This gap justifies the need for applied research that correlates the legal, operational, and technological dimensions of border control and contributes to the formulation of proposals for improving legislation and the procedures for preventing identity imposture.

II. Applicable Normative Framework in the Republic of Moldova. **National Regulations on Border Control and Travel Documents**. At the domestic level, the control of crossing the state border of the Republic of Moldova is regulated by a set of normative acts establishing the competences of the authorities involved and the conditions for the

validity of travel documents. The basic legal framework is constituted by Law No.28 of 15 February 2024 on the State Border of the Republic of Moldova [5], which replaced Law No.215/2011 and became applicable as of 6 January 2025 [6]. The new law aims to strengthen border security and align with European standards, partially transposing the provisions of Regulation (EU) 2016/399 (the Schengen Borders Code) and facilitating clarity in the interaction between citizens and border officers by explicitly establishing the obligation to present a valid identity document for access to the border area. The law also introduces provisions aimed at reducing bureaucracy and clarifying document verification procedures at checkpoints; however, it does not expressly provide detailed rules on the renewal of travel documents in cases of significant changes to the holder's physiognomy, an aspect flagged as a gap in the operational practice of border authorities [6].

The implementing mechanisms of Law No.28/2024 are detailed by Government Decision No.862 of 18 December 2024 on the implementation of the provisions of the new border law [7], a normative act that updates the rules on access to and activities in the border zone, the concept of the protection strip, and the specific verification procedures at crossing points. Concurrently, the regime of identity documents is regulated by Law No.273/1994 on identity documents within the national passport system [8], which establishes the categories of documents issued to citizens and the general conditions for their validity.

For example, the list of travel documents accepted for border crossing includes specific technical conditions and internationally recognized standards, alongside the possibility for border personnel to use official specimens for the identification of forgeries and the examination of suspicious documents. In practical operations, border officers rely on libraries of authentic and falsified images of travel documents, as well as on national and international databases, for the purpose of rapidly authenticating documents presented at checkpoints.

Regulations on foreigners' documents (such as minimum validity periods, blank pages, etc.) are stipulated in migration legislation, which requires that documents be valid and comply with international requirements at the time of entry into the Republic of Moldova. The national legal framework also includes provisions on the duration of validity and the technical conditions of documents accepted for border crossing, including the requirement that they have been issued within the last 10 years [9].

In addition to the strict framework concerning travel documents, national legislation also provides for rules on the protection of personal data in border control procedures, including the obligation of the border police to collect, process, and protect the personal data of persons crossing the border, in accordance with data protection legislation.

III. Systems and Databases Used in the Identification of Identity Imposture. The effectiveness of border control depends directly on the capacity of authorities to verify, in real time, the authenticity and validity of the document presented. A central instrument in this regard is the INTERPOL database on Stolen and Lost Travel Documents (SLTD), which enables the verification of an identity or travel document within seconds by comparing it with records submitted by Member States. According to data published by INTERPOL, the SLTD database contains approximately 138 million records and was queried approximately 3.6 billion times in 2023, generating 232,423 positive results that enabled the identification of attempts to use compromised documents [10]. These figures highlight not only the scale of the phenomenon, but also the operational value of a globally shared database for the prevention of identity imposture.

At the level of the European Union, a similar instrument with extended functionalities is the Entry/Exit System (EES), established by Regulation (EU) 2017/2226 of the European Parliament and of the Council of 30 November 2017 [11]. The EES electronically records the date, time, and location of entry and exit of third-country nationals crossing

the external borders of the Member States, together with biometric data consisting of a facial image and fingerprints. The system automatically calculates the authorized length of stay and generates alerts when this is exceeded, contributing both to the identification of persons using multiple identities and to the detection of anomalies in travel behavior.

Complementing the official databases, border authorities also use visual reference tools, such as the False and Authentic Documents Online (FADO) system, administered at the European level and made available through Frontex. FADO provides high-resolution digital images of both authentic and false or counterfeit documents, supporting the detailed comparison of security elements (microtext, holograms, UV features, OVI structures, etc.) and enabling the rapid recognition of known forgery typologies.

IV. Legislative Gaps and Difficulties in Application in Atypical Situations. Although the Moldovan normative framework and international standards provide a clear set of rules for the validity and structure of travel documents, there are no explicit provisions regarding the obligation to obtain a new document in cases of significant changes to the holder's physiognomy. This gap creates significant practical difficulties for border officers: in the absence of clear regulations, the assessment of identity remains largely at the discretion of the control officer, which may generate discrepancies in application and legal or security risks.

The technical character of identity verification is also sensitive to the quality of the photograph in the document. ICAO standards allow for biometric passports a validity of up to 10 years [4], an interval during which a person's appearance may change substantially, whether as a result of the natural aging process, aesthetic surgical interventions, trauma, medical conditions, or other factors. When the differences between the document photograph and the person's appearance are significant, automated facial recognition systems may generate either false negatives (the rejection of the actual person) or, more seriously, false positives (the acceptance of an impostor), particularly in situations where the impostor and the holder share a natural physiognomic resemblance.

Furthermore, the adaptation of national regulations to international technological developments requires continuous legislative and institutional reforms in order to maintain consistency between technical requirements and the legal obligations concerning travel documents. The progressive implementation of the EES at the external borders of the European Union [11], with which the Republic of Moldova shares crossing points through Romania, exerts additional pressure for the harmonization of national procedures with European biometric standards, both with regard to the quality of facial images recorded and the interoperability with European information exchange systems.

V. European Best Practices. At the European level, the principles and practices of identity and document control are consolidated through coordinated actions of the European Union and its specialized agencies, in particular the European Border and Coast Guard Agency (Frontex).

Frontex considers that identity fraud and the fraudulent use of documents represent a significant threat to internal security and to border control systems, as such fraud can be used as a vector for other major cross-border crimes, such as human trafficking or terrorism. The Frontex Annual Risk Analysis 2025-2026 report confirms this assessment, identifying as priority risks at air borders the use of fraudulent documents, visa abuse, and the increase in traffic through less-controlled airports, as well as the increased agility of organized criminal groups exploiting digital tools and false documents to circumvent controls [2].

In the operational context, Frontex provides support through centers of excellence and training programs that assist participating states in detecting false documents and strengthening verification capacities at the border, including through the exchange of

expertise and technical best practices. In addition, Frontex initiatives integrate modern tools for the collection and analysis of digital images of false and authentic documents (such as the False and Authentic Documents Online- FADO system), developing harmonized standards for the authentication of identity documents at the European level.

A concrete example of best practice applicable to the Republic of Moldova is the Agreement between the European Union and the Republic of Moldova on the operational activities carried out by Frontex on the national territory, signed on 17 March 2022 [1]. Under this agreement, Frontex teams were deployed at the Moldovan border to support national authorities in the daily activities of border management, including person screening, identity checks, and border surveillance tasks. This represents the first agreement of its kind concluded under the consolidated Frontex mandate, conferred by Regulation (EU) 2019/1896, which gives the Moldovan case reference value at the regional level.

Cooperation with Frontex also includes the professional training of border officers in detecting document fraud, with actions placing emphasis both on the technical identification of document security features and on the operational aspects related to the behavior of persons during the control [12]. Combining continuous training with direct access to European and international databases (SLTD, FADO, EES) creates the conditions for a modern, integrated, and resilient border control system capable of responding to new forms of identity imposture.

Conclusions and recommendations. The analysis conducted allows for the formulation of essential conclusions and specific recommendations aimed at contributing to the improvement of the normative and operational framework in the field of preventing identity imposture at the border.

Identity imposture represents a complex and multidimensional risk to border security that cannot be effectively managed through isolated instruments. The combination of authentic documents used fraudulently, significantly altered physiognomies, and the networked organization of identity frauds requires an integrated approach that associates the legal, technological, and operational dimensions. The phenomenon is not limited to the material falsification of documents, but also includes situations in which the document is authentic, yet the holder no longer corresponds to the photograph therein, whether due to the natural aging process, aesthetic surgical interventions, or other significant physiognomic changes. This reality is confirmed by the operational practice of border officers and represents a gap that affects both border security and the right of individuals to a smooth and non-discriminatory crossing.

Based on the research formulated above, through the present article, the authors propose a series of concrete recommendations, the necessity of which is supported by authors such as S. Brînză in his work, in which the aspects identified in this article are addressed through the prism of criminal liability [13], and by the fact that the criminal legislation of the Republic of Moldova already directly sanctions the use of a false identity: Article 177[1] of the Criminal Code of the Republic of Moldova criminalizes the fraudulent use of another person's identity, providing for penalties consisting of fines or imprisonment of up to 3 years. In other words, criminal law clearly states that impersonating another person is a criminal offence, not a mere administrative irregularity. For this very reason, any gap that facilitates the commission of this offence, such as the absence of an obligation to renew one's passport when one no longer resembles the photograph therein, must be corrected. If the person crossing the border under another's identity can be held criminally liable, it is only natural that the system be equipped with all the necessary tools to identify them in time.

From a legislative standpoint, it is recommended, first and foremost, to supple-

ment the national normative framework with an express obligation to renew the travel document in cases where the holder's physiognomy no longer corresponds to the photographic image in the passport. The legislation of the Republic of Moldova governing travel documents, regulated by Law No.269/1994 on the exit and entry into the Republic of Moldova, does not contain, in its current form, an express provision establishing the obligation of the passport holder to refrain from using the document when significant changes have occurred in their identification data or major changes in their physiognomy. By reference to the legislative solution adopted by Romania through Law No.174/2024 amending and supplementing Law No.248/2005 on the regime of free movement of Romanian citizens abroad, which explicitly provides, in Article 20 paragraph (7), that "the holder of a simple electronic passport or a simple temporary passport [...] is obliged not to use the travel document when changes have occurred in the holder's identification data or major changes in their physiognomy" [14], it can be observed that the Romanian legislator has opted for a preventive and accountability-oriented approach, grounded in the principles of modern administrative law and in the international standards promoted by the International Civil Aviation Organization (ICAO) through Document Doc 9303 on machine-readable travel documents. The transposition of a similar normative standard into the legislation of the Republic of Moldova would represent not only a harmonisation with regional best practices, but also a measure of intrinsic legal coherence, whereby the holder of a travel document becomes a responsible actor in maintaining the accuracy and authenticity of the certified identity, thereby contributing to the prevention of abusive or fraudulent use of passports bearing outdated data, with direct implications for national security and the consular relations of the state.

Although the growing number of individuals resorting to cosmetic surgery or other procedures that significantly alter facial features renders this situation increasingly common, the absence of such a normative provision generates a legal vacuum in the area of identity document updating with regard to changes in a person's physical appearance.

In this context, it is considered appropriate to establish an express legal obligation to renew the passport in situations where physiognomic changes are of such a nature as to impede or complicate the identification of the holder, a measure that would contribute to strengthening the security of travel documents, preventing the fraudulent use of identity, and improving the efficiency of the activities of the competent authorities in the field of border control. Such a regulation would contribute to increasing the security of travel documents, to preventing attempts at identity substitution, and to improving the efficiency of the authorities responsible for border control.

In conclusion, the prevention and combating of identity imposture at the border, including in the forms generated by significant physiognomic changes, requires an integrated strategy combining the modernization of the normative framework, the development of technological infrastructure, the continuous training of personnel, and systematic international cooperation. The establishment of an express legal obligation to renew the passport upon an essential change in the holder's physiognomy represents a concrete, necessary, and achievable step that would consolidate both the security of travel documents and the effectiveness of border control. Only through such a coherent approach can border authorities effectively respond to the risks generated by the analyzed phenomenon and contribute to the lasting consolidation of national and regional security.

THE ROLE OF COLLECTIVE EMOTIONS IN THE OUTBREAK AND MAINTENANCE OF CONFLICTS

Maria Cristina CHIRU,
PhD, Associate Professor,
Associate University Lecturer,
Danubius International University, Galaţi,
Romania
ORCID: 0009-0006-0641-0993

Abstract

In the contemporary literature on the dynamics of social and political conflicts, collective emotions are regarded as genuine mechanisms that influence both the outbreak and the perpetuation of conflicts. They are no longer viewed as mere reactions to environmental events, but as active forces that shape collective behavior, public discourse, and political decision-making. Primary and universal emotions such as fear, anger, and shame, together with hatred, resentment, and revenge, transcend personal experience and become salient at the group level, reinforcing social and national identities.

In the early stages of conflict, fear plays a major triggering role by amplifying perceptions of danger and facilitating the acceptance of radical measures, including violence. If fear initiates conflict, anger and hatred contribute to its intensification. At the collective level, hatred justifies aggression, fosters the dehumanization of the adversary, and weakens moral inhibitions. In this context, public discourse plays an essential role in activating and maintaining collective emotions. Specific forms of communication such as fear speech and hate speech transform fear and anger into instruments of social mobilization. Fear speech amplifies perceptions of threat, while hate speech stabilizes hostility and legitimizes the perpetuation of violence. Shame and humiliation may fuel resentment and revenge, contributing to the escalation of tensions and conflicts.

In conclusion, collective emotions function as genuine psychological mechanisms that activate conflicts, while collective memory contributes to maintaining a conflict-oriented perspective on reality.

Keywords: conflict, collective emotions, emotional climate, fear speech, hate speech.

ROLUL EMOȚIILOR COLECTIVE ÎN DECLANȘAREA ȘI MENȚINEREA CONFLICTELOR

Abstract

În literatura contemporană de specialitate privind studiul dinamicii conflictelor sociale și politice, emoțiile colective sunt considerate veritabile mecanisme ce influențează atât declanșarea, cât și perpetuarea acestora. Nu mai sunt privite ca simple reacții la evenimentele din mediul înconjurător, ci ca forțe active care modelează comportamentele colective, discursul public și deciziile politice. Emoțiile primare, universale precum frica, furia, rușinea și corespunzător ura, resentimentele și răzbunarea transcend experiențele personale și devin saliente la nivel de grup, accentuând identitățile sociale și naționale.

În faza incipientă a conflictelor, frica joacă un rol declanșator major, amplificând percepția pericolului și facilitând acceptarea unor măsuri radicale, inclusiv violența. Dacă frica declanșează conflictul, furia și ura contribuie la intensificarea acestuia. La nivel colectiv, ura justifică agresiunea, determină dezumanizarea adversarului și reduce inhibițiile morale. În acest context, discursul public joacă un rol esențial în activarea și menținerea emoțiilor colective. Astfel, forme specifice de comunicare precum fear speech și hate speech transformă frica și furia în instrumente de mobilizare socială. Fear speech amplifică percepția pericolului, în timp ce hate speech stabilizează ostilitatea și justifică perpetuarea violenței. Rușinea și umilința pot alimenta resentimentele și răzbunarea, contribuind la escaladarea tensiunilor și conflictelor.

În concluzie, emoțiile colective funcționează ca veritabile mecanisme psihologice activatoare ale conflictelor, în timp ce memoria colectivă contribuie la menținerea unei perspective conflictuale asupra realității.
Cuvinte-cheie: conflict, emoții colective, climat emoțional, discurs instigator la frică, discurs instigator la ură.

Introduction. Social and political conflicts represent one of the most difficult problems of contemporary society. On a large scale, they involve extensive violence and profoundly affect the well-being of the individuals involved, while simultaneously hindering the development of societies as a whole. In such conflicts, beyond the immediate costs associated with the loss of human lives, individuals feel compelled to sacrifice their own interests in favor of the conflict, while society pays a high price in economic, educational, and social terms.

Materials applied. Numerous studies [3; 8] have demonstrated that even societies involved for long periods in violent conflicts highly value the concept of peace (even if only at an abstract level) and declare that they would do "whatever is necessary" to promote it. They are willing to make certain concessions, yet they lack confidence that such concessions would lead to the resolution of conflicts and the reduction of violence. They do not trust their adversaries, believing that they will not abandon their immoral and aggressive behavior, and they fear that such concessions would place them in a position of risk and vulnerability, including the fear of being perceived as assuming responsibility for events in the history of the conflict considered immoral.

Eran Halperin [9] describes all these processes (which he considers fundamental barriers to peacebuilding and conflict resolution) as emotional phenomena because they synthesize the fundamental beliefs and evaluations of societies involved in conflict, as well as the central political motivations implied by these evaluations. When evaluations and motivations are accompanied by intense affective experiences characteristic of violent conflicts, they generate extremely negative emotions that adversely affect the likelihood of promoting peace. Thus, people who experience fear are motivated to avoid risks of any kind and become reluctant toward new peace initiatives or ideas. For those dominated by hatred, there is no genuine reason to initiate negotiations or make compromises, because they do not truly believe that such political actions can significantly change the behavior or destructive intentions of the opposing group. Finally, anger may sometimes motivate people to respond aggressively even to seemingly constructive signals coming from their enemies.

Discussions and results obtained. **I. Transitional Contexts and Emotional Climate: The Basis for the Outbreak and Maintenance of Conflicts**. Just as individuals may be characterized by a dominant emotion, societies may also develop collective emotional orientations that influence how their members perceive social reality, interpret events, and react to situations of tension or threat. Collective emotions are not merely accumulations of individual emotions, but rather constitute genuine shared affective frameworks that shape social and political behavior. The first studies on how collective emotions are generated were conducted in 1992 by Joseph de Rivera, who focused on the contexts in which they emerge, emphasizing the distinction between emotional atmosphere, emotional culture, and emotional climate [15]. Building on these contributions, Daniel Bar-Tal proposed the concept of collective emotional orientation (the characteristic tendency of a society to express a particular emotion) and highlighted the behavioral implications of collective emotions in conflict situations, arguing that the most important factor influencing their formation is context [1]. The author emphasizes that collective emotions have major behavioral implications, especially in conflict situations, because they influ-

ence the way individuals interpret the actions of opposing groups, evaluate threats, and justify their own reactions. From this perspective, collective emotions become central components of the social ethos of conflict, contributing to the construction of shared representations regarding danger, victimization, security, or legitimacy.

Focusing specifically on social contexts, Daniel Bar-Tal et al. distinguish between enduring cultural contexts, which form the basis of what may be called emotional culture, and transitional contexts, which emerge as a result of specific socio-political structural relations within a society, major events, or significant information, thereby constituting the basis of emotional climates [3]. Unlike emotional culture, which implies a certain stability and continuity over time, emotional climate is more flexible and sensitive to contextual changes, undergoing rapid transformations during periods of crisis, instability, and conflict.

Daniel Bar-Tal considers transitional context to be responsible for the outbreak and maintenance of conflicts, defining it as the set of relatively temporary physical, social, political, economic, military, and psychological conditions that form the environment in which individuals and collectivities function [2]. Transitional contexts include protracted conflicts, wars, revolutions, totalitarian regimes, information concerning major threats, and peace processes, while excluding events or sets of information with limited emotional impact. Thus, transitional context is not merely the passive background of social interactions, but an active element that shapes collective perceptions and reactions. From this perspective, psychological conditions—an integral part of the societal environment—are perceived and evaluated, generating specific emotional reactions that, in turn, lead to the emergence of particular behaviors.

The context constructed by people may possess either negative or positive characteristics, generating primarily negative or positive beliefs, attitudes, and emotions. Negative contexts may be threatening, stressful, or unjust, whereas positive contexts may be peaceful and harmonious. The former generate beliefs associated with insecurity and distrust, as well as emotions such as anger, hatred, and fear. The latter foster beliefs associated with security and trust, together with calmness and hope.

Taking into account the negative–positive asymmetry (negativity effect) [13] in reality appraisal and decision-making, negative information (compared to positive information) tends to be more coherent, more carefully analyzed, and better remembered, thereby exerting a stronger influence on analytical processes and behavioral orientations. This tendency reflects adaptive behavior, because negative information, especially information related to threats, may require rapid adjustment to new situations.

Overall, the way temporary social contexts are configured directly influences the type of collective emotional reactions and the direction of the resulting behaviors. Transitional context not only facilitates the emergence of collective emotions, but also contributes to their stabilization, transforming them into central components of a society's emotional climate. Within this framework, the study of negative emotions becomes essential for understanding the psychological and social mechanisms underlying the emergence, intensification, and persistence of conflicts, as well as for explaining how these emotions influence discourse, intergroup relations, and processes of social polarization.

II. Conflict-Specific Negative Emotions: Anger, Fear and Hatred. In the analysis of social and intergroup conflicts, understanding the emotional dimension represents an essential element in explaining their dynamics. Emotions are not merely individual reactions to external stimuli; they may also become structured at the collective level, influencing group perceptions, decisions, and behaviors. In particular, fundamental negative

emotions such as fear, anger, and hatred play a central role in shaping the ways individuals and societies interpret threats and respond to them. In this context, the analysis of these emotions offers a relevant perspective on the psychological mechanisms underlying the outbreak, escalation, and maintenance of conflicts.

Anger and fear are fundamental, primary, and universal emotions. They are among the earliest emotions to emerge in human phylogenetic evolution and have enabled human survival. They arise in situations of perceived threat and danger, allowing individuals and societies to respond adaptively. Reactions of anger or fear may be triggered by conscious evaluations of transitional contexts, but they may also be activated automatically, enabling unconscious processing.

In societies involved in conflicts, fear becomes amplified: for most individuals, fear turns into a permanent state of mind that dominates the ways they feel, think, act, and make decisions. Unlike anger, which is the most frequent emotional reaction in conflicts [9], fear is the strongest and most dominant emotion in the long term. While anger functions as the internal engine that motivates aggressive reactions, fear overwhelms the individual's entire psychic life, paralyzing actions and behaviors.

People are exposed, directly or indirectly (especially through omnipresent social media networks), to traumatic experiences. Consequently, fear is no longer vague or abstract, but becomes an integral part of everyday life—it gradually infiltrates and comes to dominate the individual's entire existence. Anxiety levels increase, feelings of safety diminish, and subjective insecurity intensifies. At the same time, a chronic and diffuse sense of victimization emerges, referred to as a "perpetual orientation of victimhood" — the belief that individuals are constantly victims persecuted by various enemies [20].

The cognitive element underlying the experience of fear is the perception of threat, while the functional role of this negative emotion is to prepare individuals for the worst possible scenario. People become hypersensitive to any cues signaling danger, emotional polarization intensifies, and fear becomes excessive, leading to a constant state of readiness for self-defense. Moreover, perceived symbolic threats (threats directed at personal values) represent some of the strongest predictors of conflict emergence.

Anger constitutes the ideal and most adaptive emotional reaction to provocations coming from an opposing group. It provides the energy necessary for retaliation while, at the same time, not entirely excluding the possibility of improvement or positive change (as hatred and contempt do).

Consequently, within the vicious cycle in which perceived provocations lead to violence and violence, in turn, generates new provocations, anger may be regarded as the "emotional fuel" that keeps this mechanism functioning at maximum intensity. According to this perspective, angry individuals attribute unjust or immoral behaviors to the opposing group, believe that urgent action is necessary to correct these perceived injustices, and consider their own group capable of initiating such corrective action [11].

In other words, anger not only motivates action, but also "rewrites" the way people evaluate risks and possible outcomes of confrontation, making aggressive actions appear more justified, safer, and more effective.

A collective orientation of fear or anger deeply penetrates the psychological structure of members of society and becomes linked to a social ethos of conflict [4]. The main problem with these two negative emotions is their stability, which may persist beyond changes in transitional contexts. At the same time, collective orientations of fear and anger tend to narrow the perspectives of society's members, linking the present to past conflict-related experiences and constructing expectations regarding the future exclu-

sively on the basis of the past [10]. Furthermore, they generate high levels of distrust and delegitimization of the adversary. Finally, collective orientations of fear and anger constitute major platforms for violence. A society dominated by fear or anger tends to react through confrontation when faced with conditions perceived as threatening.

Hatred is an extreme and enduring socially constructed negative emotion directed toward an individual or group and condemning that individual or group in a fundamental and totalizing manner [6; 7]. It is one of the most important emotions because it significantly affects people's ability to "judge clearly". In the literature, hatred is described as the most destructive affective phenomenon in the history of human nature [16].

In contexts of protracted intergroup conflict, hatred reduces public support for compromises intended to resolve the conflict, even beyond the effects of other negative emotions. In addition, hatred increases support for aggressive actions directed against the opposing group. More than that, it may even drive people to participate in massacres. Therefore, hatred contributes massively to the escalation and maintenance of long-term conflicts and represents a powerful barrier to conflict resolution.

An interesting aspect of hatred, which makes it particularly susceptible to becoming a collective emotion, is the fact that it does not require personal interaction or direct acquaintance between the hater and the hated group. The absence of interaction with the targets of hatred may even intensify it, because it reduces the likelihood of perspective-taking—the lack of direct interaction amplifies hatred because negative evaluations regarding the malicious character of the group are no longer reassessed [6].

Thus, emotions such as fear, anger, and hatred not only reflect reactions to conflictual contexts, but actively contribute to shaping and perpetuating them at both the individual and collective levels. Through their stability and their capacity to influence perceptions, evaluations, and behaviors, these emotions become central factors in the dynamics of protracted conflicts. In this sense, understanding their role is essential for explaining the mechanisms through which conflicts intensify and persist over time.

III. From Negative Emotions to Discursive Mechanisms of Conflict: Hate Speech and Fear Speech. Continuing the analysis of the role of negative emotions in conflict dynamics, it becomes essential to explore how these emotions are expressed and amplified at the discursive level. Emotions such as fear, anger, and hatred do not remain mere psychological reactions, but are transformed into instruments of social influence capable of structuring collective perceptions, legitimizing hostility, and directing group action in tense contexts.

In this regard, the concepts of hate speech and fear speech provide a relevant framework for understanding how discourse may both reflect and shape these emotions, contributing to the consolidation of threat perceptions, social polarization, and the escalation of intergroup conflicts.

Hate speech emerges as a central mechanism in the production and intensification of intergroup conflicts. Beyond its expressive dimension, hate speech contributes to redefining social norms through the banalization and normalization of hostility. The literature indicates that repeated exposure to such discourse is associated with higher levels of prejudice and increased acceptance of discriminatory expressions [22]. This process not only reflects existing divisions, but deepens them, transforming social differences into increasingly rigid lines of conflict.

Moreover, hate speech produces structural effects on conflict dynamics by inhibiting participation and reducing the space for dialogue. In line with the Spiral of Silence

Theory, exposure to hostile discourse may generate a climate of insecurity that leads individuals to withdraw from the public sphere and avoid expressing their opinions [23]. These mechanisms contribute to the marginalization of critical voices and the radicalization of dominant discourse, facilitating the reproduction of polarization [18]. Under such conditions, conflict becomes increasingly non-negotiable, fueled by simplified and antagonistic perceptions of social reality.

Furthermore, replacing legitimate criticism with forms of hostile discourse affects not only intergroup relations, but also the quality of social deliberation. Studies show that aggressive discourse contributes to the degradation of public dialogue and to the intensification of processes of adversary delegitimization [12; 14], while simultaneously exerting a disproportionate impact on certain social categories, such as women and minorities [24].

From a broader perspective, hate speech functions as a catalyst for collective mobilization around conflictual narratives. It contributes to strengthening intragroup solidarity and reinforcing symbolic boundaries between "us" and "them," generating mechanisms of conformity and social sanctioning [19]. In this way, hostile discourse becomes an integral part of collective dynamics that sustain and reproduce conflict.

Complementarily, the concept of fear speech provides an essential explanatory framework for understanding how fear is discursively mobilized. The initial definition proposed by Antoine Buyse emphasizes that this type of discourse aims to induce existential fear toward a group perceived as threatening, actively contributing to the construction of social reality [5]. Unlike hate speech, which mobilizes through direct hostility, fear speech legitimizes defensive or aggressive reactions through appeals to fear and may therefore play an even more powerful role in conflict escalation.

Subsequent research has shown that fear-based discourses are often subtler and less explicitly aggressive, which grants them greater credibility and facilitates their social acceptance [17]. By constructing simplified and emotionally persuasive narratives of threat, such discourses amplify perceptions of insecurity and contribute to heightened social polarization, with effects that may extend beyond the discursive level and influence collective behavior [17]. At the same time, their seemingly legitimate character, grounded in appeals to security or protection, makes them more difficult to challenge and easier to internalize [21].

Overall, hate speech and fear speech cannot be reduced to simple forms of expressing negative emotions, but must instead be understood as central mechanisms of conflict. They transform emotions into resources for mobilization, reinforce symbolic boundaries between groups, and reduce opportunities for dialogue and reconciliation. In this sense, these forms of discourse not only reflect conflict, but actively contribute to its production, intensification, and maintenance within the social structure.

Conclusions. The analysis of negative emotions highlights the fact that they do not merely represent reactions to conflict situations, but active mechanisms that shape collective perceptions, decisions, and behaviors. Emotions such as fear, anger, and hatred function as interpretative filters of social reality, simplifying its complexity and fostering antagonistic representations of intergroup relations. Through their stability and capacity to become sedimented at the collective level, these emotions contribute to the maintenance and reproduction of conflicts over time.

Within this framework, discourse plays a central role by transforming emotions into resources for social action. Hate speech and fear speech not only reflect existing tensions, but also amplify and legitimize them, facilitating polarization and the delegitimization of the adversary. While hate speech produces direct exclusion, fear speech con-

structs perceptions of threat that justify defensive or aggressive reactions. Together, they contribute to the escalation of conflicts and to the reduction of possibilities for dialogue and reconciliation.

Beyond its explanatory value, this perspective has essential implications for peacebuilding efforts. Understanding the role of emotions and discourse demonstrates that interventions cannot be limited to rational or institutional dimensions alone, but must also target the transformation of the emotional and discursive frameworks within which conflict develops. Reducing polarization, promoting alternative narratives, and developing forms of communication that diminish perceptions of threat thus become central components of intervention strategies.

Therefore, peace cannot be conceived exclusively as the absence of conflict, but rather as an active process of reconfiguring the emotions and discourses that sustain it. An integrated approach that takes these dimensions into account offers not only a deeper understanding of contemporary conflicts, but also concrete directions for limiting their escalation and facilitating sustainable processes of dialogue, cooperation, and reconciliation.

THE PRINCIPLE OF LEGALITY AS A PREMISE FOR CRIME PREVENTION: LANDMARKS FROM ECHR CASE-LAW AND IMPLICATIONS FOR THE REPUBLIC OF MOLDOVA

Elena PÎRĂU,
PhD Candidate,
Moldova State University,
Legal Adviser, Office of the Vice President,
Parliament of the Republic of Moldova
ORCID: 0009-0002-3155-4826

Abstract

This article examines the principle of legality in criminal law, highlighting its essential role in crime prevention. The study proceeds from the premise that the effectiveness of the preventive function of criminal law depends not only on the mere existence of a criminal prohibition, but also on the quality of criminal-law provisions, particularly in terms of clarity and foreseeability. It demonstrates how the requirements inherent in the principle of legality help guide individual conduct and reduce the risk of arbitrary interpretation and application of criminal-law provisions.

The analysis is based on relevant legal scholarship, examined in conjunction with the case-law of the European Court of Human Rights and that of the Constitutional Court of the Republic of Moldova. The findings show that ambiguous, contradictory or excessively broad criminal-law provisions undermine legal certainty, encourage inconsistent practices and diminish the capacity of criminal law to secure voluntary compliance with legal requirements. The article concludes that the principle of legality constitutes not only a safeguard against arbitrary enforcement, but also an indispensable condition for the effective fulfillment of the preventive function of criminal law.

Keywords: principle of legality, criminalisation, foreseeability, legal certainty, crime prevention, arbitrary interpretation, quality of criminal-law provisions.

PRINCIPIUL LEGALITĂȚII CA PREMISĂ A PREVENIRII CRIMINALITĂȚII: REPERE JURIDICE DIN JURISPRUDENȚA CEDO ȘI IMPLICAȚII PENTRU REPUBLICA MOLDOVA

Abstract

Prezentul articol analizează principiul legalității în dreptul penal, evidențiind rolul esențial al acestuia în prevenirea criminalității. Studiul pornește de la premisa că eficiența funcției preventive a dreptului penal depinde nu doar de existența interdicției legale, ci și de calitatea normei de incriminare, în special sub aspectul clarității și previzibilității acesteia. Cercetarea relevă modul în care exigențele principiului legalității contribuie la orientarea conduitei persoanei și la reducerea riscului de interpretare și aplicare arbitrară a normelor de incriminare.

Analiza este realizată prin valorificarea doctrinei de specialitate, în coroborare cu jurisprudența Curții Europene a Drepturilor Omului și cu jurisprudența constituțională a Republicii Moldova. Rezultatele evidențiază că normele penale ambigue, contradictorii sau excesiv de generale afectează securitatea juridică, favorizează practici neuniforme și diminuează capacitatea dreptului penal de a asigura conformarea voluntară la exigențele legii. Astfel, principiul legalității constituie nu doar o garanție împotriva arbitrariului represiv, ci și o condiție indispensabilă pentru realizarea efectivă a funcției preventive a dreptului penal.

Cuvinte-cheie: principiul legalității, incriminare, previzibilitate, securitate juridică, prevenirea criminalității, interpretare arbitrară, calitatea normei.

Introduction. The principle of legality occupies a central place among the fundamental principles of criminal law and is enshrined in international and regional human rights instruments, as well as in the domestic legal order [1, p.11]. In criminal matters, this principle requires that the criminalisation of conduct, the establishment of sanctions and the imposition of criminal liability be based exclusively on legal provisions that are accessible, clear and foreseeable, thereby protecting individuals against the arbitrary application of criminal law.

In legal scholarship, the principle of legality is generally examined in relation to the requirements inherent in the formula *nullum crimen, nulla poena sine lege*, namely the prohibition of the retroactive application of a more severe criminal law, the prohibition of analogy to the detriment of the individual, and the requirement that criminal offences and sanctions be defined with sufficient precision [1, p. 11]. From this perspective, legality represents not only a safeguard against arbitrary enforcement, but also the normative framework within which criminal law may guide conduct and require compliance with legally prescribed standards.

This article examines the relationship between the principle of legality and the preventive function of criminal law, drawing on relevant legal scholarship, the case-law of the European Court of Human Rights concerning Article 7 of the European Convention on Human Rights [2], and the case-law of the Constitutional Court of the Republic of Moldova. The central thesis advanced is that the principle of legality does not, in itself, ensure crime prevention, but constitutes an essential normative premise for achieving it. The study's original contribution lies in analysing the principle of legality not only as a safeguard against arbitrariness, but also as a normative premise for crime prevention.

Methods and materials applied. The present research examines the relationship between the principle of legality and the preventive function of criminal law, proceeding from the hypothesis that crime prevention does not depend exclusively on the existence of a criminal prohibition, but also on the quality of the criminal-law provision, particularly in terms of its accessibility, clarity and foreseeability.

From a methodological standpoint, the study is predominantly doctrinal and qualitative in nature. First, relevant legal literature was analysed in order to identify the main theoretical approaches to the principle of legality, legal certainty and the conduct-guiding function performed by criminal law. This stage made it possible to delineate the conceptual framework necessary for examining the relationship between the requirements of legality and the prevention of crime.

Secondly, the legal-logical method was applied to analyse the requirements deriving from the principle of legality in criminal matters, in particular the requirements of accessibility, clarity, precision and foreseeability of criminal-law provisions. At the same time, the synthetic method was used to integrate these requirements into the broader set of guarantees specific to the rule of law and to highlight their connection with legal certainty and the limits of legal interpretation in criminal matters.

The analysis of the case-law of the European Court of Human Rights and of the Constitutional Court of the Republic of Moldova occupies a central place in the research. The judgments were selected according to substantive criteria, namely their relevance to the interpretation of Article 7 of the European Convention on Human Rights, to the standards concerning the quality of criminal law, and to the permissible limits of judicial interpretation in criminal matters. Particular attention was given to judgments that directly illustrate the relationship between the foreseeability of criminal law, legal certainty, and the risk of arbitrariness in the application of the law.

Relevant domestic legislation was also analysed, in particular constitutional provisions, provisions of the Criminal Code and Law No.100/2017 on Normative Acts, in order to assess the extent to which the standards developed in European case-law are reflected in the domestic legal framework.

The argument proceeds from the clarification of the theoretical foundations of the principle of legality, through the identification of jurisprudential standards concerning the accessibility and foreseeability of criminal law, to the assessment of their implications for the capacity of criminal law to guide individual conduct and, ultimately, to contribute to the prevention of crime.

Discussions and results obtained. **I. Crime Prevention as a Purpose of Criminal Law and the Legality Requirements Governing Criminal-Law Provisions**. Crime prevention constitutes one of the essential purposes of criminal law, alongside the protection of fundamental social values and the maintenance of the legal order. From this perspective, criminal intervention is aimed not only at responding to offences already committed, but also at preventing the commission of new offences, both through general prevention and by preventing reoffending by convicted persons.

In the law of the Republic of Moldova, this preventive dimension has an explicit normative basis. Thus, the Criminal Code [3] provides that criminal law also aims to prevent the commission of new offences, while punishment is directed not only towards the restoration of social equity and the correction and resocialisation of the convicted person, but also towards preventing the commission of new offences both by the convicted person and by others. Consequently, prevention must be understood not as an external aim of criminal law, but as one of its inherent purposes [4, p.79].

However, this purpose can be achieved only in compliance with the requirements of the principle of legality at the constitutional level and under the Convention. Crime prevention must therefore be pursued in accordance with the requirements deriving from Article 22 and Article 23(2) of the Constitution of the Republic of Moldova [5], as well as from Article 7 of the European Convention on Human Rights [2]. Therefore, the criminal-law response cannot be assessed solely in terms of its social utility, but must also be evaluated in light of the quality of the criminal-law provision on which it is based.

From this perspective, a criminal-law provision can contribute to crime prevention only if it is sufficiently clear, accessible and foreseeable to provide individuals subject to criminal law with a sufficiently precise normative framework. In the absence of a clear, accessible and foreseeable provision, the capacity of criminal law to guide conduct is weakened, while the risk of arbitrary application increases.

II. The Principle of Legality and the Law's Conduct-Guiding Function. At the theoretical level, the connection between the principle of legality and the conduct-guiding function of law is supported by Lon L. Fuller's conception of the "internal morality of law" [6, pp.102-103]. Fuller argues that law can fulfill this function only if its rules are formulated and applied in such a way that they can be known and followed by their addressees. In this respect, the generality, clarity and stability of criminal-law provisions, together with the congruence between the text of the law and its application, are not merely requirements of legislative drafting, but conditions for the effective functioning of law.

In the context of criminal law, this approach shows that the preventive effectiveness of criminalisation does not depend solely on the existence of a sanction, but presupposes the real possibility for individuals to adjust their conduct in accordance with the requirements of the law. Insofar as the criminal prohibition is formulated with sufficient precision, the addressees of the provision can identify the limits between lawful and un-

lawful conduct and regulate their behaviour accordingly. Conversely, where the content of the criminal prohibition remains uncertain, the conduct-guiding function of the law is undermined, and voluntary compliance with the requirements of the legal order becomes more difficult to achieve.

In a complementary manner, Herbert L. Packer [7, pp.261-262] emphasises that the effectiveness of criminal law does not depend on the continuous expansion of criminalisation, but on the rational and justified use of criminal sanctions. Although his reflections primarily concern the limits of criminal intervention, they are also relevant to the principle of legality, since they show that criminal intervention preserves its preventive effectiveness only when it is reserved for sufficiently serious conduct and applied on the basis of culpability [7, pp.364-366].

This perspective is also reflected in the constitutional jurisprudence of the Republic of Moldova. In Judgment No.27 of 21 September 2017 [8], the Constitutional Court held that the criminalisation of conduct and the establishment of criminal penalties are grounded in the legislature's criminal policy choices. However, such choices must be exercised in compliance with the requirements of clarity, precision and foreseeability of criminal-law provisions. The Court also stressed, in line with the case-law of the European Court of Human Rights, that the requirement of clarity of the law is satisfied where the person concerned can ascertain from the text of the law, if necessary supplemented by judicial interpretation and appropriate legal assistance, the prohibited conduct and the consequences of non-compliance.

In the same vein, in Judgment No.2 of 30 January 2018 [9], although outside the criminal-law sphere, the Constitutional Court reiterated that the law must regulate in a coherent manner, avoid legislative ambiguity and comply with the requirements of clarity and foreseeability. The Court further held that the lack of any possibility of individualising the sanction, the ambiguity as to its nature and the imprecision of the relevant provision generate legal uncertainty and affect the individual's ability to adapt their conduct and foresee the legal consequences of their behaviour. These findings are relevant, *mutatis mutandis*, to the analysis of legality in criminal matters.

III. Accessibility and Foreseeability of Criminal Law as Requirements of Crime Prevention. The accessibility of criminal law requires that criminal-law provisions be duly published and capable of being known by their addressees. In the legal order of the Republic of Moldova, this requirement derives from the State's obligation to publish normative acts and from the rule according to which a law produces effects only after its official publication. Moreover, Law No.100/2017 on Normative Acts [10] lays down requirements concerning the transparency, publicity and systematisation of regulations. Consequently, accessibility is not merely a formal requirement, but constitutes the minimum condition for criminal-law provisions to be known and taken into account by individuals in guiding their conduct.

Foreseeability concerns the substantive quality of criminal-law provisions. A law is foreseeable where individuals are able to understand what conduct is prohibited and what legal consequences may result from its breach. For the purposes of Article 7 of the European Convention on Human Rights, the formal existence of a legal provision is not sufficient. The law must also satisfy qualitative requirements, among which clarity and foreseeability occupy a central place [11, p.7]. In criminal matters, these requirements are essential, since a foreseeable provision enables individuals to adapt their conduct in accordance with the requirements of the law.

At the same time, case-law plays a role in clarifying and applying criminal-law pro-

visions, but it cannot replace the law or extend the scope of criminal liability beyond the limits of the legal text. The definition of criminal offences and penalties remains the responsibility of the legislature, while judicial interpretation is admissible only insofar as it remains coherent and foreseeable. Likewise, Law No.100/2017 on Normative Acts [10] requires legal provisions to be drafted in clear, simple and precise language, so as to exclude ambiguity and ensure the coherence and foreseeability of the legal framework.

For this reason, the prohibition of extensive interpretation to the detriment of the individual and the prohibition of applying criminal law by analogy constitute essential safeguards of the principle of legality. Consequently, the accessibility and foreseeability of criminal law are not merely requirements of legislative drafting, but also requirements of legal certainty and prerequisites for the legitimate application of criminal law.

IV. ECHR case-law. The case-law of the European Court of Human Rights is of central importance for understanding the content of the principle of legality in criminal matters, particularly as regards the requirement of foreseeability of the law and the limits of judicial interpretation. From the perspective of Article 7 of the Convention, it is not sufficient for criminal liability to have a formal basis in a legal text. The provision must also enable the individual to determine, to a reasonable degree, what conduct is prohibited and what legal consequences his or her conduct may entail.

Several relevant criteria may be derived from this case-law for assessing the compatibility of the application of criminal law with the requirements of Article 7 of the Convention. Thus, foreseeability does not require absolute precision of the criminal norm, but it does require the legal text to be formulated with sufficient clarity to enable the individual, if necessary, with the assistance of judicial interpretation and specialised legal advice, to understand the scope of prohibited conduct and the legal risk associated with it. Foreseeability is therefore assessed not in the abstract, but by reference to the text of the law, the legal context, and the manner in which it may reasonably be understood by the addressees of the law.

The Court recognises that judicial interpretation plays a necessary role in the application of criminal law, since legal provisions may require, to some extent, clarification and development through case-law. However, such judicial development is admissible only insofar as it remains consistent with the substance of the offence and reasonably foreseeable to the person concerned. In other words, courts may clarify the meaning of the law, but they may not transform interpretation into a means of extending criminal liability beyond what reasonably follows from the statutory text.

Article 7 of the Convention prohibits not only the retroactive application of a more severe criminal law, but also judicial interpretations that, in substance, result in an extensive or analogical application to the detriment of the individual. Where the meaning attributed to a provision through case-law exceeds the limits which the addressees of the law could reasonably have anticipated, the application of criminal law becomes incompatible with the principle of legality. From this perspective, the line between permissible interpretation and interpretation incompatible with Article 7 is determined by the foreseeable and gradual character of the interpretation and by its fidelity to the logic of the legal text.

Thus, in *Tristan v. the Republic of Moldova* [12], the Court found a violation of Article 7 because the national courts treated as equivalent two distinct legal concepts relating to the legal status relevant to the offence, without sufficient justification and without such an approach being reasonably foreseeable to the applicant. This case demonstrates that foreseeability concerns not only the wording of the legal text, but also the way in which it

is interpreted and applied in practice.

In *Del Río Prada v. Spain* [13], the Court emphasised that a judicial change in the rules governing the execution of a sentence, applied retroactively, may breach Article 7 where it produces consequences that could not reasonably have been foreseen by the convicted person. The judgment shows that the requirement of foreseeability is not limited to the moment of criminalisation but also concerns the subsequent application of criminal and penal-execution rules where they affect the actual scope or duration of the punishment.

Similarly, in *Yüksel Yalçınkaya v. Türkiye* [14], the Court reaffirmed that judicial interpretation cannot lead to an unforeseeable extension of criminal liability. Courts may not, under the guise of interpretation, create or extend criminal liability in a manner that was not sufficiently identifiable in the applicable law at the time when the acts were committed. What the Court censures is not judicial interpretation as such, but its unforeseeable character and its departure from the reasonable meaning of the provision and from the constituent elements of the offence.

By contrast, in *Jidic v. Romania* [15], the Court held that judicial interpretation remains compatible with Article 7 where it is based on a genuine analysis of the applicable legal framework, is supported by coherent reasoning and falls within the limits of what could reasonably have been foreseen by the person concerned. This judgment confirms that Article 7 does not preclude the evolution of case-law, but only an evolution that unexpectedly and adversely alters the content of the criminal-law provision.

The case-law of the European Court of Human Rights, therefore, provides a framework for assessing the compatibility of the application of criminal law with the principle of legality. This framework is built around three elements: the existence of an accessible and sufficiently clear legal basis, the reasonably foreseeable character of judicial interpretation, and the prohibition of extending criminal liability through extensive interpretation or analogy to the detriment of the individual.

These criteria are particularly relevant for the Republic of Moldova, as they provide a concrete framework for assessing the quality of criminal-law provisions in national judicial practice. Only insofar as criminalisation and its interpretation comply with these requirements can criminal law function as a genuine guide to conduct and legitimately contribute to the prevention of crime.

V. The impact of unclear criminal-law provisions on crime prevention. The lack of clarity of a criminal-law provision primarily affects its ability to guide individual conduct and to ensure legal certainty. To the extent that a criminal-law provision is vague, ambiguous or contradictory, the addressees of the law cannot determine with sufficient certainty what conduct is prohibited and what legal consequences may arise from a breach of the law. In such circumstances, criminal law loses part of its capacity to function as a genuine standard of conduct, and individuals can no longer organise their behaviour by reference to stable and intelligible normative benchmarks.

Secondly, unclear criminal law encourages divergent interpretation in the process of law enforcement and broadens the sphere of discretion of the authorities called upon to apply it. Where the legal text is insufficiently precise, the same act may receive different legal classifications depending on the manner in which it is understood by criminal investigation authorities or by the courts. Such a situation undermines the uniform application of the law and reduces the individual's ability to foresee the legal consequences of his or her conduct.

A relevant example in the Republic of Moldova is provided by the case-law concerning the application of Article 166[1] of the Criminal Code on torture, inhuman or degrading

treatment. In the appeal in the interest of the law examined on 3 February 2022, the Supreme Court of Justice was called upon to address the non-uniform interpretation and application of these provisions in cases involving teaching staff. According to one line of case-law, teachers in public educational institutions could not be regarded as special subjects of criminal liability under Article 166[1] of the Criminal Code, on the ground that they did not act as public officials or as persons acting in an official capacity. According to a second line of case-law, the same professional category was recognised as capable of meeting the requirements of a special subject of the offence, on the basis that teaching staff exercise functions connected with the implementation of State policy in the field of education and have minors under their care and instruction.

This divergence in case-law illustrates the impact that an insufficiently clear criminal-law provision may have on the foreseeability of the application of criminal law. The ambiguity concerned, in essence, the scope of the phrase "any other person acting in an official capacity" and the question whether it included teaching staff. In the absence of a sufficiently precise legislative delimitation, the same provision allowed different outcomes to be reached in similar or closely related situations, thereby undermining legal certainty, reducing the ability of the addressees of the law to foresee the legal consequences of their conduct and weakening the conduct-guiding function of criminal law.

Paul Craig [17, p.63] argues that the rule of law serves to enable individuals to organise their lives and conduct in the knowledge of the legal consequences of their actions. He further notes that, in the absence of independent courts, legal certainty is undermined, since individuals can no longer have confidence that the law will be applied faithfully in accordance with both its letter and its spirit.

Lastly, the lack of clarity of criminal-law provisions weakens voluntary compliance with the requirements of the law and undermines public confidence in the administration of justice. Where the application of the law produces divergent or unforeseeable outcomes, State intervention may be perceived as unequal or arbitrary, thereby diminishing both the normative authority of criminal law and the individual's willingness to comply with it.

VI. Implications for Crime Prevention in the Republic of Moldova. The results of the analysis highlight the need for more rigorous criminal-law drafting in the Republic of Moldova. Criminal-law provisions must be drafted in a clear, coherent and sufficiently precise manner so as to enable the exact identification of prohibited conduct and to avoid overlaps or contradictions between legal provisions. In this regard, the requirements established by Law No.100/2017 on Normative Acts, concerning the clarity, coherence and predictability of regulation, cannot, in the field of criminal law, be regarded merely as rules of legislative drafting, but must be understood as a concrete expression of the principle of legality.

More specifically, high-quality criminal legislation requires the avoidance of the main forms of normative ambiguity. Interpretative difficulties may arise where general or evaluative notions such as "serious", "essential" or "considerable danger" are employed without being accompanied by clear delimitation criteria. Likewise, open-ended formulations, such as "other acts" or "in other ways", may unduly expand the scope of application of the provision, thereby undermining its foreseeability. At the same time, the lack of a precise delineation of the special subject of the offence or the existence of contradictions between provisions contributes to legal uncertainty and hampers the uniform application of the law.

These deficiencies have implications not only at the stage of legislative drafting, but

also in the process of law enforcement. In the absence of sufficiently clear provisions, criminal investigation authorities and courts are compelled to compensate, through interpretation, for the gaps or imprecision of the legal text. This situation may lead to different outcomes in similar cases and may cause the permissible limits of interpretation to be exceeded in criminal matters. Accordingly, compliance with the principle of legality does not consist solely in the existence of criminal-law provisions but also requires their application in a coherent and foreseeable manner.

In Judgment No.22/2018 [18], the Constitutional Court held that the phrase "serious consequences" used in Article 328(3)(d) of the Criminal Code was not defined by law and was not accompanied by substantive criteria capable of delimiting its content. In the absence of such benchmarks, the application of the aggravating circumstance was left to the discretion of the law-enforcement and judicial authorities, which led to inconsistent practice and created the risk of extensive interpretation to the detriment of the individual. Therefore, the issue does not lie in the need to aggravate criminal liability as such, but in the obligation of the legislature to formulate the qualifying element in an explicit, clear and sufficiently precise manner.

The alignment of legislation and national practice with the standards developed in the case-law of the European Court of Human Rights and of the Constitutional Court must be regarded as an essential condition of the rule of law. At the same time, it is necessary to strengthen the professional training of judges, prosecutors and other legal practitioners, particularly with regard to the requirements deriving from Article 7 of the Convention. Lastly, the interpretation of the law must be carried out with caution in order to avoid transforming it into an instrument for the indirect expansion of criminal liability.

Conclusions. The principle of legality constitutes the essential legal framework within which criminal law can legitimately fulfill its preventive function. However, crime prevention cannot be achieved solely through the mere formal expansion of criminal prohibitions. It also requires that such prohibitions be drafted with sufficient precision to allow individuals to ascertain the limits of permissible conduct and the consequences arising from a breach of the law.

For the Republic of Moldova, the research findings highlight the need for increased attention to the quality of criminal-law provisions, both at the stage of legislative drafting and in the processes of legal interpretation and application. A clear and foreseeable criminal law enhances legal certainty, fosters consistency in judicial practice and limits the risk of arbitrariness, thereby contributing to the practical effectiveness of crime prevention policy.

INFLUENCE PEDDLING: A CRITICAL ANALYSIS OF THE REPUBLIC OF MOLDOVA CRIMINAL LAW REGULATIONS IN THE CONTEXT OF EUROPEAN HARMONIZATION

Vitalie MUNTEAN,
PhD Student,
"Ștefan cel Mare" Academy of the Ministry of Internal Affairs,
Senior Investigating Officer,
National Investigations Inspectorate, General Police Inspectorate,
Republic of Moldova
ORCID: 0009-0001-6567-5223

Abstract

This study analyzes the regulation of the offense of influence peddling in the criminal legislation of the Republic of Moldova, focusing on the amendments made in 2024 and the degree of harmonization with international and European standards in the field of combating corruption.

The research analyses the constituent elements of the offense under Article 326 of the Criminal Code of the Republic of Moldova, identifying interpretative and practical difficulties in judicial practice. The study includes a comparative analysis with the regulations in Romania and other EU Member States, as well as with the provisions of international conventions in the field. Gaps in the current normative framework are identified and proposals are formulated for optimizing the mechanism of criminal liability in cases of influence peddling, including in a cross-border context.

***Keywords**: influence peddling, corruption, criminal liability, public official, real or imaginary influence, extended confiscation, European harmonization.*

TRAFICUL DE INFLUENȚĂ: O ANALIZĂ CRITICĂ A REGLEMENTĂRILOR JURIDICO-PENALE DIN REPUBLICA MOLDOVA ÎN CONTEXTUL ARMONIZĂRII EUROPENE

Abstract

Prezentul studiu analizează reglementarea infracțiunii de trafic de influență în legislația penală a Republicii Moldova, cu accent pe modificările operate în anul 2024 și pe gradul de armonizare cu standardele internaționale și europene în materie de combatere a corupției. Cercetarea examinează elemente constitutive ale infracțiunii prevăzute la Art. 326 din Codul penal al Republicii Moldova, identificând dificultățile de interpretare și aplicare în practica judiciară.

Studiul include o analiză comparativă cu reglementările normative din România și din alte state membre ale Uniunii Eropene, precum și a prevederilor convențiilor internaționale în domeniu. Sunt identificate lacune ale cadrului normativ actual și sunt formulate propuneri de lege ferenda pentru optimizarea mecanismului de tragere la răspundere penală pentru traficul de influență, inclusiv în context transfrontalier.

***Cuvinte-cheie**: trafic de influență, corupție, răspundere penală, funcționar public, influență reală sau imaginară, confiscare extinsă, armonizare europeană.*

Introduction. Corruption represents one of the gravest threats to economic development and to citizens› trust in state institutions. In the Republic of Moldova, the phenomenon of corruption has profoundly affected the quality of implementing the reforms necessary for the country›s modernization and European integration. From this perspective, criminal policy plays an essential role within the overall set of anti-corruption measures, and the criminalization of acts of corruption must meet international standards and provide effective tools for combating these criminal manifestations [5; 6; 7].

Influence peddling occupies a special place in the system of corruption offenses, representing a form of corrupting the decision-making circuit through the involvement of an intermediary who claims that they can influence the decision of a public official [12]. As specialty doctrine has emphasized, this offense sanctions the compromising of the impartiality of public authorities and the trading of real or presumed influence over public officials [12, p.345].

It is no coincidence that, in 2024, the body of criminal law norms regarding liability for corruption offenses in the Republic of Moldova underwent modernization, in the context of commitments undertaken through the Association Agreement with the European Union [5] and recommendations from relevant international bodies [8].

The present study proposes an in-depth criminal law investigation of the offense of influence peddling, with the following specific objectives: clarifying the evolution of national and international regulations in the matter; analyzing the constituent elements of the offense provided in Art. 326 of the Criminal Code of the Republic of Moldova (hereinafter CC RM) [1]; examining national judicial practice and identifying difficulties of interpretation; conducting a comparative study with the criminal laws of other states, particularly Romania [2]; formulating *lege ferenda* proposals for improving the existing legal framework.

Discussions and results obtained. The offense of influence peddling has undergone changes in the legislation of the Republic of Moldova, reflecting the constant concern of the legislator to adapt the normative framework to international standards and the dynamics of criminal phenomena [12]. Currently, the act is criminalized in Art. 326 of the Criminal Code of the Republic of Moldova [1], and in 2024 significant amendments were made concerning both the objective element and the sanctioning regime.

The evolution of the regulation has been decisively influenced by the international commitments undertaken by the Republic of Moldova, particularly through the ratification of the Criminal Law Convention on Corruption (Strasbourg, 1999) [6] and the United Nations Convention against Corruption (UNCAC, 2003) [7]. These international instruments impose on States Parties the obligation to criminalize influence peddling in domestic law and to ensure effective, proportionate, and dissuasive sanctions [6, Art.12; 7, Art.18].

In Romanian doctrine, it has been held that the offense of influence peddling presupposes the cumulative fulfillment of several conditions, among which: the existence of real or apparent influence over a public official, the promise to induce the official to adopt a certain conduct, as well as the demanding, receiving, or accepting the promise of money or other benefits [9]. These elements are, in broad terms, also found in the regulation in the Republic of Moldova, but national particularities require a detailed analysis [12].

The Generic Legal Object of the offense of influence peddling consists of social relations relating to the proper conduct of activity in the public sphere, the integrity of public officials, and the prestige of public authorities [12, p.347]. Regarding the special legal object, the offense has a dual structure, protecting *principally* social relations concerning

the correct formation of public decision-making acts, and *subsidiarily* public trust in the impartiality of the administration. It is noteworthy that, unlike bribe-taking where the public official is the perpetrator, in the case of influence peddling the *moral prejudice caused to the image of public authority is potentiated by speculation about "imaginary influence"* – which transforms this offense into a tool for combating apparent corruption, not just real corruption [13, p.210].

The Material Object of the offense consists of the money, valuables, goods, or any other benefits that are the subject of trading influence [2]. According to Art. 291 para. (2) of the Romanian Criminal Code, these goods are subject to confiscation, and if they can no longer be confiscated, confiscation by equivalent is ordered, a measure that ensures the dissuasive character of the sanction. The victim is the state, as the holder of the protected public interests, and in a narrow sense it may be the public authority, public institution, or legal entity within which the public official targeted by the influence carries out their activity [13, p.215].

The Objective Element. The material element of the offense of influence peddling consists of the alternative actions of: a) demanding; b) receiving; c) accepting the promise of money, goods, or other benefits [2]. These actions may be carried out directly by the perpetrator or indirectly, through other persons, as well as for oneself or for another [12, p.350].

An essential requirement of the objective element is the perpetrator's quality as a person who *has influence* or *lets it be believed that they have influence* over a public official [2]. Thus, the legislator opted for a broad configuration of the active subject, including both the situation of real influence and that of imaginary (simulated) influence. As has been noted in specialized literature, this regulation also covers the hypothesis where the person boasts of having connections with an official or does not deny the statements of others regarding the existence of such influence [10].

The perpetrator's promise aims at inducing the public official to perform, not to perform, to expedite, or to delay the performance of an act within their official duties, or to perform an act contrary to these duties [2]. It is important to underline that, for the offense to exist, it is not necessary that the perpetrator actually exercised their influence or that the targeted act was performed. The offense is consummated at the moment of demanding, receiving, or accepting the promise, regardless of the subsequent execution of the promise [12, p.353].

In Romanian judicial practice, it has been held that it is irrelevant whether the perpetrator indicated or not the name of the public official over whom they have influence, it being sufficient to have determined the interested person solely through the quality of the targeted official [10]. This interpretation is also pertinent for judicial practice in the Republic of Moldova, allowing the sanctioning of acts where the influence is described generically, but sufficiently to create the conviction that it can be exercised over a competent official.

The Subjective Element. Subjectively, the offense of influence peddling is committed with direct intent, qualified by purpose. The perpetrator aims to obtain money, goods, or other benefits for oneself or for another, in exchange for the promised influence over the public official. In the case of demanding, direct intent results from the very nature of this action, and in the case of receiving or accepting the promise, the perpetrator has the representation that they are receiving goods or accepting the promise in consideration of the influence they have or claim to have [12, p.355].

The Subject of the Offense is any criminally responsible natural person (who has

reached the age of 16, a general subject). Although influence peddling is frequently committed in the environment of public officials, this quality is not a *sine qua non* condition for retaining Art.326 CC RM. *An important distinction*: if the perpetrator is a public official and peddles influence over *another* official, the act remains influence peddling. If the public official demands money to exercise their *own* duties, the act will be classified as passive corruption (Art. 324 CC RM) [12, p.356].

Comparative Analysis with Romanian Legislation. The Romanian Criminal Code criminalizes influence peddling in Art. 291, with the following content: "*The demanding, receiving, or accepting the promise of money or other benefits, directly or indirectly, for oneself or for another, committed by a person who has influence or lets it be believed that they have influence over a public official and who promises that they will induce them to perform, not to perform, to expedite, or to delay the performance of an act within their official duties, or to perform an act contrary to these duties, shall be punished with imprisonment from 2 to 7 years*" [2].

We observe major similarities with the regulation in the Republic of Moldova, reflecting a common source of inspiration and legislative harmonization efforts in the European space. The main differences concern the sanctioning regime and the configuration of causes for non-punishment. Thus, Art. 292 of the Romanian Criminal Code provides that the perpetrator who gave money or other benefits for buying influence shall not be punished if they report the act before the criminal investigation body has been notified [2]. Similarly, in the criminal legislation of the Republic of Moldova, para. (4) of Article 326 CC RM provides: "The person who promised, offered, or gave goods or services listed in para. (1) is released from criminal liability if they were extorted from them or if the person self-denounced, not knowing that the criminal investigation bodies are aware of the offense they committed".

The essential difference lies in the threshold of application: while in Romania the report must be made *before the notification of the criminal investigation bodies*, in the Republic of Moldova the legal text conditions the release on the lack of knowledge that "*the criminal investigation bodies are aware of the offense*". This latter wording is *more restrictive and harder to prove in practice*, which reduces the incentive for proactive cooperation in the initial phases of the investigation – an aspect that merits review "*de lege ferenda*".

The Constitutional Court of Romania, through Decision No.95/2023, dismissed the exception of unconstitutionality of the provisions of Arts.291 and 292 of the Romanian Criminal Code, holding that the notions of "person who has influence" and "person who lets it be believed that they have influence" are sufficiently clear and foreseeable, and the theoretical and jurisprudential developments from the old regulation retain their validity [9].

From the practice of the Constitutional Court of the Republic of Moldova, Decision No.46 of 14 May 2024 concerning the inadmissibility of referral No.32g/2024 on the exception of unconstitutionality of certain provisions of Article 326 of the Criminal Code (influence peddling) must be highlighted. By the aforementioned decision, the Court decided that: "The referral regarding the exception of unconstitutionality of the text 'followed by the promised influence or the obtaining of the pursued result' in Article 326 para. (2) let. d) of the Criminal Code, as well as of the provisions of Article 326 of the Criminal Code, raised by lawyers Ilie Gîlca and Mihai Garaba, in the interests of Ms. L. G., in case No.1-1332/2022, pending before the Chișinău Court, Buiucani seat, is declared inadmissible".

Relation to International Standards. The Criminal Law Convention on Corruption (Strasbourg, 1999) provides in Article 12 the obligation of States Parties to criminalize influence peddling, defined as "*the promising, offering, or giving, directly or indirectly,*

of any undue advantage to a person who asserts or confirms that s/he is able to exert influence over the decision-making of a public official, in exchange for the exercise of such influence" [6]. Furthermore, the United Nations Convention against Corruption (UNCAC) recommends that States Parties criminalize influence peddling, without however imposing a mandatory obligation in this regard [7, Art.18].

European Directives on combating corruption, although they do not directly target influence peddling, impose high standards of integrity in public administration and protection of the financial interests of the European Union [15]. In the context of the Moldova-EU Association Agreement [5], the Republic of Moldova has assumed the obligation to gradually align its legislation with the EU acquits, including in the field of combating corruption.

Difficulties in Judicial Practice. Judicial practice in the Republic of Moldova reveals a series of difficulties in applying Art.326 CC RM [14]. Among the most frequent problems are:

a) *Proof of real influence or its appearance*: it is often difficult to prove that the perpetrator had the real possibility to influence the official or, in the case of simulated influence, that they created a credible appearance in this regard [12, p.360].

b) *Delimitation from other offenses*: especially from bribe-taking (Art. 324 CC RM) and abuse of power or abuse of office (Art. 327 CC RM). The main distinguishing criterion is the perpetrator's quality as an intermediary and the fact that they do not directly exercise the targeted service duties [12, p.362].

c) *The problem of preparatory acts and attempt*: since the offense is consummated at the moment of the promise to intervene before an official, it is difficult to establish the boundaries between preparatory acts (non-punishable) and attempt [13, p.220].

d) *Evidence in cross-border offenses*: in the context of globalization, many acts of influence peddling involve foreign elements (perpetrators established abroad, goods transferred to offshore accounts, public officials from different states), which raises complex issues of international judicial cooperation [8, p.78].

Conclusion. The research undertaken within this study reveals that the regulation of criminal liability for corruption offenses in the Republic of Moldova has registered significant progress, with an indirect impact also on the applicability of Art. 326 CC RM. These amendments reflect the legislator's concern to adapt the normative framework to international standards and the dynamics of the criminal phenomenon, but the critical analysis carried out demonstrates that there are still multiple aspects that require improvement, both in terms of the content of the incrimination norm and the mechanisms for effective application.

In terms of criminal law theory, the study confirms the structural complexity of the offense of influence peddling, which involves a dual nature: on the one hand, it protects social relations concerning the integrity of public officials and the correctness of the decision-making process, and on the other hand, it sanctions intermediary behaviors that compromise citizens' trust in the act of authority [12; 13]. The broad configuration of the objective element, which includes both real and imaginary influence, represents an adequate legislative solution, as it also covers hypotheses where the perpetrator exploits appearances to obtain undue benefits. However, the lack of clear criteria for evaluating the existence of influence generates difficulties in judicial practice, requiring the intervention of the legislator or the Supreme Court for uniformity of interpretations [14].

The comparative analysis with Romanian legislation [1] and with European standards [6; 7; 15] highlights an evident legislative convergence, but also nuances in the sanc-

tioning regime that may influence the efficiency of combating the phenomenon. Contrary to a mistaken perception, both legislations provide a special cause for non-punishment/ mitigation for the whistleblower (Art. 326 para. (4) CC RM vs. Art. 292 Romanian CC). *The essential difference lies in the threshold of application*: while in Romania the report must be made *before the notification of the criminal investigation bodies*, in the Republic of Moldova the legal text conditions the release on the lack of knowledge that "*the criminal investigation bodies are aware of the offense*". This latter wording is more restrictive and harder to prove in practice, which reduces the incentive for proactive cooperation.

From the perspective of the impact on public security, influence peddling should not be viewed in isolation but as part of a complex criminal ecosystem that includes money laundering [4], tax evasion, and high-level corruption [8]. In a cross-border context, these offenses take on a special dimension, involving transfers of funds to jurisdictions with preferential tax regimes, the use of offshore companies, and opaque corporate structures to conceal beneficial owners. The Financial Action Task Force (FATF) Mutual Evaluation Report of 2023 [8] draws attention to the vulnerabilities of the Republic of Moldova in this area and recommends strengthening mechanisms for international cooperation and automatic exchange of information.

A gap identified following the comparative analysis and correlation with FATF [8] and UNCAC [7] standards consists of the lack of an explicit aggravating circumstance for acts involving a systemic foreign elements (e.g., influence peddled over an international official or the use of offshore jurisdictions for receiving benefits). Although Art. 326 para. (3) provides for the liability of the legal person, the mechanism of extended confiscation remains underutilized in Moldovan judicial practice in cases of influence peddling.

De Lege Ferenda Proposals:

1. **Textual Harmonization with Art. 12 of the Strasbourg Convention**: Introducing explicitly into the text of Art. 326 CC RM the phrase "*directly or indirectly*" in relation to the action of influencing, to unequivocally cover corruption schemes, including those with a transnational dimension, in which the perpetrator claims to be able to influence a foreign public official or an official of an international organization.
2. **Reevaluation of the Cause for Impunity**: Amending para. (4) Art. 326 CC RM to grant the benefit of release from criminal liability also in the situation where the report takes place *before the commencement of criminal prosecution*, regardless of whether the law enforcement body knew or did not know about the commission of the act (the Romanian model). This amendment would exponentially increase the number of self-reports and enhance the efficiency of evidence in mediated corruption cases.

Finally, the harmonization of the legislation of the Republic of Moldova with European Union standards regarding influence peddling is not only an obligation arising from the Association Agreement [5], but an essential condition for consolidating the rule of law, increasing citizens' trust in justice, and ensuring a healthy investment climate. The prompt and effective implementation of the formulated recommendations, corroborated with corruption prevention efforts, can contribute decisively to reducing the negative impact of this phenomenon on national security and to accelerating the European path of the Republic of Moldova.

COMPARATIVE LEGAL ANALYSIS OF THE SOURCES OF CRIMINAL LAW IN FOREIGN COUNTRIES

Alexandru ZOSIM,
PhD, Associate Professor,
Criminal Law and Criminology Department,
"Ștefan cel Mare" Academy of the Ministry of Internal Affairs,
Republic of Moldova
ORCID: 0000-0003-0423-8932

Abstract
The article analyzes the system of sources of criminal law in the Anglo-Saxon and Romano-Germanic legal traditions and mentions the tendencies in the formation of criminal law in certain states.
The topic of the article seems to be relevant, since such a study allows carrying out a wider – through contrast and comparison of existing regulations – study of the advantages and disadvantages of domestic experience in legal regulation and, if necessary, putting forward proposals for borrowing foreign countries' experience. The main specific legal methods are: the comparative legal method and the formal legal method. With regard to the practical plane, the conclusions of the article can become the basis for future changes in the Republic of Moldova.
Keywords: sources of criminal law, legal system, statute, judicial precedent, codified criminal law.

ANALIZA JURIDICO-COMPARATIVĂ A IZVOARELOR DREPTULUI PENAL DIN ȚĂRILE STRĂINE

Abstract
Prezentul articol analizează sistemul izvoarelor dreptului penal din state străine, acestea fiind examinate și caracterizate în contextul familiei de common law (dreptul anglo-saxon), al familiei de drept continental (dreptul romano-german) și al familiei dreptului religios (dreptul musulman). Abordarea comparativă a dreptului penal, inclusiv a izvoarelor acestuia, este necesară pentru elaborarea unor metode eficiente de combatere a criminalității, având în vedere atât experiența națională, cât și cea internațională.
Cuvinte-cheie: izvoarele dreptului penal, sistem juridic, statut, precedent judiciar, lege penală codificată.

Introduction. The criminal law of a state possesses its own particularities, which are determined by the form of government, national and historical development, religious concepts, and the level of legal culture.

The diversity of legal systems, including in the field of criminal-law regulation, allows us to establish the tendencies in the formation of criminal law in certain states, to determine the main sources of criminal law, and to identify the consequences of international cooperation and its influence on the formation of the criminal policies of states. At present, there is a tendency toward the harmonization of legal systems, as a result of which certain sources of criminal law from one legal system are also used in other legal systems.

Within the framework of a comparative legal analysis of the sources of criminal law in foreign countries, we shall characterize these sources and examine them in the context of the common law family — Anglo-Saxon law, the continental law family — Romano-Ger-

manic law, and the religious law family — Islamic law.

The comparative approach to criminal law, including the sources of criminal law, is necessary for the development of methods for combating crime, taking into account both national and international experience.

These considerations have predetermined the choice of the research subject. The study of any legal system must begin with the examination of its sources. By source is understood the form of expression of legal norms.

Methods and materials applied. In the process of the respective investigation, the comparative method of study was used. In addition to the comparative method, a series of other methods were also applied, such as: the method of logical analysis, logical interpretation, classification, etc.

Discussions and result obtained. It is generally unanimously accepted that the main sources of law are the normative legal act, legal precedent, legal custom, and the contract.

From a historical point of view, the division of law into statutory law and case law has taken shape. The system and structure of the sources of law, as well as the form of expression of basic legal concepts, depend on the manner in which criminal provisions are expressed in normative acts or in court decisions concerning specific cases.

The normative legal act is generally accepted and is considered the most convenient source of law. In the sphere of criminal-law regulation, the main normative legal act is the Criminal Code. First, in the traditional Criminal Code, the General Part and the Special Part are distinguished. Second, the basic principles of criminal law are established. Third, specific categories of offences are characterized and the sanctions for committing them are determined. The Criminal Code is considered a source of criminal law in France, Germany, and the USA. The absence of a codified legal act is associated with the historical development of the English legal system — England and Wales.

A particularly important source of criminal law in foreign countries is constitutional legislation. In particular, the Constitutions of France, the USA, and Germany contain criminal-law norms. For judicial practice in the USA, a direct reference to constitutional norms in the reasoning of a court judgment may serve as a norm of criminal law. However, the uncodified constitution of the United Kingdom does not exclude the role of other acts of constitutional importance, for example, The Bill of Rights, in defining the principles of criminal law.

The sources of criminal law in foreign countries may also include doctrinal works in the field of criminal law. We note that, in countries where legislation is codified to the maximum extent, references to such sources are absent — France and Germany — whereas in countries where judicial precedent is predominant, references to extensive scholarly works of jurists are recognized as a norm and, therefore, are regarded as a source of criminal law — England and the USA. English law may be viewed as a set of rules based on the old common law of England, modified and developed through authoritative decisions of courts throughout history and significantly expanded through legislative acts of Parliament.

The main sources of law in the common law family — the Anglo-American type of the criminal-law family — are statutes, namely parliamentary legislation, and judicial precedents. England is the homeland of common law. The specific feature of English criminal law consists in the absence of a single codified criminal law. However, there is a significant number of statutes, whose role has recently increased. The role of judicial precedents as sources of criminal law in England remains relevant. Judicial precedent is understood as a court decision in a specific criminal case, which is binding upon the respective court and the lower courts with regard to the interpretation of the principles and rules of common law. At present, in English jurisprudence, each court is obliged to follow the decision of a higher court in the hierarchy, while courts of appeal are bound by their previous decisions.

There is an exception to this rule. The House of Lords, since 1966, has had the right to modify judicial practice where necessary. In addition, higher courts have the right to annul the decision of a lower court, as well as, in certain cases, their own previous decision. Any legal norm, including judicial precedent, may be modified by an Act of Parliament.

Over several centuries, court decisions in criminal cases were published in judicial reports. Today, the best-known and most authoritative are the English judicial reports, which are published weekly [1, p.109-111].

In specialized literature, among the sources of common law, including English criminal law, the works of renowned jurists are noted; at present, they do not have the value of a source of law, yet they still possess significant authority. When analyzing the sources of criminal law in the common law family, contemporary guides must be taken into consideration, for example, W. Blackstone's Commentaries on the Laws of England, published in 1765. This work is frequently referred to as an authoritative source [3].

The main sources of criminal law in the common law family also include statutes, or statutory law. There is a large number of statutes — over 8,000 — which contain rules concerning the criminal liability of natural and legal persons. In general, legislative acts in the field of criminal law regulate liability for specific categories of offences. In this context, the basic principles of criminal liability continue to be based on the rules of common law.

It is noteworthy that, alongside modern statutes, old laws continue to exist, such as the Treason Act of 1351.

The official publication of legislative acts is carried out by the King's Printer, either in the form of separate acts or in the form of an annual collection of Acts of Parliament. With regard to the territorial application of the law, the presumption is used that an Act of Parliament applies throughout the entire territory of the United Kingdom, unless the act itself provides otherwise.

However, sometimes an act may specify that its provisions do not apply on the territory of Scotland or Northern Ireland. There are also cases in which the applicability of a law extends beyond the territorial borders of the United Kingdom, for example, in the case of legislation on combating terrorism. According to the rules on the temporal application of the law, it enters into force from the date of Royal Assent, unless the law provides for another date.

As a rule, if a law is clearly drafted, without ambiguous terminology, it does not require judicial interpretation. In other cases, in practice, its interpretation is necessary. In English criminal law, three methods — or approaches — of statutory interpretation are applied: the "literal" rule, the "golden" rule, and the "mischief" rule. Literal interpretation presupposes that the text contained in the law is interpreted word for word. If the law is drafted in such a way that two or more literal interpretations are possible, the court applies the interpretation that is the most consistent and leads to a logical result. In this case, the "golden" rule of interpretation is applied. According to the "mischief" rule, interpretation is reduced to correcting an error. For this interpretation, the law is read as a whole. In this process, the court carefully analyzes both the long title and the short title of the law. Provisions relating to criminal law are interpreted restrictively. If a law establishing criminal liability contains ambiguous or undefined terms, it must be interpreted in favor of the individual. From this rule derives the presumption that liability is excluded in the absence of guilt. The latter, according to a general rule, constitutes a mandatory element of the corpus delicti.

Alongside statutes, there also exists such a source of English criminal law as delegated legislation [2, pp.96-106]. Its advantage consists in the fact that it allows for the rapid adoption and amendment of regulations, without the need for approval by Parliament. Among the forms of delegated legislation, its superior form is distinguished: the "Order in

Council", by which laws are implemented. The "Order in Council" is issued by the government and sanctioned by the Privy Council. Delegated acts are published by His Majesty's Stationery Office in a special collection.

With reference to the continental legal family, it may be stated that law, in the broad sense, prevails over other sources of law and represents the basic source of criminal law. The norms of French criminal law are determined in the form of a system: first — constitutional and international norms; then — codified and uncodified criminal laws; and subordinate normative acts adopted by the bodies of executive power. In this context, the role of judicial precedent is limited. Nevertheless, the decisions of the Criminal Chamber of the Court of Cassation of France are of considerable importance for French criminal law. We note that constitutional norms as a source of criminal law include the constitutional act — the Declaration of the Rights of Man and of the Citizen of 1789 [4, p.576].

Undoubtedly, this act contains important principles of criminal law. For the first time, the principle was enshrined that "everything which is not prohibited by law may not be prevented, and no one may be compelled to do what the law does not require" (Art. 5). Another important principle established in the Declaration is that "no one may be accused, arrested, or detained except in the cases determined by law and in the form prescribed by it" (Art. 7). Also of essential significance is the principle prohibiting punishment otherwise than as provided by law, adopted prior to the commission of the offence and duly published in a lawful manner. The Declaration proclaims the principle of equality of all persons before the law. For the first time, the principle of the presumption of innocence was constitutionally recognized. At the same time, the Declaration excludes criminal liability solely for thoughts, opinions, or beliefs.

A significant source is the Constitution of the French Republic of 1958, which contains provisions directly related to criminal law. In particular, Article 17 of the Constitution stipulates that the right to grant pardons is conferred upon the President of the Republic. The Constitution also regulates matters concerning the criminal liability of the highest officials of the French Republic — the President and members of the Government. Moreover, it is specified that the President is responsible for actions carried out in the exercise of his duties, with the exception of high treason. Members of the Government may be held criminally liable during the period in which they exercise their functions.

Ratified international agreements and treaties, as a source of law, have a force that exceeds the status of law only after their official publication, provided that each such agreement or treaty is also applied by the other party [5, p.74]. In this situation, the norms of international law must be placed "at the top" of the state's legal system, since their priority in relation to national legal norms is recognized. However, the situation is complex, because the existence of a norm of international law does not mean that it may be applied to the detriment of domestic national law, if it contradicts it. In this case, the contradictions must be evident and easily identifiable. Priority may be only temporary, since the terms of validity of the agreement are usually limited. Another issue is the fact that norms of international law do not contain sanctions, which means that it is necessary for the states that sign and ratify the agreement to adopt separate laws. Therefore, it would be more appropriate to suspend the application of domestic law that contradicts the norms of international law than to repeal those norms. In the event of a conflict between French law and an international treaty, it is proposed that the respective law be considered incompatible also with the norms of the Constitution of France, which constitutes a ground for its examination by the Constitutional Council, with a view to the subsequent repeal of that law [6, p.105]. In particular, international agreements apply in criminal law, being represented by treaties on extradition, legal assistance, and conventions on combating

certain types of offences. International treaties have influenced the inclusion of specific norms in the Criminal Code of France, as well as the harmonization of national criminal-law norms with agreements of international law [6, pp.105-139]. As a source of criminal law, the French Criminal Procedure Code of 1958 is traditionally considered, in which the most important principles of criminal law are enshrined. For example, the prohibition of being punished twice for the same act.

The next source of criminal law is considered to be the Code of Military Justice (1966). This Code contains norms concerning criminal liability for military offences. Criminal liability is also regulated by other sources of French criminal law, such as the Highway Code, the Labour Code, the Code of Residential and Non-Residential Real Property, the Intellectual Property Code, the Customs Code, the Tax Code, the Urban Planning Code, the Consumer Protection Code, and the Public Health Code.

In addition, criminal liability for certain offences is provided for in special laws, such as the Law on Commercial Companies (1966), the Law on Gambling (1983), the Law on the Activities of Credit Institutions and Their Supervision, and the Law on the Judicial Reorganization and Liquidation of Enterprises, which have not been included in any of the codes.

Subordinate normative acts should also be considered a source of criminal law. They appear in two main forms: in the form of subordinate normative acts having the force of law — for example, the Ordinance of the Provisional Government of France (1944), and Ordinance No.45-174 of 2 February 1945 on offences committed by minors — and in the form of acts that do not have the force of law, namely simple decrees adopted by the government.

Conclusion. In conclusion, we emphasize that, within the Anglo-Saxon legal family, the principal source of law is judicial precedent, while the essential role in the formation of law is attributed to the court. Procedural law has priority in relation to substantive criminal law. Statutory law is widely used, whereas legal customs constitute auxiliary, supplementary sources of law.

On the other hand, the continental legal family — the Romano-Germanic family — is characterized by a unified hierarchical system of sources of written law, in which normative acts play a dominant role. In this context, the role of codified acts is important, while subordinate normative acts — regulations, circulars, and instructions — have major significance. Legal custom and judicial precedent are considered auxiliary, supplementary sources of law. A special role is attributed to legal doctrine, which has developed the fundamental principles underlying the construction of this legal system.

METROLOGICAL CONTROL OF AXIOLOGICAL CONSISTENCY AS A STRATEGY FOR PREVENTING CRIMES AGAINST JUSTICE

Yaroslav LANTINOV,
PhD, Associate Professor,
Department of Criminal Law and Criminology,
Kharkiv National University of Internal Affairs,
Ukraine
ORCID: 0000-0002-1858-6842

Abstract

Contemporary crime prevention doctrine in the field of justice remains captive to a legal-positivist paradigm that identifies the object of criminal law protection with the normal activity of judicial institutions. This paper argues that such an approach is theoretically inadequate: it mistakes the mechanism for the outcome it is meant to produce. The proposed reorientation reconceptualises justice not as institutional activity but as an emergent state of a system of activities — the state of axiological consistency of verification. This state is defined by three measurable parameters: informational purity (absence of entropic noise in the verification channel), algorithmic validity (genuine normative character of the legal algorithm applied), and logical coherence (consistency of outputs for equivalent inputs regardless of party status). Offences against justice are reconceptualised accordingly as acts of entropic intervention that degrade the system's capacity to achieve this state — not isolated violations but components of a process of systemic regression from democratic self-governance toward despotic control.

The paper derives a metrological prevention strategy organised around the monitoring and maintenance of these three parameters, and argues for a shift from activity metrics to state metrics as the operative standard of prevention success. The stakes of this prevention are argued to be existential rather than procedural: justice as axiological consistency is a necessary condition for the rule of law and for human flourishing.

Keywords: axiological consistency, metrological control, offences against justice, crime prevention, systemic regression, entropic intervention, state metrics.

CONTROLUL METROLOGIC AL CONSISTENȚEI AXIOLOGICE CA STRATEGIE DE PREVENIRE A INFRACȚIUNILOR ÎMPOTRIVA JUSTIȚIEI

Abstract

Doctrina contemporană de prevenire a criminalității în domeniul justiției rămâne captivă unei paradigme juridico-pozitiviste care identifică obiectul protecției dreptului penal cu activitatea normală a instituțiilor judiciare. Această lucrare susține că o astfel de abordare este teoretic inadecvată: aceasta confundă mecanismul cu rezultatul pe care este destinat să-l producă. Reorientarea propusă reconceptualizează justiția nu ca activitate instituțională, ci ca o stare emergentă a unui sistem de activități – starea de consistență axiologică a verificării. Această stare este definită prin trei parametri măsurabili: puritatea informațională (absența zgomotului entropic în canalul de verificare), validitatea algoritmică (caracterul normativ autentic al algoritmului juridic aplicat) și coerența logică (consistența rezultatelor pentru intrări echivalente, indiferent de statutul părților). Infracțiunile împotriva justiției sunt reconceptualizate în consecință ca acte de intervenție entropică care degradează capacitatea sistemului de a atinge această stare – nu ca încălcări izolate, ci ca componente ale unui proces de regresie sistemică de la autoguvernarea democratică spre controlul despotic.

Lucrarea dezvoltă o strategie de prevenție metrologică organizată în jurul monitorizării și menținerii acestor trei parametri și susține necesitatea unei treceri de la metricile activității la indicatorii de stat ca standard operativ al succesului prevenției. Se argumentează că mizele acestei prevenții sunt existențiale mai de-

grabă decât procedurale: justiția, înțeleasă ca consistență axiological, reprezină o condiție necesarăatât pentru statul de drept cât și pentru prosperitatea umană.

Cuvinte-cheie: consecvență axiologică, control metrologic, infracțiuni împotriva justiției, prevenirea criminalității, regresie sistemică, intervenție entropică, indicatori de stat.

Introduction. **The Paradigmatic Deficit of Contemporary Prevention Doctrine**. Contemporary crime prevention doctrine in the field of justice has long remained captive to a legal-positivist paradigm. Within this paradigm, prevention is conceived as a set of measures directed at protecting the «normal activity» of judicial and law enforcement bodies. The object of protection is identified with the institution — its authority, its procedures, its formal structure. This approach, however operationally convenient, conceals a fundamental theoretical deficit: it mistakes the vessel for its contents.

The legal-positivist method, being operationally closed, attempts to explain legal phenomena without departing from law as a self-referential system. As Luhmann observed, a legal system built on autopoietic self-reproduction — where each operation refers to a previous operation of the same system — loses its connection to social reality without cognitive openness to external systems of knowledge. This closure, as Gödel's incompleteness theorem suggests, renders the system incapable of full self-verification. The consequence for prevention doctrine is significant: a paradigm that defines the object of protection through the very categories it seeks to protect cannot generate genuinely new instruments of prevention. It can only reproduce existing frameworks under new labels.

The practical consequence of this paradigmatic deficit is visible in the persistent gap between formal reform and operational reality. Judicial systems may be restructured, procedural codes rewritten, and institutional names changed — yet the quality of legal signal produced by the system remains unaffected. This is not a failure of political will alone. It is a failure of conceptual apparatus: the doctrine lacks the categories necessary to identify what precisely is being destroyed when offences against justice are committed, and therefore lacks the tools to prevent it.

This paper proposes a reorientation of prevention doctrine — from the protection of institutional authority to the metrological control of axiological consistency. This reorientation draws on activity theory, cybernetic analysis, and the pragmatist criterion of truth to reconceptualise justice not as a procedure or an institution, but as an emergent state of a system of activities — a state that can be measured, monitored, and protected.

Methods and materials applied. The paper employs a theoretical-analytical method combining three intellectual traditions. The systemic-cybernetic approach — drawing on Wiener's cybernetics and Shannon's information theory — provides the framework for conceptualising justice as an information-processing system and offences against justice as entropic interventions. The activity-theoretical approach — drawing on the tradition of Leontiev and Engeström — provides the conceptual distinction between activity and emergent state. The pragmatist criterion of truth — following William James — provides the operationalisation standard: a concept is valid to the degree that it is capable of influencing real activity and generating falsifiable predictions. No empirical data collection was conducted; the materials of the study are the relevant theoretical sources in jurisprudence, cybernetics, systems theory, and philosophy of law. This paper develops arguments first presented in: Lantinov Ya. (2026). "*Justice as a State of Axiological Consistency: Reconceptualizing the Generic Object of Criminal Offenses*". Forum Prava, Ukraine, 85(1), p.27-34.

Discussions and results obtained. I. The Object of Protection Reconsidered: From

Activity to State. The foundational move required by this reorientation is a reconceptualisation of the generic object of criminal offences against justice. Under the prevailing doctrine — exemplified by the Ukrainian criminal law tradition — the generic object is defined as the «normal, statutorily regulated activity» of courts and the bodies that assist them. This definition, despite its apparent precision, contains an internal contradiction that Ukrainian scholarship has begun to identify but not yet resolved.

The contradiction may be stated simply: activity is not justice. Activity — the procedural sequence of investigation, adjudication, testimony, translation, and enforcement — is the technological process through which justice may or may not be achieved. It is the mechanism, not the outcome. A judge may follow every procedural rule with perfect formal compliance and still produce a decision that is manifestly unjust. Conversely, justice — understood as a substantive quality of the outcome — may be approximated through imperfect procedures if the core parameters of the verification process remain intact.

This distinction between activity and state requires a three-level analytical framework. The first level is the judicial system in its static aspect: the ensemble of institutions, personnel, infrastructure, and resources. This is the «hardware» of justice — necessary but not sufficient. The second level is judicial proceedings in their dynamic aspect: the cluster of specialised law-enforcement activities — investigation, adjudication, witnessing, translation, verification — that constitute the operational process. This is the «software» — the procedure. The third level is justice itself as a target state: the emergent property that arises when judicial proceedings ensure the axiological consistency of verification. This is the outcome — and it is this outcome, not the procedure, that constitutes the genuine object of criminal law protection.

The practical implication for prevention doctrine is direct: if the object of protection is the state rather than the activity, then prevention must be directed at the conditions that enable or disable the emergence of that state — not merely at the formal integrity of the procedure.

II. Axiological Consistency: Parameters and Metrological Standards. The concept of *axiological consistency* of verification synthesises three fundamental parameters of the system. Each parameter is operationally defined — that is, its violation is objectively identifiable — which satisfies the pragmatist criterion of truth advanced by William James: a concept is valid to the degree that it is operationally capable of influencing real activity.

The first parameter is *informational purity*: the absence of entropic noise in the verification process. Drawing on Shannon's mathematical theory of communication, we may describe judicial proceedings as an information channel through which factual data is transmitted, processed, and converted into a legal signal — the judicial decision. Any deliberate distortion of this channel — false testimony, fabrication of evidence, concealment of material circumstances — constitutes the introduction of entropic noise. The principle of «garbage in, garbage out» applies with full force: even a formally impeccable procedure will produce a corrupted output if the input data has been contaminated. Prevention, on this parameter, means minimising entropy at the point of data entry into the verification system.

The second parameter is *algorithmic validity*: the requirement that the legal algorithm through which decisions are made possesses genuine legal character. The law functions as an algorithm: it specifies the transformation rules by which factual inputs are converted into legal outputs. However, not every formally enacted statute qualifies as law in the substantive sense. If the algorithm violates human rights or contradicts the principles of a democratic and law-governed society, then even its technically correct appli-

cation cannot produce justice — it produces a technically precise error. As Fuller argued, an unjust law is not law in the relevant sense: *lex iniusta non est lex*. Prevention, on this parameter, means ensuring that the algorithms applied in judicial proceedings possess genuine normative validity — and resisting the use of formally enacted but substantively illegitimate rules under the guise of law.

The third parameter is *logical coherence*: the requirement that the system produce consistent outputs for equivalent inputs regardless of the subjective status of the parties. Any selective application of rules — where identical factual situations receive different legal treatment depending on who the parties are — constitutes a rupture of consistency. This rupture is not merely a procedural irregularity: it is a structural indicator of the transition from justice to despotic governance. A system that applies rules selectively is no longer a verification system — it is an instrument of domination. Prevention, on this parameter, means monitoring and protecting the stability of the system's response function.

Taken together, these three parameters constitute a metrological standard for justice — an operationalised set of criteria against which the actual functioning of judicial systems can be assessed. This is the analytical basis for what we term metrological control of axiological consistency.

III. Offences Against Justice as Systemic Regression. Once justice is reconceptualised as an emergent state defined by three measurable parameters, the nature of offences against justice becomes theoretically clarified in a way that the prevailing doctrine cannot achieve.

Under the prevailing doctrine, offences against justice appear as a heterogeneous collection of individual acts — bribery, rendering a knowingly unjust decision, false testimony, obstruction of proceedings — united primarily by their formal location in Chapter XVIII of the Criminal Code. Their systemic significance — their relationship to one another and to the broader social order — remains theoretically underspecified.

The proposed framework transforms this picture. Offences against justice are not isolated acts: they are acts of entropic intervention in a verification system. Each such act — whether it distorts the informational input, corrupts the legal algorithm, or ruptures the logical coherence of the system — degrades the capacity of the system to achieve the state of axiological consistency. In cybernetic terms, they introduce noise into the channel, corrupt the algorithm, or destabilise the response function.

The social significance of this degradation follows from a chain of determination that connects the state of justice to the broadest conditions of human flourishing. *Justice as a state of axiological consistency is a necessary condition for the rule of law*. The rule of law is a precondition for the functioning of society as a democratic and law-governed social formation. A democratic and law-governed social formation is the only known environment in which the final value — the beneficence of the social order for the human person — can be realised.

This chain means that offences against justice are not merely violations of procedural rules or attacks on institutional authority. They are acts of systemic regression — movements of the society away from democratic self-governance and toward despotic control. When justice loses axiological consistency, the rule of law is replaced by command-and-control governance. The autonomous person — the agent capable of independent goal-setting, resource coordination, and strategy correction — loses the guarantees of protection and is reduced to an object of despotic administration. The judicial system, stripped of its verification function, becomes a ritual instrument for the legitimation of arbitrariness.

This understanding fundamentally reframes the stakes of prevention. Preventing offences against justice is not a matter of protecting the dignity of the courtroom or the authority of the judicial robe. It is a matter of protecting the conditions under which autonomous persons can exist and flourish — the conditions under which society remains a dynamic space of free and predictable interaction among agents rather than a field of despotic subjugation.

IV. Metrological Control as a Prevention Strategy: Practical Implications. The reconceptualisation of justice as a measurable state and of offences against justice as acts of entropic intervention generates a correspondingly reconceptualised prevention strategy — one organised around metrological control rather than institutional protection.

Metrological control, in this context, means the systematic monitoring and maintenance of the three parameters of axiological consistency. It is prevention conceived not as the reactive suppression of individual violations but as the proactive maintenance of system integrity.

The first practical implication concerns the *monitoring of informational purity*. Prevention doctrine must develop instruments for identifying and filtering entropic interventions at the earliest possible stage of the verification process. This means institutional mechanisms for the detection of false testimony, fabricated evidence, and concealed circumstances — not merely as individual criminal acts but as signals of systemic degradation. An isolated false testimony is a criminal offence; a pattern of false testimony in a particular jurisdiction or case category is an indicator of systemic entropy that requires a systemic response.

The second practical implication concerns the *verification of legal algorithms*. Prevention must include mechanisms for the ongoing assessment of statutory provisions against the standards of axiological consistency. This is not merely constitutional review in the formal sense — it is a substantive test of whether the algorithms applied in judicial proceedings possess genuine normative validity. Where statutory provisions are found to generate systematically unjust outcomes despite formal procedural compliance, the prevention response must address the algorithm itself, not merely its application.

The third practical implication concerns the *protection of agent autonomy*. The logical coherence of the verification system depends on the independence of all participants in the system of activities — judges, prosecutors, defence counsel, witnesses, experts, translators. Any institutional pressure that compromises the independence of these participants constitutes a threat to logical coherence and therefore a threat to justice as a state. Prevention must therefore include robust mechanisms for the protection of participant autonomy against both external pressure and internal hierarchical subordination.

The fourth and perhaps most fundamental practical implication is a *reorientation of prevention metrics* — one that operationalises the conceptual shift announced at the outset of this paper. The prevailing doctrine measures prevention success through activity indicators: the number of prosecutions initiated, the number of convictions secured, the speed of case processing. These track the quantity of judicial procedure, not the quality of judicial outcome. They are, in the terms of this analysis, measures of the mechanism — not of the state it is meant to produce. The metrological approach proposed here requires the development of genuinely state-level indicators — measures that track the actual level of axiological consistency in the judicial system: the rate of evidentiary contamination, the consistency of legal application across comparable cases, the degree of participant independence. Only such indicators can provide a genuine basis for assessing whether prevention efforts are succeeding in protecting justice as a state rather than merely

maintaining the appearance of judicial activity.

Conclusions. This paper has argued for a fundamental reorientation of crime prevention doctrine in the field of justice — from the protection of institutional activity to the metrological control of axiological consistency.

The key propositions may be summarised as follows:

1. First, the generic object of criminal offences against justice is not the normal activity of judicial institutions but the capacity of the social system to achieve the state of justice — understood as the emergent property of a system of activities characterised by informational purity, algorithmic validity, and logical coherence.

2. Second, offences against justice are acts of entropic intervention that degrade this capacity — not isolated individual violations but components of a process of systemic regression from democratic self-governance to despotic control.

3. Third, effective prevention requires metrological control: the systematic monitoring and maintenance of the three parameters of axiological consistency, the development of state metrics rather than activity metrics, and the protection of participant autonomy as a structural safeguard of system integrity.

4. Fourth, the stakes of this prevention are not procedural but existential: justice as a state of axiological consistency is a necessary condition for the rule of law, which is in turn a necessary condition for the beneficence of the social order for the autonomous human person.

Effective prevention of offences against justice is therefore not a technical matter of criminal law enforcement. It is a strategic commitment to the conditions under which autonomous persons can exist, act, and flourish — a commitment to protecting the society as a dynamic space of free and predictable interaction against its regression into a field of despotic domination.

THE CORRELATION BETWEEN THE CONCEPTS OF "PUBLIC ORDER" AND "PUBLIC SECURITY" IN THE PROCESS OF THE LEGAL QUALIFICATION OF THE CRIME OF MASS RIOTS

Ana-Maria CHEPESTRU,
PhD in Law, Senior Officer,
Legal Directorate, Ministry of Internal Affairs,
Republic of Moldova
ORCID: 0000-0002-2988-8440

Abstract

In the presence of certain institutional shortcomings or dysfunctions, various criminal activities may emerge that are likely to affect the effective exercise of individuals' fundamental rights and freedoms.

At present, the issue of mass riots has acquired particular importance, since in most cases this offence is regarded as one of the serious forms of disturbance of public security. The offence of mass riots constitutes an unlawful act with a high degree of social danger, which directly affects the system of social relations and values related to public security. By its nature and the manner in which it is committed, it produces adverse consequences for public safety, thereby affecting social stability, public order, social cohesion, the normal functioning of state institutions, and the security of persons and their property. The disturbance of social balance generates significant risks for the harmonious development of the state in the economic, political, social, cultural and other fields. Ensuring public order and public security constitutes one of the fundamental priorities of the Republic of Moldova.

Keywords: social danger, offence, mass riots, public security, public order, interdependence, social cohesion.

CORELAȚIA DINTRE CONCEPTELE „ORDINE PUBLICĂ" ȘI „SECURITATE PUBLICĂ" ÎN PROCESUL DE CALIFICARE JURIDICĂ A INFRACȚIUNII DE DEZORDINI ÎN MASĂ

Abstract

În condițiile existenței unor carențe sau disfuncționalități sectoriale, se conturează diverse activități infracționale, susceptibile să afecteze exercitarea efectivă a drepturilor și libertăților fundamentale ale persoanei.

Actualmente, problematica dezordinilor în masă dobândește o importanță deosebită, întrucât de cele mai multe ori, această infracțiune este tratată ca una dintre formele grave de perturbare a securității publice. Infracțiunea de dezordini în masă constituie o faptă ilicită cu un grad sporit de pericol social, care aduce atingere în mod nemijlocit ansamblului relațiilor și valorilor sociale ce vizează securitatea publică. Prin natura și modalitățile sale de comitere, aceasta generează consecințe negative asupra climatului de siguranță colectivă, afectând stabilitatea socială, ordinea publică, coeziunea socială, funcționarea normală a instituțiilor statului, securitatea persoanelor și a bunurilor acestora etc. Tulburarea echilibrului social determină apariția unor riscuri substanțiale pentru evoluția armonioasă a statului în domeniul economic, politic, social, cultural etc. Asigurarea ordinii și securității publice se circumscrie sferei priorităților fundamentale ale statului Republica Moldova.

Cuvinte-cheie: pericol social, infracțiune, dezordini în masă, securitate publică, ordine publică, interdependență, coeziune socială.

Introduction. Chapter XIV, "Offences against Public Security and Public Order" of the Special Part of Criminal Code No.985 of 2002 (hereinafter – the Criminal Code) includes all offences whose generic legal object is represented by social relations concerning public security and public order. Accordingly, such offences directly infringe either public security or public order.

Given the placement of Article 285, which criminalises mass riots, within the Criminal Code, it is specified that the aforementioned offence infringes social values relating to public security. In this respect, in order to determine precisely the scope of the concept of "public security" we propose to elucidate the particular features and meanings of the notions of "public order" and "public security".

The importance of the subject addressed lies in the need for a rigorous conceptual delimitation between the notions of "public order" and "public security", as this distinction has direct implications for the legal classification of the offence of mass riots. The existence of divergent doctrinal approaches and imprecise formulations within the national regulatory framework accentuates the need for an in-depth analysis capable of clarifying the dividing lines between the two concepts and contributing to ensuring a uniform and foreseeable judicial practice consistent with the requirements of the principle of legality in criminal law.

Since Article 285 of the Criminal Code establishes this offence as an act infringing social values relating to public security, an unclear or inconsistent interpretation of the content of this legal value may generate significant difficulties in the application of the criminal-law provision. The legal classification of acts that may fall within the scope of the offence of mass riots inevitably presupposes the correct identification of the primary social value harmed, as well as the determination of its relationship with other related values protected by the criminal-law provision. In the absence of a uniform understanding of the notions of "public security" and "public order," there is a risk of non-uniform legal classifications, confusion with other similar offences, or even the unjustified application of the criminal-law provision in situations that do not reach the level of social danger specific to this offence.

Methods and materials applied. In the process of examining the topic addressed in this article, several national legal sources (laws and Government decisions), doctrinal sources (compendia, monographs, manuals, guides, abstracts, and scientific articles), as well as case-law were consulted in conjunction.

At the same time, in preparing this scientific article, several research methods were employed: (1) the method of literal interpretation, used to explain the lexical meaning of the relevant terms; (2) the systemic method, used to analyse the provisions of national legal acts in relation to the subject addressed; (3) the comparative method, used to compare various legal norms within the national normative framework; and (4) the deductive method, used to interpret the doctrinal meanings formulated in the course of researching the subject matter.

Discussions and results obtained. The elucidation and clarification of the conceptual content of the notions of "public security" and "public order" begin with a systematic analysis of the relevant national legal acts that expressly enshrine these concepts. The analysis of the normative framework constitutes a necessary first methodological step, as it allows for the identification of the legal meanings assigned by the legislator to the concepts of "public order" and "public security", highlights the manner in which they are regulated in national legislation, and reveals possible overlaps or terminological inconsistencies. Such an approach also provides an important premise for the subsequent doc-

trinal and jurisprudential analysis and contributes to grounding a coherent and uniform interpretation of the criminal-law provision criminalising mass riots.

Having regard to the placement of the offence of mass riots within the system of the Special Part of the Criminal Code, specifically within Chapter XIV, "Offences against Public Security and Public Order", it is essential to note the position of the authors Brînza S. and Stati V., who highlight the closer interconnections between the special legal objects of the offences provided for in that chapter, distinguishing the following three types thereof:

1. Offences against public security (Articles 278, 278[1], 279, 279[1], 279[2], 280, 281-286, 289, 289[1]-289[3], 295, 295[1] and 295[2]);
2. Offences against public security affecting the carrying out of specific types of activity (Articles 290-293, 296-298, 300, 301 and 301[1]);
3. Offences against public order (Articles 287, 288 and 302) [2, p. 226].

From another perspective, author Macari V. takes the view that the object of mass riots consists of public order, the life and health of the person, and the owner's property [6, p.323], an aspect with which we disagree, since, in the case of the offence of mass riots, public order cannot be analysed autonomously from public security, the latter having a broader content within which the notion of public order is also integrated, thus ensuring the cohesion and interdependence of a complex body of social values.

The notion of "public order" has been enshrined since the early modern period, being expressly regulated in the French Declaration of the Rights of Man and of the Citizen of 1789, which, in Article X, provided that no one may be held accountable for his or her opinions, even religious ones, provided that their manifestation does not disturb the public order established by law [9].

In this context, it may be inferred that public order is conceived as a legitimate legal limitation on the exercise of fundamental rights and freedoms, intended to ensure a balance between individual liberty and the general interests of society. This limitation does not extinguish such freedoms, but rather regulates them within a normative framework that guarantees social coexistence and stability, as well as respect for the essential values protected by law.

A recent normative act regulating the field of public order and security is Law No.249/2025 on the National Security of the Republic of Moldova, which, in Article 10(1), provides that public order and security represent the state of legality, stability and civic peace ensured by the public authorities and institutions that implement preventive and coercive measures to combat unlawful acts, protecting the life and integrity of persons, fundamental rights and freedoms, as well as property and public health, maintaining public safety, guaranteeing respect for the law and the efficient functioning of public authorities and institutions [14].

Also from the perspective of the normative framework, it is apparent that, in the content of Article 21 of Law No.320/2012 on Police Activity and the Status of the Police Officer, the legislator indicates the fields of "public order" and "public security" as two distinct, yet intrinsically connected, segments of activity, without establishing a conceptual delimitation between them. Indeed, that article expressly stipulates the duties of the police in the field of maintaining, ensuring and restoring public order and public security, and in the protection of the rights and legitimate interests of the person and the community [16].

The same thesis may also be supported by reference to the requirements of Article 2(3) of Law No.219/2018 on the General Inspectorate of Carabineers, which provides

that the General Inspectorate of Carabineers forms part of the national public order and security system and of the national defence system [15]. Such normative enshrinement highlights the interdependent nature of the notions of "public order" and "public security", these being configured by the legislator not as autonomous and isolated legal realities, but as convergent elements of a unified institutional framework aimed at ensuring the protection of the fundamental interests of society and the State.

Furthermore, another normative act supporting the idea set out above is the Regulation on the Organisation and Functioning of the Ministry of Internal Affairs, approved by Government Decision No.693/2017, which states in paragraph 6 subparagraph 1), that the Ministry of Internal Affairs performs the functions established by the Regulation in the field of public order and public security.

In the same vein, attention is drawn to the Public Order and Security Strategy for 2017-2020, approved by Government Decision No.354/2017, which, in paragraph 3 subparagraphs 1) and 2), defines the notions under consideration as follows:

1. Public Order: the component of the legal order expressing the state of effective functioning of the institutions of the rule of law, of respect for the fundamental rights and freedoms of citizens, and of public and private property, ensured through the necessary body of legal regulations, behavioural norms, social values and specific institutions, including for the restoration of disturbed balances [11];

2. Public Security: the state of confidence, peace and social cohesion, absence of dangers and threats concerning the life, liberty, welfare and prosperity of the population and the community, ensured through specific actions by the competent authorities [11].

At the same time, according to paragraph 16 of the National Programme on Public Order and Security, approved by Government Decision No.727/2025, public order and public security constitute essential foundations of a functional rule-of-law state, ensuring the necessary framework for the exercise of fundamental rights and freedoms, the protection of the person, communities and property, as well as the proper functioning of public institutions. The situation analysis explores the way in which concerns relating to public order and public security manifest themselves in the Republic of Moldova in various settings, from the domestic sphere, within the community and in public spaces, in specific contexts such as public events, the public space of the online environment, and up to the security area and critical infrastructure [10].

Under the same legal perspective, paragraph 8 of the Regulation on the Organisation and Functioning of the National Centre for Integrated Coordination of Public Order Actions, approved by Government Decision No.1206/2016, clarifies the notion of "public order" as the state of legality, balance and social peace through which the public security and personal security of individuals, communities and property, as well as public health and morality, are ensured, and which allows the exercise of the individual's fundamental rights and freedoms, as well as the effective functioning of institutions in a rule-of-law state [12].

From a jurisprudential perspective, an explanation of the concept of "public order" is also found in Ruling No.4 of 19 June 2006 of the Plenary of the Supreme Court of Justice of the Republic of Moldova on judicial practice in criminal cases concerning hooliganism, which, in paragraph 3, notes that public order means a body of social relations ensuring a peaceful environment of coexistence in society, the inviolability of the person and the integrity of property, as well as the normal activity of state and public institutions [13].

With regard to the connection between the concepts of "public security" and "public order", author Manea V. points out that not all authors correctly perceive the correla-

tion between public order and public security, considered as social values protected by criminal law [20, p.16].

From the opinion set out above, it may be concluded that the specialised literature contains multiple doctrinal views regarding the concepts under analysis, which attests to the existence of varied and, at times, divergent explanations. Thus, these may highlight elements of convergence between the notions, may emphasise the conceptual differences between them, or, in certain situations, may even generate contradictory opinions.

The same author, Manea V. considers that public security is the factual state created by legal rules, intended to ensure the most favourable conditions of coexistence for the community, such that the interests of the members of the community are shielded from any danger. Therefore, public security concerns the community as a whole (ut universi), unlike personal security, which concerns individuals taken separately (ut singuli) [7, p.80].

In a broad sense, author Chirița V. notes that public security includes several groups of social relations in the field of non-dangerous conditions for the life of society as a whole; public order; ecological security; the health of the population and the morality of society as a whole; the security of private, social or state interests in the course of carrying out various types of work; the security of private, social or state interests in the handling of objects dangerous to society; the security of private, social or state interests in the use of means of transport; and the security of private, social or state interests in the use of computerised information [4, p.56].

In a narrower sense, author Borodac A. explains that public security is a system of rules ensuring the protection of the most important values of the person, the material and spiritual values of society, the authority of official power, as well as the sovereignty and territorial inviolability of the country [1, p.399].

Likewise, author Cușnir V. considers that public security constitutes that part of internal security and that segment of national security which concerns the state of legal order, the protection of the population, public and private property, and the rights, freedoms and legitimate interests of the person against threats arising from within the country [17, p.14].

In another conceptual dimension, authors Brînza S., Ulianovschi X., Stati V. and others consider that public order is presented as the social value consisting of a peaceful environment of coexistence in society, the inviolability of the person and the integrity of property, as well as the normal activity of state and public institutions [3, p. 533].

Author Admiralova I.A. considers that public order, as a certain legal category, constitutes a system of public relations that arises and develops in public places in the process of interaction among persons, conditioned by the needs of society's development, whose legal regulation and other social regulations ensure the personal and public safety of persons, a calm living environment, and the coherence and rhythm of public life [23, p.254].

Consistently, author Zavatin V. remarks that public order may be understood as a legal and factual state that permits the achievement and maintenance of balance based on social consensus, necessary for the optimal functioning of the social whole under the conditions of the domestic legal regulations in force, with a view to promoting and affirming social progress in a democratic society [22, p.19].

Overall, Romanian legal literature considers the concept of "public order" to be one subordinate to the "legal order". The notion of public order marks the supremacy of rules protecting the general interests of society over conventional rules inspired by private interests [18, p. 111].

The notion of "public order" means the organisation and conduct of political, economic and social life within a State according to a body of generally binding rules and measures. Romanian public order is formed by the body of the fundamental legal principles of the Romanian State. From the perspective of international law, the notion of public order also includes the fundamental norms of the legal system of the court, which do not permit the application of foreign rules, although those rules would otherwise be competent pursuant to the court's conflict-of-laws rules [18, p.113].

From the perspective of societal organisation, it is considered that public order may also be viewed as a social order in which the citizen is not merely the beneficiary of rights and freedoms, but also of obligations, including those relating to the minimum requirements of life in society [21, p.81].

Public order is configured as a state of affairs accepted and required in society, regulated by law and aimed at ensuring respect for citizens' rights and freedoms. The extensive level of regulation and prosocial behaviour in the spirit of values specific to the nation lead to the protection and consolidation of the State. Reference to public order presupposes taking into account several elements linked to the regulation of the characteristics of the rule of law, in relation to which the issue also arises of the intervention of the competent bodies in order to prevent the breach of public order or maintain it [21, p.83].

With regard to the correlation between the two concepts, authors Chirița V. and Tihon V. indicate that public security is not identical to public order and, although the concepts are coherent with one another, neither can be absorbed by the other. Therefore, public security constitutes a non-dangerous, safe condition, whereas public order means the arrangement of things and acts on the basis of a series of rules and norms. Consequently, although both categories, public security and public order, being interdependent, contribute to ensuring the normal existence of society, like any component of the social mechanism, they nevertheless have a clearly established autonomy, each ensuring the harmless operation of its own sector of social welfare [5, p.16].

Most often, the concepts of "public order" and "public security" (in Romanian specialised literature, the term "public safety" is also used) are employed together, being closely interconnected and interdependent. The essence of this relationship is that both are intended to establish an adequate social order that satisfies the needs of citizens and society, while the violation of the norms will entail both the liability of the subjects concerned and State intervention [19, p.165].

From another perspective, author Kudelici A.V. advances the thesis that the notions of "public order" and "public security" are synonymous [8, p.15].

In this regard, we consider that the assimilation of the two concepts cannot be supported either normatively or doctrinally. The analysis of the national legal framework reveals clear delimitations between "public order" and "public security", each with distinct legal content, a specific object of protection, and its own safeguarding mechanisms. Similarly, the specialised literature emphasises that these notions operate at different functional levels and must not be confused.

Public security should therefore be understood as a comprehensive concept reflecting the overall state of societal protection against threats to life, personal integrity, property, and the functioning of state institutions. By contrast, public order constitutes only one component of this general state, concerning the body of rules governing social coexistence and compliance with behavioural norms in public spaces. Accordingly, public order falls within the broader concept of public security as an integral component; the

two notions are therefore neither identical nor equivalent.

Conclusions. In light of the foregoing, we conclude that, although public security and public order are interdependent and both serve to ensure the normal and balanced functioning of society, they do not entirely overlap. Each of these notions possesses well-defined conceptual and functional autonomy, guaranteeing the stable functioning of a particular segment of social life.

In the context of the offence of mass riots, public order cannot be analysed in isolation from public security, since the notion of public security, in its broad sense, encompasses the social value of "public order", thereby creating a functional interdependence and making an essential contribution to the maintenance of social equilibrium and stability.

Both the specialised literature and judicial practice consistently recognise that the offence of mass riots constitutes a criminal-law offence infringing public security. Nevertheless, despite its unanimous recognition at doctrinal and practical levels, this concept is not currently expressly enshrined in the Criminal Code.

In our view, public security constitutes a coherent body of rules and protective mechanisms concerning social relations aimed at guaranteeing and defending the fundamental rights and freedoms of an indeterminate circle of persons. It is achieved through establishing and maintaining an effective legal order, as well as through creating a stable, safe, and predictable social climate conducive to the undisturbed conduct of the activities of both natural and legal persons, while ensuring their normal conditions of existence and functioning.

Republic of Moldova
ORCID: 0009-0002-2988-5095

Abstract

This paper examines the European legal framework on the protection of users and minors in the digital age through three complementary instruments of European Union law: Regulation (EU) 2024/1689 on artificial intelligence (the AI Act), Regulation (EU) 2022/2065 on digital services (the DSA), and Regulation (EU) 2016/679 on the protection of personal data (the GDPR).

The study starts from the specific vulnerability of minors in the online environment, supported by the 4C+1 conceptual framework of five risk categories (content, contact, conduct, consumer, and cross-cutting), and analyses the concrete safeguards established by the three regulations. It also looks at the working preventive mechanisms made available by the Court of Justice of the European Union, the European Data Protection Board, and the European Commission, including through the Guidelines on the protection of minors adopted under Article 28(1) of the DSA and the Commission's first preliminary decision against Meta of April 2026.

In the final part, the article assesses the state of legislative harmonisation of the Republic of Moldova in this field, in the context of the completion of the bilateral screening, identifies the structural gaps of the domestic legal framework, and sets out consolidated directions for harmonisation, including from the perspective of preventing modern forms of digital crime against children.

Keywords: AI Act, DSA, GDPR, online protection of minors, digital user safety, harmonisation, Republic of Moldova.

SIGURANȚA UTILIZATORILOR ȘI PROTECȚIA MINORILOR ÎN ERA DIGITALĂ PRIN PRISMA AI ACT ȘI DSA: IMPLICAȚII PENTRU CADRUL NORMATIV AL REPUBLICII MOLDOVA

Abstract

Prezenta lucrare examinează cadrul juridic european dedicat protecției utilizatorilor și a minorilor în era digitală prin prisma a trei instrumente complementare ale dreptului Uniunii Europene: Regulamentul (UE) 2024/1689 privind inteligența artificială (AI Act), Regulamentul (UE) 2022/2065 privind serviciile digitale (DSA) și Regulamentul (UE) 2016/679 privind protecția datelor cu caracter personal (GDPR).

Studiul pornește de la specificul vulnerabilității minorilor în mediul online, susținut de cadrul conceptual al celor cinci categorii de risc 4C+1 (conținut, contact, conduită, consumator și transversale) și analizează garanțiile concrete instituite de cele trei regulamente. Sunt examinate, de asemenea, mecanismele preventive funcționale puse la dispoziție de Curtea de Justiție a Uniunii Europene, de Comitetul European pentru Protecția Datelor și de Comisia Europeană, inclusiv prin Orientările privind protecția minorilor adoptate în temeiul articolului 28 alineatul (1) din DSA și prin prima decizie preliminară a Comisiei împotriva Meta din aprilie 2026.

În partea finală, articolul evaluează stadiul armonizării legislative a Republicii Moldova în acest domeniu, în contextul finalizării screening-ului bilateral, identifică lacunele structurale ale cadrului normativ intern și formulează direcții consolidate de armonizare, inclusiv din perspectiva prevenirii formelor moderne

de criminalitate digitală împotriva copiilor.

Cuvinte-cheie: AI Act, DSA, GDPR, protecția minorilor în online, siguranță utilizatorilor digitali, armonizare, Republica Moldova.

Introduction. One of the most important transformations of today's digital society is the massive presence of children and adolescents in the online environment. They use social networks, messaging apps, digital games, and content-sharing platforms from ever younger ages and for increasingly longer periods of time, often without adult supervision [27]. In this way, minors come to interact daily with a digital environment built largely for adult users, in which the personalisation of offers, the capture of attention, and the use of data have a special impact on a category of users still going through cognitive, emotional, and social development.

The vulnerability of minors in the online environment is not simply a lack of experience. Recent European research, in particular the work developed by Sonia Livingstone and Mariya Stoilova around the 4C framework, shows that the risks children face on the internet can be grouped into four categories: Content, Contact, Conduct, and Contract, to which a series of further risks are added, concerning privacy, health, and fair treatment [21]. This classification shows that the danger does not come only from the illegal or harmful content to which the minor may be exposed, but also from the way digital services are built, from the business models of platforms, and from the algorithmic mechanisms that decide what the user sees. The legal consequence is direct: the protection of minors in the online environment can no longer be thought of as a series of isolated prohibitions, but as a safeguard built into the very structure of the services offered.

Against this background, a dense European legal framework has been built in recent years, around two relatively new instruments with complementary aims. Regulation (EU) 2024/1689 on artificial intelligence (the AI Act) [1] takes a risk-based approach to algorithmic systems and expressly prohibits practices that exploit age-related vulnerabilities, while Regulation (EU) 2022/2065 on digital services (the DSA) [2] sets out graduated due diligence obligations for providers of intermediary services, with specific measures for platforms accessible to minors. The two regulations are completed by the General Data Protection Regulation (GDPR) [3], which provides specific protection for children's personal data, and by the Charter of Fundamental Rights of the European Union [4], in Article 24 raises the best interests of the child to the rank of a primary principle of the Union. At international level, the Council of Europe Framework Convention on Artificial Intelligence, Human Rights, Democracy and the Rule of Law [8], the first international treaty with binding legal character in this field, reinforces the same safeguards.

The need for a stronger legal protection is all the more pressing as the use of artificial intelligence systems and digital platforms may generate, for minors, a wide range of harms. The AI Act expressly recognises that the use of artificial intelligence may harm public interests and fundamental rights, causing material or moral damage, including of a physical, psychological, societal, or economic nature [1]. In the case of children, these effects translate concretely into exposure to harmful content through opaque recommender systems, behavioural manipulation through persuasive design elements, commercial profiling and targeted advertising that exploit age-related weaknesses, as well as risks of online sexual exploitation, harassment, or grooming made possible by the way services are designed. From the perspective of preventing digital crime, this reality highlights an important fact: many of the offences committed against minors in the online environment are preceded, accompanied, or made easier by the technical configuration of the

platforms, which means that the obligations placed on providers acquire, indirectly, a preventive function.

For the Republic of Moldova, the protection of minors in the digital age is not just a matter of public policy choice; it is part of the obligations assumed through the EU accession process. The bilateral screening completed on 22 September 2025 requires a systematic assessment of the compatibility of national legislation with the EU acquis, including in the fields of digital services regulation, data protection, and the safety of products and services. The Moldovan legal framework includes a special law, namely Law No.30/2013 on the protection of children from the negative impact of information [16], and has recently benefited from the harmonisation of the data protection regime through Law No.195/2024 [15], but does not yet have an equivalent of the obligations set out in the AI Act and the DSA.

This article pursues three aims. First, it examines what the three European regulations provide on the protection of minors and what their common points are. Second, it identifies the preventive mechanisms that have proven to be effective and functional in practice. Finally, it puts forward observations on the directions the Republic of Moldova may follow in order to take up the most useful normative and institutional solutions of the European model.

Methods and materials applied. The scientific approach is based on the complementary use of several legal research methods. Through the method of legal analysis, the relevant provisions of the AI Act, the DSA, and the GDPR were examined, with emphasis on the articles that establish specific safeguards for minors. The systemic method allowed a correlated interpretation of these normative instruments, highlighting how these acts complement one another and articulate with the Charter of Fundamental Rights of the EU and with the relevant Council of Europe instruments. This integrated approach is important, because the protection of minors in the digital environment is not achieved through a single normative act, but through the combined application of several regulations, each of which addresses a distinct dimension of risk. The comparative method was used to confront the legal framework of the European Union with the current state of the legislation of the Republic of Moldova, identifying both the elements of harmonisation already in place and the structural gaps that require attention in the context of the accession process. Finally, through synthesis, the conclusions of the research and possible directions for regulation were formulated.

The materials used include the normative acts of the European Union and the legislation of the Republic of Moldova relevant to the topic studied, the applicable instruments of international law, institutional documents with interpretative value, specialised legal doctrine, as well as the relevant case law of the Court of Justice of the European Union.

Discussion and results obtained. **I. Conceptual Framework: The Minor as a Vulnerable Subject in the Digital Space**. The starting point of any legal analysis on the protection of minors in the digital environment is the very definition of the notion of minor. The United Nations Convention on the Rights of the Child defines, in Article 1, the child as any person under the age of 18, unless the applicable law provides for an earlier age of majority [7]. The same age limit is taken up, indirectly, by European Union law instruments: the AI Act refers to "age-related vulnerabilities" without setting a threshold age, while the DSA consistently uses the term "minor", leaving Member States to determine, by reference to domestic law, the boundary between minor and adult. The GDPR introduces, in Article 8(1), a specific rule for the consent of the child in connection with information society services: the processing of a child's data is lawful only if the child has reached

the age of 16, with Member States being able to set a lower age, but not below 13 years [3]. This differentiation between a general limit (18 years) and a specific limit for digital consent (16 or, where applicable, 13 years) marks a particular feature of the protection of minors in the online environment: the child is not seen as a unitary and rigid category, but as a legal subject in development, whose cognitive and judgement capacities are built progressively.

On this normative basis, the idea of the enhanced vulnerability of the child stands out, a notion which, in the digital space, takes on a new dimension compared with how it was understood in classical law. Recital (38) of the GDPR expressly puts forward this dimension, stressing that children deserve increased attention as regards data protection, since they may be less aware of the risks, consequences, and safeguards related to the processing of their data, especially for the purposes of marketing and profiling [3]. Recent doctrine, however, goes further and shows that the vulnerability of the minor in the online environment is not only an individual feature, but is largely the result of the way digital services are built. The specialists Natali Helberger, Marijn Sax, Joanna Strycharz, and Hans-W. Micklitz, argue that the architecture of the digital environment — such as the design of interfaces, attention-capturing mechanisms, the personalisation of options, and so on — generates a significant vulnerability that affects all users but reaches minors with greater intensity [23]. For the law, this perspective has an important consequence, since the protection of minors can no longer rely solely on the child's awareness of the risks to which he or she is exposed, but must address the very digital environment in which the child operates.

The concrete risks to which minors are exposed on the internet can be grouped into four categories, generically called "4C" [21]:

1. *Content*: content risks concern exposure to harmful, violent, or sexual material that promotes self-harm, disinformation, or dangerous behaviours.

2. *Contact*: contact risks refer to situations in which the minor is approached by persons who seek to harm him or her, including through grooming, harassment, or exploitation.

3. *Conduct*: conduct risks cover harmful behaviours in which the minor may be involved as a witness, participant, or victim, in destructive actions such as cyberbullying or the sharing of inappropriate content.

4. *Contract*: contract risks arise in the commercial relationships of the minor in the digital environment, from subscriptions with hidden costs to commercial profiling and targeted advertising.

To these four categories, in the more recent version of the classification, a series of cross-cutting risks is added, concerning the privacy, health, and fair treatment of the child, regardless of the main type of risk. Moreover, the European Commission's Guidelines on the protection of minors adopted under Article 28(1) of the DSA take up and extend this classification, expressly recognising five categories of risks: (1) content; (2) contact; (3) conduct; (4) consumer; and (5) cross-cutting [26].

A significant part of these risks lies on the border between civil and criminal law. Thus, the sexual grooming of a minor through social networks, exposure to child pornography materials, or the use of artificially generated (deepfake) content of a sexual nature may constitute both breaches of the obligations of digital service providers and distinct criminal offences. At European Union level, Directive 2011/93/EU on combating the sexual abuse of children sets out a common set of incriminations, structured around four main categories that Member States are required to transpose, such as: sexual abuse,

including causing a child to witness sexual activities; sexual exploitation through prostitution or pornographic performances, including online; the production, possession, distribution, or knowing access of child pornography materials; and the grooming of children for sexual purposes through digital means (online grooming) [5]. At international level, the Lanzarote Convention and the Budapest Convention enshrine the same type of protection, with emphasis on the digital component of these offences [9; 10]. This reality confirms that the protection of minors in the digital environment cannot be separated from the prevention of modern forms of crime directed against children, and that the obligations placed on online service providers acquire, indirectly, a function of preventing digital criminality.

In European Union law, the protection of minors in the digital environment also rests on a firm constitutional foundation. Article 24 of the Charter of Fundamental Rights of the European Union enshrines the right of children to such protection and care as is necessary for their well-being and provides that, in all actions concerning children, whether taken by public authorities or by private institutions, the best interests of the child must be a primary consideration [4]. This principle, drawn from the United Nations Convention on the Rights of the Child, runs through the entire normative framework analysed in this article and serves as an interpretative benchmark for all provisions applicable to minors: from the consent regime under the GDPR to the systemic risk assessment obligations placed on providers of very large online platforms under the DSA.

In the domestic law of the Republic of Moldova, the same logic is reflected in the Constitution, which, in Article 50, guarantees that the mother and the child have the right to special assistance and protection from the State, completing the framework set out in Article 28 on intimate, family, and private life and Article 32 on freedom of expression [11]. These constitutional benchmarks show that the protection of minors is not a public policy option, but a fundamental legal obligation, which takes priority over and conditions any specific regulation in the field of the digital environment.

II. Safeguards Offered by the AI Act, the DSA, and the GDPR. The three EU acts examined in this article do not have the exclusive aim of protecting minors, but each of them contains specific provisions designed to respond to their particular vulnerabilities in the online environment. The analysis of the three acts makes it possible to identify the concrete safeguards each establishes for users, with emphasis on minors. The way in which these safeguards complement each other will be examined later.

2.1. Safeguards offered by the AI Act. The definition of an artificial intelligence system used by the regulation takes up, with the adaptations needed for the European context, the updated definition put forward by the OECD in 2024 [30], ensuring terminological compatibility with the relevant international standards. Regulation (EU) 2024/1689 classifies AI systems by levels of risk, in which the most severe category (prohibited practices) directly concerns the protection of minors. Article 5(1)(a) prohibits the placing on the market or the use of artificial intelligence systems that use subliminal techniques or intentionally manipulative or deceptive techniques, capable of distorting a person's behaviour and leading them to take a decision they would not otherwise have taken, if this causes or is likely to cause significant harm. Article 5(1)(b) goes further and expressly prohibits those systems which exploit the vulnerabilities of a person or of a group of persons related to age, disability, or a specific social or economic situation, where this produces a substantial distortion of behaviour [1]. This prohibition expressly targets the child as a protected subject, since the minor is by definition a person belonging to an age category with specific vulnerabilities.

The second risk-level category concerns the regime applicable to high-risk systems. Annex III to the regulation lists, among these, artificial intelligence systems used in education and vocational training, such as: systems that assess learning outcomes, that significantly influence access or admission to educational institutions, or that monitor the behaviour of candidates during examinations [1]. Since these systems apply, in particular, in relation to minors, the legislator places on providers a set of specific obligations, such as: risk management throughout the life cycle of the system, the quality and representativeness of the training data, the transparency of technical documentation, effective human oversight, and so on. These obligations have direct effects on the protection of children. European doctrine has stressed that these requirements are essential precisely in order to counter the phenomenon of algorithmic discrimination, often generated by biases embedded in the training data and amplified to the detriment of vulnerable users [25]. To these obligations is added, under Article 27, the mandatory fundamental rights impact assessment, when the system is deployed by public authorities or by operators providing public services.

Another line of protection concerns the transparency obligations laid down in Article 50. AI systems intended for direct interaction with natural persons must be designed in such a way that the user is informed that he or she is interacting with an AI system, and artificially generated or manipulated content, including images, videos, or audio recordings of the deepfake type, must be marked as such [1]. For minors, this obligation has particular relevance, since their ability to distinguish between authentic content and artificially generated content is generally presumed to be lower than that of adults, which exposes them to additional risks of manipulation and deception.

2.2. Safeguards offered by the DSA. Regulation (EU) 2022/2065 contains the most consistent set of obligations expressly dedicated to the protection of minors in the online environment. The central point is Article 28, which requires providers of online platforms accessible to minors to put in place appropriate and proportionate measures to ensure a high level of privacy, safety, and security for this category of users [2]. The same provision prohibits, in paragraph (2), the presentation of advertising based on profiling, when the platform is aware with reasonable certainty that the recipient is a minor. This prohibition effectively eliminates one of the most widespread ways of capturing and monetising children's attention in the online environment. However, the above-mentioned obligations do not require providers to process personal data in order to assess whether the user is a minor.

In addition, Article 25 prohibits manipulative design elements (dark patterns). These are design elements of the online interface that deceive or manipulate users or that significantly affect their ability to take free and informed decisions [2]. This prohibition covers, among other things, the order in which options are presented, the visual asymmetry between accept and refuse buttons, and the procedural obstacles placed in the way of exercising a user (consumer) right. This prohibition is to be read together with the general regime of unfair commercial practices established by Directive 2005/29/EC [6], which classifies as unfair those practices that are likely to distort the economic behaviour of vulnerable consumers, a category in which minors are expressly recognised by the European legislator. Article 27 sets out the obligation for providers of online platforms to explain, in their general terms and conditions, the main parameters of their recommender systems and the options through which users can influence those parameters. Article 14(3) requires that, when a platform is mainly intended for minors or is mostly used by them, the general terms must be drafted in a language that minors can understand.

The most demanding category of obligations is reserved for very large online platforms (VLOPs) and very large online search engines (VLOSEs). Articles 34 and 35 require these providers to identify, analyse, and mitigate the systemic risks generated by their services, among which expressly figure the negative effects on the exercise of the fundamental rights of the child and on the protection of minors [2]. Article 35(1)(j) sets out the expected mitigation measures, such as: age verification, parental control tools, mechanisms that help minors signal abuses or access appropriate support. The correct interpretation of these articles is clarified by the relevant official commentary, according to which the obligations imposed by the regulation are graduated in nature, depending on the type and size of the service concerned [22].

2.3. Safeguards offered by the GDPR. Regulation (EU) 2016/679 protects minors first of all through the specific consent regime. Article 8 provides that, where information society services are offered directly to a child, the processing of personal data is lawful only if the child has reached the age of 16, or at least 13 years, if the Member State so provides [3]. For children below this age, processing is lawful only with parental consent, and the controller is obliged to make reasonable efforts to verify this consent.

In addition to the consent rule, the regulation reflects in several places the concern for the specific protection of the child. Recital 38 recognises that minors need specific protection because they may be less aware of the risks, consequences, and safeguards related to the processing of their data, especially for purposes of marketing and profiling. Recital 71 expressly states that automated decision-making should not concern a child, which significantly reduces the scope of application of the regulation's provisions on profiling as regards minors [3]. To these provisions is added the general transparency obligation in Article 12, according to which information addressed to the data subject must be provided in a concise, transparent, intelligible, and easily accessible form. In the case of minors, this requirement translates into the obligation to use a language adapted to their capacity for understanding.

III. Functional Preventive Mechanisms and Application in Practice. The effectiveness of the normative framework analysed in the previous sub-chapter depends, in the final analysis, on how the normative acts complement each other in practice and on the capacity of institutional mechanisms to turn the legal safeguards into concrete effects. In what follows, we will examine, step by step, how the AI Act, the DSA, and the GDPR work together at the functional level, the legal instruments with interpretative value, the recent case law of the Court of Justice of the European Union, and the first measures applying the Digital Services Regulation as regards the protection of minors.

3.1. The combined application of the three regulations at the functional level. A telling example is advertising profiling addressed to minors. Article 28(2) of the DSA expressly prohibits this practice [2], Article 6(1) and Article 8 of the GDPR set out strict conditions on the legal basis and on the valid consent of the child [3], and Article 5(1)(b) of the AI Act prohibits the use of artificial intelligence systems that exploit age-related vulnerabilities [1]. The three acts therefore address the same practice from different angles: the DSA classifies it as a negative obligation of the platform, the GDPR subjects it to the rules on consent, and the AI Act potentially classifies it as a prohibited practice when it involves manipulative algorithmic systems. This convergence produces a rather high level of protection, together forming a solid legal framework for the protection of minors in the digital space.

3.2. Institutional Documents with Interpretative Value (Soft Law). Two recent soft law instruments offer the most concrete benchmarks for the application of the normative

framework. On the one hand, the European Commission's Guidelines on the protection of minors adopted under Article 28(1) of the DSA, published on 14 July 2025 and officially approved in October 2025, organise the obligations of providers around the main categories of risk (4C+1: content, contact, conduct, consumer, and cross-cutting) and set out four basic principles [26]:

1. The proportionality of measures in relation to the identified risk;
2. The rights of the child as an interpretative benchmark;
3. Safety-by-design;
4. Age-appropriate design.

The document provides detailed recommendations on age verification, the limitation of manipulative design elements, and the adjustment of recommender systems in order to avoid the exposure of minors to harmful content. On the other hand, the statement of the European Data Protection Board (EDPB) on age assurance (Statement 1/2025), adopted on 11 February 2025, puts forward ten principles so that these mechanisms respect the standards of the GDPR. Among the most important are the principle of proportionality, the principle of data minimisation, the prohibition of using the data collected for age verification for purposes of further profiling, and the finding that mere self-declaration of age cannot be considered a sufficiently reliable method when high risks for children are at stake [29]. These two documents complete each other, the Commission's Guidelines setting out what must be done for the protection of minors, and the EDPB statement specifying how it must be done in order to respect the right to data protection.

3.3. Recent Case Law of the Court of Justice of the European Union. Two recent judgments of the Court, although they do not directly concern minors, strengthen the safeguards they enjoy in the online environment. In Case C-252/21 *Meta Platforms Inc. and Others v Bundeskartellamt*, delivered by the Grand Chamber on 4 July 2023, the Court held that the processing of Facebook users' data outside the platform (off-Facebook data) is subject to the strict requirements of the GDPR and that a national competition authority may find an infringement of the regulation if this is necessary in order to establish the existence of an abuse of dominant position [20]. At the same time, the Court stated that, when the controller holds a dominant position on the market, the validity of users' consent must be examined with increased rigour, since the imbalance of power may affect freedom of choice. In Case C-446/21 *Maximilian Schrems v Meta Platforms Ireland*, delivered on 4 October 2024, the Court confirmed that the principle of data minimisation, laid down in Article 5(1)(c) of the GDPR, expressly limits the use of personal data for personalised advertising, both as regards the categories of data used and the duration of their retention [19]. Applied in relation to minors, these judgments strengthen the legal foundations of the prohibition of advertising profiling laid down in Article 28(2) of the DSA and reduce the margin of discretion of platforms as regards the consent of minors or of those holding parental responsibility.

3.4. Concrete Application: The Commission's Preliminary Decision against Meta. On 29 April 2026, the European Commission communicated its preliminary findings, according to which Meta had breached the DSA obligations on the protection of minors on the Facebook and Instagram platforms [28]. The Commission identified two main shortcomings. First, the age verification mechanisms used by Meta were not considered adequate to prevent children under 13 from accessing the two platforms, even though Meta's own terms of use expressly prohibit this access. Second, the Commission found that Meta had not taken sufficient measures after receiving notifications indicating the massive presence of minors under 13 on its platforms.

The formal procedure, launched in May 2024, calls into question the very design of the Facebook and Instagram interfaces, which is considered likely to exploit the weaknesses and inexperience of minors and to encourage addictive behaviours, the so-called *rabbit hole* effect — the tendency of platforms to steer the user towards increasingly radical or captivating content. If the shortcomings are confirmed, Meta risks a sanction of up to 6% of its global annual turnover, in accordance with Article 74 of the DSA. This procedure represents the first major case of application of the DSA obligations as regards the protection of minors and shows that the European mechanisms have started to produce concrete effects.

In conclusion, the synergy between the AI Act, the DSA, and the GDPR does not remain at the theoretical level, but takes the form of a concrete set of instruments that work through combined application. Recent institutional documents, the case law of the Court, and the first decisions applying the Digital Services Regulation show that this legal architecture is starting to demonstrate its preventive effectiveness in favour of children, although its application to the entire European digital ecosystem will depend, in the medium term, on the capacity of national authorities to cooperate and on the technical and human resources allocated to supervision. In the medium term, the European debate is already moving towards a possible Digital Fairness Act, an instrument put forward in the doctrine in order to strengthen consumer protection in the digital environment through stricter rules on manipulative design elements, personalised marketing, and harmful practices directed at vulnerable groups, including minors [24].

IV. Conclusions and Implications for the Legal Framework of the Republic of Moldova. The analysis carried out in the previous chapters has shown that the protection of users, and in particular of minors, in the digital environment represents, in EU law, a field regulated through a complex architecture in which the AI Act, the DSA, and the GDPR complement one another and produce, through their combined application, a level of protection that none of the three acts could have offered on its own. The accession process of the Republic of Moldova to the European Union therefore calls for serious reflection on how the principles, mechanisms, and obligations set out by this framework can be taken up in domestic law, taking into account the specific features of the country and the existing institutional capacities.

The Moldovan legal framework already has several instruments of direct relevance for the protection of minors in the digital environment. Law No.30/2013 on the protection of children from the negative impact of information sets out a regime for the classification of information likely to affect the physical, mental, or moral development of children and imposes concrete obligations on providers of information and on media platforms [16]. However, this normative act appears to be already outdated and requires considerable adjustment, or even replacement. The adoption of Law No.195/2024 on the protection of personal data, which enters into force on 23 August 2026, is probably the most important step taken so far in harmonisation with the European acquis in the field covered by this paper, since it substantially transposes the rules of the GDPR, including those on the consent of the child. To these regulations are added: Law No.284/2004 on information society services [18]; Law No.72/2025 on electronic communications [17]; Law No.105/2003 on consumer protection [13]; as well as the provisions of the Criminal Code, in particular Articles 175[1] (Grooming of a minor for sexual purposes) and 208[1] (Circulation of materials regarding the sexual abuse of a child), which criminalise, among other things, perverse acts committed in the digital environment in relation to minors [12]. In addition, the accession of the Republic of Moldova to the Council of Europe Framework Convention on

Artificial Intelligence, signed in Vilnius on 5 September 2024, marks an important international commitment in the direction of alignment with European standards in this field [8].

However, the Moldovan legal framework shows significant gaps when compared with the European model analysed. The first and most visible gap is the absence of specific national legislation transposing the systemic obligations established by the AI Act and the DSA. There is no internal equivalent of the prohibition of manipulative practices that exploit age-related vulnerabilities, of the obligation on providers of online platforms to ensure a high level of privacy, safety, and security for minors, of the prohibition of advertising profiling addressed to children, or of the systemic risk assessment obligations. Another gap is institutional in nature: the national authorities that would supervise the application of such rules, such as the National Centre for Personal Data Protection, the General Police Inspectorate, the State Inspectorate for the Supervision of Non-Food Products and Consumer Protection, do not currently have explicit competences or dedicated technical resources to investigate the functioning of algorithmic systems, to assess the design of platforms, or to cooperate across borders in complex investigations. The general procedural framework for the activity of these authorities is regulated by the Administrative Code [14], but it does not contain special procedures adapted to the specific features of investigating algorithms or of cooperating with digital services coordinators from other States. Another constraint concerns the preventive-criminal component: the Criminal Code criminalises classical offences against minors, but is not yet fully adapted to the emerging forms of digital criminality, in particular online grooming through algorithmic platforms, the generation of deepfake content of a sexual nature depicting children, and exploitation through automated behavioural profiling.

Building on the European model and on the gaps identified, four consolidated lines of action emerge for the Republic of Moldova. First, the transposition of the DSA obligations on the protection of minors, in the sense of introducing specific obligations for providers of online platforms accessible to minors: the prohibition of advertising profiling addressed to children, the obligation to draft terms of use in a language understood by minors, the obligation to put in place accessible mechanisms for reporting abuses and harmful content. Second, the development of a domestic legal framework on artificial intelligence systems, inspired by the principles of the AI Act, which should expressly prohibit manipulative practices that exploit age-related vulnerabilities and set out a regime of specific obligations for high-risk systems used in fields concerning minors, such as education. Third, the strengthening of the supervisory and investigative capacities of the national authorities, through specialised staff training, the development of technical skills for algorithmic auditing, and the setting up of mechanisms for inter-institutional cooperation between the data protection authority, the consumer protection authority, and the criminal prosecution bodies. Fourth, the adaptation of the Criminal Code to the modern forms of digital criminality against minors, taking into account recent technological developments, in particular the generation of synthetic content and exploitation through automated systems.

The protection of minors in the digital age cannot be ensured exclusively through a single normative act or by a single institution. The European model analysed shows that the effectiveness of such a regime depends on the combined application of several legal instruments, on the simultaneous involvement of several authorities, and on their capacity to cooperate. For the Republic of Moldova, harmonisation with the EU acquis in this field should not be seen merely as an obligation assumed in the accession process, but as an opportunity to build, already from the current stage, a digital environment that is safer

for children, more transparent for users, and more accountable for service providers. The transposition of European norms, however well it may be carried out, will not produce concrete effects in the absence of a legal culture that recognises the rights of the child in the digital environment as fundamental rights, and of a sustained effort of digital literacy for children, parents, and teachers. This is, in the final analysis, the ground on which regulation proves its practical usefulness, not only through the sanctions it lays down, but also through the gradual change in the way in which the entire society understands and manages the risks to which children are exposed in the digital world.

Abstract

The economic base determines the social, political, cultural, and institutional superstructure. Therefore, the economic situation of a state tends to determine certain human behaviors, including criminal behavior at the level of companies. It is found both in areas of maximum prosperity and poverty [1].

Over the last two decades, the evolution of corporate criminality has moved from a niche technique to a global strategic priority, situated at the intersection of technology, economy, geopolitics, and civil society. Threats evolve faster than defense mechanisms. For the purpose of implementing the conditionalities of the National Regulatory Plan for 2025, in the context of aligning the legislation of the Republic of Moldova with that of the European Union, the main objective of the state is the consolidation and alignment of national legislation with relevant international standards. This represents an essential necessity for the integration of the Republic of Moldova into the European Union and for ensuring fair and efficient justice.

Keywords: legal entity, criminal liability of the legal entity, EU directives, national legislation.

PROCEDURI DE ARMONIZARE A LEGISLAȚIEI NAȚIONALE A PEDEPSEI APLICATE PERSOANEI JURIDICE ÎN CORAPORT CU LEGISLAȚIA UNIUNII EUROPENE

Abstract

Baza economică determină suprastructura socială, politică, culturală și instituțională. Prin urmare situația economică a unui stat tinde să determine anumite comportamente umane, inclusiv comportamentul infracțional la nivelul companiilor. Ea se regăsește atât în zone de prosperitate maximă, cât și de sărăcie [1].

În ultimele două decenii, evoluția criminalității corporatiste a evoluat de la tehnică de nișă la o prioritate strategică globală, aflată la intersecția dintre tehnologie, economie, geopolitică și societate civilă. Amenințările evoluează mai repede decât mecanismele de apărare. În scopul implementării condiționalităților din Planul național de reglementări pentru anul 2025, în contextul alinierii legislației Republicii Moldova la cele ale Uniunii Europene, principalul obiectiv al statului este consolidarea și alinierea legislației naționale la standardele internaționale relevante. Aceasta reprezintă o necesitate esențială pentru integrarea Republicii Moldova în Uniunea Europeană și pentru asigurarea unei justiții echitabile și eficiente.

Cuvinte-cheie: persoană juridică, răspunderea penală a persoanei juridice, directive UE, legislație națională.

Introduction. "The defining characteristic of the postmodern political era is the absolute domination of money as a principle of organizing human and international relations. Sometimes it seems that nothing else exists", said Jim Hoagland, quoted by David C. Korten in the book "The Post-Corporate World". Corporations support the political world, impose the laws that are adopted, and have individuals who lead intelligence, inquiry, and investigation services, as well as magistrates in key positions. It is clear that no one dares to initiate investigations and criminal inquiries. Victor Hugo stated that: "behind every great fortune lies a crime". The enormous fortunes held by only a few hundred or thousand corporations were obtained and amplified through financial speculation, direct or blatant theft, corruption, falsification of accounting records, fraudulent use of confidential information, and manipulation of capital markets. All these values were achieved by criminal structures operating within large and medium-sized corporations. Corporate criminality represents a special category in the extremely diverse landscape of criminality as a social phenomenon. It represents the most sophisticated form of illegal action conceived by the top structures of large corporations (super-elites) and implemented through refined strategies involving governmental and law-enforcement institutions. The fusion between corporate criminality and the political world has generated numerous financial benefits for the decision-makers of large corporations that control money, markets, technologies, and information [1, p.13-14].

The discussion of the criminal liability of the legal entity raises many essential aspects of criminal liability, some involving the reassessment or even reform of fundamental principles of criminal law. Among these, the most affected would be the principle of individual and personal criminal liability, the grounding of criminal liability on the principle of guilt, and the principle of equality before criminal law, principles from which major deviations would have to be accepted [2, p.29].

In legal doctrine, it has been shown that to establish the criminal liability of a legal entity means, in reality, engaging the criminal liability of all the individuals who compose it, sanctioning without distinction the guilty and the innocent, those who approved and those who disapproved of the criminal act, those who did not vote and those who decided upon its commission. The idea of such liability would lead to the admission of criminal liability for another, which is not accepted [3, p.59].

The necessity of sanctioning the legal entity derives from the usefulness of attracting it to criminal liability. For a long period of time, it was considered that the legal entity had a fictitious character, being only an instrument intended to satisfy the interests of its members, so that its criminal liability could not be discussed. Supporters of this conception stated that the legal entity cannot commit an offense on its own, directly, but only through a natural person, being incapable of its own action; that due to the specialty of its legal capacity it cannot commit offenses, this being contrary to the principle of specialty and exceeding the limits of the activity of the legal entity; that the lack of a subjective element in the case of the legal entity determines the impossibility of bringing it to criminal liability, guilt being an essential feature of the offense; that the personal character of criminal liability would also oppose the establishment of such liability upon the legal entity, which would in reality answer for the act of another; and that the technical difficulty of applying a punishment to the legal entity also militates against the introduction of such an institution into criminal legislation [4, p.656-657].

In the Criminal Code of the Republic of Moldova of 2002, for the first time among the legal provisions, the possibility of bringing the legal entity to criminal liability was included, unlike at least the legal provisions of the criminal law of the MSSR from 1961 [5].

The promoters of the idea regarding the criminal irresponsibility of legal entities traditionally invoked the impossibility of applying punishment to a legal entity. However, it can certainly be observed that some sanctions of a purely physical nature, which aim to produce suffering or eliminate the offender, by their nature, are not capable of being applied to legal entities. Such punishments are imprisonment or the death penalty. As regards the criminal liability of legal entities, and particularly the range of punishments, the basis of this argument has been seriously shaken by the experience of certain foreign legislations (France, the Netherlands, the USA, England, Belgium, etc.), which contain a whole arsenal of punishments and security measures applicable, not without effectiveness, to legal entities. According to the current regulations of the Criminal Code of the Republic of Moldova, the following punishments may be applied to legal entities: fine; deprivation of the right to carry out a certain activity; liquidation [6, p.67].

Methods and materials applied. The most important document adopted in this field by the Council of Europe is Recommendation R(88)18 concerning the liability of enterprises as legal persons for offences committed in the course of their activities. The purpose of the Recommendation is to encourage the adoption of legislative measures so that, on the one hand, enterprises may be declared liable for offences committed in the course of their activities, without however exempting the natural persons who committed the act from liability, and, on the other hand, to create a system of sanctions and measures adapted to enterprises, for the purpose of ensuring effective punishment of unlawful activity, preventing the commission of new offences, and repairing the damage caused by the offence [3, p.439].

The Recommendation — concerning public or private enterprises endowed with legal personality and carrying out economic activities — formulates several principles which should govern the regime of criminal liability of legal persons: a legal person may be liable for offences committed in the exercise of its activity, even if such offences are unrelated to the object of the enterprise and regardless of whether the natural person who committed them has been identified or not; the enterprise must be exempted from liability when its management was not involved in the commission of the offence and took all necessary measures to prevent its commission; engaging the liability of the enterprise must not lead to exempting from liability the natural persons involved in committing the offence. In particular, persons exercising management functions must be liable for omission in fulfilling their obligations, an omission which led to the commission of the offence; criminal sanctions should be applied only when required by the nature of the offence, the gravity of the enterprise's fault, the consequences for society, and the need to prevent other offences. For less serious acts, recourse to other forms of liability is indicated, such as, for example, administrative liability [3, p.440].

The Recommendation provides for a wide range of applicable sanctions, as principal or accessory, with or without suspension, to legal persons, including: closure of the enterprise; dissolution of the enterprise; publication of the decision by which a sanction or measure was imposed.

The criminal liability of legal persons is also addressed by Resolution No.1 concerning the civil, administrative and criminal aspects of the fight against corruption, adopted during the Conference of European Ministers of Justice (Malta, 1994).

Recommendation R(96)8 was adopted in 1996 and concerns criminal policy in a changing Europe, considering it appropriate for member states to adopt provisions establishing the criminal liability of legal persons or other measures having the same purpose. Likewise, Resolution (97)24 concerning the 20 guiding principles in the fight against

corruption emphasizes the need to establish measures preventing the transformation of legal persons into shields for concealing offences.

Although the European Convention on Human Rights makes no reference to a possible criminal liability of legal persons, it is not incompatible with such liability. Consequently, when there is a criminal charge against a legal person, it benefits from the guarantees of a fair trial conferred by Article 6 of the Convention. This case-law is in line with doctrinal orientation, which considers that the provisions of Articles 6 and 7 of the Convention protect legal persons to the same extent as natural persons.

Under the auspices of the Council of Europe, the Criminal Law Convention on Corruption was also concluded in Strasbourg on 27.01.1999. The regulations of the Convention oblige member states to include in their national legislation sanctions applicable to legal persons committing the offences covered by the Convention. Among these, signatory states are obliged to adopt the necessary measures to allow the engagement of criminal liability of legal persons for offences of bribery, trading in influence, and money laundering committed on their behalf by a natural person. The condition of criminal liability must arise when the natural person acted in a management, control, or representation function, or participated as an instigator or accomplice in the commission of the offences covered by the Convention.

According to Article 26 of the United Nations Convention against Corruption (New York, 31 October 2003 – RM, 6 July 2007), the state adopts the necessary measures, in accordance with its legal principles, to establish the liability of legal persons participating in the offences established by the Convention [7, p.1284].

Regulations concerning the liability of legal persons are also found in Article 12 of the Convention on Cybercrime, adopted in Budapest on 23.11.2001, as well as in Article 10 of the Council of Europe Convention on the Prevention of Terrorism and respectively Article 22 of the Council of Europe Convention on Action against Trafficking in Human Beings, both adopted in Warsaw on 16 May 2005. These conventions impose on States Parties the obligation to ensure the imposition of effective, proportionate, and dissuasive sanctions, whether criminal or otherwise, on legal persons responsible for the offences provided by the convention [3].

Discussions and results obtained. On 26 July 1995, the Convention on the protection of the financial interests of the European Communities was adopted. The Second Protocol to the Convention, signed on 19.06.1997, concerns the repression of money laundering and the liability of legal persons. According to it, states are obliged to adopt the necessary measures to ensure the possibility of holding legal persons liable. Article 4-1 provides that: "each Member State shall take the necessary measures to ensure the application, in the case of a legal person declared liable under Article 3-1, of effective, proportionate and dissuasive sanctions, including criminal or non-criminal fines and possibly other sanctions" [3, p.450].

Regarding the conditions for engaging the criminal liability of the legal person, the drafters opted for the indirect model, which presupposes that the liability of the legal person derives from the conduct of the natural person who, according to the regulation, has the capacity to bind it criminally. It is considered that the possibility of establishing the direct model in the case of negligent offences may still be discussed, which would imply that the guilt of the legal person be founded directly on the attitude or policy promoted by it. At the same time, it would be possible for this differentiated treatment to be developed through case-law, under the control of the Court of Justice of the European Communities.

The sanctions applicable to legal persons provided by the Convention are principal penalties (the fine) and complementary penalties (publication of the conviction decision; exclusion from the benefit of subsidies for a certain period; confiscation of goods produced or obtained through the commission of offences). We note that the drafters did not regulate as a penalty the dissolution of the legal person or the suspension of its activity, sanctions known in numerous legal systems.

During the process of ratification of the Convention, difficulties arose in introducing criminal liability of legal persons into the domestic law of all Member States of the European Union. This was because liability of the legal person was also to be applied by states which had initially rejected this idea. According to the synthesis reports related to the Convention project, only Italy and Greece considered that implementation of these provisions would raise constitutional problems. Austria and Germany also invoked gaps related to the compatibility of the project with their legal tradition, the legal systems of these countries not recognizing at that stage the actual criminal liability of the legal person. The entry into force of the project represented the etymology of the evolution of Community legislation and case-law, being an important step in the direction of generalizing criminal liability for legal persons in Continental European law [7, p.456].

The United Nations Convention against Transnational Organized Crime (New York, 15 November 2000 – RM, 17 February 2005) calls on states to adopt the necessary measures, in accordance with their legal principles, for establishing the liability of legal persons participating in serious offences involving an organized criminal group and committing the offences provided by the Convention. According to the same article, states must ensure in particular that legal persons held liable are subject to effective, proportionate and dissuasive sanctions of a criminal or non-criminal nature, including monetary sanctions [7, p.1284].

Nowadays, modern digital society is exposed from ordinary citizens and companies to governments, armies, and critical institutions. Failure to adapt leads to systemic failure — organizations that do not innovate will quickly become vulnerable to attacks they can no longer understand, prevent, or control. We live in an era in which Artificial Intelligence is no longer a science-fiction concept, but a real catalyst of digital transformation in all fields — from healthcare and transport to education, commerce, and security.

Organizations now generate tens of millions of security events and logs daily, while attacks become increasingly sophisticated, rapid, and polymorphic; the human capacity to manually detect and respond to all these signals is, quite simply, exceeded.

Policies and regulations adapted to the new digital reality. International examples: European Union — proposals within the AI Act for regulating generative technologies. United States — laws against deepfakes in electoral campaigns. Criminal liability for the abusive use of AI. There is increasing discussion about introducing a legal framework that would establish the responsibility of actors involved in the development, distribution, and use of AI to be used or prohibited in: electoral campaigns, governmental communications, financial markets and stock declarations, and public health fields [8, p.159-160].

Currently, the national legislation is in the process of implementing the conditionalities of the National Regulatory Plan for 2025, in the context of aligning the legislation of the Republic of Moldova with those of the European Union. For the execution of the roadmap "Rule of Law", Chapter 23 "Justice and Fundamental Rights", adopted by GD No.275/2025: – Pillar: II. Combating corruption, Action 1.1 "Amending the Criminal Code for alignment with the EU acquis on combating corruption in the private sector in order to regulate the liability of legal entities for acts of corruption and related actions", and Ac-

tion 1.7 "Amending the regulatory framework for the purpose of regulating sanctions for violating international restrictive measures, in accordance with EU standards". The main objective of this project is to consolidate and develop current regulations to ensure more efficient prevention and combating of criminal acts, and the alignment of national legislation with relevant international standards is an essential necessity for the integration of the Republic of Moldova into the European Union and for ensuring fair and efficient justice [9].

The European normative acts which jointly regulate new categories of penalties applicable to legal persons that need to be transposed into national legislation are: a) exclusion from the right to benefit from state benefits or aid – (Directive 2024/1226; Directive 2018/1673; Framework Decision 2003/568/JHA; Framework Decision 2008/913/JHA); b) exclusion from access to public funds, including public procurement procedures, grants and concessions – (Directive 2024/1226; Directive 2018/1673); c) disqualification from the right to carry out commercial activities – (Directive 2024/1226; Directive 2018/1673; Framework Decision 2003/568/JHA; Framework Decision 2008/913/JHA); d) placing under judicial supervision – (Directive 2024/1226; Directive 2018/1673; Framework Decision 2003/568/JHA; Framework Decision 2008/913/JHA); e) legal liquidation – (Directive 2024/1226; Directive 2018/1673; Framework Decision 2003/568/JHA; Framework Decision 2008/913/JHA); f) closure of the establishments that served for the commission of the offence – (Directive 2024/1226; Directive 2018/1673; Framework Decision 2008/913/JHA); g) publication in the public interest of the full text of the judgment – (Directive 2024/1226) [10].

Conclusions and recommendations. As part of the European integration process, the Republic of Moldova has undertaken a series of objectives related to the transposition into the legislation of the Republic of Moldova of certain directives and decisions. Thus, in order to achieve a high level of security and justice within the European Union, as well as to ensure the integrity of the European internal market, it is necessary to establish rules for aligning the sanctions and offences committed by legal persons. Following these considerations, the purpose of the amendments proposed by legal practitioners and the legislator is to harmonize the Criminal Code of the Republic of Moldova through:

1. Adjustment of the institution of the legal person as a subject of the offence. This will exclude from the circle of legal persons liable to criminal punishment the following subjects: states, public bodies exercising state authority and public international organizations, where appropriate by amending Article 23 of the Criminal Code of the Republic of Moldova.

2. Transfer of criminal liability in the case of the reorganized legal person. This mechanism presupposes preventing the possibility of legal persons evading criminal prosecution or trial of the case through their reorganization. The transition of criminal liability must be made proportionally, depending on the value of the assets which the reorganized legal person absorbs from the dissolved legal person guilty of committing the act, where appropriate by supplementing Article 21 of the Criminal Code of the Republic of Moldova.

3. Establishment of criminal records and recidivism status of the legal person, as well as their transfer in the case of reorganized legal persons. The current wording of Articles 34, 110 and 111 of the Criminal Code of the Republic of Moldova does not clearly provide that a legal person may commit an offence in a state of recidivism or that it may have a criminal record. Thus, it is necessary to clearly establish that a legal person may commit an offence in a state of recidivism and that, in respect of such entities, criminal records may exist.

4. Adjustment of the system of penalties applicable to legal persons and the introduction of new sanctions such as: a) exclusion from the right to benefit from state benefits or aid; b) exclusion from access to public funds, including public procurement procedures, grants; c) disqualification from the right to carry out commercial activities; d) placing under judicial supervision; e) legal liquidation; f) closure of the establishments that served for the commission of the offence; g) publication in the public interest of the full text of the judgment. Transposition of EU legislation on combating money laundering through criminal law measures and combating corruption in the private sector. These proposals revise the system of sanctions applicable to legal persons, with the aim of creating a fairer, more efficient and more dissuasive legal framework. In the current wording of the Criminal Code of the Republic of Moldova, the penalty of liquidation of the legal person and deprivation of the right to carry out a certain activity may be applied, including as principal penalties, without being accompanied by a pecuniary penalty. This approach allows a legal person to avoid the direct financial consequences of its act, even when it is sanctioned with the penalty in the form of liquidation or deprivation of the right to exercise a certain activity, as principal penalties. Thus, it has been established that the only principal penalty shall be the fine, while the other sanctions shall be complementary penalties. The already existing complementary penalties (deprivation of the right to carry out a certain activity and liquidation of the legal person), as well as the newly introduced ones, in order to have sufficient dissuasiveness must accompany the penalty in the form of a fine. This amendment will eliminate situations in which a legal person, by committing an offence, causes damage to the state or other persons, but is independently subjected only to a penalty in the form of liquidation or in the form of deprivation of the right to carry out a certain activity.

5. Transposition of Directive 2024/1226 on the definition of criminal offences and penalties for the violation of Union restrictive measures. Among these being primarily criminal liability, as well as administrative liability, as an option for Member States in relation to the value of the "funds or economic resources". In particular, criminal liability is to be applied in the following cases: making funds or economic resources, directly or indirectly, available to a designated person, entity or body or for their benefit, in breach of a prohibition constituting a Union restrictive measure; failure to comply with the obligation to freeze funds or economic resources belonging to, owned, held or controlled by a designated person, entity or body, in breach of an obligation constituting a Union restrictive measure; carrying out transactions or continuing transactions with a third country, with bodies of a third country or with entities or bodies owned or controlled directly or indirectly by a third country or by bodies of a third country, including the award or continued performance of public procurement contracts or concession contracts, where the prohibition or restriction of such conduct constitutes a Union restrictive measure; defining international restrictive measures and the total turnover (from 1% to 5%) applied to legal persons [11].

CRIMINAL LIABILITY FOR TAX EVASION OF ECONOMIC ENTITIES IN THE REPUBLIC OF MOLDOVA: THEORETICAL DISTINCTIONS, PRACTICAL ASPECTS AND CONTEMPORARY CHALLENGES

Roman RUSSU,
PhD Student,
"Ștefan cel Mare" Academy of the Ministry of Internal Affairs,
Senior State Inspector, National Center for Personal Data Protection,
Republic of Moldova
ORCID: 0009-0001-6437-4736

Abstract

This study analyzes the criminal liability for tax evasion by economic entities in the Republic of Moldova, focusing on the theoretical distinctions between criminal and contraventional liability, practical aspects, and contemporary challenges. Examining the provisions of Article 244 of the Criminal Code of the Republic of Moldova and Article 301 of the Contraventional Code, the study highlights the criteria for incrimination, value thresholds, and qualification difficulties in the context of increasingly complex evasion schemes, including the use of tax havens and shell companies. The analysis reveals that the lack of clear definitions, uneven application of the law, and insufficient international cooperation affect the effectiveness of combating the tax evasion phenomenon.

The study includes an analysis of the case law of the Supreme Court of Justice and the judgments of the European Court of Human Rights in the cases of Epidavr S.R.L. v. the Republic of Moldova, Tasoncom S.R.L. v. the Republic of Moldova and Avicola Vulcănești S.A. v. the Republic of Moldova. Solutions are proposed for improving the regulatory framework and judicial practice, including harmonization with European directives 2011/16/EU and (EU) 2018/843. The study analyzes recent legislative amendments, including Law No.136/2024 on tightening criminal sanctions for tax evasion, as well as the international commitments undertaken by the Republic of Moldova through accession to the Inclusive Framework on BEPS and implementation of OECD standards on automatic exchange of information.

Keywords: criminal liability, tax evasion, economic entities, contraventional liability, judicial practice, Art. 244 CC RM, ECHR case law, European harmonization.

RĂSPUNDEREA PENALĂ PENTRU EVAZIUNEA FISCALĂ A ENTITĂȚILOR ECONOMICE ÎN REPUBLICA MOLDOVA: DELIMITĂRI TEORETICE, ASPECTE PRACTICE ȘI PROVOCĂRI CONTEMPORANE

Abstract

Prezentul studiu analizează răspunderea penală pentru evaziunea fiscală a entităților economice în Republica Moldova, cu accent pe delimitările teoretice dintre răspunderea penală și cea contravențională, aspectele practice și provocările contemporane. Examinând prevederile Art. 244 din Codul penal al Republicii Moldova și Art. 301 din Codul contravențional, studiul evidențiază criteriile de incriminare, pragurile valorice și dificultățile de calificare în contextul complexității tot mai mari a schemelor de evaziune, inclusiv utilizarea paradisurilor fiscale și a firmelor fantomă. Analiza relevă că lipsa unor definiții clare, aplicarea neuniformă a legii și insuficiența cooperării internaționale afectează eficiența combaterii fenomenului evazionist.

Studiul include o analiză a jurisprudenței Curții Supreme de Justiție și a hotărârilor Curții Europene a Drepturilor Omului în cauzele Epidavr S.R.L. c. Republicii Moldova, Tasoncom S.R.L. c. Republicii Moldova și Avicola Vulcănești S.A. c. Republicii Moldova. Se propun soluții pentru îmbunătățirea cadrului normativ și a practicii judiciare, inclusiv prin armonizarea cu directivele europene 2011/16/UE și (UE) 2018/843. Sunt

analizate modificările legislative recente, inclusiv Legea nr. 136/2024 privind înăsprirea sancțiunilor penale pentru evaziune fiscală, precum și angajamentele internaționale asumate de Republica Moldova prin aderarea la Cadrul Incluziv BEPS și implementarea standardelor OCDE privind schimbul automat de informații.

Cuvinte-cheie: răspundere penală, evaziune fiscală, entități economice, răspundere contravențională, practică judiciară, art. 244 CP RM, jurisprudență CEDO, armonizare europeană..

Introduction. Legal liability, as a measure of state coercion, represents a fundamental instrument in ensuring compliance with tax obligations. The Constitution of the Republic of Moldova, in Article 58, explicitly provides that «citizens have the obligation to contribute through taxes and duties to public expenditure" [1, Art. 58]. To guarantee this constitutional obligation, the legislator has established two distinct forms of liability for the avoidance of tax obligations: contraventional liability and criminal liability.

Tax evasion is the logical result of the flaws and inconsistencies of an imperfect and poorly assimilated legislation, of defective methods and modalities of application, as well as the lack of foresight and incompetence of the legislator whose fiscality is just as guilty as those whom it thereby provokes to evasion [2, p. 414].

At the same time, tax evasion represents a totality of lawful or unlawful procedures through which taxpayers evade, in whole or in part, the taxable matter of tax obligations. According to author S. Gorobievschi, tax evasion can be defined as "the totality of unlawful actions committed intentionally by taxpayers aimed at reducing tax obligations or evading their payment" [3, p. 62]. The evasion phenomenon in the Republic of Moldova continues to be one of significant proportions, which outlines the need for a multidisciplinary study to answer the question "why do more and more people avoid honoring their tax obligations and seek methods of avoidance". In essence, an adequate formula for tax evasion consists of the taxpayer's evasion, by any means, in whole or in part, from the payment of taxes, duties, and/or any other sums due to the public budget [3, p. 63].

It should be noted that, although the Tax Code of the Republic of Moldova (hereinafter TC RM) does not expressly define the notion of "tax evasion", but regulates the procedure for examining tax violations, the Criminal Code of the Republic of Moldova (hereinafter CC RM) criminalizes this act in Art. 244. Through Law No.206 of November 18, 2011, amendments were made both to the Criminal Code and to the Contraventional Code (hereinafter Contraventional Code) by introducing liability for tax evasion by natural persons (not practicing entrepreneurial activity) both as a crime (Art. 244[1] CC RM) and as an administrative contravention (Art. 301 Contraventional Code). Previously, only tax evasion by enterprises, institutions, and organizations was criminally sanctioned in accordance with Art. 244 of the CC RM [6].

The purpose of the study is to research aspects related to legal liability for tax evasion in the Republic of Moldova, a liability materialized in the form of criminal liability. The specific objectives aim to: critically analyze the normative framework regulating criminal liability for tax evasion of economic entities; theoretically delineate between criminal and contraventional liability; identify application problems of Art. 244 CC RM in judicial practice; highlight contemporary challenges generated by the complexity of evasion schemes and the European integration of the Republic of Moldova.

In conducting this study, classical scientific research methods specific to legal sciences were used. The logical method allowed for the coherent analysis of relevant legal concepts and institutions, as well as the identification of relationships between them. The comparative method was used to highlight similarities and differences between the legislation of the Republic of Moldova and European standards in the matter, particularly

Directive 2011/16/EU on administrative cooperation in the field of taxation [4] and Directive (EU) 2018/843 on the prevention of the use of the financial system for the purposes of money laundering or terrorist financing [5]. The historical method allowed the analysis of the evolution of regulations in the field, including legislative amendments made through Law No.206 of November 18, 2011 [6], which introduced liability for tax evasion by natural persons both as a crime (Art. 244¹ CC RM) and as an administrative contravention (Art. 301 Contraventional Code), as well as the subsequent evolution of these norms.

The empirical material of the research consists of national normative acts (Constitution of the Republic of Moldova, Criminal Code, Contraventional Code, Tax Code), European normative acts (Directive 2011/16/EU, Directive (EU) 2018/843), the jurisprudence of the Supreme Court of Justice of the Republic of Moldova, judgments of the European Court of Human Rights in the cases *Epidavr S.R.L. v. the Republic of Moldova* [7], *Tasoncom S.R.L. v. the Republic of Moldova* [8] and *Avicola Vulcănești S.A. v. the Republic of Moldova* [9], as well as national and international specialized literature.

Discussion and results obtained. Any act committed, to be recognized as a crime, must meet the essential characteristics provided by law: social danger, criminal illegality, guilt, and punishability. In the case of tax evasion, the legislator opted for a dual incrimination, distinct depending on the subject and the gravity of the act, establishing both contraventional and criminal liability.

I. Evolution of the Normative Framework: From Art. 301 Contraventional Code to Art. 244¹ CC RM. An important stage in regulating liability for tax evasion was marked by Law No.206 of November 18, 2011 [6], through which amendments were made both to the CC RM and the Contraventional Code. Thus, liability was introduced for tax evasion by natural persons (not practicing entrepreneurial activity) both as a crime – Art. 244¹ CC RM, and as an administrative contravention – Art. 301 Contraventional Code [10, p. 73]. Previously, only tax evasion by enterprises, institutions, and organizations was criminally sanctioned in accordance with Art. 244 of the CC RM, being considered the most dangerous manifestation from a social perspective of the tax evasion phenomenon [11].

The initial content of Art. 301 Contraventional Code, as described in doctrine [10], provided that tax evasion by natural persons not practicing entrepreneurial activity, committed by evading the submission of the income tax declaration or by including distorted data in the declaration, constituted a contravention if the amount of income tax to be paid did not exceed 2,500 conventional units of fine (equivalent to 50,000 lei at that time). The same acts, if the tax amount exceeded this threshold, were qualified as a crime under Art. 244¹ CC RM. The contraventional sanction consisted of a fine from 2,000 to 3,000 lei, and the act was not sanctioned if the tax due was less than 100 c.u. (2,000 lei) [10, p. 74].

II. Repeal of Art. 301 Contraventional Code and Consolidation in Art. 244¹ CC RM. In the process of improving criminal and contraventional legislation, Art. 301 of the Contraventional Code was repealed by Law No.178 of 26.07.2018, and the respective acts were fully included in the sphere of criminal liability, under the incidence of Art. 244¹ CC RM. This legislative amendment had the effect of eliminating the contraventional character of tax evasion for natural persons and establishing a single value threshold for the incidence of criminal liability, in accordance with the provisions of Art. 244¹ CC RM. Thus, currently, tax evasion by natural persons not practicing entrepreneurial activity is exclusively a crime, without a distinct contraventional variant existing.

The distinction between criminal and contraventional liability in matters of tax evasion by economic entities continues to be made through the prism of value thresholds. According to Art. 244 para. (1) CC RM, tax evasion by enterprises, institutions, and organ-

izations, committed by intentionally including in accounting, tax, and/or financial documents, including electronic ones, manifestly distorted data regarding income or expenses not based on real operations or based on operations that did not exist, or by intentionally concealing taxable objects, accounting, tax, and/or financial documents, if the *cumulative amount of tax, duty, mandatory state social insurance contribution, or mandatory health insurance premium for a fiscal year exceeds 50 forecasted average monthly salaries per economy*, established by Government decision in force at the time of the act, constitutes a crime [11]. For the year 2026, the amount of the forecasted average monthly salary per economy is 17,400 lei, thus the value threshold for the incidence of criminal liability is 870,000 lei (50 x 17,400) [15]. If the cumulative amount does not exceed this threshold, the act may be sanctioned contraventionally, in accordance with the provisions of the Contraventional Code [12].

An important distinctive element is the active subject of the act. In the case of Art. 244 CC RM, the active subject can be both a natural person (the entity's manager or accountant) and the legal entity itself, to the extent that the law provides for criminal liability of the legal entity. Conversely, the tax contravention can be committed by both natural and legal persons, but the sanctions are exclusively pecuniary (fines) and do not entail criminal consequences such as a criminal record. Doctrine notes that tax evasion is a criminal offense affecting social relations regarding the formation of the national public budget through the non-fulfillment of tax obligations by taxpayers [13, p. 74].

Judicial practice reveals significant difficulties in applying Art. 244 CC RM, generated by the complexity of tax evasion schemes, the difficulty of proving intent, and the non-uniform interpretation of certain legal notions. According to author Al. Borodac, "the crime of tax evasion presents an increased social danger, as it affects the very existence of the state by undermining its financial base" [14, p. 187].

According to Art. 244 CC RM, the crime of tax evasion can be committed in several alternative normative modalities: by intentionally including in accounting, tax, and/or financial documents, including electronic ones, manifestly distorted data regarding income or expenses not based on real operations or based on operations that did not exist, or by intentionally concealing taxable objects, accounting, tax, and/or financial documents [15, p. 13].

According to the opinion expressed in doctrine by some authors, unreal operations are those that do not have their own legal existence, unlike operations that did not exist in fact, which refer to creating the appearance of an operation that in reality did not take place [15, p. 14]. Author A. Palii emphasizes that "the crime of tax evasion is generally carried out through the use of complex fraudulent methods, involving false documents and fictitious transactions" [16, p. 112].

A major problem concerns establishing the subjective element of the crime. In order for Art. 244 CC RM to be applicable, proof of the active subject's direct or indirect intent to evade the payment of taxes and duties is necessary. In practice, perpetrators often invoke "accounting errors" or "different interpretations of tax legislation" to justify non-payment of tax obligations, making it difficult to differentiate between a simple tax contravention and the crime of evasion. Author C. Bulai assesses that "the subjective element of the crime of tax evasion presupposes direct intent, manifested through awareness of the illicit nature of the actions and the will not to pay tax obligations" [17, p. 256].

A major challenge lies in quantifying the damage. In the case of economic entities using shell companies or offshore schemes, determining the exact amount due to the state budget is extremely difficult. Offshore zones (tax havens) are privileged territories

in the financial universe, where immense transactions can be carried out without any possibility of control, using banking institutions in these zones [18, p. 74].

Criminal investigation bodies investigate tax evasion cases "post factum", which often leads to the impossibility of seizing supporting documents and halting the investigation. The lack of effective international cooperation instruments and automatic exchange of information exacerbates this problem, allowing economic entities to hide assets in offshore jurisdictions.

Last but not least, another problem relates to the legal qualification of acts in the context of concurrence of offenses. In judicial practice, the question arises whether, when the main act is tax evasion and subsequently the sums are subjected to money laundering operations, we are in the presence of a real concurrence of offenses or a single act. In this regard, it has been shown that Art. 244 CC RM is applicable when tax evasion by enterprises, institutions, and organizations generates prejudicial consequences consisting of non-payment of tax obligations [15, p. 15].

In the context of the European path of the Republic of Moldova, significant legislative amendments have been made. Through Law No.136 of 06.06.2024 amending certain normative acts (amending the Criminal Code and the Contraventional Code, effective from 07.09.2024) [19], Art. 244 of the Criminal Code (Tax evasion of enterprises, institutions, and organizations) was revised, increasing the fine penalty applied to natural and legal persons, as well as the prison sentence for natural persons [20]. Thus, the new normative framework provides for more severe penalties for acts of tax evasion: if the cumulative amount of tax, duty, mandatory state social insurance contribution, or mandatory health insurance premium for a fiscal year exceeds 100 forecasted average monthly salaries per economy, established by Government decision in force at the time of the act, the act is punishable by a fine of 13,000 to 20,000 conventional units or imprisonment from 3 to 7 years, with deprivation of the right to hold certain positions or exercise a certain activity for a term of 2 to 5 years, and the legal person is punishable by a fine of 20,000 to 40,000 conventional units, with deprivation of the right to exercise a certain activity or liquidation of the legal person. According to Art. 244 para. (5) CC RM, the acts provided for in para. (1)-(4), committed by an organized criminal group or a criminal organization or in their favor, are punishable by imprisonment from 5 to 10 years, with a fine of 17,000 to 20,000 conventional units and deprivation of the right to hold certain positions or exercise a certain activity for a term of 3 to 5 years, and the legal person is punishable by a fine of 40,000 to 60,000 conventional units, with deprivation of the right to exercise a certain activity or liquidation of the legal person [11, Art. 244 para. (2)-(5)].

On May 27, 2024, the Republic of Moldova officially became a member of the Inclusive Framework on BEPS (Base Erosion and Profit Shifting), the largest and most important structure at the international level in the tax field, encompassing over 140 member countries [21; 22]. This accession represents an important step towards alignment with international standards of tax transparency and aims to develop mechanisms to combat tax evasion, improve tax rules, and ensure a transparent fiscal environment. Through Government Decision No.844 of December 18, 2024, the accession of the State Tax Service of the Republic of Moldova to the Inclusive Framework on BEPS was approved [23].

The Republic of Moldova has also strengthened its commitments within the Global Forum on Transparency and Exchange of Information for Tax Purposes. In 2023, the Republic of Moldova committed to carrying out the first reciprocal data exchanges according to the Common Reporting Standard (CRS) by 2024 [24]. Currently, over 120 countries carry out the same type of automatic exchange of information, and the Republic of

Moldova was authorized to carry out reciprocal exchanges of data on financial accounts starting in 2023, with the first exchange taking place in 2024 [25, p.3]. In December 2025, the Republic of Moldova announced it would include cryptocurrencies in the automatic exchange of information on financial accounts with other countries, updating the existing framework to reflect developments in the financial market and new tax risks, including those related to digital assets [26].

Regarding the jurisprudence of the Supreme Court of Justice of the Republic of Moldova (hereinafter SCJ RM) in matters of tax evasion, it reveals a non-uniform practice, especially concerning the individualization of punishment and the application of mitigating or aggravating circumstances. In some cases, courts have ordered conviction with suspension of sentence execution under supervision, while in others, effective prison sentences were opted for, without clear reasoning for the difference in treatment. In case file No.1ra-1528/17 (Decision of the Criminal Panel of October 11, 2017), the Court ordered the conditional suspension of sentence execution based on Art.90 Criminal Code, noting that the tax authority had found tax evasion by the enterprise. Conversely, in case file No.1ra-169/2021 (Decision of May 25, 2021), although the crime of tax evasion was committed on a particularly large scale, the court analyzed the possibility of conditional suspension of sentence execution but also highlighted the strict conditions under which it may be granted. This different approach, without explicit justification of the criteria leading to distinct solutions, illustrates the lack of a unitary practice.

Another aspect generating non-uniform practice is how courts evaluate mitigating and aggravating circumstances. For example, in case file No.4-1re-58/2017 (Decision of April 6, 2017), the Court retained several mitigating circumstances, ordering the conditional suspension of sentence execution. In contrast, in case file No.1ra-491/21 (Decision of April 14, 2021), the appellate court indicated that the individualization of criminal punishment must consider the concrete circumstances of the case but did not detail the extent to which these influenced the final decision. This lack of transparency in reasoning contributes to the unpredictability of sanctions.

In this context, the appellate court indicated that the defendant's actions constitute the elements of the crime provided for by Art. 244^1 para. (2) Criminal Code, which, according to Art. 16 Criminal Code, is classified as a minor offense, and, in accordance with the provisions of Art. 60 para. (1) lit. a) Criminal Code, Art. 332 para. (1) Criminal Procedure Code, thus the statute of limitations for criminal liability had expired in the case, as the crime was committed during the fiscal period 2012-2014, and a term of 2 years had expired from the date of the crime for being held criminally liable. Regarding the first instance court's solution, which ordered release from criminal liability due to the expiration of the statute of limitations, the appellate court noted that the trial court did not consider that such a solution can only be adopted when the statute of limitations for criminal liability is fulfilled at the time the criminal case is in the criminal investigation phase or before it is brought before the court, which in this case was not confirmed. Indeed, in the present case, the first instance court issued a conviction sentence, finding the defendant guilty of committing the crime provided for by Art. 244^1 para. (2) Criminal Code, consequently, as effect of the expiration of the statute of limitations, the trial court should have discussed either the issue of exemption from punishment or non-execution of the conviction sentence in connection with the statute of limitations.

This non-uniform practice has significant consequences for the principle of equality before the law and for trust in the justice system. Defendants who commit similar acts may receive completely different sanctions, depending on the court hearing the case,

which undermines the predictable and equitable nature of criminal law.

To remedy this situation, it is necessary for the SCJ RM to issue a guidance ruling establishing clear criteria for individualizing punishment in cases of tax evasion crimes, particularly regarding the application of mitigating and aggravating circumstances. It is also essential for courts to provide detailed reasoning for choosing a particular sanction to ensure transparency and coherence in judicial practice.

At the international level, the European Court of Human Rights has issued several relevant judgments in cases against the Republic of Moldova that directly or indirectly concern aspects of criminal liability for economic crimes.

Thus, in the case of *Epidavr S.R.L. v. the Republic of Moldova* (Application No.37129/16), the European Court found a violation of Art. 8 of the Convention (right to respect for private life and professional premises) in the context of searches conducted in a criminal investigation for tax evasion through "shell companies" [7]. The Court noted that the company was not named as a suspect in the criminal case and that the sole basis for the search was an internal report of the criminal investigation officer, which merely indicated that the company "could" be involved in the investigated activities. The Court remarked that the search warrants were imprecise, lacked convincing evidence, and did not justify the necessity of the measure, and their extremely general wording conferred an unlimited margin of discretion to the investigative bodies [7].

In the case of *Tasoncom S.R.L. v. the Republic of Moldova* (Application No.59627/15), the European Court sanctioned the violation of the right to a fair trial (Art. 6 § 1 of the Convention) and the right to property (Art. 1 of Protocol No.1) [8]. The Court found that the rejection of the revision request and the upholding of the tax conviction of the applicant company, although it had been definitively acquitted in a criminal trial for the same facts, deprived the acquittal of its useful effects and was contrary to the principle of legal certainty [8, p.1-2].

More recently, in the case of *Avicola Vulcănești S.A. v. the Republic of Moldova* (Application No. 1441/15), the European Court examined an application based on Article 6 § 1 of the Convention, regarding the principle of legal certainty in tax matters [9]. Also, the Constitutional Court of the Republic of Moldova, by Decision No.30 of March 5, 2026, dismissed as inadmissible the exception of unconstitutionality of Article 84 para. (1), Art. 261 para. (6), and Art. 228 para. (3) of the Tax Code [27].

These judgments underscore the importance of respecting procedural guarantees in matters of economic crimes and the need to ensure a balance between the effective fight against tax evasion and the protection of fundamental rights.

In the context of the European path of the Republic of Moldova, harmonizing criminal tax legislation with European Union standards represents a major challenge. Directive 2011/16/EU on administrative cooperation in the field of taxation [4] and Directive (EU) 2018/843 on the prevention of the use of the financial system for the purposes of money laundering or terrorist financing [5] require Member States to adopt effective measures to combat tax evasion, including through adequate criminalization of serious acts.

A crucial aspect concerns the statute of limitations for criminal liability. The Court of Justice of the European Union was recently seised by Romanian judicial authorities with a request for a preliminary ruling in the case *Lin II* (C-280/25), concerning the interpretation of limitation periods for criminal liability in cases of tax evasion. This issue is particularly relevant for the Republic of Moldova, given the commitments undertaken under the Association Agreement with the European Union and the need to align national legislation with the jurisprudence of the Luxembourg Court.

Furthermore, the criminal liability of the legal person for tax evasion represents an important contemporary challenge. Although the legislation of the Republic of Moldova provides, in principle, for the criminal liability of the legal person, its application in cases of tax offenses is extremely low, in contrast to EU Member States, where this institution is frequently used. In Romanian doctrine, for example, it has been shown that the criminal liability of the legal person for the crime of tax evasion is expressly established, and this does not exclude the criminal liability of the natural person who contributed to the commission of the crime [28, p.448]. According to Art. 136 Romanian Criminal Code, all legal persons are criminally liable, except for the state and public authorities, for crimes committed in the realization of their object of activity or in the interest or on behalf of the legal person [28, p.448-461]. Moreover, the criminal liability of the legal person does not exclude the criminal liability of the natural person who contributed to the commission of the same act.

At the same time, it is noted that in the Republic of Moldova, the most widespread forms of legal organization are individual enterprises and limited liability companies, and according to data from the State Register of Legal Entities, as of March 28, 2021, there were 99,789 registered and active individual enterprises and 126,170 limited liability companies [29, p.340]. This reality requires increased attention from the legislator regarding the adaptation of the normative framework to the specifics of these entities.

Recent practice reveals large-scale cases of tax evasion. For example, in February 2026, two administrators and one accountant were investigated for tax evasion on a particularly large scale, with estimated damages exceeding 7,000,000 lei, within companies in the construction, architecture, and design fields [30]. Also, cases of tax evasion amounting to nearly three million lei within two transport companies have been reported [31]. These cases illustrate the scale of the evasion phenomenon and the need for effective countermeasures.

Conclusions. Following the analysis conducted, it is found that criminal liability for tax evasion by economic entities in the Republic of Moldova, mainly regulated by Art. 244 of the CC RM, represents a legal instrument of primary necessity in ensuring compliance with the constitutional obligation to contribute to public expenditure [1, Art. 58]. However, the study reveals a significant gap between the gravity of the evasion phenomenon – proven by damages of hundreds of millions of lei, recent cases of particularly large-scale evasion [30; 31], and frequent links to tax havens [18, p.74] – and the actual efficiency of current criminal sanctioning mechanisms.

The theoretical distinction between criminal and contraventional liability, although seemingly clear through the prism of the value threshold of 50 forecasted average monthly salaries per economy [11, Art. 244 para. (1)], proves insufficient in practice. The complexity of modern tax evasion schemes, involving shell companies, abusive transfer pricing, and offshore jurisdictions, makes it extremely difficult to accurately establish damages and prove intent, creating a grey area where many serious acts remain at the boundary of the contraventional.

This situation is all the more problematic as, according to doctrine, "the crime of tax evasion presents an increased social danger, as it affects the very existence of the state by undermining its financial base" [14, p.187].

From the perspective of judicial practice, the analysis of the decisions of the Supreme Court of Justice and cases resolved at the national level highlights a non-uniform application of the law, especially regarding the individualization of punishment. This inconsistency affects both the deterrent nature of sanctions and public trust in the judicial system. Also, the jurisprudence of the European Court of Human Rights draws attention

to the need for strict compliance with procedural guarantees during the criminal investigation phase and the principle of legal certainty.

An important legislative progress is represented by Law No.136/2024 [19], which tightened criminal sanctions for tax evasion, including by increasing the limits of fines and prison sentences for aggravated variants [11]. Moreover, the Republic of Moldova's accession to the Inclusive Framework on BEPS in May 2024 [21] and the commitments undertaken within the Global Forum on Transparency and Exchange of Information [24; 25] represent essential steps towards alignment with international standards.

However, the effective implementation of these instruments remains a major challenge. Automatic Exchange of Information (AEOI) requires not only bilateral and multilateral agreements but also adequate technical and human capacities at the level of the State Tax Service and criminal investigation bodies. Also, the criminal liability of the legal person, although provided for in principle, is rarely applied in cases of tax offenses, in contrast to states like Romania, where this institution is expressly established and frequently used [28, p.448-449].

Thus, we consider that the current regulation of criminal liability for tax evasion by economic entities in the Republic of Moldova is at a crossroads. On the one hand, the recent legislative amendments and assumed international commitments are commendable and reflect a genuine political will to combat the phenomenon. On the other hand, without a profound reform of the criminal and procedural criminal framework and without a significant strengthening of institutional capacity, these measures risk remaining ineffective in the face of increasingly sophisticated cross-border schemes.

At the same time, we consider that a first priority direction for action is the ***proper clarification of the criteria for distinguishing between criminal and contraventional liability***. In our opinion, the current value threshold – 50 forecasted average monthly salaries per economy – is adequate to distinguish between a negligent accounting error and an organized tax fraud, but its application in practice requires additional qualitative criteria, such as: the existence of simulated cross-border transactions, the use of non-cooperative jurisdictions for tax purposes, or the involvement of interposed entities without real economic substance.

The second direction concerns the ***effective criminal liability of the legal person***. Although the Criminal Code of the Republic of Moldova provides for this form of liability, its application in cases of tax evasion is almost non-existent. We consider it necessary to have explicit regulation, similar to the Romanian model, allowing for the application of sanctions such as fines proportional to turnover, prohibition from participating in public procurement, placement under judicial supervision, or, in the most serious cases, dissolution of the legal entity with subsidiary patrimonial liability of the founders, administrators, and accountant.

The third direction refers to ***strengthening international cooperation and digital tools***. Accession to the Inclusive Framework on BEPS and implementation of automatic exchange of information are correct steps but must be complemented by operational cooperation mechanisms between criminal investigation bodies in different jurisdictions.

Finally, we believe that the true challenge is not only of a legislative nature but also cultural and institutional. Effectively combating tax evasion requires a paradigm shift: from a reactive approach, investigating "post factum", to a proactive one, based on risk analysis and prevention. It is also essential to strengthen the trust of citizens and the business environment in the tax system, so that the payment of taxes and duties is perceived not as a burden but as a contribution to the common good.

In conclusion, although the current normative framework of the Republic of Moldova regarding criminal liability for tax evasion by economic entities has made notable progress – especially through Law No.136/2024 and the assumed international commitments – major structural deficiencies remain. The prompt adoption of the recommended measures – particularly within the next 2-3 years, in line with the review cycles of EU and OECD standards – could transform the current vulnerability into a regional model of good practice.

Abstract

The issue of respecting the right to privacy and guaranteeing it during the criminal prosecution phase remains a sensitive subject for states such as Romania and the Republic of Moldova. Research and resolving the deficiencies found contribute to improving the quality of the act of justice, and not only, and to strengthening citizens' trust in state institutions. From this point of view, the research project is primarily due to the review and analysis of the establishment of guarantees that benefit subjects to whom preventive arrest is applied, and not only, and in terms of assessing the applicability of criminal procedural norms by the competent bodies of the states, from this point of view, of respecting the right to privacy of accused or defendants to whom preventive arrest is applied, according to the legislation of the Republic of Moldova or defendants, according to the legislation of Romania. In this sense, the importance is determined precisely by the need to identify legislative gaps that affect this right to privacy of accused/defendants to whom preventive arrest is applied.

The study aims to establish the directions and trends of criminal procedure in ensuring and realizing the right to privacy of accused/defendants to whom preventive arrest is applied. In this regard, practical aspects of respecting the right to privacy of accused/defendants to whom preventive arrest is applied are also addressed, in order to highlight the technical and procedural difficulties faced by law enforcement agencies, in order to ensure respect for the right to privacy in the practice of applying criminal procedure norms.

Keywords: protective measures, right to privacy, criminal prosecution phase, accused, defendants, preventive arrest.

SCOPUL APLICĂRII MĂSURII ARESTULUI PREVENTIV ÎN CONCORDANȚĂ CU RESPECTAREA DREPTULUI LA VIAȚA PRIVATĂ
